1. C. *leucographus*, Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Gært. tab. 162. fig. 1. Moriſ. Bleſſ. 244. (Cirſium maculis argenteis notatum, Tourn. Inſt. 448.) "Leaves toothed-ſpinous; peduncles naked, very long, one-flowered; calyxes ſpinous, inclined." *Root* annual. Allion. Biennial. La Marck. *Stam* two or three feet high. *Root-leaves* ſcarcely petioled, growing cloſe to the ground. *Stem-leaves* ſmooth, bright green, ſpotted with white, half-embracing the ſtem, and running down it ſo as to form three uninterrupted membranous wings, oblong-egg-ſhaped, pinnatifid nearly to the middle; lobes furniſhed with ſpines. *Flowers* purple, ſmall; peduncles woolly and white, eſpecially towards the ſummit, generally naked, but ſometimes with a ſmall leaf or two; ſpines of the calyx ſtraight, not pungent. *Down* ſimple. A native of Italy and the ſouth of France. 2. C. *peregrinus*, Willd. 2. Retz. Obſ. 1. p. 27. (C. lacteus peregrinus camerarii, Rai. hiſt. 312.) "Leaves ſcolloped, ſpinous, downy underneath; peduncles generally naked, many-flowered; calyxes ſpinous, deciduous." Retz. *Root* annual. *Stem* three feet high, branched, ſtriated, ſmooth; terminal branches downy. *Leaves* ſeſſile, ſpotted with white above. *Flowers* red; florets few, ſcarcely longer than the ſcales of the common calyx; peduncles terminal and axillary; terminal ones branched, winged, long, from three to ſix-flowered; axillary ones ſhort; ſcales of the calyx a little downy, deciduous, furniſhed with ſoft ſpines. *Seeds* ſmall, white, beſmeared with a whitiſh pellucid gum, which faſtens the down ſo ſtrongly to them, that it cannot eaſily be ſeparated; down capillary. A native of Spain. Ray. 3. C. *lanceolatus*, Linn. Sp. Pl. 2. Mart. 2. Lam. 2. Eng. bot. 1 .7. (Cnicus lanceolatus, Willd. 10.) Spear thiſtle. "Leaves pinnatifid, hiſpid; ſegments divaricated; calyx villous; ſtem hairy." *Root* biennial, branched. *Stem* three or four feet high, erect, ſtrong, branched, furrowed, many-flowered. *Leaves* alternate, woolly underneath; lobes pinnatifid, or palmate at the baſe; ſegments alternately divaricated, mucronate-ſpinous; ſpines yellow, ſhining. *Flowers* terminal, erect, large; calyx egg-ſhaped; ſcales acutely ſpinous, aſcending, clothed, like the under ſurface of the leaves, with a white, cotton-like web; florets uniform, purple; anthers yellow. *Seeds* inverſely egg-ſhaped, ſhining; down feathery. Dr. Smith. A native of waſte places and road ſides throughout Europe, flowering from June till winter. 4. C. *nutans*, muſk thiſtle. Linn. Sp. Pl. 3. Mart. 4. Lam. 3. Willd. 6. Eng. bot. 107. "Leaves interruptedly decurrent, ſpinous; flowers drooping; ſcales of the calyx lanceolate; their upper part ſpreading." *Root* annual, (biennial, Lam.) ſpindle-ſhaped. *Stem* two or three feet high, erect, a little branched, ſtriated, ſmoothiſh. *Leaves* deeply ſcolloped and waved, very ſpinous, green on both ſides, a little hairy, but not rough. *Flowers* terminal, ſolitary, peduncled, of a rich crimſon colour, ſmelling ſtrongly of muſk in warm weather; peduncles woolly; calyx egg-ſhaped; ſcales lanceolate, acutely ſpinous, ſomewhat woolly; the outer ones ſpreading, the inner ones more cloſe. *Seeds* ſhining, compreſſed, marked with dotted ſtreaks; down rough, but not feathery. Dr. Smith. A native of a calcareous ſoil in many parts of Europe, flowering in June. The dried leaves of this and the preceding ſpecies are ſometimes uſed to curdle milk. 5. C. *macrocephalus*, Willd. 5. Deſf. atl. 2. p. 245. "Stem downy; leaves interruptedly decurrent; flowers drooping; calyx-ſcales egg-lanceolate, woolly, their upper part ſpreading." Allied to the preceding, but differs in having a downy ſtem, and flowers two or three times larger. A native of Tunis, flowering early in the ſpring. 6. C. *lanuginoſus*, Willd. 4. (C. orientalis acanthi folio candidiſſimo, Tourn. Cor. p. 31.) "Leaves decurrent, lanceolate, pinnatifid, toothed, ſpinous, ſnowy white with down on both ſides; flowers terminal, ſolitary, ſeſſile." Whole plant covered with a denſe, white down. *Stem* toothed, with ſpines on the decurrent leaves. *Leaves* with three or four ſpinous teeth on the upper ſegments. *Flowers* purple, a little leſs than thoſe of C. nutans, erect; calyx-ſcales lanceolate, not ſpreading. A native of Armenia. 7. C. *criſpus*, curled thiſtle. Linn. S. Pl. 5. Mart. 6. Lam. 5? Willd. 13. "Leaves decurrent, ſpinous at the margin; flowers aggregate, terminal, with ſoft ſpines. Linn. Calyx-ſcales linear-awl-ſhaped, mucronate, ſpreading." Willd. *Leaves* downy, white, with green veins. *Peduncles* downy; ſcales of the calyx recurved, but not pungent. Linn. There is much confuſion in authors with reſpect to the plant intended by Linnæus. La Marck ſays that the flowers of his criſpus are not aggregate. 8. C. *polyanthemus*, Linn. Mant. 109. Mart. 7. Willd. 15. (C. pycnocephalus paluſtris, Trium. obſ. tab. 103. Cirſium paluſtre polianthemum, Vail. act. 160.) "Leaves ſcolloped, ciliated, naked underneath; flowers peduncled, cluſtered." Very like C. criſpus, but differs from it in having neither the petioles nor the under ſurface of the leaves downy. *Stem* taller than that of C. criſpus. *Leaves* deeply runcinate, not rigid, rather obtuſe, ciliated with ſoft ſpines, marked with hollow veins, paler beneath, but not white; upper ſtem-leaves lanceolate, irregularly ſcolloped, entirely decurrent, curled, ſcarcely pungent. *Flowers* purple, nearly ſeſſile, three or four together at the top of the ſtem; peduncles curved, not hairy; anthers violet; ſtyles white; ſtigmas purple. *Down* capillary. A native of Rome. Linn. 9. C. *acanthoides*, welted thiſtle. Linn. Sp. Pl. 4. Mart. 5. Willd. 9. Eng. bot. 973. (C. criſpus, Hudſ. Lightf. C. polyacanthos, Curt. Lond. Sibth. C. inclinans, With. 2d. ed. Mart. 39.) "Leaves decurrent, ſcolloped, ſpinous; calyxes globular, generally peduncled; ſcales recurved. *Root* annual, ſpindle-ſhaped, white. Whole plant green. *Stem* three feet high or more, erect, branched, furrowed, but little hairy; branches elongated, ſpreading. *Leaves* rather interruptedly decurrent, ſmaller than in C. nutans, green on both ſides, ſmoothiſh. *Flowers* terminal, a little inclining, deep purple, odorous; calyx globular; ſcales linear, recurved at the tip, ſlightly ſpinous, a little woolly; florets deeply divided nearly to the baſe ſo as to appear two-lipped; the upper lip four-cleft, the lower ſimple. *Down* deciduous; capillary, rough. Linn. and Dr. Smith. We have obſerved, beneath the diviſions of the ſegments,

five depreſſions reſembling nectareous glands. A native of ditch banks and hedges, flowering in June and July. 10. C. *nigreſcens*, Lam. 16. "Leaves decurrent, narrow, ſcollop-toothed, ſpinous, curled; flower large, terminal." *Stem* ſimple, ſcarcely a foot high, a little downy, ſometimes two-flowered. *Leaves* dark green, beſet here and there with a woolly down. *Flower* purple; calyx-ſcales briſtle-ſhaped, rather looſe, not pungent. Lam. Deſcribed from a dried ſpecimen. Obſerved by Villars on the Alps about Grenoble. 10. C. *hamuloſus*, Willd. 10. Ehr. Beitr. p. 166. "Leaves decurrent, lanceolate, pinnatifid-toothed, ſpinous, villous underneath; peduncles one-flowered, downy; calyx-ſcales awl-ſhaped, ſpinous; inner one recurved." *Root* biennial. *Stem* four or five feet high, much branched, erect. *Flowers* purple, drooping; calyx roundiſh. A native of Hungary. 12. C. *candicans*, Willd. 2. Waldſt. and Kitaib. Pl. Rar. Hung. i. p. 85. tab. 83. "Leaves ſemi-decurrent, lanceolate, pinnatifid, ſpinous, downy beneath; peduncles ſcaly, downy; calyx egg-ſhaped; ſcales awl-ſhaped, ſtraight." *Root* biennial. *Stem* ſmooth below. *Flowers* purple, leſs than thoſe of C. *criſpus;* calyx ſmooth. A native of Hungary. 13. C. *paniculatus*, Willd. 16. Mart. 46. Vahl. Symb. i. p. 68. Ait. Kew. iii. p. 143?" "Leaves ſemi-decurrent, tooth-ſcolloped, ſpinous, ſmooth; flowers panicled." *Root* perennial. *Stem* two feet high, erect, purpliſh, furrowed, angular, ſmooth, ſpinous. *Leaves* lanceolate; ſpines rigid, yellowiſh. *Flowers, towards the ſummit*, numerous, on woolly peduncles; *below* ſolitary, or growing two or three together, nearly ſeſſile; calyx egg-ſhaped; ſcales ſmooth, terminated by a ſmall yellowiſh ſpine. *Down* capillary. Vahl's plant is a native of the Pyrenées. The Kew plant was brought from the ſouth of Europe, and introduced in 1781, by Monſ. Thouin. The ſtem-leaves are ſaid to be unequally ciliated; the lower ones lyre-ſhaped and waved, but there appears little doubt of its identity with that of Vahl. 14. C. *paluſtris*, Linn. Sp. Pl. 6. Mart. 8. Lam. 6. Curt. Lond. Faſ. 6. tab. 56. Eng. Bot. 974. (Cnicus paluſtris, Willd. 1.) "Leaves decurrent, pinnatifid-toothed, ſpinous, rough; calyx egg-ſhaped, aggregate, with very ſmall ſpines." *Root* biennial, branched. *Stem* from three to ſix feet high, erect, ſtiff, angular, often branched; branches ſpreading. *Leaves* interruptedly decurrent, deep green. *Flowers* purple or white, terminal, often ſeſſile; calyx-ſcales lanceolate, keeled, preſſed cloſe, ſcarcely woolly. *Seeds* very ſmooth, not ſtriated; down deciduous, feathery. Dr. Smith. A native of wet ſituations in England, and many other parts of Europe, flowering in July and Auguſt. 15. C. *pungens*, (Cnicus, Willd. 2. Cirſium orientale, acanthi folio, Tourn. Cor. 32.) "Leaves decurrent, woolly underneath, pinnatifid, ſpinous; flowers in cloſe racemes; calyx-ſcales egg-ſhaped, ſpinous; ſpines ſpreading." *Stem* erect, branched, furrowed; ſpines ſtrong, yellowiſh, half an inch long. *Flowers* the ſize of thoſe of C. *paluſtris;* calyx-ſcales preſſed cloſe, terminated by a rigid, ſpreading, yellowiſh ſpine; down feathery. Similar in the infloreſcence and general habit to C. *paluſtris*, and in the ſhape of the leaves to C. *lanceolatus*. A native of Armenia. 16. C. *arenarius*, Deſf. Atl. ii. p. 247. tab. 222. (Cnicus, Willd. 3.) "Leaves decurrent, woolly, lanceolate, toothed, curled, ſpinous at the edge; flowers in cloſe racemes; calyx-ſcales lanceolate awl-ſhaped, pungent, reflexed." *Stem* a foot and a half, or two feet high; erect, ſimple, downy. *Leaves* unequally pinnatifid-toothed, with a white, woolly rib. *Flowers* pale violet, five or ſix at the top of the ſtem, nearly ſeſſile; calyx egg-ſhaped, the ſize of that of C. *lanceolatus;* ſcales cloſely imbricated at the baſe, woolly. *Seeds* four-cornered, ſmooth; down ſeſſile, white, feathered. Deſf. l. c. A native of Barbary near Sfax. 17. C. *pycnocephalus*, Linn. Sp. Pl. 7. Mart. 9. Lam. 7. Willd. 17. Jacq. Hort. tab. 47. "Leaves decurrent, pinnatifid-ſcolloped, pubeſcent, ſpinous; peduncles without leaves, downy; calyxes deciduous." *Root* perennial. *Stem* from one to three feet high, white, with hairs. *Root-leaves* ſomewhat lanceolate, a little ſcolloped; *ſtem-leaves* oblong, toothed, pubeſcent on both ſides, whiter, and almoſt woolly underneath. *Flowers* purple; peduncles ſhort, white with down, neither winged nor ſpinous; pedicels with three or four flowers; calyxes about the ſize of a hazel nut, oblong; ſcales awl-ſhaped, erect, ſpreading, with ſmall ſpines; florets often nine or ten; border erect. Linn. 18. C. *auſtralis*, Linn. jun. Supp. 348. "Leaves decurrent, runcinate, ſpinous; calyxes nearly ſeſſile, terminal." C. *Arabicus*, Willd. 3. Jacq. Ic. 1. tab. 166. Collect. i. p. 56? "Leaves decurrent, oblong, ſcolloped, ſpinous, white-veined, villous underneath; flowers ſeſſile, rather cluſtered; calyxes cylindrical." Willd. C. *galactites*, Lam. 21? "Stem winged, branched; upper wings broader; leaves decurrent, angularly toothed, ſpinous, downy underneath; flowers ſeſſile, axillary and terminal." La Marck. We have tranſcribed the ſpecific character given by each of the three authors, becauſe the identity of the plants has not been abſolutely aſcertained, though it ſeems highly probable. Profeſſor Martyn, however, conſiders the arabicus and the auſtralis as diſtinct ſpecies, n. 3, and 11. *Stem* about a foot high, woolly or cottony. *Leaves* alternate, remote, ſeſſile, ſcarcely decurrent all the way from one to another, oblong, ſomewhat ſcolloped at the ſides, a little cobwebbed, the lateral veins running out into white ſpines. Linn. jun. Oblong, ſcolloped in a pinnatifid manner, toothed, ſpinous, attenuated at the baſe, ſmoothiſh, and white-veined above, woolly-villous underneath; the root and lower ſtem ones petioled, the reſt decurrent. Willd. Decurrent, almoſt petioled, angular, toothed, ſpinous, green above, whitiſh and cottony underneath. Lam. The white veins are not mentioned by La Marck; but his ſpecific name implies them. *Flowers* terminal and lateral, terminal ones ſeveral, lateral ones ſolitary, ſeſſile. Linn. Willd. Lam. Calyx-ſcales lanceolate-egg-ſhaped, preſſed cloſe. Willd. Somewhat ſpreading. Linn. A native of the ſouth of Europe. Linn. Lam. Arabia? Willd. 19. C. *tenuiflorus*, Willd. 14. Mart. 51. Curt. Flor. Lond. Faſc. 6. tab. 55. Eng. Bot. 412. (C. acanthoides, Lam. 4. Hudſ. 351. Lightf. 451. With. Ed. ii. 871.) "Leaves decurrent, ſcolloped, ſpinous, downy; calyxes ſomewhat cylindrical, aggregate, ſeſſile; ſcales lanceolate, rather erect." *Root* annual, ſpindle-ſhaped, ſmall. Whole plant white, with down. *Stem* four feet high, erect, ſtiff, but little branched, furrowed. *Leaves* ſcolloped, moſt woolly underneath, broadly decurrent. *Flowers* pale purple, terminal, cluſtered, ſeſſile; calyx ſlender, pale, ſcarcely woolly; ſcales lanceolate, even, ſmooth, rather erect, but little nerved, acutely ſpinous; florets from ten to fifteen; down deciduous, capillary, rough. There was long much controverſy among Britiſh botaniſts concerning this thiſtle; the herbarium of Linnæus at length determined that it has not been inſerted among his works. Dr. Smith was for ſome time inclined to conſider C. pycnocephalus, auſtralis, and the plant before us, as only varieties of the ſame ſpecies. He obſerves, however, that the two former have fewer ſcales in their calyx, the ſtalk leſs winged, and their flowers, whether ſeſſile or pedunculated, are much fewer together, with leſs numerous florets. See Eng. Bot. La Marck's acanthoides is clearly the preſent plant, and he ſpeaks of it as very common in uncultivated ground, dry ditches, and under the ſhelter of walls in France and other parts of

Europe. In Great Britain it appears to be very local, though abundant where it has once gained a footing. It is common about London, growing, as Curtis obſerves, in the very ſuburbs. We have obſerved it about the ſkirts of Edinburgh and Sunderland, and ſhould have ſuppoſed it confined to the neighbourhood of populous towns, if we had not found it in great plenty at Blackpool in Lancaſhire, about the dry banks, which are the only fences of the incloſed land in that naked part of the country. 20. C. *argentatus*, Linn. Mant. 280. Mart. 10. Lam. 8. Willd. 18. Jacq. hort. tab. 192. (Cirſium ægyptiacum minus, foliis ad limbum argenteis.) "Leaves decurrent, runcinate, ſpinous; peduncles ſomewhat downy, one-flowered; calyxes egg-ſhaped, mucronate, not pungent." *Root* annual. *Stem* a foot high, zig-zag, ſmooth, alternately branched. *Leaves* ſmall, oblong, green, ſpotted with white, eſpecially about the indentures. *Flowers* ſmall, purple, ſcarcely opening, terminal; peduncles very long, one-flowered, downy, erect; calyx falling off entire with the ripe ſeeds; ſcales cloſely imbricated, erect; down capillary. Linn. and Lam. A native of Egypt. 21. C. *cyanoides*, Linn. Sp. Pl. 9. Mart. 13. Lam. 9. Willd. 19, 20. α. *monoclonos*, Gmel. ſib. 2. p. 42. tab. 15. β. *polyclonos*, tab. 16. "Leaves decurrent, pinnatifid, linear, entire, without ſpines, petioled, downy underneath." *Root* perennial. *Stem* in α. nearly ſimple, with few leaves; in β. much branched, the upper leaves much dilated at the baſe, the lower ones with linear pinnæ. *Down* capillary. Willdenow makes them diſtinct ſpecies. A native of Tartary. 22. C. *canus*, Linn. Mant. 108. Mart. 14. La Marck 10. (Carduus tuberoſus, Jacq. Vind. 280. from the deſcription. Auſt. 1. tab. 42, 43. Cnicus canus, Willd. 4. Cirſium tomentoſum radice bulboſa, Bauh. hiſt. 3. p. 44. C. montanum maximum, Rai. hiſt. p. 305.) "Leaves decurrent, lanceolate, toothed, a little cobwebbed, with hairs on both ſides." *Roots* perennial, ſpindle-ſhaped, aggregate, fleſhy, white. *Stem* four feet high, green, angular, cobwebbed. *Leaves* ſomewhat ſcolloped, toothed; fringed with white, ſcarcely pungent ſpines; keeled. *Flowers* ſolitary, purple, terminal; peduncles long, with a few ſmall floral leaves; calyx not pungent, marked with a white line on the outſide. Linn. *Down* feathery. A native of Auſtria. 23. C. *pectinatus*, Linn. Mant. 279. Mart. 15. Lam. 11. Willd. 21. "Leaves decurrent, lanceolate, pinnatifid-pectinate; peduncles very long; flowers drooping as the ſeed ripens." *Root* biennial. Whole plant ſmooth. *Stem* two feet high, erect. *Leaves* with a pale keel, deeply toothed, ſo as to reſemble a comb; teeth equal, lanceolate, large, entire, but ſlightly ciliated; ending in a ſoft ſpine, and furniſhed at their baſe with a ſmall deflexed tooth. *Flowers* purple, the ſize of the common burdock, terminal; peduncles very long, one-flowered, ſomewhat downy; calyx-ſcales linear, ſpreading; anthers white; piſtil long. Linn. Raiſed by Linnæus from ſeeds brought among other kinds from Pennſylvania. 24. C. *alpeſtris*, Willd. 23. Waldſt. and Kitaib. pl. rar. Hung. "Leaves ſemi-decurrent, pinnatifid, acuminate; ſegments two-lobed, ciliate-ſpinous; peduncles downy; calyx-ſcales linear-awl-ſhaped, ſpreading." *Stem* a foot, or a foot and halfhigh, ſimple. *Leaves* green on both ſides. *Flowers* purple, two or three at the top of the ſtem; peduncles leafleſs, downy. *Seed-down* capillary, rough. A native of the Croatian Alps. 25. C. *defloratus*, Linn. Sp. Pl. 21. Mart. 16. Lam. 12. Willd. 24. Jacq. Auſt. tab. 89. Hall. helv. 677. tab. 18. fig. 2. "Leaves decurrent, lanceolate, ſerrated, ſomewhat ciliated with ſpines, ſmooth; peduncles very long, woolly, one-flowered." *Root* perennial. Whole plant ſmooth. *Stem* ſometimes ſimple, only a foot high, one-flowered; ſometimes branched, a foot and half high. *Leaves* dark green, peduncles leafleſs, a little cottony towards the ſummit. *Flowers* purple, often drooping as the ſeeds ripen. *Down* capillary. A native of Auſtria, Switzerland, and the ſouthern provinces of France. 26. C. *ſeminudus*, Willd. 25. "Leaves ſemi-decurrent, ſerrated, ſpinous, grey underneath; peduncles very long, one-flowered, woolly." Similar to the preceding, but its leaves are ſhorter, grey underneath, and leſs deeply ſerrated; the calyx-ſcales ſpreading. A native of the northern parts of Perſia. 27. C. *medius*, Lam. 13. Gouan. Illuſt. 62. tab. 24. Mart. 43. excluding the reference to Allioni pedem. (Cnicus Gouani, Willd. 6.) "Leaves decurrent, pinnatifid, ſpinous at their edges; ſtem one-flowered; calyx-ſcales without ſpines, ſpreading, briſtle-ſhaped." Similar to C. defloratus, but its leaves are villous underneath, larger and more divided. *Root* perennial. *Stem* a foot and half high, ſimple. A native of the Pyrenées. 28. C. *carlinæfolius*, Lam. 14. Willd. 8. Vahl. Symb. i. p. 67. "Leaves decurrent, ſmooth on both ſides, pinnatifid; pinnæ angularly cut, ſpinous; peduncles one-flowered, woolly under the flower." Lam. *Stem* a foot and half high, erect, branched, ſmooth, ſpinous, woolly near the ſummit. *Leaves* reſembling thoſe of the preceding ſpecies in ſhape, but ſmooth on both ſides; ſpines ſtrong, yellowiſh. *Flowers* purple, ſeldom more than three; calyx-ſcales lanceolate-awl-ſhaped, ſpreading, rather pungent. Vahl. A native of the ſouth of France. 29. C. *carlinoides*, Mart. 42. Willd. 7. Gouan Illuſt. 62. tab. 23. (Carlina pyrenaicus, Linn.? Carduus tomentoſus pyrenaicus, Tourn. Inſt. 441.) "Leaves decurrent, pinnatifid, downy; ſegments palmate, ſpinous; flowers cluſtered." Vahl. *Root* perennial. *Stem* a foot high, or more, white with down, ſometimes panicle-branched; branches axillary, alternate, ſolitary. *Root-leaves* three or four inches long, ſomewhat lanceolate, petioled, very woolly; pinnules on each ſide from twelve to fifteen, imbricated, three or five-cleft, the lobes alternately ſmaller, ending in a ſtrong yellow ſpine. *Stem-leaves* crowded, very like thoſe of the root, but as they approach the top of the ſtem the pinnules are narrower and leſs palmated. *Flowers* purple, from four to eight; peduncles ſhort, woolly; calyx in flowering time very ſmooth, green, acuminate-egg-ſhaped; ſcales looſely imbricated, but not ſquarroſe, nearly equal, a little pungent; the inner ones ſometimes violet-purple, more ſlender, flexible and ſoft. Gouan. A native of the Pyrenées, and of the Alps about Col Tende. La Marck believes it to be the carlina pyrenaicus of Linnæus. 30. C. *argemone*, Lam. 15. "Leaves decurrent, broadly egg-ſhaped, twice pinnatifid, ciliated, ſmooth on both ſides; peduncle terminal, one-flowered." Lam. *Stem* about a foot high, ſimple, ſmooth. *Leaves* ciliated, with very ſmall ſpines. *Calyx* ſmooth; ſcales cloſe, not pungent. Deſcribed from a ſingle ſpecimen in the herbarium of Thouin, brought from the Pyrenées by abbé Pourret. 31. C. *monſpeſſulanus*, Linn. Sp. Pl. 10. Lam. 17. Mart. 17. Gouan. Monſp. 422. (Cnicus Monſp. Willd. 9. Cirſium foliis non hirſutis, floribus compactis, Bauh. pin. 377.) "Leaves decurrent, lanceolate, ſomewhat repand, or angularly ſcolloped, ſmooth, unequally ciliated; peduncles alternate; calyxes not pungent." Linn. *Root* perennial. *Stem* four feet high, channelled, a little branched, greeniſh below, ſlightly cottony towards the ſummit. *Leaves* almoſt entire, a little glaucous, the lower ones entirely decurrent, middle ones ſemi-decurrent, upper ones ſeſſile. *Flowers* purple, remarkably ſmall for the ſize of the plant; calyx-ſcales ſmall, expanding at the points. *Down* feathery. A native of the ſouth of France. 32. C. *pyrenaicus*, Lam. 18. Mart. 45.? Jacq. obſ. 4. p. 11. tab. 95. Gouan. illuſt. 63. (Cirſium pyrenaicum

cum altiſſimum, Tourn. Inſt. 448. Cnicus pyrenaicus, Willd. 5.) "Leaves decurrent, lanceolate, a little repand, downy underneath, ciliate-ſpinous; flowers cluſtered." Lam. Perhaps only a variety of the preceding: it is, however, larger, and conſtantly diſtinguiſhed by its leaves being cottony and whitiſh underneath, by the long, yellowiſh-white, pungent ſpines with which the leaves are ciliated, and by its cluſtered flowers at the top of the ſtem. The root-leaves are more than a foot long, narrowing into a petiole. Lam. A native of the Pyrenées. We are in doubt whether the pyrenaicus of profeſſor Martyn be the ſame plant. His only ſynonyms are Jacq. obſ. 4. 11. Ger. Prov. 179. n. 13. and Allion. pedem. n. 549. tab. 12. neither of which are quoted either by La Marck or Willdenow. His ſpecific character accords ſufficiently with La Marck's, except in deſcribing the leaves as downy on both ſides; but his larger deſcription taken from Allioni does not ſeem to be conſiſtent with it. It is as follows. *Stem* three feet high, or more, ſtriated, green, ſmooth. *Leaves* alternately ſeſſile, and decurrent with ears; almoſt winged, or very deeply gaſhed, with few teeth, ending in a longer ſpine; the whole edge ciliate with ſhort ſpines. *Flowers* at the top, three or four, with a ſmall leaf under each; peduncles cobwebbed. Top of the ſtem almoſt naked; calyx-ſcales not pungent, linear, reflected at the end. This deſcription agrees better with C. pratenſis of La Marck, which is certainly not the pratenſis of the Engliſh botaniſts; but there are ſome differences, as will appear from the following deſcription. 33. C. *ambiguus*, (C. pratenſis, Lam. 23. C. pratenſis aſphodeli radice, foliis profunde et tenuiter laciniatis, Bauh. pin. 377.) "Leaves ſemi-decurrent, pinnatifid-laciniate, ciliated, ſmooth on both ſides; flowers generally ſolitary, peduncled." *Root* perennial. *Stem* three or four feet high, ſtriated, a little branched. *Leaves* ſmooth, and green on both ſides; ſpines not pungent; root leaves long, pinnatifid; pinnules cut into deep ſegments; lower ſtem leaves cut in the ſame manner, and at leaſt ſemi decurrent; upper ones ſmaller, leſs divided, leſs decurrent, many of them ſeſſile. *Flowers* purple, reſembling thoſe of C. monſpeſſulanus. A native of the ſouth of France, deſcribed by La Marck from a living plant. La Marck obſerves that it may poſſibly be C. tuberoſus of Linnæus, but not all his ſynonyms. 34. C. *chius*, Mart. 20. Jacq. hort. 3. tab. 5. "Lower leaves ſemi-decurrent, ſemi-pinnatifid, ciliate-ſpinulous; upper ones embracing the ſtem or ſeſſile; ſtem not ſpinous; peduncles one-flowered." Nearly allied to the preceding, if it be more than a variety. *Stems* five or ſix feet high, branched from top to bottom, angular, villous, erect. *Leaves* lanceolate-oblong; the upper ſurface almoſt ſmooth, and deep green; the lower ſomewhat villous, and paler, but no where woolly; acuminate and pinnatifid; ſegments lanceolate, ciliate-ſpinous, ſcarcely pungent; root-leaves a foot and half long. *Flowers* purpliſh fleſh-colour, erect; peduncles terminal on each branch, one-flowered, near the flower a little woolly, and aſh-coloured; calyx egg-ſhaped, not hirſute; ſcales with an oblong, glutinous bump on the back, ending in a ſhort, ſoft, dark purple ſpine. *Seeds* ſhining: down feathery. A native of Chios, received by Jacquin about the year 1770, from Marſigli of Padua. 35. C. *creticus*, Lam. 20. (Cirſium creticum altiſſimum, C. lanceolati-folio. Tourn. Cor. 32.) "Leaves decurrent, pinnatifid, ſmooth underneath; ſegments divaricated, ſpinous; flowers ſmall, cluſtered; calyx ſcales ſmall, ſomewhat ſpinous." *Stem* a little branched near the ſummit, ſpinous, ſtriated, almoſt ſmooth. *Leaves* reſembling thoſe of C. lanceolatus, but narrower. *Flowers* purple; calyx globular. A native of the Iſle of Candia, deſcribed by La Marck from a dried ſpecimen in the herbarium of Juſſieu. 36. C. *pannonicus*, Linn. jun. Supp. 348. Mart. 18. Lam. 22. Willd. 26. (C. ſerratuloides; Jacq. auſt. v. 3. tab. 5. Cirſium anguſtifolium non laciniatum; Bauh. pin. 377.) "Leaves ſemi-decurrent, naked, undivided, ciliated; flower often ſolitary." *Root* perennial. A native of Hungary and Auſtria. 37. C. *parviflorus*, Linn. Mart. 279. Mart. 21. Lam. 23 Willd. 27. (Cirſium pratenſe alpinum polycephalum, aſphodeli radice; Tourn. Inſt. 448.) "Leaves adnate at the baſe, ſcarcely decurrent, lanceolate, naked, irregularly ſcolloped, ciliated with weak ſpines." *Root* perennial. *Stem* upright. *Leaves* green on both ſides. *Flowers* white, terminal, peduncled, the ſize of thoſe of Serratula tinctoria; calyx egg-ſhaped; ſcales with a white keel, ending in a ſoft ſpine; ſtyles long. A native of mountains in the ſouth of Europe.

** *Leaves not decurrent.*

38. C. *Caſabonæ*, Linn. Sp. Pl. 12. Mart. 23. Lam. 24. (Cnicus caſabonæ; Willd. 42. Acarna major, caule non folioſo; Bauh. pin. 379. Acarna Theophraſti anguillaræ; Lob. ic. 2. Barrel. ic. 1221.) "Leaves ſeſſile, narrow-lanceolate, perfectly entire, flat; downy underneath, armed with triple ſpines on the edge; flowers axillary, ſeſſile, in a kind of ſpike; calyx-ſcales lanceolate, ſpinous, ſpreading." *Root* biennial. *Stem* two or three feet high (ſix, Mart.) perfectly ſimple, upright, channelled, whitiſh or reddiſh, thick ſet with leaves in its whole length. *Leaves* acute, ſmooth, bright green above, very white or ſaffron-coloured underneath; ſpines very ſharp, yellowiſh. *Flowers* purple. A native of the ſouth of France and Italy. The trivial name is derived from Caſabona, herbariſt to the grand duke of Tuſcany, who ſent the ſeeds to J. Bauhin. 39. C. *afer*, Jacq. hort. Schoenb. 2. tab. 145. (Cnicus afer; Willd. 3.) β. C. diacantha, Mart. 48. Billard ic. pl. Syr. 2. p. 7. tab. 3. "Leaves ſeſſile, lanceolate, downy underneath, ſomewhat ſcolloped, lobes emarginate, armed with double ſpines; flowers peduncled, in a kind of corymb; calyx-ſcales lanceolate, ſpinous, remarkably ſpreading." The ſeparation of the indentures is more angular in α than in β, but there is no other difference, Willd. *Root* annual. *Stem* two feet high, ſtraight, ſimple, ſtriated, downy. *Leaves* ſmooth above, but the nerves are white with down; ſpines at the edge ſometimes, but rarely, ternate or ſolitary, unequal, diverging, yellow; the end one ſingle. *Flowers* few, violet; peduncles ſingle, ſtriated, downy, ſometimes furniſhed with one or two leaves; calyx egg-ſhaped; ſcales lanceolate-egg-ſhaped, pubeſcent, ending in a long, awl-ſhaped, rigid, ſharp dagger-point, the lower ones reflexed; ſegments of the florets awl-ſhaped, upright, unequal; ſtigma jointed, awl-ſhaped, ſeldom bifid. *Seeds* inverſely egg-ſhaped, very ſmooth, brown; down whitiſh, feathery, Billardiere; α is a native of Barbary; β. of Syria. 40. C. *hiſpanicus*, Lam. 25. (Carduus polyacanthos hiſpanicus; Tourn. Inſt. 441. Barr. ic. 474.) "Leaves ſeſſile, lanceolate, waved, downy underneath, furniſhed at the edge with very long ſpines not proceeding from the ſame point; flowers in a kind of corymb." *Root* perennial, long, woody, bearing on its crown the remains of former leaves which give it a ſcaly appearance. *Stem* not more than twelve or fifteen inches high, ſimple, thick, ſomewhat woody, ſtriated, whitiſh and cottony, thick-ſet with leaves. *Leaves* very ſmooth above. *Flowers* large; peduncles about an inch long; calyx formidably ſpinous. A native of Spain. 41. C. *gnaphaloides*, Mart. 50. Cyrill. rar. neap. 1. 27. tab. 9. "Leaves ſeſſile, in a ſort of whorl, quite entire, downy underneath." *Root* perennial, woolly, ſpringing from the clefts of rocks whence the plant hangs. *Stems* one or two feet high, much branched, white, with a cloſe nap, clothed with leaves from top to

bottom. *Leaves* lanceolate-linear, two or three inches long, green and ſmooth above, except at the baſe, a little rolled back on the ſides; thoſe of the former year remaining withered and dry at the bottom of the ſtem. *Flowers* purple, terminal; calyx egg-ſhaped, contracted at the top, glaucous green; ſcales ſimple, ſtiffiſh, acute but not pungent; anthers purple, each terminating at the bottom in two cirrhi; filaments very hairy at the top. *Seeds* egg-ſhaped, grey; down very long. A native of the Upper Calabria, gathered in 1783 by Angelo Fuſani. Before that it was known to exiſt only in the Herbarium of Ferrantes Imperati, under the name of Jacea. 42. C. *ſtellatus*, Linn. Sp. Pl. 13. Mart. 24. Lam. 26. Foliis integris, flore purpureo, Tourn. 440. (Cnicus ſtellatus, Willd. 44.) "Leaves ſeſſile, linear-lanceolate, entire, not pungent, downy underneath; axillary ſpines in pairs, ſomewhat branched; flowers ſeſſile, lateral, and terminal." In habit reſembling *Centaurea calcitrapa*. *Root* annual. *Stem* a foot high, much branched, a little cottony. *Leaves* three inches long, green above, very narrow at the baſe. *Flowers* purple, ſolitary; peduncles with two or three floral leaves; calyx-ſcales long, ſharp, pungent. A native of Sicily and the county of Nice. 43. C. *dentatus*. (Cnicus dentatus, Willd. 41.) "Leaves embracing the ſtem, lanceolate, doubly toothed, ſpinous, woolly underneath; ſtem one-flowered; calyx-ſcales lanceolate-egg ſhaped, mucronate, preſſed cloſe." *Stem* half a foot high or more, ſimple, erect, furrowed, eſpecially near the flower. *Leaves* on the ſtem generally four; lower ones ſomewhat petioled; upper ones embracing the ſtem, narrowed at the baſe. Deſcribed by Willdenow from a dried ſpecimen. Native country unknown. 44. C. *virginianus*, Linn. Sp. Pl. 18. Mart. 29. Lam. 40. Willd. 30. Gron. Virg. 117. Jacq. Obſ. 4. p. 13. tab. 99. (Cirſium minus virginianum, Moriſ. Hiſt. 3. p. 150. Rai Sup. 197.) "Leaves ſeſſile, lanceolate, edged with ſpinous teeth, downy underneath; ſtem leafy, one-flowered; calyx not pungent." Linn. "Calyx-ſcales mucronate." Willd. *Stem* ſlender, a foot or eighteen inches high, furniſhed with 26 or 28 leaves, which diminiſh in ſize from the bottom to the top. *Flower* purple. A native of Virginia. 45. C. *linearis*, Mart. 22. Willd. 35. Thunb. Jap. 305. "Leaves ſeſſile, linear, ciliate-ſpinous, ſmooth; flowers terminal, ſolitary." *Stem* a foot high, herbaceous, erect, round, ſtriated, not ſpinous; branches alternate, ſpreading, a little downy near the top. *Leaves* two inches long, ſpreading. *Flowers* ſmall; calyx a little downy at the baſe. A native of Japan. 46. C. *giganteus*, Deſf. Atl. 2. p. 245. tab. 221. C. ſcaber, Poiret. Itin. 2. p. 201. (Cnicus giganteus, Willd. 19.) "Leaves embracing the ſtem, egg-ſhaped, ſcolloped, beſet with briſtly hairs, downy underneath; lobes ſpinous; peduncles about three-flowered; calyxes globular; ſcales egg-lanceolate, ſpinous, preſſed cloſe. A native of Algiers. 47. C. *lanatus*. (Cnicus lanatus, Willd. 21.) "Leaves ſeſſile, lanceolate, ſcolloped, ſmooth, downy underneath, ſpinous at the edges; calyxes oblong; ſcales egg-ſhaped, mucronate, recurved." *Stem* erect, ſtriated, ſmooth, branched. *Leaves* two inches long. *Peduncles* naked, one-flowered, pubeſcent. Similar in habit to C. *arvenſis*. A native of the Eaſt Indies, communicated to Willdenow by Dr. Roxburgh. 48. C. *ſyriacus*, Linn. Sp. Pl. 15. Mart. 26. Lam. 27. (C. maculis albis exoticus, Bauh. pin. 381. C. latifolius echinos obſoletæ purpuræ ferens, Bauh. pin. 380. C. lacteus ſyriacus, Cam. Hort. 35. tab. 10. Cnicus ſyriacus, Willd. 45.) "Leaves embracing the ſtem, oblong, toothed, ſpinous, white-veined; flowers nearly ſeſſile, bracteated; calyx-ſcales oblong-lanceolate, preſſed cloſe, mucronate." Willd. *Root* annual. *Stem* two or three feet high, erect, ſimple, almoſt ſmooth. *Leaves* angularly ſcolloped, green, ſpotted with white; lower ones narrowed into a petiole. *Flowers* white, ſometimes purple, ſolitary, lateral, and terminal; bractes four or five, with ſtrong white nerves, ending in a ſpine; down feathery. A native of Syria, Candia, and Spain. 49. C. *flaveſcens*, Linn. Sp. Pl. 24. Mart. 35. Lam. 48. Cavan. Hiſp. ic. 1. p. [illegible] n. 52. tab. 46. Krock. Sileſ. n. 1346. (Cnicus flaveſcens, Willd. 46.) "Leaves lanceolate, entire, ſmooth, toothed, not pungent; flowers leafleſs, with ſoft ſpines." Linn. *Root* annual. *Stem* eighteen inches high, upright, grooved, ſmooth, ſparingly branched. *Leaves* alternately ſcattered, attenuated to the baſe, ſometimes a little decurrent, unequally toothed; teeth ending in a little evaneſcent briſtle, ſlightly channelled, and ſomewhat rigid. *Flowers* yellowiſh white, terminal, ſolitary; calyx cylindrical, oblong, broader at the baſe; ſcales linear, all preſſed cloſe, yellow, ending in a weak ſpine. *Seeds* top-ſhaped, four-cornered; down abundant, feathery. Cav. Found in Spain by Loefling, and in Sileſia by Krocker. 50. C. *leucanthus*, Willd. 34. Cavan. ic. 2. p. 52. tab. 165. "Leaves oblong-lanceolate, ſeſſile, ſmooth, ſerrated, not pungent; ſtem one-flowered; calyx-ſpines reflexed." *Root* annual. A native of Spain. 51. C. *heterophyllus*, Linn. Sp. Pl. 20. Mart. 30. Engl. Bot. tab. 675. (Carduus helenoides, Lam. 42. Hudſ. p. 352. Lightf. p. 457. With. p. 702. Hull. p. 179. Cnicus heterophyllus, Willd. 24.) Melancholy thiſtle. "Leaves embracing the ſtem, lanceolate, ciliated, entire; ſometimes, but rarely, laciniated; downy underneath, flower often ſolitary, peduncled." *Root* perennial, knotty, black. *Stem* three feet high or more, erect, generally ſimple, one or two-flowered, round, furrowed, woolly. *Leaves* acute, green, ſmooth above, white with down underneath, doubly ciliated with ſmall ſpines at the edges, occaſionally pinnatifid, whence the trivial name; root-leaves gradually leſſening into rather long petioles; ſtem-leaves numerous, alternate, heart-ſhaped at the baſe. *Flower* purple, terminal, at firſt nodding, afterwards erect, large; peduncle elongated, downy, either naked, or with a ſhort leaf immediately under the flower; calyx egg-ſhaped, ſlightly pubeſcent; ſcales lanceolate, erect, naked at the tip, keeled, browniſh, ending in a ſhort, obſolete ſpine; anthers white; ſtigma linear, exſerted, purple, emarginate. *Down* of the marginal ſeeds nearly rough, of the reſt feathery; a proof that Willdenow is not ſupported by nature in making its ſtructure in this reſpect a ſufficient generic diſtinction. There is frequently a ſmaller flower, on a rather long peduncle, in the axil of one of the upper leaves. A native of Switzerland, Dauphiny, and of the mountainous parts of England, Wales, and Scotland, flowering in July and Auguſt. 52. C. *helenoides*, Linn. Sp. Pl. 21. Mart. 31. (Cnicus helenoides, Willd. 25.) "Leaves embracing the ſtem, lanceolate, toothed, ciliated with ſmall unequal ſpines; ſtem ſpineleſs." Linn. In habit much reſembling the preceding, but twice the height. *Root* perennial, ſcarcely creeping. *Stem* furrowed, leafy from the top to the bottom. *Leaves* from 40 to 50, white underneath, but not ſnowy white, as in C. *heterophyllus*, toothed, not laminated, half embracing the ſtem with round, reflexed, adnate auricles; floral leaves awl-ſhaped. *Flowers* four or five at the top of the ſtem, only half the ſize of thoſe in the preceding ſpecies. Willd. from a living plant. A native of Siberia. Dr. Smith aſſures us that he has not ſeen it either wild or cultivated in Great Britain. 53. C. *pratenſis*, Mart. 40. Hudſon, p. 353. Withering, p. 701. Smith Flor. Brit. 10. Eng. Bot. Pl. 177. (C. diſſectus, Linn.? Hudſ. 1ſt Ed. C. heterophyllus, Rel. 306. Lightf. p. 456. C. anglicus, Lam. 43. Cirſium anglicum, Ray. Syn. 193 Lob. Ic. 583. Ger. Emac. 1183. Pet. Herb. Brit. tab. 22. *fig.* 1. Cnicus pratenſis, Willd. 23.) Meadow thiſtle. "Leaves ſeſſile, lanceolate, ſomewhat

what toothed, ciliated, woolly underneath; ſtem nearly naked, one-flowered; calyx villous." *Root* perennial, creeping; fibres long, ſimple, fleſhy. *Stem* erect, about a foot and half high, ſimple, ſeldom more than one-flowered, round, ſurrowed, woolly. *Leaves* unequally toothed, ſometimes a little ſcolloped, ciliated with ſtronger and more pungent ſpines than thoſe of C. heterophyllus, roughiſh, cobwebbed beneath, but not ſnowy white; root-leaves three or four, petioled; ſtem-leaves two or three, ſmaller, remote, embracing the ſtem. *Flower* purple, terminal, at firſt nodding, afterwards erect; peduncle a little thickened at the top, ſnowy white; ſcales lanceolate, erect, ending in a weakiſh ſpine; down as in C. heterophyllo. A native of marſhy places in France and England. We are informed by Dr. Smith, (Eng. Bot.) that Linnæus took up his diſſectus from books, without having it in his herbarium. All his ſynonyms are ſaid by La Marck to belong to the preſent plant, ſpecimens having been ſent him from the neighbourhood of Orleans, which perfectly agree with Lobel's figure. It ſeems, therefore, probable that he accidentally prefixed an erroneous ſpecific character to his ſynonyms, and that his diſſectus has no ſeparate exiſtence. 54. C. *ſerratuloides*, Linn. Sp. Pl. 22. Mart. 32. Lam. 47? Gmel. Sib. ii. p. 52. tab. 22, and 23. *fig.* 1. Jacq. Vind. 281. Auſt. 2. tab. 127. (Cnicus ſerrulatoides, Willd. 26.) "Leaves embracing the ſtem, lanceolate, entire; ſerratures ſpinous briſtle-ſhaped; peduncles one-flowered." Linn. "Leaves ſeſſile, lanceolate, remotely ſerrated, ciliated, with ſmall ſpines, green on both ſides; calyxes not pungent, globularly conic; down feathery, very long." Lam. According to Linnæus it differs from C. helenoides in its ſmaller, ſcarcely furrowed ſtem, and narrower leaves, with the floral ones lanceolate, not awl-ſhaped. Willdenow adds that in this ſpecies the ſtem is branched, and the leaves green on both ſides. La Marck aſſerts, that his ſerratuloides reſembles his helenioides (which, however, is heterophyllus), in nothing but the generic character. It appears, nevertheleſs, from his deſcription, that there are many points of reſemblance, and that his plant is probably the ſerratuloides of Linnæus, as we think it certainly is that of Willdenow and Jacquin, though Jacquin ſays the ſtem is ſimple when wild, and branched only when cultivated. A native of Siberia, Swiſſerland, and Auſtria. 55. C. *tartaricus*, Linn. Sp. Pl. 23. Mart. 33. Lam. 33. Jacq. Auſt. tab. 90. (Cnicus Tartaricus, Willd. 35.) "Leaves embracing the ſtem, lanceolate; ſerratures ſpinous awl-ſhaped; flowers with three leaves." Linn. "Leaves embracing the ſtem, oblong-lanceolate, toothed, ciliate-ſpinous; peduncles one-flowered; calyxes bracteated; ſcales lanceolate, ſpinous. Willd. Habit and ſize of the preceding. Linn. *Root* perennial. *Stem* a foot and a half high, ſmooth, ſometimes ſimple, and ſometimes with a branch or two, each bearing a ſingle flower. *Leaves* a little ſcolloped, toothed, ſmooth on both ſides; root-leaves large, petioled; ſtem-leaves rather diſtant. *Flower* yellowiſh white; bractes generally three, ſmall, lanceolate, ciliated. La Marck. Calyx-ſcales with a white keel. Linn. A native of Siberia and the Alps. 56. C. *carniolicus*, Mart. 41. (Cnicus carniolicus, Willd. 33. Cirſium carniolicum, Scop. Carn. n. 1005. tab. 54.) "Leaves heart-ſhaped, embracing the ſtem, oblong-egg-ſhaped, toothed, ciliated; root-leaves oblong, obtuſe, ſcolloped, ciliated; flowers terminal, ſomewhat cluſtered; calyxes involucred; ſcales linear-lanceolate, ſpreading. Willd. *Root* perennial. *Stem* hairy. *Root-leaves* petioled, hairy on both ſides; petioles hairy. *Flowers* yellowiſh white; calyx involucred, with three lanceolate ciliate leaves. Willd. 57. C. *anguſtifolius*, Lam. 34. "Leaves ſeſſile, long, narrow; tooth-pinnatifid, ciliated; flower involucred by about ſix linear bractes. *Stem* near two feet high, a little branched, and ſomewhat woolly. *Leaves* green, ſmooth on both ſides, ſome oppoſite, others alternate. *Flowers* ſolitary, terminal. Cultivated in the royal garden at Paris, and ſaid to be a native of the Alps. 58. C. *acanthifolius*, Lam. 32. (Cnicus pratenſis acanthi folio, flore flaveſcente, Tourn. Inſt. 450. Carduus pratenſis latifolius, Bauh. Pin. 376. Cirſium, Hall. 173.) "Leaves embracing the ſtem, long, pinnatifid; pinnules parallel, ciliate-ſpinous; bractes concave, entire, rather coloured, covering the flowers." Nearly allied to the three preceding. *Root* perennial. *Stem* ſtriated, ſmooth, weak. *Leaves* large, diſtant, pale green; lower ones narrowing into the petiole. *Flowers* yellowiſh white, terminal, cluſtered; bractes ciliated. A native of meadows in many parts of Europe. 59. C. *pauciflorus*. (Cnicus pauciflorus, Willd 34. Waldſt. and Kitaib. Pl. Rar. Hung.) "Leaves embracing the ſtem, egg-ſhaped, ſomewhat lyrate, ciliate-ſerrated, rugged; root-leaves lyrate; flowers cluſtered; calyx-ſcales lanceolate; the inner ones ſpreading." *Root* biennial. *Stem* naked towards the top, with three or four cluſtered, terminal flowers. *Leaves* paler underneath; root-leaves a foot long, oblong, broad, a little ſcolloped. A native of Hungary. 60. C. *antarcticus*, Vill. Delph. iii. p. 12. tab. 19 (Cnicus antarcticus, Willd. 32.) "Leaves heart-ſhaped, embracing the ſtem, pinnatifid, lanceolate at the top, ciliate-ſpinous, rather woolly underneath; flowers cluſtered; calyx-ſcales lanceolate egg-ſhaped, mucronate, ſpreading at the tip." *Root* perennial. *Leaves* dilated at the baſe, pinnatifid and toothed in the middle, elongated, and lanceolate at the end. *Flowers* white, terminal. 61. C. *ſemipectinatus*, Lam. 41. "Leaves embracing the ſtem, entire at the baſe, pinnatifid-pectinate towards the top, green on both ſides; branch-leaves very entire; flowers rather cluſtered, terminal." *Root* perennial. *Stem* two or three feet high, more or leſs branched. *Leaves* divided in their upper part into lanceolate ſegments reſembling the teeth of a comb, each ending in a ſpine. *Flowers* two or three together, pale or yellowiſh, acquiring a purple tint from the colour of the anthers; calyx ſmooth, not pungent. Cultivated in the royal garden at Paris, ſuppoſed to have been brought from Tartary. 62. C. *montanus*. (Cnicus montanus, Willd. 31. Waldſt. and Kitaib. Pl. Rar. Hung.) "Leaves embracing the ſtem, pinnatifid, rugged, ſpinous-ciliated; ſegments alternate, oblong-lanceolate three-nerved; ſtem branched; flowers cluſtered: calyx-ſcales egg-ſhaped, ſpreading at the tip." *Root* perennial. *Flowers* purple. A native of dry mountains in Croatia. 63. C. *rivularis*, Mart. 36. Jacq. Auſt. i. tab. 91. (Cnicus rivularis, Willd. 30.) "Leaves toothed, ciliated, naked, embracing the ſtem; root and lower ſtem ones pinnatifid; flowers cluſtered, capitate; calyx-ſcales lanceolate-egg-ſhaped, preſſed cloſe." Willd. *Root* perennial. *Stem* uſually ſingle, two or three feet high, erect, round, hollow, a little villous, angular at the bottom, ſtriated at the top, with a few diſtant bractes; generally quite ſimple but ſometimes with ſhort, one-flowered, axillary branches; ſometimes, eſpecially towards the top, covered with a white wool; ending either in a ſingle flower, or a few collected into a head, rarely ſix or ſeven, and in that caſe the lower ones are peduncled. *Leaves* ſomewhat villous, deeper green above, whitiſh underneath; root ones lanceolate, narrowing into the petiole. *Flowers* purple; calyx egg-ſhaped, ſomewhat glutinous, but not villous; ſcales lanceolate-acuminate, not pungent, outer ones dark green, inner ones dark purple and gradually longer; down ſomewhat ſcattered. A native of Auſtria and Hungary. Profeſſor Martyn has quoted Scopoli n. 1005. tab. 54. under both C. carniolicus and C. rivularis, adding to the latter a reference to Jacquin, and by referring from one to the other, ſeems to think they may poſſibly be the ſame plant. He has nevertheleſs given diſtinct deſcriptions of each, of the former from Scopoli, and of the latter from Jacquin, which do not very well accord with each other. Willdenow, who had dried ſpecimens of both, has kept them ſeparate. 64. C. *ſaliſburgenſis*, (Cnicus ſaliſburgenſis; Willd. 29.) "Leaves toothed, ciliated, naked; ſtem-leaves embracing the ſtem, pinnatifid, root ones undivided, oblong; ſtem two-flowered; calyx-ſcales egg-lanceolate, preſſed cloſe." *Root* perennial. *Stem* hairy. *Leaves* ſmooth, beſet with very ſhort, ſcattered hairs. A native of moiſt meadows about Saltzburg. 65. C. *rigens*, Mart. 47. Hort. Kew. 3. p. 144. La Chenal in Act. Helv. 4. p. 294. tab. 16. (Cnicus rigens; Willd. 28. Cirſium; Hall. n. 176.) "Leaves oblong-lanceolate, ſmooth, ſpinous at the edges, pinnatifid; ſegments obliquely lobed; calyxes oblong, bracteated." Martyn ſuppoſes it to be the ſame with C. antarcticus of Villars, ſee n. 57. A native of Switzerland. 66. C. *Allionii*, (Cnicus medius; Willd. Cirſium medium. Allion. ped. n. 542. tab. 49.) "Leaves ſeſſile, pinnatifid; ſegments generally three-cleft, ciliate-ſpinous; ſtem branched, calyxes naked; ſcales, egg-lanceolate, mucronate, preſſed cloſe." *Root* perennial. Perfectly diſtinct from C. medius of Gouan (ſee n. 27.) which has been quoted as a ſynonym, notwithſtanding it has decurrent leaves. Willd. from a living plant. 67. C. *radiatus*, Willd. 28. "Leaves pectinate-pinnatifid, naked, rugged; ſegments linear, not pungent, terminal one egg-ſhaped; upper leaves ſeſſile; calyx-ſcales egg-ſhaped, mucronate; inner ones elongated, linear, coloured." *Root* perennial. *Stem* branched, many-flowered. *Leaves* green on both ſides; lower ones petioled. *Flowers* violet. *Down* capillary. A native of calcareous mountains in Hungary. 68. C. *lycopifolius*, Willd. 29. Villars delph. 3. p. 23. tab. 19. "Leaves egg-ſhaped, pinnatifid-toothed, not pungent, grey underneath; upper ones ſeſſile; ſtem one-flowered; calyx-ſcales egg-ſhaped, not pungent." Similar in habit to the preceding. *Root* perennial. A native of mountains in Dauphiny. 69. C. *nitidus*, Willd. 32. Waldſt. and Kitaib. pl. rar. Hung. 1. p. 52. tab. 52. "Leaves not pungent; root-leaves egg-ſhaped, toothed, cut at the baſe; ſtem-leaves pinnatifid-linear; ſtem one-flowered; calyx-ſcales egg-ſhaped, mucronate." *Root* perennial. *Upper leaves* entire, linear-lanceolate. A native of calcareous mountains in Hungary. 70. C. *eriſithales*, Lam. 36. Jacq. Obſ. 1. p. 28. tab. 17. and Auſt. tab. 310. (Cnicus eriſithales; Linn. Sp. Pl. 4. Willd. 37. Cirſium acanthoides montanum, flore flaveſcente: Tourn. Illuſt. 448.) "Lower leaves petioled, egg-ſhaped, deeply pinnatifid; pinnules parallel, three-nerved; peduncles naked, one-flowered." *Root* perennial. *Stem* a foot and half high, generally ſimple, nearly ſmooth. *Leaves* nearly ſmooth, greeniſh; lower leaves near together, toothed, ſpinous ciliated; upper ones embracing the ſtem, diſtant, narrow. *Flowers* yellowiſh white, terminal, nodding. A native of France and other temperate parts of Europe. 71. C. *tricephalodes*, Lam. 35. (Cirſium: Hall. helv. n. 175. Cardus-cirſium maximum profunde laciniatum. Pluk. tab. 154. fig. 2.) "Leaves embracing the ſtem, pinnatifid, ſerrated, ciliated; flowers ſeſſile, about three, cluſtered at the top of the ſtem." *Root* perennial. *Stem* two or three feet high, ſimple, a little cottony under the flowers. *Lower leaves* petioled, egg-ſhaped, a little cut or doubly toothed, green and ſmooth above, with ſhort hairs on their hindmoſt nerves; upper leaves embracing the ſtem, deeply pinnatifid; pinnules parallel, narrow, ciliated. *Flowers* purple; calyx ſmooth, not pungent. A native of Auvergne and Dauphiny. La Marck obſerves, that this and the preceding have been confounded by Linnæus and Haller. 72. C. *ochroleucus*, Mart. 44. (Cnicus ochroleucus; Willd. 38. Cirſium; Allion. ped. n. 545. Hall. helv. n. 174.) "Leaves embracing the ſtem, decurſively pinnatifid, ciliated, pinnules lanceolate, three-nerved, upper ones confluent; peduncles drooping; calyx-ſcales lanceolate, reflexed." *Root* perennial. *Flowers* yellowiſh white. A native of Switzerland and Savoy. 73. C. *haſtatus*, Lam. 37. "Leaves embracing the ſtem, halbert-lanceolate, pinnatifid, grey underneath; flowers about ſeven, cluſtered at the top of the ſtem; terminal one erect." *Stem* a foot and half high, ſimple, abundantly leafy, cottony in its upper part. *Leaves* acuminate, green and ſmooth above, white and cottony underneath, pinnatifid half way down; pinnules narrow, curved upwards, ending in a weak ſpine. *Flowers* large, purple; calyx ſmooth, not pungent. A native of the Alps about Grenoble. 74. C. *erucagineus*, Lam. 38. "Leaves embracing the ſtem, pinnatifid; pinnules laciniated upwards." *Stem* two feet high or more, cottony towards the top. *Leaves* green and almoſt ſmooth above, ſlightly villous and pale underneath, ſpinous ciliated; root leaves large, petioled; ſtem ones ſmaller, embracing the ſtem. *Flowers* large, whitiſh with a red tint from the colour of the anthers, partly cluſtered ſeveral together at the top of the ſtem, partly ſolitary, peduncled, in the axils of the upper leaves; calyx ſmooth, not pungent. Cultivated in the royal garden at Paris, and ſaid to be a native of Siberia. 75. C. *altiſſimus*, Linn. Sp. Pl. 17. Mart. 28. Lam. 39. (Cnicus altiſſimus; Willd. 20. Cirſium altiſſimum; Dill. Elt. 81. tab. 69. fig. 80.) "Leaves ſeſſile, pinnatifid, ſcolloped, ſerrated, not pungent; ſtem much branched; calyxes villous, ſomewhat ſerrated." *Root* perennial. *Stem* ten or twelve feet high. *Leaves* green above, cottony and whitiſh underneath. *Flowers* purple, ſingle at the top of each branch; calyx woolly; bractes ſeveral, narrow, toothed, forming an involucrum. 76. C. *bulboſus*, Lam. 44. (C. bulboſus Monſpelienſium, ſive acanthus ſilveſtris quibuſdam, foliis laciniatis, J. Bauh. 3. p. 43. C. bulboſus monſpelienſium; Lob. ic. n. p. 10. Cirſium, Hall helv. n. 177.) "Stem naked above, with one or two flowers; leaves deeply pinnatifid; pinnules cut, lobed, ciliated, ending in a ſmall ſpine; flowers ſolitary." *Root* compoſed of ſeveral bulbs or tubes. *Stem* a foot and half or two feet high, ſlender, ſtriated, cottony, eſpecially near the top, with two or three leaves on its lower part. *Leaves* almoſt all petioled, greeniſh above, and beſet with ſhort, thinly ſcattered hairs, cottony and white underneath. *Flowers* purple, rather ſmall, terminal; ſcales egg-ſhaped-acuminate, not pungent. A native of Germany, Switzerland, and the ſouth of France. There is a variety in the neighbourhood of Paris, with leaves almoſt entirely green. La Marck obſerves that Linnæus was probably unacquainted with this plant, having erroneouſly referred Lobel's C. bulboſus to his tuberoſus from which it is perfectly diſtinct, its leaves not being decurrent. He conceives that the tuberoſus of Linnæus may poſſibly be the plant which he has deſcribed under the name of pratenſis, and which we on account of the uncertainty have called ambiguus, (ſee n. 53) pratenſis as a ſpecific name being pre-occupied. 77. C. *laciniatus*. Lam. 45. (Jacea aculeata ſ. tuberoſa; Tabern. ic. 154. "Stem leafy, branched; leaves deeply pinnatifid, green on both ſides; pinnules laciniated, ſpinous ciliated; peduncles one flowered." Diſtinct from the preceding. Its leaves are not decurrent; it therefore is not the tuberoſus of Linnæus. *Stem* a foot and half high, ſmooth, channelled. *Leaves* large, ſomewhat petioled. *Flowers* large, purple or white, peduncled; calyx not pungent. Deſcribed from a dried ſpecimen in the herbarium of Juſſieu, and ſuppoſed to be a native of the Alps. 78. C. *arvenſis*, Lam. 46. Curt. Flor. Lond. faſc. 6. tab. 57. Smith, Flor. Brit. p. 851.

p. 851. Eng. bot. 975. C. ſerratula arvenſis, Linn. Sp. Pl. Mart. Willd. Carduus vulgatiſſimus viarum, Rai ſyn. 194.) Creeping or way thiſtle. "Leaves ſeſſile, pinnatifid, ſpinous; ſtem panicled; calyxes egg-ſhaped, ſlightly ſpinous; down feathery." *Root* perennial, creeping, tapering, deſcending deep into the ground, not eaſily extirpated. *Stems* three feet high, erect, round, ſmooth, many-flowered. *Leaves* ſlightly decurrent, alternate, ſmoothiſh; lobes unequal, ciliated, ſpinous. *Flowers* purple, rarely white; calyx egg-ſhaped; ſcales broad-lanceolate, preſſed cloſe, woolly at the edges, with a ſhort, ſpreading ſpine; down deciduous, root permanent as in ſerratula. Dr. Smith. A native of moſt parts of Europe. 79. C. *diſcolor*, (Cnicus diſcolor, Willd. 189.) "Leaves ſeſſile, pinnatifid, hairy, downy underneath; pinnules two-lobed, divaricated, ſpinous; calyxes globular, cobwebbed, pubeſcent, ſcales egg-ſhaped, preſſed cloſe, ending in a ſpreading ſpine." *Root* biennial. A native of North America. 80. C. *orientalis*, (Cnicus orientalis; Willd. 17.) "Leaves ſeſſile, pinnatifid, ſmoothiſh above, downy underneath; pinnules lanceolate, ſpinous; calyxes egg-ſhaped; ſcales preſſed cloſe: outer ones awl-ſhaped, inner ones lanceolate." *Stem* downy. *Leaves* narrow, downy on the midrib above, ſnow-white underneath: pinnules with a ſpine at the tip, and at the upper part of the baſe. *Calyx* only half the ſize of that of C. lanceolatus. A native of the Eaſt. 81. C. *cynaroides*, Lam. 28. (C. creticus foliis lanceolatis, Tourn. Cor. 31. Cnicus cynaroides; Willd. 16.) "Leaves ſeſſile, oblong, pinnatifid, downy underneath; pinnules angular, divaricated, ſpinous; flower large, terminal." *Stem* erect, ſtriated, cottony. *Leaves* ſmooth, and ſhining above, very white underneath. *Flower* purple; calyx-ſcales lanceolate, pungent; outer ones reflexed, and widely ſpreading. A native of the iſle of Candia. 82. C. *ciliatus*. Hort. Kew. 3. p. 144. Murray Com. Goett. 1784. p. 35. tab. 5. (Cnicus ciliatus; Willd. 12.) "Leaves embracing the ſtem, hiſpid, pinnatifid; pinnules two-lobed, divaricated, ſpinous, downy underneath; calyxes egg-ſhaped, ſcales lanceolate, ſpinous, ciliated, reflexed." *Root* perennial. *Stems* many from the ſame root, five or ſix feet high, hairy, round, with prominent lines, and horizontal white hairs, branched on the upper part; branches about a foot long, compound, alternate, aſcending; branchlets three, ſhort, zig-zag. *Root-leaves* a foot and half long, ſpreading in all directions. *Stem-leaves* about a foot long, half embracing the ſtem, horizontal, alternate, rough, and green above, with ſtraw-coloured veins, which end in awl-ſhaped ſpines of the ſame colour. *Flowers* terminal, ſolitary, yellowiſh white; calyx cylindric, oblong, broader at the baſe; ſcales yellow, linear, preſſed cloſe, ending in a weak ſpine. *Seeds* top-ſhaped, four-cornered; down abundant, feathery. A native of Siberia. 83. C. *leucocephalus*. (Cnicus leucocephalus; Willd. 13. Cirſium creticum altiſſimum C. lanceolati folio flore albo; Tourn. Cor. 32.) "Stem-leaves ſeſſile, pinnatifid, hiſpid, downy underneath; pinnules lanceolate, ſpinous at the tip; calyxes cylindrical, alternate, villous, involucred, ſcales oblong, preſſed cloſe, ending in recurved ſpines." Willd. *Root-leaves* petioled; pinnules lanceolate, two-lobed, divaricated, ciliated at the edges, ſpinous at the tip; pinnules of the ſtem-leaves undivided, revolute at the edges; with a ſtrong, yellow ſpine at the tip, at the bottom of each indenture. *Flowers* alternate, axillary, on ſhort peduncles; involucrum of three or five leaves. A native of Crete. 84. C. *echinatus*. Deſfon. atl. 2. p. 247. (Cnicus echinatus, Willd. 14.) "Leaves ſeſſile, pinnatifid, hiſpid, woolly underneath; pinnules two-lobed, divaricated, ſpinous; calyxes egg-ſhaped, woolly, bracteated; ſcales awl-ſhaped, ſpinous, preſſed cloſe. *Stem* a foot high, erect, firm, furrowed, woolly; branches erect, forming a kind of corymb, one-flowered. *Leaves* reſembling thoſe of C. lanceolatus; hiſpid above, with numerous ſhort, yellowiſh hairs, repand-pinnatifid; lobes remote, ending in a long yellowiſh ſpine, ſolitary or in pairs, one larger. *Flowers* a third part longer than thoſe of C. lanceolatus; peduncles leafy, ſtriated, woolly; bractes narrow-lanceolate, ſurrounding the calyx; calyx egg-ſhaped, woolly; ſcales cloſely imbricated, ſpinous and looſe at the tip. Desf. A native of Barbary. 85. C. *eriophorus*. Linn. Sp. Pl. 16. Mart. 27. Lam. 29. Eng. bot. 386. (Cnicus eriophorus, Willd. 15.) Fryars crown. Fryars thiſtle. Woolly headed thiſtle. "Leaves ſeſſile, pinnatifid, in two ranks, ſpinous, rugged; pinnules alternate, erect; calyxes globular, woolly." *Root* biennial. *Stem* three or four feet high, erect, round, furrowed, ſmoothiſh, many-flowered, much branched; branches ſpreading. *Leaves* ſpreading, alternate, deeply pinnatifid with two ranks of oblong divaricated ſegments, which point alternately upwards and downwards, armed with ſtrong ſpines, rough above with ſmall rigid, cloſe-preſſed briſtles, woolly underneath. *Flowers* purple, or white, large, terminal, ſolitary, erect; peduncle leafy; calyx globular, or ſomewhat depreſſed; ſcales linear, numerous, ſpreading, beautifully cobwebbed, tipped with a leafy appendage, coloured, ciliated, ſmooth, mucronate-ſpinous; down feathery, deciduous. A native of England and moſt parts of Europe, on a calcareous ſoil. 86. C. *ferox*, Lam. 30. (Cnicus ferox; Linn. Mart. 109. Mart. 3. Willd. 11. Cn. lanceolatus validiſſimis aculeis, Tourn. Inſt. 450. Carduus tomentoſus. Lobel. ic. 2. p. 11.) "Leaves ſeſſile, pinnatifid; pinnules lanceolate, diſtant; flowers large; bractes linear, very ſpinous." La Marck obſerves that this plant is ſo far from being of a different genus from the preceding, as Linnæus makes it, that it is ſcarcely a diſtinct ſpecies. *Root* biennial. *Stem* not ſo high as that of C. eriophorus. *Leaves* ſeſſile, or a little embracing the ſtem, not decurrent as repreſented by Linnæus, greeniſh, and rough with numerous ſpines above, a little cottony, and whitiſh underneath. *Flowers* large, purple; bractes ending in a ſtrong ſpine, rough at their edges and over their whole ſurface, with a great number of very ſharp ſpines. A native of the ſouth of France. 87. C. *ſpinoſiſſimus*, (Carduus comoſus, Lam. 31. Cnicus ſpinoſiſſimus, Linn. Sp. Pl. 3. Mart. 6. Willd. 48. Carlina polycephalos alba, Bauh. pin. 380. Cirſium, Hall. helv. n. 172. tab. 5. Cirſium ſpinoſum, Gmel. Sib. 2. p. 64. tab. 25.) "Leaves embracing the ſtem, lanceolate, pinnatifid, ſpinous; ſtem ſimple; flowers ſeſſile, cluſtered at the top among numerous leaves." β. "Heads of flowers naked, without ſpines." *Stem* a foot and half high, furrowed. *Leaves* near the flowers cloſe ſet, pubeſcent, yellowiſh, with long ſharp ſpines. *Flowers* yellowiſh white: calyx-ſcales ſmooth, ending in a long ſpine. A native of the Alps. If β be not, as Haller thinks it, a diſtinct ſpecies, it is a very remarkable variety, Lam. 88. C. *echinocephalus*. (Cnicus echinocephalus; Willd. 49.) "Leaves ſeſſile, rigid, deeply pinnatifid, downy underneath; pinnules linear, ſpinous at the tip; calyxes globular, ſmooth; ſcales lanceolate, ſpinous, ſpreading." *Root* perennial. *Stem* from four to ſix inches high, ſimple, erect, downy. *Leaves* alternate, crowded; pinnules entire, diſtant. *Flowers* ſolitary, terminal, or on ſhort branches from the axils of the upper leaves; calyx-ſcales purple. A native of Tauria. De Boeher. 89. C. *acaulis*, Linn. Sp. Pl. 26. Mart. 38. Lam. 49. Eng. bot. 161. (Cnicus acaulis, Willd. 40.) Dwarf thiſtle. "Stemleſs; calyx ſmooth." *Root* perennial, woody, blackiſh. *Leaves* depreſſed, ſpreading in a radiate manner, and covering a ſpace often not leſs than a foot in diameter, petioled, ſmooth, pinnatifid; pinnules ſomewhat palmated, ſpinous. *Flowers* purple, large, generally ſolitary, almoſt ſeſſile;

calyx egg-ſhaped; ſcales lanceolate, ſcarcely keeled; ſomewhat ciliated at the tip, ſlightly ſpinous. A native of gravelly and chalky paſtures in many parts of Europe, not a general Engliſh plant, but abundant in Norfolk, where it is the peſt of the ſheep downs. When cultivated in a garden, and ſometimes when wild on a rich ſoil, a ſtem is produced bearing ſeveral flowers; it is then the C. dubius of ſeveral German botaniſts. 90. C. *inermis*, (Cnicus inermis, Willd. 22.) "Leaves ſeſſile, lanceolate, gaſhed, toothed, downy underneath; root leaves pinnatifid; calyx-ſcales egg-lanceolate, membranous at the edge, preſſed cloſe." *Root* perennial. *Stem* furrowed, green, ſlightly villous. *Root-leaves* a foot long, or more, deeply pinnatifid, toothed; lower ſtem-leaves five or ſix inches long, attenuated at the baſe, acuminate at the tip, pinnatifid in the middle; upper ones undivided, attenuated both ways, toothed. *Flower* ſolitary, terminal, very large; calyx-ſcales, as well as the whole plant, without ſpines. Native country unknown. 91. C. *pinnatifidus*, Cavan. ic. 1. p. 58. tab. 83. (Cnicus pinnatifidus, Willd. 47.) "Leaves petioled, oblong, pinnatifid, toothed, woolly; calyx cylindrical, terminal, ſcales preſſed cloſe, oblong, cartilaginouſly mucronate; tips ſpreading." *Root* annual. *Stem* four or five inches high, ſimple, erect, downy. *Leaves* egg-ſhaped, ſomewhat lyrate, without ſpines, cloathed on both ſides with a fine wool; midrib and veins downy. *Flower* ſolitary. A native of Spain. 92. C. *centauroides*, (Cnicus centauroides, Linn. Sp. Pl. 5. Mart. 7. Willd. 50. Centaurium majus, foliis cinaræ cornuti; Moriſ. hiſt. 3. p. 131. tab. 25. fig. 2.) "Leaves pinnatifid; calyxes ſcarious; ſcales acuminate." *Root* perennial. *Leaves* without ſpines. A native of the Pyrenees and of Siberia; Georg. it. 1. p. 229. 93. C. *uniflorus*, (Cnicus, Linn. Mant. 572. Mart. 8. Willd. 51. Centaurea calycibus membranaceis. Gmel. Sib. 2. p. 86. tab. 38.) *Root* perennial. *Stem* two feet high, erect, ſomewhat angular, ſcarcely woolly, one-flowered. *Leaves* numerous, ſeſſile, without ſpines; greyiſh; pinnules alternate; upper leaves ſmaller, more nearly entire; root leaves petioled; ſegments lanceolate, ſerrated. *Flower* violet, terminal, ſeſſile; calyx large, globular; ſcales looſe, egg-ſhaped, villous, grey; florets ſix-cleft; ſegments linear, acute; ſtamens white, longer than the corolla; ſtyle longer than the ſtamens, thread-ſhaped, violet. Willd. A native of Siberia. 94. C. *carthamoides*, (Cnicus carthamoides, Willd. 52.) "Leaves without ſpines, ſeſſile, oblong, toothed; root-leaves ſome undivided, others pinnatifid; calyx ſcarious, villous." *Root* perennial. *Stem* erect, round, thick, ſtriated. *Flower* purple, large, terminal, ſolitary; calyx-ſcales roundiſh-egg-ſhaped. Willd. A native of Siberia. 95. C. *cernuus*, (C. cernuus, Linn. Sp. Pl. 6. Willd. 53. Mart. 9. Carduus, Gmel. ſib. 2. p. 47. tab. 19.) "Leaves embracing the ſtem, egg-ſhaped, toothed; root-leaves heart-ſhaped; petioles winged, ſpinous-toothed; calyx ſcarious, generally ſolitary, drooping, terminal; root perennial. A native of Siberia. 96. C. *mollis*, Linn. Sp. Pl. 25. Mart. 37. Willd. 36. (C. mollior 1. Cluſ. hiſt. 2. p. 151. C. foliis decuſſivè interruptèque pinnatis; Gouan illuſt. p. 63. Cirſium, Jacq. vind. 276. auſt. tab. 18. Scop. Carn. 4. 1000.) "Leaves pinnatifid, linear, revolute at the edges, downy; ſtem nearly naked, one-flowered; calyx-ſcales downy, egg-lanceolate, ſquarrous," Willd. *Root* perennial. A native of Auſtria, and the ſouth of France. La Marck aſſerts that the plants of Cluſius and of Gouan are perfectly diſtinct, and that both of them are ſtrictly ſpecies of Serratula. We have our doubts whether our ſix preceding ones do not properly belong to that genus, their calyx-ſcales not appearing truly ſpinous in the moſt lax ſenſe of the term; but as Willdenow has placed them under his Cnicus, of which a ſpinous calyx-ſcale enters into the eſſential character, we have not thought fit to remove them. In the membranous, cartilaginous, or ſquarrous edgings and terminations of their calyx-ſcales, they may be thought to approach thoſe ſpecies of Carthamus which have leafy appendages to thoſe ſcales. This is ſtill more the caſe with C. eriophorus. But as a compound ſpine, or more than one to each ſcale, forms the eſſential generic character of Carthamus, as La Marck has determined it, they cannot be placed under that genus. La Marck's diſtinction, indeed, is altogether artificial; and it would perhaps be more conducive to ſcientific accuracy and perſpicuity if Carthamus as well as Cnicus were incorporated with Carduus. The genus would not be much larger; and it might eaſily be divided into well-defined ſections, if we had thought that the form of our work authorizes us to innovate ſuch a change, and have relieved us from the neceſſity, to which we have reluctantly ſubmitted, of no longer calling the well known marianus a carduus. But all the liberty that we allow ourſelves is to exerciſe our own judgment when authors differ, and to follow thoſe who appear to us to have moſt cloſely followed the ſteps of nature.

Of the propagation and culture of plants of this genus, little is to be ſaid. In their wild ſtate, the Author of nature has made abundant proviſion for their increaſe, by annexing to their ſeeds a light, and often feathery down, which makes them readily float in the air, and ſcatters them far and wide over all the neighbouring fields. As they are uſually conſidered rather in the light of noxious weeds than of ornamental plants, few of them are admitted into the flower garden or greenhouſe; and thoſe few are valued more for their rarity than for their beauty. Some of them, however, if it were not for the general prejudice againſt them, might with advantage be ſparingly introduced into the borders of the pleaſure ground. Of the native Engliſh ſpecies, the eriophorus, the heterophyllus, and the nutans are the moſt ſtriking. The firſt two have the additional recommendation of being not common; and we ſhould ſuppoſe that every one who ſpends any part of the ſummer months at Buxton, muſt think the cloſe ranks of the laſt which line the ſides of all the ſtone walls, a real ornament to that naked country.

By the farmer the whole tribe is held in abhorrence, and marked for deſtruction. The annual and biennial kinds are eaſily got rid of by cutting them down with a weeding hook in corn fields, and mowing them in paſtures before they ripen their ſeeds. But thoſe that are perennial can be extirpated only by plowing the fields, and carefully gathering the roots. Of theſe, the moſt tormenting to the Engliſh farmer is the arvenſis, which on account of its creeping root that ſtrikes deep into the ground, has been called by Curtis the curſed thiſtle. Thiſtles in general, it cannot be denied, make part of the curſe pronounced upon the ground at the original fall of man from his native innocence. "*Curſed is the ground for thy ſake: thorns and thiſtles ſhall it bring forth to thee: in the ſweat of thy face thou ſhalt eat bread, till thou return unto the ground.*" In what manner the human race would have lived if they had never ſinned, we are not able to determine; and as we have no experience to aſſiſt us in our inquiries, it would be folly to attempt to gueſs. But of this we are certain, that with their preſent feelings and habits, they cannot attain even to a moderate degree of happineſs unleſs they engage in ſome kind of uſeful labour. A bleſſing has, therefore, been graciouſly intermingled with the curſe. To fallen man it is an advantage, for which he ought to be highly thankful, that he is obliged to cultivate the earth for the comfortable ſupport of his life, and that no part of the produce of the ground is ſpontaneouſly raiſed to that ſtate of excellence which is moſt conducive to his enjoyment.

Let no one then preſume to aſſert that thiſtles are made in vain, even though it ſhould be allowed that they have no other uſe than to preſerve a conſiderable part of mankind, either from the intolerable liſtleſſneſs of doing nothing, or from the painful conſciouſneſs of having done miſchief. On this ſuppoſition they are not without a final cauſe, in which the wiſdom and the goodneſs of the adorable Creator are equally conſpicuous.

But in the works of God there is always a manifold uſe. Linnæus has obſerved, that the carduus lanceolatus protects by its ſpines the annual plants which have ſown themſelves in its neighbourhood, and gives them an opportunity of maturing their ſeeds without diſturbance. Dr. Withering adds, that if a heap of clay be thrown up, nothing would grow upon it for ſeveral years if the ſeeds of this plant were not wafted to it by the winds, which vegetate and afford ſhelter for other plants, ſo that the whole becomes fertile. The truth of the latter obſervation we are rather inclined to doubt. But ſuppoſing it to have little or no foundation in fact, the pious philoſophical mind will readily perceive other valuable purpoſes in the general economy of nature, to which this deſpiſed and hated race of vegetables are ſubſervient. The ſeeds afford ſuſtenance to ſeveral kinds of birds, which either ſerve to repleniſh our tables, or delight us with the melody of their notes, the beauty of their plumage, and the elegance of their flight. The leaves are eaten by various inſects, which though they do not appear immediately uſeful to man, may, for ought we know, be important links in the great chain of creation, on which the welfare of the whole depends. Or, if they be not either immediately or remotely uſeful to man, who will preſume to think that infinite benevolence may not create diſtinct ranks of beings, merely for the ſake of giving them capacities and means of enjoyment, and of adding to the general maſs of happineſs which is bountifully diffuſed through the univerſe?

Carduus *marianus*, Linn. See Carthamus *marianus*.

Carduus *foliis ſpinoſis ad inſtar juniperi*, Moriſ. See Doypis *ſpinoſa*.

Carduus *braſilianus*, *foliis aloes*, Bauh. pin. See Bromelia *ananas*.

CARDWANG, Cape, in *Geography*, a cape on the N. coaſt of the iſland of Java. S. lat. 5° 55′. E. long. 107° 10′.

CARDY, or Caroy, two ſmall rocks on the eaſtern coaſt of Ireland, about two cables' length E. of Newhaven point, and near a mile north of Balbriggen, in the county of Dublin, which are dry about half ebb. N. lat. 53° 38′. W. long. 6° 11′.

CARDYNUS, in *Ancient Geography*, a mountain of Aſia, near the Tigris, and probably not far from Niſibis.

CARDYTENSES, a people of Aſia, in Syria, inhabiting the ſmall territory called Cyrreſtica, according to Pliny.

CARE′, a place of Spain, between Liminium and Saragoſſa. Anton. Itin.

CAREARA, in *Geography*, a town of Perſia, in the province of Segeſtan; 87 miles S.E. of Kin.

CARECARDAMA, in *Ancient Geography*, a town of India, on this ſide of the Ganges. Ptolemy.

CAREDIVA, in *Geography*, an iſland of the Indian Ocean, on the weſtern ſide of the iſland of Ceylon.

CAREENING, a term, in the *Sea Language*, uſed for the laying of a veſſel on one ſide, to caulk, ſtop up leaks, and refit or trim the other ſide.

The word comes from *cariner*, which ſignifies the ſame, formed of the Latin *carina*, *the keel of a ſhip*.

A ſhip is ſaid to be brought to a *careen*, when the greateſt part of her lading, &c. being taken out, and a pontoon, or another veſſel lower than herſelf, laid by her ſide, ſhe is haled down to it as low as occaſion requires, and there kept, by the weight of ballaſt, ordnance, &c. as well as by ropes, leſt it ſhould ſtrain her maſts too much. This is done with deſign to trim her ſides, or bottom, to caulk her ſeams, or to mend any fault ſhe has under water. Hence, when a ſhip lies on one ſide in ſailing, ſhe is ſaid to *ſail on the careen*.

Ships of war are generally careened every three years.

The *half careen* is when they can only careen half the ſhip, not being able to reach ſo low as the bottom of the keel.

CAREER, or Carier, in the *Manege*, a place incloſed with a barrier, wherein they run the rings.

The word is alſo uſed for the race, or courſe of the horſe itſelf, provided it does not exceed 200 paces.

In the ancient circus, the career was the ſpace which the bigæ, or quadrigæ, were to run at full ſpeed, to gain the prize. See Circus.

Career, in *Falconry*, is a flight or tour of the bird, about 120 yards.

If it mounts more, it is called a *double career;* if leſs, a *ſemi-career*.

CAREK, in *Geography*. See Karek.

CARELIA, a province of Eaſtern Finland, is now the government of *Viborg;* which ſee. This country became a part of Sweden in 1293; in 1338 part of it was ſurrendered to Ruſſia; and in 1721 the greater part of the remainder was given up to the empire.

CAREMA, a town of Piedmont, in the marquiſate of Ivrea; 6 miles N.W. of Ivrea.

CAREMBOULE, a town of the iſland of Madagaſcar, near the ſouth coaſt. S. lat. 25° 20′. W. long. 84° 1′.

CARENAGE Bay, a bay on the weſt coaſt of the iſland of St. Lucia. N. lat. 13° 35′. W. long. 60° 50′.

Carenage *town*. See St. George.

CARENI, in *Ancient Geography*, a people mentioned by Pliny, and placed in the northern part of the iſle of Albion, or in the north-weſtern part of Scotland. They are alſo called *Carini*. They ſeem to have dwelt about Lochbay, on the N.W. coaſt of Roſsſhire. Camden places them in Caithneſs.

Careni, a people of Aſia, towards Perſia; placed by Steph. Byz. between the rivers Cyrus and Euphrates. Procopius ſays that theſe people offered to Coſroes money to avoid being pillaged; but that he refuſed it, becauſe they were not Chriſtians.

CARENNAC, in *Geography*, a town of France, in the department of the Lot and Garonne, ſeated on the Dordogne; 2½ leagues N.W. of St. Céré.

CARENTAN, a town of France, in the department of the Channel, and chief place of a canton in the diſtrict of St. Lô, ſituate in a marſhy ſoil, which makes the air inſalubrious. It has a port for ſmall veſſels; its principal commerce conſiſts of butter and cattle. The place contains 2857, and the canton 11,951 inhabitants; the territory comprehends 182½ kiliometres and 15 communes. N. lat. 49° 18′. W. long. 1° 21′ 50″.

CARENTIA, or Garentia, in *Ancient Geography*, a town of Italy, belonging to the Libici, placed by Cluvier towards the confluence of the Seſſites and the Padus.

CARENTOIR, in *Geography*, a town of France, in the department of Morbihan, and chief place of a canton in the diſtrict of Vannes; the place contains 5310, and the canton 11,249 inhabitants; the territory includes 200 kiliometres and 7 communes.

CARENTOMAGUS, in *Ancient Geography*, a place of Gaul, in Aquitania Prima, E. of Divona (Cahors), and W. of Segodunum (Rhodes).

CARENUVE, in *Geography*, a town of the iſland of Ceylon; 54 miles N.W. of Trincomaly.

CAREOTÆ, in *Ancient Geography*, a people of European Sarmatia. Ptolemy.

CAREPULA, a town of Africa, placed by Ptolemy in Mauritania Cæſarienſis.

CARERA, in *Geography*, a ſmall trading place between Caliture on the coaſt of Coromandel, and Montipoli, or Great Poli, 31 leagues N. and N.E. by N. from it.

CARES, in *Ancient Geography*, a town of Spain, in the territory called Tarragonenſis. Pliny.

Cares, or Kares, in *Geography*, a town of European Turkey, ſeated on mount Athos, in an elevated and pleaſant ſituation; it has ſeveral convents, and a market every Saturday, for corn and other proviſions; 17 miles S.E. of Salonki.

CARESAN, or Caſſen, a ſea port town of *Arabia* Felix, ſeated on the Indian Ocean, 100 leagues N.E. from Aden. N. lat. 16° 5′. E. long. 52° 7′.

CARESENA, or Caresenia, in *Ancient Geography*, a country of Aſia, extending along the river Careſus, and bounded by Dardania, according to Strabo, who ſays that it is a mountainous, cultivated, and well peopled country, and that it derives its name from the river; which has its ſource at Malonte, a place ſituate between Palæicepſis and Achæium, over againſt Tenedos, and diſcharges itſelf into the *Æſepus*.

CARESTINI, Giovanni, in *Biography*, one of the greateſt ſingers and actors that Italy ever produced, ſince the invention of the muſical drama or opera. He arrived in England in the year 1733, when Handel firſt began his regency in the Haymarket at his own peril, after the Royal Academy of Muſic was diſſolved, and the nobility and gentry had engaged a band of vocal and inſtrumental performers to oppoſe him. This ſeparation, which was occaſioned by a quarrel between Handel and Seneſino, divided the muſical part of the nation into two factions, which gained nothing by the conflict but the gratification of ruining each other. The powerful opponents with whom Handel had to contend hired the theatre in Lincoln's-inn Fields of Rich, the patentee, and engaged Seneſino and Cuzzoni for principal ſingers, and Porpora to compoſe.

*Careſtini* was born at Filatrana, in the march of Ancona, and at 12 years old went to Milan, where he was patroniſed by the Cuſani family, whence he was frequently called *Cuſanino*. His voice was at firſt a powerful and clear ſoprano, which afterwards changed into the fulleſt, fineſt, and deepeſt counter-tenor that has perhaps ever been heard. His firſt appearance on the ſtage ſeems to have been at Rome, in the female character of Coſtanza, in Bononcini's opera of Griſelda, 1721. In 1723 he was at Prague, during the great muſical congreſs there, on occaſion of the coronation of the emperor Charles VI. as king of Bohemia. In 1724 we trace him at Mantua; and in 1726 at Venice, where he performed with Farinelli, and the famous tenor Paita. In 1728 he was at Rome, and again in 1730, where he performed in Vinci's celebrated operas of *Aleſſandro nell' Indie* and *Artaſerſe*, both written by Metaſtaſio. He was now engaged by Handel to ſupply the place of Seneſino, who, together with his whole troop, except the Strada, had deſerted from him, and enliſted under the banners of Porpora and the Barons, at Lincoln's-inn Fields. Careſtini's perſon was tall, beautiful, and majeſtic. He was a very animated and intelligent actor, and having a conſiderable portion of enthuſiaſm in his compoſition, with a lively and inventive imagination, he rendered every thing he ſung intereſting, by good taſte, energy, and judicious embelliſhments. He manifeſted great agility in the execution of difficult diviſions from the cheſt in a moſt articulate and admirable manner. It was the opinion of Haſſe, as well as of many other eminent profeſſors, that whoever had not heard Careſtini was unacquainted with the moſt perfect ſtyle of ſinging. He continued in the higheſt reputation for twenty years after quitting England, and ſung at Berlin with the *Aſtrua* in 1750, 1754, and 1755. This admirable performer was here but two ſeaſons, when he had the Strada as firſt woman for his partner. He performed in Handel's two beſt operas, *Ariadne* and *Alcina*, the firſt year againſt Seneſino and Cuzzoni, who were joined; the ſecond year againſt Farinelli. But ſeveral excellent judges, who had frequently heard him, and with whom we converſed many years after his departure, never ſpoke of his grand ſtyle of ſinging, fine figure, and dignified action, without rapture; among theſe, Haſſe, who had often compoſed for him, and Quantz, who heard him at every period of his fame, were his greateſt panegyriſts.

CARESUS, in *Ancient Geography*, a town of Aſia, in the country called Careſena. It was ſeparated from the Granicus to the north-weſt by a ſmall chain of mountains. Strabo.

CARET, in *Geography*, a town of Germany, in the Tyroleſe; 12 miles S.W. of Bolzano.

Caret, a ſmall bay in the gulf of Darien, which has two iſlands before it that are moderately high, and covered with trees.

Caret, in *Grammar*, a character in this form (ʌ) denoting that there is ſomething inſerted or interlined, which ſhould regularly have come in where the character is placed. This mark is alſo called a circumflex, when placed over ſome vowel of a word, to denote a long ſyllable; as "Euphrâtes."

Caret, in *Zoology*, ſynonymous with Caretta, which ſee.

CARETTA, in *Geography*, a ſmall low iſland, about ¼ of a league from the main, lying on the coaſt of Peru, in the Southern Pacific Ocean, 3 leagues from the cape of Cangallan, or St. Gallan.

Caretta, in *Zoology*. See Testudo *caretta*. Caretta is ſometimes applied to the ſpecies *Teſtudo imbricata*, Knorr, &c.

Caretta, in *Botany*, Rheed. Mal. ii. tab. 22. See Guillandina *bonducella*.

CAREW, George, in *Biography*, earl of Totneſs, the deſcendant of an ancient family in the weſt of England, which came over probably from France with William the Conqueror, and originally derived this name from Carew-caſtle, in Pembrokeſhire, was born in 1557. At the age of 15 he was admitted a gentleman commoner in the univerſity of Oxford, where he made a good proficiency in learning, particularly in the ſtudy of antiquities; but being inclined to a military life, he went to Ireland, and ſerved againſt the earl of Deſmond. Having ſucceſſively occupied ſeveral important poſts, and commanded abroad in the expedition againſt Cadiz, in 1596, he was appointed preſident of Munſter, in 1599, and in the following year treaſurer of the army, and one of the lords-juſtices of Ireland. When he was advanced to the office of governor, he found the country in a ſtate of open rebellion; and yet by his prudence and valour he ſucceeded, with a ſmall force, in reducing it to the queen's obedience, and in counteracting the hoſtile deſigns of the Spaniards, who landed at Kinſal, in 1601. Having ſettled the province in a firm and univerſal peace, he obtained permiſſion to reſign his office in the beginning of the year 1603, and arrived in England three days before queen Elizabeth's death. Upon the acceſſion of king James he was particularly noticed, and advanced to ſeveral poſts of honour, and, in 1605, created a baron, by the title of lord Carew of Clopton in Warwickſhire, as he had married the daughter and heireſs of William Clopton, eſq. When the crown devolved on Charles I. he was created, in 1625, earl of Totneſs. Having eſtabliſhed the character of a faithful ſubject, a wiſe and valiant commander, an honeſt counſellor, a good ſcholar, and a patron of learning, he cloſed his life at the Savoy, in London, in 1629, and was buried at Stratford-upon-Avon, near Clopton, whence he took his firſt title. After his death his natural ſon, Thomas Stafford, publiſhed, in 1633, a work written under his direction, and entitled "Pacata Hibernia," or The Hiſtory of the Wars in Ireland, particularly within the Province of Munſter, during the Years of his Government, fol. illuſtrated with 17 maps. In the Bodleian library are alſo four large volumes of chronologies, charters, &c. relating to Ireland, which were collected by ſir George Carew: and his materials for writing "The Hiſtory of the Reign of King Henry V." are inſerted in Speed's Chronicle. Biog. Brit.

Carew, Thomas, an Engliſh poet of the 17th century, belonged to the family of the Carews in Glouceſterſhire, which originally deſcended from that of Devonſhire. Having been educated in the univerſity of Oxford, and farther improved himſelf by travelling, he was honourably received at court, and much reſpected for his polite and elegant accompliſhments. Charles I. appointed him gentleman of the privy chamber, and ſewer in ordinary; and by Ben Jonſon, ſir William Davenant, and other poets of that period, his abilities and performances were extravagantly admired and applauded. It redounds, however, much more to his praiſe, that he was intimate in his youth with the great earl of Clarendon, who ſpeaks highly of his amiable qualities, and of his talents for light poetry of the amorous kind, in the elegance and fancy of which he had few equals. From him alſo we learn, that Carew, after paſſing 50 years of his life in a careleſs and licentious manner, died (about the year 1639) with ſentiments of penitential remorſe and unfeigned reſpect for Chriſtianity. He left behind him ſeveral poems, which have been frequently reprinted, and a maſque, entitled, "Cœlum Britannicum." Biog. Brit.

Carew, Richard, was a deſcendant of the Corniſh branch of the Carew family, and born in 1555. After ſpending three years in the univerſity of Oxford, and about the ſame time in the Middle Temple, he travelled into foreign parts: and upon his return ſettled in his native county. The only original work written by him, if we except "The true and ready way to learn the Latin tongue," which is aſcribed to him, was his "Survey of Cornwall," publiſhed in 4to. at London, in 1602. This work, which is much commended by Camden, has been ſince in a great degree ſuperſeded by Dr. Borlaſe's excellent publications relative to the county of Cornwall. Mr. Carew was held in high eſtimation for his talents and learning by ſeveral of the moſt eminent ſcholars of his time; and particularly by ſir Henry Spelman, who extols him for his ingenuity, virtue, and learning. He died in 1620. Biog. Brit.

Carew, George, brother of the preceding, was educated at Oxford, ſtudied the law in the inns of court, and then travelled to foreign countries. On his return, he was called to the bar, and enjoyed ſome poſts of honour and profit. Queen Elizabeth conferred upon him the honour of knighthood; and he was employed at home in treating with the Scotch concerning an union between the two kingdoms, and abroad in foreign embaſſies, firſt to Poland and afterwards to France. During his reſidence in the latter country, he formed an acquaintance with ſeveral literary perſons, and particularly with Thuanus, to whom he communicated hints relating to Poland, which were of uſe to that excellent author in compiling part of his hiſtory. After his return from his French embaſſy in 1609, he drew up, for the uſe of James I., a perſpicuous "Relation of the State of France, with the Characters of Henry IV. and the principal perſons of that Court," which valuable tract was communicated, in MS., by the earl of Hardwicke, to Dr. Birch, who publiſhed it in 1749, at the cloſe of his "Hiſtorical View of the Negociations between the Courts of England, France, and Bruſſels, from the year 1592 to 1617." This intelligent writer commends it as a model upon which ambaſſadors may form and digeſt their notions and repreſentations; and Mr. Gray alſo repreſents it as an excellent performance. From a letter written by Thuanus to Camden, in the ſpring of the year 1613, it appears that he was then lately deceaſed. Biog. Brit.

CAREX, in *Botany*, (derivation uncertain, ſuppoſed by ſome from the Greek verb, *κειρω*, *tondeo*, *abſcindo*, in alluſion to the ſharp edges of the triangular ſtem, and agreeably to the character given of it by Virgil,

"Frondibus hirſutis, et carice paſtus acuta," Georg. iii. 231. Profeſſor Martyn derives it, but, we think, with leſs probability, from *careo*, not *quia viribus careat*, but becauſe, from its roughneſs, it is fit *ad carendum*, to card, teaze, or pull.) Linn. Gen. 1046. Schreb. 1407. Gært. 17. Juſſ. p. 26 Vent. vol. ii. p. 91. Laiche, Lam. Encyc. Claſs and order, *monœcia triandria*. Nat. ord. *calamariæ*, Linn. *Cyperoideæ*, Juſſ.

Gen. Char. *Flowers* diſpoſed in one or more oblong, imbricated catkins; the male and female in ſome ſpecies on the ſame, in others on diſtinct catkins. Male. *Cal.* glume one-valved, one-flowered, lanceolate, acute, concave, permanent. *Cor.* none. *Stam.* filaments three, briſtle-ſhaped, erect, longer than the calyx; anthers erect, long, linear. Female. *Cal.* as in the male. *Cor.* petals none; nectary inflated, oblong-egg-ſhaped, contracted upwards, opening at the tip, ſometimes with two teeth, permanent. *Piſt.* germ three-ſided, within the nectary; ſtyle ſimple; ſtigmas either three or two, awl-ſhaped, incurved, long, acuminate, pubeſcent. *Peric.* none, except the enlarged nectary which protects the ſeed. *Seeds* ſingle, acutely egg-ſhaped, moſt frequently three-ſided, one angle often leſs than the other.

Eſſ. Char. Seed incloſed in the permanent nectary.

An admirable monograph of the Britiſh ſpecies has been publiſhed by the Rev. Dr. Goodenough, in the Tranſactions of the Linnæan Society, of which we have gratefully availed ourſelves. Mr. Wahlenberg, of Upſal, has alſo written an excellent monograph of the genus publiſhed in "Kongl. Vetenſkaps Academiens Nya Handlingar Für Aprilis, Majus Junius, 1803," and republiſhed in the fourth number of the Annals of Botany. We had made our arrangement, and drawn up the article before this work fell into our hands, but have ſince inſerted all his new ſpecies, with ſuch additions to the others as ſeemed important. From him we have alſo borrowed the references to the coloured figures, publiſhed by Mr. Schkuhr of Wittenburg.

Of the earlier modern botaniſts Lonicer appears to be nearly the only one who retained the term carex, and uſed it in its ancient acceptation. It was not employed either by Tournefort or Ray. Tournefort united ſeveral ſpecies under the vague appellation of cyperoides; one or two of which, if rightly underſtood, have both male and female flowers on the ſame ſpike; but his generic character comprehends thoſe only which have them in ſeparate ſpikes. Ray has adopted a ſtill more exceptionable name, gramen cyperoides; and has been juſtly accuſed by Dr. Goodenough of including cyperus under it, and thus "making the thing likened include and refer to itſelf for its original;" but in juſtice to our great countryman it ought to be added, that though, in the introduction to the genus, as it ſtands in his Synopſis, he has, perhaps, inadvertently made cyperus one of the diviſions of his gramen cyperoides, in the ſubſequent nomenclature of ſpecies he has carefully kept them diſtinct. We may obſerve, by the way, that this impropriety is of frequent occurrence in the writings of Juſſieu and other French botaniſts.

About the beginning of the laſt century, Micheli and ſome others applied the term carex to thoſe ſpecies, which have male and female flowers on the ſame ſpike, calling the others, either cyperoides or ſcirpoides. Linnæus extended it to both, and formed the preceding generic character, to which, as to its ſubſtance, all ſubſequent authors have acceded. Dr. Goodenough, indeed, doubts whether the two families may not be advantageouſly again divided; but with due deference to this excellent naturaliſt, whoſe name muſt always carry with it a great weight of authority, as Linnæus's generic character is clear and definite, and eſpecially as the two families ſometimes run a little one into the other, it is ſurely more conducive to ſcientific preciſion to keep them together; and the caſe of the inveſtigating ſtudent is quite as well conſulted, by making them ſubdiviſions of one large genus.

A great diverſity of opinions has prevailed with reſpect to the proper appellation of that part, which Linnæus has called the nectary. Tournefort calls it a veſicle, which afterwards becomes a capſule. Ray does not appear to have noticed it. Linnæus himſelf, when he ſpeaks of it in an advanced ſtate, ſometimes calls it a tunic; but more generally, though in defiance of his own definition, a capſule. Gærtner, in the firſt volume of his great work, "de fructibus et ſeminibus plantarum," calls it a coriaceous nut, formed of the indurated corolla, obſerving that it is not a true pericarp, but a mere involucre of the ſeed, ſince it permits the piſtil to paſs freely through it, which is contrary to the nature of a pericarp. If this eminent carpologiſt had lived to publiſh a ſecond edition of his work, he would probably have called it an angidion. See the preface to the ſecond volume, p. 32. La Marck, regarding only the form, calls it, not unaptly, though not very ſcientifically, an urceole. Dr. Smith, in ſeveral parts of his Engliſh botany, had expreſſed an inclination to conſider this puzzling appendage to a very ſimple flower, as a true permanent corolla, which gradually hardens, and finally becomes an envelope of the ripened ſeed; but afterwards, in conſequence of ſuggeſtion from Dr. Goodenough, ſupported by his own deliberate judgment, was induced to call it an aril, "as a name much better expreſſing its true nature than the hypothetical one of nectary, the erroneous one of capſule, or even the analogical denomination of corolla." As ſuch it is deſcribed in his Flora Britannica. See alſo the fifth volume of the Tranſactions of the Linnæan Society, p. 265. It may be proper to add, that in the third volume of the ſame Tranſactions there is a paper by Dr. Goodenough, in which he intimates a belief, that all carices diſpoſe of their ſeeds by the opening of the point of what he there calls the capſule; and as this opening is obſerved in ſome very early, and in others not till they are quite old, in the former caſe it has been deſcribed as opening, and in the latter as quite cloſed. In a very recent number of the Engliſh botany, Dr. Smith ſtill continues to call it a tunic, a term which as it leaves the matter *adhuc ſub judice*, we ſhall employ in the following deſcriptions, in all caſes where we do not uſe the more general term, fruit.

In dividing the genus into ſections, Linnæus ſeparated thoſe which have ſeſſile from thoſe which have peduncled female ſpikes. Dr. Goodenough obſerves, that this has been a ſource of great perplexity; for cultivation, or in a natural ſtate a luxurious growth, does away the whole diſtinction. The peduncle, moreover, is often or in a great degree concealed by the ſheath of the foliaceous bracte. Thus C. diſtans always has its ſpikes on long peduncles, but as they are embraced by the ſheaths, Linnæus ſtiled them nearly ſeſſile. Dr. Goodenough has therefore propoſed a new mark of diſtinction, founded on the proportion which the peduncle bears to the ſheath, and which is the ſame under every variation of ſoil and cultivation. If the ſheath be of the ſame length as the peduncle, he calls it *vagina æquans*; if half the length, *dimidiata*; if about a quarter, *abbreviata*.

Species. * *Spike ſingle, ſimple.*

1. C. *dioica*, Linn. Sp. Pl. Mart. 1. Lam. 1. Wahlen. 1. Eng. bot. tab. 543. Flor. dan. 369. Schkuhr 1. tab. A. Q. W. fig. 1. 2. (C. lævis; Hoppe. Maſc. Gramen cyperoides, ſpicâ ſimplice caſſa; Rai Syn. Ed. 2. 267. Gramen cyper. minimum ſpicâ caſſâ ſimp. Inorie. §. 8. tab. 12. fig. 22. Fæm. Gram. cyper. ranunculi capitulo rotundo; Rai Syn. 425. "Spike ſimple, with both male and female flowers; upper ones male; fruit divaricated, reflexed, tapering at both ends; ſtigmas two." *Root* perennial, fibrous, not creeping as in C. dioica. *Stems* often a foot high, ſimple, ſlender, ſmooth, leafy near the baſe. *Leaves* briſtle-ſhaped, in tufts, rigid, ſmooth, channelled, nerved, nearly as long as the ſtems. *Spike* linear, erect, at firſt reſembling that of C. dioica, in which ſtate it is figured in Flora danica. *Male flowers,* numerous; glumes brown, finally preſſed cloſe; *female* looſely imbricated, finally reflexed; glumes deciduous, being forced off by the bending back of the ripening germ. *Fruit* elliptical-lanceolate, ſharp-edged on each ſide, ſlightly cloven at the tip, without ribs, of a poliſhed brown colour, ſomewhat reſembling that of a flea, whence the trivial name; ſtigmas two. *Seed* elliptical brown. A native of marſhy ground in England and other parts of Europe, flowering in June. 6. C. *obtuſata,* Wahlen. 5. Liljeblad Act. Stockh. 1793, tab. 4. "Spike of about four flowers; ſtigmas three; fruit inverſely egg-ſhaped, inclining to globular, ſomewhat coriaceous, patent-diverging; orifice tranſparent, two-lobed; leaves very narrow." A native of Sweden in dry gravelly ſoil. 7. C. *petræa,* Wahlen. 6. "Spike with numerous male flowers at the top, three ſcattered female ones at the baſe; ſtigmas three; glumes ſomewhat circinate, large, very brittle; fruit top-ſhaped, very ſlender, erect; ſtem acutely angular. A native of rocky mountains in the north of Lapland. 8. C. *pyrenaica,* Wahlen. 7. "Spike many-flowered, denſe; female flowers numerous; ſtigmas three; fruit narrow-oblong, with a ſhort beak, diverging." A native of the Pyrenées. 9. C. *pauciflora,* Mart. 45. Lightfoot Flor. Scot. tab. 6. fig. 2. Smith Flor. Brit. n. 4. Schkuhr 4. tab. A. fig. 4. (C. patula; Hudſ. 402 and 657. C. leucoglochin; Linn. jun. Supp. 413. Ehrt. Phyt. n. 8. Mart. 52. Wahlen. 8.) "Spike ſimple, with few flowers; fruit ſpreading, awl-ſhaped; ſtigmas three." *Root* perennial, creeping. *Stems* from three to five inches high, aſcending, ſmooth, obſcurely triangular. *Leaves* generally two, even, channelled, about half the length of the ſtem. *Spike* looſe; flowers from four to ſix; terminal; one of them male, erect; the reſt female, ſpreading, finally bent down. *Fruit* ſomewhat triangular, furrowed; ſtigmas three. According to Lightfoot there are ſometimes only two. A rather rare native of alpine marſhes in Scotland, flowering in June. In the north of Sweden common. 10. C. *ſquarroſa,* Linn. Sp. Pl. 4. Mart. 4. Lam. 4. "Spike ſimple, with male and female flowers, cylindrical; lower flowers male; fruit imbricated, horizontal." *Spike* thick. *Fruit* with a long linear beak. One of the largeſt ſpecies in the genus. Linn. A native of Canada, Kalm. 11. C. *hamata,* Mart. 46. Wahlen. 10. Swartz. Prod. 18. (C. uncinata; Schkuhr 7. tab. G. fig. 30. C. phleoides; Cavanilles Icon. vol. 5. p. 40. tab. 464. fig. 1.) "Spike rather long, male flowers at the top; ſtigmas three; glumes oval, as long as the fruit, obvolute; fruit oblong, obtuſe, convex on one ſide, a little concave on the other, ciliated, with a long and hooked awn." Wahlen. A native of mountains in Jamaica; Swartz. Chili, Cav. Iſle of France. Grondal. 12. C. *uncinata,* Linn. jun. Sup. Mart. 5. and 53. Lam. 6. Wahlen. 11. "Spike very long, thickened above; male flowers at the top, ſtigmas three; glumes adnate, oblong, ſhortiſh; fruit oblong, with a ſhort and roundiſh beak, and a rather long, hooked awn." Wahlen. The moſt beautiful ſpecies in the genus. *Female flowers* occupying two thirds of the ſpike; awn curved above the middle, thickened at the joint. Small ſpikelets ſometimes hang down at the ſide, which are perhaps barren. Linn. jun. A native of New Zealand. Forſt. 13. C. *erinacea,*

*nacea*, Wahlen. 12. Cavanilles Icon. vol. 5. p. 40. tab. 464. fig. 2. "Spike linear, ſhortiſh; male flowers at the top, ſtigmas three; glumes ſomewhat circinate, rather large; fruit roundiſh-egg-ſhaped, triangular; awn very long, hooked. A native of the weſt coaſt of ſouth America. 14. C. *rupeſtris*, Mart. 47. Allion. Pedem. 2292. tab. 92. fig. 1. "Spike oblong, male flowers at the top; female glumes awned." *Stem* ſcarcely four inches high, naked, triangular, twice as long as the leaves. *Spike* an inch long; male glumes ſomewhat egg-ſhaped, not awned; female broad, egg-ſhaped, acute, bay-coloured, with a paler edge, and a broadiſh nerve ending in an awn. A native of Piedmont.

** *Spike compound. Male and female flowers on the ſame ſpikelet.*

15. C. *Bellardi*, Mart. 48. Wahlen. 15. Allion. Ped. 2293. tab. 92. fig. 2. Schkuhr 25. tab. D and H h, fig. 17. (C. myoſuroides; Villars Dauph. 2. 194. tab. 6?) "Spike ſomewhat compound, linear; ſpikelets of two flowers, upper one male; lower female, with three ſtigmas; glumes ſomewhat circinate, large, very brittle; fruit top-ſhaped, ſlender; ſtem round; leaves filiform." Wahlen. *Root* fibrous. *Stems* numerous, about ſeven inches high, ſtriated, ſomewhat curved. *Leaves* convoluted, ſtriated, ſomewhat curved, about the height of the ſtem. *Spike* about an inch long; flowers generally ſolitary, alternate, ſeſſile; ſo that the ſpike ſeems to be interrupted; glumes egg-ſhaped, acute, without awns, bay with a whitiſh edge. Allion. A native of Piedmont. Although theſe two authors do not exactly agree in their manner of deſcribing the infloreſcence, the difference ſeems to be only verbal. The myoſuroides of Villars, which he ſuſpects may be the ſame plant, and which he ſays has hermaphrodite flowers and *half naked* ſeeds, muſt be diſtinct, and if his deſcription be exact, is ſcarcely a Carex. 16. C. *capenſis*, Wahlen. 14. Thunb. "Spikelets male at the top, ſomewhat compound, near together; ſtigmas three; fruit oblong, acute, convex on both ſides, obtuſely angular, a little curved outwards, bractes ſomewhat foliaceous, ſtem round. 17. C. *cyperoides*, Linn. jun. Suppl. 413. Mart. 6. and 54. Lam. 5. Wahlen. 33? Schkuhr 28. tab. A. fig. 5? (C. bohemica; Schreb. gram. tab. 28. fig. 3. Mich. gen. p. 70. tab. 33. fig. 19. Cyperus minor, capitulis inflexis; Buxb. Cent. 4. p. 34. tab. 61. Scirpus pica multipartita, feminibus cordatis; Gmel. ſib. v. 1. p. 81.) "Head terminal, roundiſh; flowers abſolutely ſimple, awl-ſhaped, involucre long." *Flowers* abſolutely ſimple, (which is ſingular), pedicelled, forming a ſimple umbel, Linn. jun. La Marck adopts all the younger Linnæus's ſynonyms; but gives the following deſcription, which appears to be taken from Schreber, reſembling Cyperus in its general habit and involucre, and Scirpus in the diſpoſition of its flowers. *Root* perennial. *Stems* about a foot high, triangular, ſheathed in their lower part with a few gramineous, narrow leaves. *Head* round, terminal, compoſed of numerous cloſe ſpikelets. *Flowers* on the outſide of each ſpikelet male, on the inſide female; ſtamens white; piſtil longer than the tunic; ſtyle bifid. *Involucre* four-leaved. Martyn inadvertently gives it twice, with preciſely the ſame ſynonyms to both, but annexes Schreber's deſcription to n. 6. and the younger Linnæus's to n. 54. If they really belong to the ſame ſpecies, Linnæus's plant muſt be a very ſingular variety with one-flowered ſpikelets, for ſuch the pedicel determines them to be: it proves alſo that the ſpecies, whether one or two, ought not to be placed in the firſt ſection. Wahlenberg gives the following ſpecific character of his cyperoides; "ſpikelets male at the baſe, forming a head; glumes linear-briſtle-ſhaped; fruit bicuſpidate; bractes cloſe together, foliaceous, long." A native of Bohemia, the Levant and Siberia. 18. C. *curvula*, Mart. 49, Lam. 10. Wahlen. 16. Hall. helv. n. 1353. Allion. pedem. n. 2295. tab. 92. fig. 3. Schkuhr 25. tab. D and H h, fig. 17. "Stem and leaves rigid, curved; ſpike ſingle; glumes awned." *Root* perennial. *Stems* ſlender, naked, ſcarcely longer than the leaves. *Leaves* narrow, ruſh-like, three or four inches long, a little curved. *Spike* ſhort, apparently ſimple, but compoſed of two or three cluſtered ſpikelets. *Glumes* lanceolate, acute, reddiſh, membranous, and whitiſh at the edges. A native of high mountains in Switzerland, Dauphiny and Piedmont. 19. C. *incurva*, Mart. 57. Lightfoot Flor. Scot. 544. tab. 24. Smith Flor. Brit. 10. Goodenough 9. Wahlen. 19. Schkuhr 19. tab. H h, fig. 25. (C. juncifolia; Allion. pedem. 2296. tab. 92. fig. 4. Flor. Dan. 432?) "Spikelets cluſtered in a head; lower flowers female, bractes membranous; ſtem roundiſh, ſmooth; leaves channelled." Dr. Smith. Very nearly allied to the preceding, if it be more than a variety. *Root* perennial. *Stems* three inches long, aſcending, naked, even, on the ſea-ſhore curved, on moiſt mountains often ſtraight. *Leaves* ſhorter than the ſtem, linear, channelled, even, nerved. *Spike* compound, ſhort, nearly conic when in flower, obtuſe when in ſeed; ſpikelets roundiſh, few-flowered, browniſh. *Bractes* ſhorter than the ſpikelets, partly embracing the ſtem, concave, elliptical, obtuſe, ſlightly keeled. *Glumes* egg-ſhaped, brown, white at the edges, with a very ſlender keel. *Fruit* egg-ſhaped, acute, green, brown at the tip, undivided, ſmooth at the edges. *Stamens* capillary, very long, white. *Stigmas* two, brown. *Seed* lenticular. Lightfoot deſcribes his plant as having no involucre and ſuch it appears in his figure. Dr. Smith attributes to it two bractes which are repreſented very diſtinctly in Mr. Sowerby's figure in Engliſh botany. Dr. Goodenough was honoured with a ſight of Lightfoot's original ſpecimen in her majeſty's herbarium, but fearful of doing any injury by handling it, forebore taking a minute deſcription. We are doubtful of the figure in Flora Danica, though quoted both by Dr. Goodenough and Dr. Smith. It appears to differ not only in habit, but alſo in the ſtructure of the piſtil. If it be our plant it is taken in an advanced ſtate of fructification, and without the bractes. It ſeems probable that the latter may be generally puſhed off by the ripening fruit. Specimens of this plant were ſent to Dr. Hope from the deep, looſe ſand at the mouth of the water of Naver, and from the neighbourhood of Skelberry in Dunroſſneſs in Shetland. Dr. Smith received others from Profeſſor Beattie, gathered near Aberdeen. It flowers in July and Auguſt. 20. C. *fœtida*, Mart. 50. Lam. 7. Wahlen. 20. Allion. Flor. ped. 2297. Hall. helvet. 1355. Scheuch. gram. 495. Prodr. tab. 4. It. p. 458. fig. 11. Villars Dauph. 2. 195. "Spike compound, egg ſhaped, brown; ſpikelets cluſtered." Lam. *Root* perennial. *Stem* naked, triangular, often a little curved, about the length of the largeſt leaves. *Leaves* about three inches long, near two lines broad, tufted, graſs-like, keeled. *Spike* ſhort, a little conical, brown or blackiſh, naked at its baſe; ſpikelets ten or twelve, egg-ſhaped, acute, blunt, forming a regular cluſter. Sometimes there are two long, tailed leaves under the ſpike, ſometimes only one, and ſometimes none. According to Haller the plant has an unpleaſant ſmell, both green and dry. A native of boggy ground on mountains in Switzerland, Dauphiny and Piedmont. La Marck conſiders the juncifolia and fœtida of Allioni as the ſame plant, and quotes C. incurva of Lightfoot as a ſynonym; but Dr. Smith, who gathered both on the hill called Rouche near Mount Cenis, has determined them to be perfectly diſtinct, and the juncifolia to be Lightfoot's incurva, though on the Alps it is ſeldom curved. Wahlenberg, on

the other hand, makes all the three diſtinct ſpecies, and gives the following ſpecific characters of the juncifolia and incurva. 21. C. *juncifolia*, n. 17. "Spikelets ſeſſile, male at the top, collected into a ſmall oblong head; fruit rather roundiſh-depreſſed, attenuated; orifice two-lobed, ſtigmas two; ſtem round, incurved; leaves convolute; inner ones very ſhort." C. *incurva*. n. 19. "Spikelets ſeſſile, male at the top, denſely collected into an ovate-globular head, few, ſomewhat diverging; fruit circinate-ovate, ſemiglobular, beaked; orifice very entire; ſtigmas two; ſtem rather acutely angular, ſomewhat incurved: leaves convolute." 22. C. *ſimpliciuſcula*, Wahlen. 18. (Schœnus monoicus; Eng. bot. 1410?) "Spikelets ſeſſile, male at the top, cluſtered into a linear ſpike; fruit oblong, depreſſed, ſlightly beaked; orifice very entire; ſtigmas two; leaves very narrow, convolute." A native of Weſtmoreland in England, ſent to Swartz by Mr. (doubtleſs Dawſon) Turner. From this circumſtance, added to its not being mentioned by any Britiſh botaniſt, we think it almoſt certain that this plant is no other than Schœnus monoicus of Engliſh botany, which remained for ſome time undetermined, and as Dr. Smith obſerves, was taken by every body, even the able Mr. Schkuhr, for a Carex: but in that caſe Wahlenberg has greatly erred in deſcribing the fructification. 23. C. *ſtenophylla*, Wahlen. 21. (C. juncifolia, Hoſt. Schkuhr. Car. 18. tab. G. and I i. fig. 32). "Spikelets ſeſſile, male at the top, collected into an ovate head; fruit ventricoſe, roundiſh, rather flatly convex, ribbed, ſlightly ſerrated at the edge; orifice two-toothed; ſtigmas two; ſtem acutely angular; leaves very narrow." 24. C. *Baldenſis*, Linn. Sp. 5. Mart. 7. Lam. 9. Wahlen. 13. Vill. Dauph. 2. 196. tab. 6. Schkuhr. tab. 4. fig. 81. (C. alpina ſeg. ver. 1. 125. n. 5. gram. junceum; Bauh. pin. 6. n. 12. prod. 13. tab. 13. Hiſt. 2. 509.) "Spikes egg-ſhaped, triangular, ternate, cluſtered, terminal, ſeſſile; involucre two-leafed." Linn. *Root* perennial. One leaf of the involucre longer than the ſpikes, the other ſhorter. *Spikelets* three or four, collected into a head, white, oblong; glumes of the male flowers on the upper part of the ſpikelets lanceolate; of the female flowers gibbous; ſtyle long, three-cleft. Linn. *Stem* naked, triangular, at leaſt ſeven inches high. *Leaves* all radical, rather narrow, half the length of the ſtem *Spikelets* three, ſeſſile, ſhort, reddiſh brown or whitiſh, forming a kind of three-lobed ſpike. Seguier. A native of Mount Baldo and the neighbourhood of Verona. La Marck thinks it muſt be rare, neither Haller nor Allioni having deſcribed it, and he himſelf having never ſeen it, but conjectures that the following may be a variety of it without the involucre. 25. C. *tripartita*, Mart. 59. Allion. ped. n. 2298. tab. 92. fig. 5. Hall. helv. 1356. (C. lobata; Lam. 8. Wahlen. 23. Vill. Dauph. 2. 197. ?) "Spike compound, egg-ſhaped, ſomewhat lobed, ferruginous-brown; lower glumes mucronate." Lam. *Root* perennial. *Stem* trianlar, naked, a little longer than the largeſt leaves. *Leaves* four or five inches long, two lines broad, tufted, gramineous, keeled. *Spike* ſhort, naked at its baſe, commonly three-lobed; lateral, lobes very ſhort; ſpikelets about twelve, ſeſſile, male at the top, egg-ſhaped, cluſtered; ſtigmas two. A native of Switzerland, Dauphiny, and Piedmont. 26. C. *bipartita*, Mart. 60. Lam. 11. Allion. pedem. 2301. tab. 89. fig. 5. "Stem round, naked; ſpikes two, upper one compound, terminal." *Root* perennial, fibrous, throwing out ſeveral ſtems and leaves in a tuft. *Stems* four or five inches high, twice the length of the leaves, ſtriated, cylindrical. *Leaves* gramineous, ſmooth, a little rolled in at their edges, ſtriated, acute, almoſt pungent. *Spikes* two, upper one an inch long; ſpikelets ſeſſile, alternate, cluſtered; lower one near the other, ſhorter, egg-ſhaped, pedicelled; bracte reddiſh brown, acute; glumes egg-ſhaped, acute, not awned, brown, whitiſh at their edges as they grow old. Sometimes, but rarely there is a third ſpike beneath the other two. A native of ſpongy ground on the mountains of Piedmont. 27. C. *diviſa*, Mart. 56. Goodenough 12. Smith 13. Linn. Soc. Tranſ. vol. ii. tab. 19. fig. 2. Wahlen. 27. Eng. bot. 1096. Schkuhr 11. tab. V v. fig. 61. (C. hybrida; Lam. 17. Gramen cyperoides ex monte Ballen. ſpicá divulſâ; Rai Syn. 423.) "Spike once or twice compounded; bracte leafy, erect; fruit not ſpreading; root creeping." *Root* perennial, creeping horizontally to a conſiderable extent, black, ſtrong, twiſted. *Stems* a foot high and more, upright, weak, naked, trianlar; angles roughiſh upwards. *Leaves* narrow, upright, bright green, rough at the edges and keel, various in length. *Spike* an inch long, egg-ſhaped, often doubly compound at the baſe, of a dark ruſty colour, denſe, rather compreſſed; ſpikelets ſeveral, irregularly cluſtered, egg-ſhaped, acute; female flowers loweſt, moſt numerous, and flowering ſooneſt, which, as Dr. Goodenough obſerves, occaſions a conſiderable elongation of the ſtyles waiting for their impregnation *Bracte* at the baſe of the ſpike leafy, upright, acutely triangular, often very long, but ſometimes ſhorter than the ſpike. *Glumes* elliptical, mucronate, brown, a little membranous at the edge; keel pale. *Fruit* ſhorter than the glume, egg-ſhaped, with a rough dilated margin, cloven at the point; ſtigmas two, brown, very long. A native of marſhy ground, flowering in May and June. 28. C. *muricata*, Linn. Sp. Pl. 11. Mart. 13. Gooden. 13. Smith 14. Wahlen. 28. Schkuhr 13. tab. E. fig. 22. (C. ſpicata; Hudſon With. 2d. Ed. Relh. Lightf. Sibth. C. vulpina β; Lam. C. paluſtris media; Mich. gen. 69. tab. 33. fig. 14. Gram. cyper. ſpicatum minus; Rai Syn. 424. Gram. ſylv. Moriſ. 8. tab. 12. fig. 27. β. G. cyperoides ſpicis minoribus, minuſque compactis; Scheuchz. Ag. 488. tab. 11. f. 5. γ. C. loliacea; Schkuhr 14. tab. E e. fig. 91. Suter. Flor. Helv. 18. capſulis ſubacutangulis.) "Spike oblong, once or twice compounded, prickly; fruit divaricated, pointed, cloven; root fibrous." *Root* perennial. *Stem* from a foot to a foot and half high, upright, ſtraight, naked, except at the baſe, triangular, the angles rough upwards. *Leaves* bright green, narrow, often longer than the ſtem, rough on the edges and keel. *Spike* oblong, an inch long or more, cylindrical, obtuſe, interrupted at the baſe, ſometimes branched; ſpikelets eight or ten, ſeſſile, roundiſh; male flowers uppermoſt. *Bractes* egg-ſhaped, membranous, keeled, the loweſt tipped with a narrow, rough, leafy point; the lower ones longer than the ſpikelets, ſpreading. *Glumes* egg-ſhaped, membranous, mucronate, brown, with a green keel. *Fruit* divaricated, egg-ſhaped, convex on one ſide, green, at length brown, rough at the margin towards the top, deeply cloven at the point; ſtigmas two. A native of moiſt paſtures, flowering in May and June. 29. C. *ſtellulata*, Mart. 63. Gooden. 4. Smith 5. (C. muricata, Hudſ. Lightfoot. With. 2d. ed. Lam. 20. C. echinata, Sibth. Gram. cyper. ſpicatum minimum, ſpicâ divulſâ aculeatâ, Rai Syn. 424.) "Spikelets three or four, remote; fruit divaricated, acuminate; beak not cloven." *Root* perennial, fibrous. *Stem* from ſix to twelve inches high, erect, ſtraight, naked except at the baſe, triangular; angles roughiſh upwards. *Leaves* flat, keeled, ſhorter than the ſtem; nearly erect, and roughiſh towards their point, on the edges and keel. *Spikelets* ſeſſile, alternate, roundiſh, nearly at equal diſtances, not very remote from each other; the loweſt generally ſupported by a leafy bracte; male flowers beneath the female, and leſs numerous. *Glumes* egg-ſhaped, brown, membranous and white at the edges; keel broad, green. *Fruit* ſpreading in every direction, egg-ſhaped, ribbed, mucronate, ſcarcely emarginate, not cloven, roughiſh on each ſide; ſtigmas two. Common in wettiſh barren ground, flowering in May and June. All the Engliſh botaniſts took this for C. muricata of Linnæus, till the fortunate acquiſition of the Linnæan muſeum by Dr. Smith ſet them right. It is remarkable that La Marck fell into the ſame miſtake. Dr. Goodenough, indeed, ſuppoſes that Linnæus, and the Swediſh botaniſts after him, confounded the two plants, notwithſtanding the different poſition of the male and female flowers, a character which ſtruck La Marck as a ſufficient diſtinction between this ſpecies, (his muricata) and vulpina, though in other reſpects nearly allied. 30. C. *curta*, Mart. 64. Gooden. 5. Smith 4. Willd. Car. Berol. 19. tab. 2. fig. 3. Schkuhr. 33. tab. C. fig. 13. (C. caneſcens, Lightfoot. Flor. Dan. tab. 285. Lam. 21.? C. brizoides, Hudſ. C. elongata, Leers 197. tab. 14. fig. 7. Gr. cyper. elegans, Rai Syn. 423. n. 6. and 7. 3d. ed. Pluk. Phyt. tab. 34. fig. 4. Rel. Rudb. 2. f. 34. G. cyper. ſpicis curtis divulſis. Loeſel. Pruſſ. 117. tab. 32.) "Spikelets about ſix, elliptical, a little ſeparate, naked; glumes egg-ſhaped, rather acute, membranous; tunic entire." Dr. Smith. *Root* perennial, rather creeping. *Stem* a foot high, triangular, ſmooth except in the upper part. *Leaves* linear, flattiſh upwards, narrow, ſomewhat glaucous, roughiſh, nearly as high as the ſtem. *Spikelets* from four to ſix, or more, ſeſſile, generally alternate, elliptical, obtuſe, many-flowered; the loweſt ſometimes but rarely furniſhed with a bracte; lower flowers male, fewer than the female. *Glumes* egg-ſhaped, membranous, remarkably tender; white, ſhining, with a ſlender green rib. *Fruit* egg-ſhaped, compreſſed, acute, ſmooth; ſtigmas two. *Seed* exactly elliptical. A native of watery places in England and Scotland and other parts of Europe, readily diſtinguiſhed in a ſtate of maturity by its ſilvery ſpikelets. 31. C. *caneſcens*, Linn. Sp. Pl. 16. Mart. 17. "Spikelets roundiſh, remote, ſeſſile, obtuſe; fruit egg-ſhaped, rather obtuſe." Similar to curta; ſo much ſo that Loeſel's figure referred by Dr. Goodenough and Dr. Smith to curta, is almoſt equally expreſſive of both; but when they are brought together, a wide difference preſents itſelf. The curta is ſmaller in all its parts: its bractes, moreover, are ſilvery and very tender; whereas in the caneſcens they are membranous and hard, as in the reſt of the genus, and are brown with a white edge, which gives it a real, hoary appearance. See Dr. Goodenough's remarks in Linn. Tranſ. vol. ii. p. 147. Wahlenberg, however, notwithſtanding what has been advanced by Dr. Goodenough, unites the curta of that able botaniſt with the caneſcens of Linnæus, (at leaſt of the flora ſuecica,) under the following ſpecific character. "Spikelets five, male at the baſe, rather near together; glumes nearly as long as the fruit; fruit roundiſh-ovate, rather acute, convex on one ſide, leſs ſo on the other; angles rather obtuſe; orifice two-toothed; ſtigmas two." β. "upper ſpikelets aggregate; fruit ſpreading, acute, convex on one ſide, nearly flat on the other; angles rather acute." 32. C. *elongata*, Linn. Sp. Pl. 15. Wahlen. 41. Schkuhr tab. E. fig. 25. "Spikelets oblong, ſeſſile, remote; fruit egg-ſhaped, acute." Linn. "Upper ſpikelets male at the baſe, rather near together, in a kind of raceme; rather denſely flowered; glumes ſhortiſh; fruit oblong-acuminate, convex on both ſides, obtuſely angular, ribbed, curving a little outwards; orifice nearly entire; ſtigmas two." Wahlen. A native of Europe. 33. C. *loliacea*, Linn. Sp. Pl. 13. Wahlen. 47. Schkuhr tab. P p. 10.? "Spikelets ſomewhat egg-ſhaped, roundiſh, ſeſſile, remote; fruit egg-ſhaped, roundiſh, not awned, divaricated." *Root* creeping. *Stem* even, naked towards the top. *Leaves* gramineous, tender, even. *Spikelets* from four to eight, ſmall, ſcattered at the top of the ſtem, white. Similar to C. muricata, but differs in being only half the ſize, with fruit leſs divaricated, obtuſe, not acute at the edges." Linn. "Spikelets three, male at the baſe, a little diſtant, few-flowered; glumes ſhort; fruit ſomewhat oval-elliptical, rather convex on both ſides, obtuſe, obtuſely angular, divaricated; orifice quite entire; ſtigmas two; bractes briſtly; leaves very narrow." Wahlen. A native of Sweden. La Marck is aſſured that the laſt three are all one ſpecies, in which the curta of Dr. Goodenough is doubtleſs included. He even doubts whether the ſtellulata, his muricata, is ſufficiently diſtinct. The laſt three are ranked by him under the ſpecific name of caneſcens with the following character. "Spikelets egg-ſhaped, ſeſſile, remote, nearly naked; fruit egg-ſhaped, acute, rather converging." He diſtinguiſhes two varieties; (α) the elongata of Linnæus and Leers. Scheuch. gram. 487. tab. 11. fig. 4. and probably Hall. helv. 1359. (β) the caneſcens of Linnæus and Pollich, and the loliacea of Linnæus. Rai hiſt. p. 1297. n. 10. Syn. 3d. ed. p. 424. n. 10. Loeſel. Pruſſ. tab. 32. Hall. helv. 1359? He adds that Plukenet's tab. 34. fig. 4. appears to be taken from a plant of this ſpecies in an early ſtate of the flower. 34. C. *virens*, Lam. 22. (C. nemoroſa, Mich. gen. 69. n. 4. tab. 33. fig. 10.? Gram. cyper. echinata minus, Barrel. ic. 20. n. 2.) "Spikelets egg-ſhaped, ſeſſile, rather remote; the loweſt furniſhed with a long bracteal leaf." Allied to La Marck's caneſcens, but ſufficiently diſtinguiſhed by the long bracteal leaf, as it is from remota, by having only one. *Root* perennial. *Stem* about a foot high, ſlender, triangular, leafy on the lower part. *Leaves* as long as the ſtem, about a line broad, green, ſtriated, roughiſh at the edges. *Spike* one or two inches long, ſlender, a little interrupted in its lower part; ſpikelets from five to ſeven, ſeſſile, alternate, oval, greeniſh. A native of moiſt ground in France. 35. C. *microſtachya*, Wahlen. 42. Ehrart. Schkuhr 31. tab. C. fig. 11. "Lateral ſpikelets female, few, crowded, minute; terminal one male at the baſe, three times the length of the others; glumes ſhortiſh; fruit ovate-acuminate, thin and ſomewhat membranous at the edges; ſtigmas two." A native of moiſt ground in the neighbourhood of Upſal. 36. C. *norvegica*, Wahlen. 43. Schkuhr 40. tab. S. fig. 56. "Spikelets four, male at the baſe, rather near together, oval-elliptical, turgid; fruit ſomewhat circinate, rather large, nearly orbicular, pointed, obtuſely angular, thick; ſtigmas two; bractes cuſpidate." A native of muddy ſhores in Norway. 37. C. *glareoſa*, Wahlen. 44. Schkuhr tab. A a a, fig. 97. "Spikelets three, rather crowded, oblong; terminal one male at the baſe; glumes as long as the fruit; fruit oblong, acuminate, very convex on one ſide, flat on the other, rather acutely angular, ribbed; ſtigmas two; leaves very narrow, inner one much the ſhorteſt; ſtem flaccid." A native of gravelly ſhores on the coaſt of Norway, and of the gulph of Bothnia. 38. C. *tenuifolia*, Wahlen. 48. "Spikelets three, male at the baſe, crowded, rather many-flowered; glumes nearly as long as the fruit; fruit broadly oblong-ovate, rather acute, convex on one ſide, nearly flat on the other; ſomewhat acutely angular, ſpreading; leaves very narrow." A native of Lapland in moiſt paſtures. 39. C. *remotiuſcula*, Wahlen. 50. "Spikelets about ſix, male at the baſe, ſomewhat remote, rather few-flowered; glumes ſhortiſh; fruit ovate-oblong, attenuated, convex on one ſide, flat on the other, acutely angular, ſpreading; orifice bifid; ſtigmas two; lower bractes foliaceous, long, very narrow." A native of Siberia, in the Herbarium of Swartz. 40. C. *remota*, Linn. Sp. Pl. 14.

and axillaris, 12. Mart. 15. Lam. 23. Wahlen. 51. Eng. Bot. 832. Flor. Dan. 370. (C. anguſtifolia capitulis pulchellis, Mich. Gen. 70. n. 2, 3. tab. 33. fig. 15, 16. Gram. Cyp. Rai. Syn. p. 424. n. 11. Pluk. Phyt. tab. 34. f. 3. Moriſ. §. 8. tab. 12. f. 17.) "Spikelets ſolitary, remote, nearly ſeſſile; bractes very long, overtopping the ſtem; ſeed-tunic almoſt entire." Dr. Smith. *Root* perennial. *Stem* a foot high, ſlender, feeble, triangular, rough upwards, ſmooth and roundiſh at the baſe. *Leaves* narrow, pale green, rough at their edge. *Spikelets* alternate, ſolitary, egg-ſhaped, white, about ſix or eight; three or four of the loweſt very diſtant; bractes gramineous; male flowers loweſt; glumes broad-egg-ſhaped, membranous, white, with a green keel. *Fruit* egg-ſhaped, acuminate, longer than the glume, roughiſh at the edge in the upper part, generally entire at the orifice; ſtigmas two. *Seed* lenticular. A native of moiſt groves, and banks of ditches, in ſhady places, flowering in May and June. 41. C. *gibba*, Wahlen. 52. (C. remota, Thunb. Flor. Jaq.) "Spikelets male at the baſe; lower ones ſomewhat ternate, rather diſtant; glumes ſhort; fruit ſomewhat lenticular, beaked, very convex on one ſide, a little ſo on the other, thin and entire at the edges; orifice two-toothed; ſtigmas two; bractes foliaceous, long, rather narrow; ſtem limber." A native of Japan. 42. C. *axillaris*, Mart. 12. Gooden. 8. Smith Flor. Brit. 9. Linn. Tranſ. v. 2. tab. 19. fig. 1. Wahlen. 53. Eng. Bot. 993. "Spike interrupted; lower ſpikelets in remote cluſters; upper ones ſolitary, all ſeſſile; bractes elongated; ſeed-tunic cloven." *Root* perennial, fibrous. *Stem* erect, ſtrong, ſtiff, from one to three feet high, triangular; angles rough. *Leaves* ſhorter than the ſtem, rough at the edge, and near the tip of the keel. *Spikelets* more turgid than thoſe of C. remota; the loweſt bracte about the height of the ſtem; the others ſhorter; lower flowers male; glumes egg-ſhaped, acute, membranous, browniſh, with a green keel. *Fruit* egg-ſhaped, acuminate, a little longer than the glume, rough at the edges near the tip; ſtigmas two. A native of wet ditch banks, flowering in June. The *axillaris* of Linnæus is nothing more than his *remota*, inſerted through inadvertence with nearly all the ſame ſynonyms, and with no material difference in the ſpecific character. Dr. Goodenough obſerves, that Buddle is the firſt who noticed this ſpecies, and diſtinguiſhed it from the more common remota. A ſpecimen is preſerved in his Herbarium, p. 31. n. 6. It has been found ſince by Mr. Curtis near Putney, and by Mr. Woodward near Norfolk. 43. C. *chordoriza*, Linn. Jun. Sup. p. 414. Mart. 67. Wahlen. 22. Schkuhr 17. tab. G. fig. 31. Ehrt. Phytoph. 77. "Spikelets male at the baſe, rather cloſe together; fruit ſemiglobular, woody, elongated at the baſe; ſtigmas two; loweſt leaf very ſhort; the other ſheaths leafleſs; root ſlender, creeping." Wahlen. A native of Sweden. 44. C. *heleonaſtes*, Linn. Jun. Sup. Mart. 68. Ehr. Phytoph. n. 28. Wahlen. 45. Schkuhr. 42. tab. I i. fig. 97. "Spikelets four, male at the baſe, crowded, ſomewhat globular; glumes nearly as long as the fruit; fruit egg-ſhaped, acute, convex on one ſide, a little ſo on the other, rather obtuſely angular, ſpreading; ſtigmas two; ſtem ſtiff." A native of Sweden. 45. C. *ovalis*, Mart. 65. Gooden. 6. Smith Flor. Brit. 7. Eng. Bot. 306. (C. leporina, Hudſ. Relh. Sibth. Lam. 16. Leers. t. 14. f. 6. Ehr. Phyt. n. 38. Gram. cyper. ſpica e pluribus ſpicis, &c. n. 2. Scheuchz. tab. 10. fig. 19. Moriſ. tab. 12. fig. 29.) "Spikelets about ſix, oval, near together, alternate; glumes lanceolate, as long as the fruit." *Root* perennial, creeping. *Stem* a foot high or more, erect, acutely triangular, rough at the angles, leafy at the baſe. *Leaves* deep green, flat, keeled, nearly as long as the ſtem, and ſheathing its lower part, alternate, roughiſh on the edge and keel. *Spikelets* from four to ſix, of a ruſty green colour, elliptical; bractes at the baſe of each ſpikelet lanceolate; the lower one longer than the reſt, and ending in a leafy point; male flowers inferior, few; females numerous; glumes egg-lanceolate, acute, membranous at the edge, with a green keel. *Fruit* lanceolate, acuminate, convex on one ſide, nearly entire at the orifice, rough at the edge; ſtigmas two. *Seed* roundiſh, elliptical. Dr. Smith. Common in wet marſhy paſtures, flowering in June. 46. C. *leporina*, Linn. Sp. Pl. 8. Wahlen. 35. "Spike compound; ſpikelets egg-ſhaped, ſeſſile, near together, alternate, naked." Linnæus, as appears from his references to Moriſon and Scheuchzer, confounded this ſpecies with the preceding. It is, however, as Dr. Goodenough obſerves, perfectly diſtinct. The ſpecimen in Linnæus's herbarium, now in Dr. Smith's poſſeſſion, is a ſmaller plant, with only three nearly globular ſpikelets, blunter and ſhorter glumes, and fruit entirely ſmooth. It is a native of the higheſt Alps. Wahlenberg neverthèleſs ſtill conſiders the leporina of Linnæus, and the ovalis of Goodenough, as one and the ſame plant. 47. C. *divulſa*, Mart. 58. Gooden. 14. Smith Flor. Brit. 15. Schkuhr 12. tab. Ww. fig. 89. Eng. Bot. tab. 629? (C. caneſcens, Hudſ. α. C. muricata; β. Wahlen. 28. C. nemoroſa ſpicâ longâ divulſâ, &c. Mich. Gen. 69. tab. 33. fig. 10. Gram. Cyper. ſpica longa divulſa, Rai Syn. p. 424. n. 11.) "Spike elongated, twice compounded, often branched at the baſe; lower ſpikelets remote; fruit nearly erect, nearly ſmooth at the edge." *Root* perennial, fibrous. *Stem* a foot high or more, weak, ſomewhat reclining, naked, acutely triangular; angles rough, eſpecially near the tip. *Leaves* narrow, longer than the ſtem; edge and keel rough. *Spike* interrupted in its lower part, pale green; lower ſpikelets remote, ſometimes in pairs; the loweſt often compound; bractes ſmall, broad-egg-ſhaped, ſharply keeled, ending in a rough briſtle-ſhaped leaflet, often longer than the ſpikelet; upper flowers male; glumes egg-ſhaped, acute, white; lower ones generally with a green keel. *Fruit* egg-ſhaped, convex on one ſide, without ribs, ſmooth, white, green at the tip, cloven, rough only at the tip; ſtigmas two. *Seed* orbicular, compreſſed. A native of moiſt woods, flowering in May. 48. C. *Schreberi*, Wahlen. 36. Willd. Schkuhr 30. tab. B, fig. 9. "Spikelets five, male at the baſe, ſomewhat cluſtered; glumes as long as the fruit; fruit oval-ovate, rather acute, a little convex, rather acutely angular; orifice emarginate; leaves very narrow; root creeping." A native of ſandy ſoil near Berlin. 49. C. *lagopina*, Wahlen. 37. (C. leporina, Fl. Dan. tab. 294. Approximata, Hoppe Herb.) "Spikelets three, male at the baſe, cluſtered; glumes rather ſmall; fruit ſomewhat circinate, acute, ſomewhat beaked, convex on one ſide, a little concave on the other, obtuſe and quite entire at the edges; orifice two-lipped; ſtigmas two." A native of the Lapland mountains. 50. C. *ſtraminea*, Wahlen. 38. Willd. Schkuhr 38. tab. G. fig. 34. "Spikelets five, male at the baſe, a little diſtant, ſomewhat globular; glumes lanceolate, as long as the fruit; fruit roundiſh-inverſely egg-ſhaped, beaked, membranous at the edges; orifice bifid; ſtigmas two." A native of North America. 51. C. *vulpina*, Linn. Sp. Pl. 10. Mart. 11. Lam. 19. Gooden. 15. Smith 16. Eng. Bot. 307. Leers, tab. 14. fig. 5. Flor. Dan. tab. 308. Wahlen. 29. Schkuhr. 10. tab. C. fig. 10. (C. paluſtris major, Mich. Gen. 69. tab. 33. fig. 13. Gram. Cyper. Rai Syn. 423. n. 8. Moriſ. §. 8. tab. 12. fig. 24. G. paluſtre cyperioides, Ger. Em. 21.) "Spike thrice compounded, compact, obtuſe; fruit diverging; glumes acuminate; ſtems with compreſſed, very acute angles." *Root* perennial, fibrous, forming thick tufts. *Stem* two feet high, erect, ſtiff, ſtrong, ſuddenly contracted in a ſingular manner, when it becomes the rachis of the ſpike, concavely and acutely triangular ; angles very rough. *Leaves* deep green, broad, higher than the ſtem, rough on the edges and keel. *Spike* oblong, ſometimes a little interrupted ; ſpikelets egg-ſhaped, upper flowers male ; bractes egg ſhaped at the baſe, briſtle-ſhaped at the tip, rough, ſpreading widely ; glumes egg-ſhaped, acuminate, membranous, brown, with a green keel. *Fruit* diverging, egg-ſhaped, acuminate, convex on one ſide, ribbed, cloven, and rough at the tip ; ſtigmas two. *Seed* elliptical-orbicular. A native of marſhes and the banks of rivers. 52. C. *glomerata*, Thunb. (C. vulpina, β. Wahlen. “ Spike oblong ; ſtem obtuſely angular ; leaves broadiſh, rather ſhort. A native of the Cape of Good Hope. 53. C. *brizoides*, Linn. Sp. Pl. 9. Mart. 12. Lam 18. Scop. Carn. n. 1170. Wahlen. 39. Schkuhr 32. tab. C. fig. 12. (C. ſpicis teretibus acutis alternis ſe contingentibus, Hall. Helv. 244. Mich. Gen. 70. tab. 33. fig. 17.) “ Spike compound, two-ranked, naked ; ſpikelets oblong, contiguous ; ſtem naked.” It appears from the herbarium of Linnæus that, early in life, he called the curta of Dr. Goodenough brizoides, there being a ſpecimen of it ſo named by himſelf ; but afterwards, as our excellent naturaliſt obſerves, he ſeems to have forgotten his own original determination upon the matter, for the ſpecific character given in the Species Plantarum muſt have been intended for another plant. There is a ſpecimen in the herbarium of ſir Joſeph Banks, named brizoides, which anſwers entirely to this ſpecific character, to the ſynonym of Haller, and to the figure of Micheli, and which Dr. Goodenough is perſuaded is the brizoides of the Species Plantarum. It is the only ſpecimen he has ſeen, and he has drawn the following deſcription from it. *Root* perennial, creeping. *Stem* erect, naked, triangular ; angles acute, rough. *Leaves* pale green, ſlender, longer than the ſtem, rough on the edges and the keel ; the lower ones ſhorter and ſheathing the baſe of the ſtem. *Spikelets* about ſeven, round, or a little oblong, rather in two ranks, near together, moſt frequently contiguous ; lower flowers males ; glumes oblong, acute, pale, with a green keel, ſomewhat tender, with a delicate white edge, about as long as the fruit. *Fruit* oblong, acute, ſmooth, ſomewhat triangular, minutely ſerrated at the edges, cloven at the tip, flat on one ſide ; ſtigmas two. Dr. Goodenough adds, that the true brizoides is very properly deſcribed by Schreber in his Spicilegium Fl. Lipſ. p. 63. n. 675. See Linn. Tranſ. vol. ii. p. 148. According to La Marck it differs from C. ovalis, his leporina, in having its ſpikelets longer, acute, more ſlender, and not compreſſed. His deſcription does not materially differ from Dr. Goodenough's, but he obſerves, that the ſpikelets are often curved, like thoſe of bromus pinnatus. Wahlenberg gives the following ſpecific character, which identifies his plant with thoſe deſcribed by Goodenough and La Marck. “ Spikelets numerous, male at the baſe, contiguous, ſomewhat lanceolate, ſometimes curving outwards ; fruit ovate-lanceolate, very convex on one ſide, a little concave on the other, attenuated, finely ſerrated at the edges ; orifice bifid.” A native of France, Swiſſerland, and Carniola. 54. C. *microſperma*, Wahlen. 30. “ Spike thrice compound, thickiſh ; ſpikelets, male at the top, cluſtered ; glumes pointed ; fruit ſmall, ventricoſe-oval, with a ſhort acuminate beak, acutely angular, ſomewhat diverging ; ſtigmas two leaves rather narrow.” A native of Pennſylvania, preſerved in the herbarium of Thunberg. 55. C. *arenaria*, Linn. Sp. Pl. 6. Mart. 8. Lam. 14. Gooden. 10. Smith 11. Wahlen. 32. Eng. Bot. 928. Schkuhr 8. tab. B. fig. 6. (C. maritima humilis, Mich. Gen. 67. tab. 33. fig. 4. Rai Syn. p. 423. n. 5. Pluk. Phyt. tab. 34. fig. 8. Loeſ. Pruſſ. tab. 31.) “ Spikelets cluſtered, ſpiked, almoſt monoicous ; bractes membranous ; lower ones gramineous ; ſtem triangular ; leaves flat.” *Root* perennial, creeping juſt below the ſurface in all directions, ſcaly, with downy fibres. *Stems* a foot high, numerous, erect, except when they are borne down by the ſand, naked, ſharply triangular, roughiſh in the upper part. *Leaves* ſheathing the baſe of the ſtem, erect, acuminate, rough at the edges. *Spike* egg-ſhaped, compound, compreſſed ; ſpikelets alternate, near together, brown, many-flowered ; bractes lanceolate, keeled, membranous at the edge, the lower ones lengthened out into a leaf ; male flowers in the upper part of each ſpikelet, very numerous in the upper ſpikelets ; females moſt numerous in the lower ; glumes egg-lanceolate, brown, ſcarcely membranous, pointed ; fruit egg ſhaped, acute, ribbed, bordered with a membrane on each ſide on the upper part, rough at the edge, cloven at the tip ; ſtigmas two. *Seed* lenticular or obſcurely triangular. Frequent among the ſand of the ſea-ſhore, flowering in June. 56. C. *repens*, Bellardi. App. Flor. Pedem. (C. arenaria, β. Wahlen.) “ Spikelets rather near together ; bractes ſmall, ſcaly, awnleſs ; ſtem roundiſh. A native of Piedmont. 57. C. *intermedia*, Gooden. 11. Smith 12. Wahlen. 31. Schkuhr 9. tab. B. fig. 7. (C. diſticha, Mart. 55. Hudſ. Relh. Sibthorp. C. arenaria, Leers, tab. 14. fig. 2. C. ſpicata, Pollich. n. 875. Lam. 15. Rai Syn. p. 423. n. 4. Pluk. Phyt. tab. 34. fig. 7, not good. Moriſ. § 8. tab. 12. f. 32. “ Spikelets cluſtered, ſpiked, ſome of the loweſt and the terminal one female ; intermediate ones male ; ſtem triangular, erect.” *Root* perennial, creeping, but ſtriking deep into the ground. *Stems* a foot high and more, erect, ſtiff, naked, acutely triangular, rough at the angles. *Leaves* ſheathing the baſe of the ſtem, ſcarcely as high, erect, flat, roughiſh at the edge and on the keel. *Spike* oblong, obtuſe, ruſty brown, ſoft, a little compreſſed, not at all two-ranked ; ſpikelets near together, numerous, imbricated towards the top, egg-ſhaped, often one or two male flowers at the top of the female ſpikelets, and one or two female ones at the baſe of the males ; bractes egg-lanceolate, membranous, keeled, brown, with a white edge ; lower ones ending in a briſtle-ſhaped leaf ; glumes egg-ſhaped, brown, with a pale nerve, membranous and white at the edge. *Fruit* egg-ſhaped, acute, bordered with a membrane on each ſide, rough at the edge, cloven at the tip ; ſtigmas two, ſometimes three. A native of marſhy ground. 58. C. *uliginoſa*, Linn. Sp. Pl. 7. Mart. 9. Lam. 13. “ Spike compound ; lower ſpikelets remote, furniſhed with a long gramineous bracte ; ſtem round.” Similar in appearance to C. arenaria, but the root is not manifeſtly creeping. *Stem* a finger's length, round, gloſſy, naked. *Spike* more compreſſed than in any other ſpecies, ruſt-colour ſpikelets ſeven or eight ; at the baſe of the ſpike there is a leaf of the ſame length with it, erect, gloſſy, linear. *Leaves* next the root alternate, convex beneath, channelled above, gloſſy on both ſides, linear, acuminate, ſhining, as long as the ſtem, Linn. Turf-moors in Sweden. A ſpecies ſcarcely known, and not retained by Wahlenberg. 59. C. *paradoxa*, Wahlen. 24. Willd. Act. Berol. Schkuhr. 23. tab. E. fig. 21. “ Spikes male, forming a panicle ; lower branches a little diſtant ; fruit roundiſh-oval, ſlightly convex ; angles rather obtuſe ; orifice two-toothed ; ſtigmas two.” A native of wet ground about Berlin and Hall. 60. C. *teretiuſcula*, Gooden. 16. Smith 15. Linn. Tranſ. v. ii. tab. 19. fig. 3. Eng. Bot. 1065. (C. paniculata, β. Wahlen. C. diandra, Schrank.) “ Spike twice or thrice compound, denſe, rather pointed ; ſpikelets cluſtered ; fruit ſpreading, gibbous ; ſtem roundiſh.” *Root* fibrous, ſomewhat creeping, not forming a tuft. *Stem* a foot or a foot and a half high, acutely triangular, but the ſides between the angles are convex, which gives it the roundiſh appearance expreſſed in the trivial name. *Leaves* erect, ſomewhat rigid, about the length of the ſtem, rough at the edges and on the keel. *Spike* oblong-egg-ſhaped; ſpikelets egg-ſhaped; upper flowers female; bractes egg-ſhaped, membranous, the loweſt with a rough, often very ſhort foliaceous point; glumes egg ſhaped, brown, membranous at the edges, white, with a very even keel. *Fruit* brown, egg-ſhaped, acuminate, very convex on the outſide, rather flat on the other, gibbous on both ſides at the baſe, hiſpidly ſerrated on both ſides near the tip, greeniſh cloven at the tip; ſtigmas two. *Seed* orbicular, gibbous on the outſide. A native of boggy ground. Mr. Crowe of Norwich is the firſt Engliſh recent diſcoverer of this plant, but it was known to Ray, as is evident from the addition to his deſcription of the next ſpecies. Synop. p. 197. 1ſt. ed. 422. 3d. 61. C. *paniculata*, Linn. Sp. Pl. 17. Mart. 18. Lam. 24. Weylen. 25. Leers tab. 14. fig. 4. Eng. bot. 1064. Schkuhr 23. tab. C. fig. 20. (C. ſpica multiplici ferruginea; Mich. gen. 68. tab. 33. fig. 7. C. ſpica longiore laxa. Rai Syn. 422. n. 1. Moriſ. § 8. tab. 12. fig. 23. Cyperus alpinus longus inodorus; Scheuchz. Prod. 27. tab. 8. fig. 2.) "Spike thrice compound, panicle-branched, acute, interrupted; fruit ſpreading, beaked; ſtem acutely triangular." *Root* perennial, fibrous, forming large and firm tufts in bogs which would otherwiſe be ſcarcely paſſable. *Stem* two or three feet high, erect; angles very rough; ſides flat, with many ribs. *Leaves* acuminate, erect, rough on the edges and keel. *Spike* thrice compound; branches alternate, ſomewhat ſpreading, a little ſeparate; ſpikelets egg-ſhaped; lower flowers female, few; bractes egg-ſhaped, acute, brown, rough on the keel, membranous and white at the edge, the loweſt ending in a rough briſtle-ſhaped point. *Fruit* green, lanceolate-egg-ſhaped, convex on one ſide, with a ſharp, cloven beak, rough on both ſides near the tip; ſtigmas two. *Seed* egg ſhaped, convex on the outſide. The ſpike varies in being more or leſs branched. A native of wet, ſpongy ground, flowering in June. 62. C. *rivularis*, Wahlen. 26. Willden. Schkuhr 21. tab. C c. fig. 87. "Spikelets male at the top, five, rather near together, oblong; glumes as long as the fruit, mucronate; fruit roundiſh-ventricoſe, ſomewhat beaked, membranous at the edge near the tip; orifice divided, ſtigmas two." A native of Hungary on the banks of rivers. 63. C. *ſpartea*, Wahlen. 55. (C. indica, Schkuhr 27. tab. B b. fig. 86.) "Spikes compound; branches aggregate, male, and linear at the top; glumes oval; bractes ſheathing, fruit triangular, nearly globular, rather obtuſe; orifice emarginate; ſtigmas three; leaves narrow, a little incurved at the edges." A native of the Cape of Good Hope. 64. C. *indica*, Linn. Mant. 574. Mart. 19. Lam. 26. Wahlen. 56. "Spikes cylindrical, panicled, pinnated; a few of the loweſt flowers female." Linn. *Stems* a foot and a half high, erect, obſcurely triangular, ſmooth and even. *Leaves* on the ſtem remote, rough at the edges, often longer than the ſtem. *Panicle* formed of many alternate, ſtiff, triangular, ſpreading racemes; ſpikelets alternate, nearly ſeſſile, in two rows, remote, ſpreading, imbricated on all ſides with awl-ſhaped ſcales, with two or three female flowers at the baſe; bractes ſheathing. *Fruit* egg-ſhaped, acute, triangular. Linn. Stigmas three, Wahlen. A native of the Eaſt Indies. 65. C. *polyſtachya*, Wahlen. 57. Swartz. Flor. Ind. Occid. App. "Spikes compound, pinnate; branches crowded, numerous, attenuated upwards, ſtigmas three; glumes lanceolate; bractes ſheathing; fruit lanceolate, with an awl-ſhaped recurved beak; ſtem ſtiff." A native of the higheſt mountains in Jamaica. 66. C. *cladoſtachya*, Wahlen. 58. (C. flaccida; Swartz. Append.) "Spikes compound; branches rather near together, few, weak, with ſcattered flowers; glumes lanceolate, bractes ſheathing; fruit oblong; with an awl-ſhaped beak curved outwards, ſtigmas three; ſtem flaccid; leaves very narrow." A native of mountains in Jamaica. 67. C. *ſcabrella*, Wahlen. 59. (C. laxa; Swartz Flor. Ind. Occ. App.) "Spikes compound; branches cluſtered, ſomewhat globular-ovate; bractes ſheathing; fruit oval, acute, a little curved outwards; ſtigmas three; ſtem feeble, leaves very narrow." A native of mountains in Jamaica. 68. C. *cruciata*, Wahlen. 60. "Spikes doubly compound; branches and branchlets divaricated; bractes ſheathing; fruit oval, with a ſhort beak rather curved outwards; ſtigmas three." A native of the neighbourhood of Canton in China. 69. C. *ovata*, Rudge in Linn. Tranſ. vol. 7. p. 96. tab. 9. fig. 1. "Spikes egg-ſhaped, pendulous; fruit egg-ſhaped, acute." *Stem* erect, triangular; angles acute, rough. *Leaves* erect, ſlender, rough at the edges. *Spikes* four or five, peduncled; flowers denſely imbricated; glumes egg-ſhaped, acute, brown, as long as the fruit; bractes at the baſe of the peduncles a little embracing the ſtem. *Fruit* egg ſhaped, compreſſed, acuminate, cloven at the tip; ſtigmas three, glandular, rather thick. A native of Newfoundland. 70. C. *magellanica*, Lam. 25. Schkuhr tab. N. fig. 51. (C. atrata β. Wahlen.) "Spikes oblong, on long peduncles; fruit compreſſed, lenticular." In habit and ſize reſembling Juncus campeſtris. *Stem* five or ſix inches high, leafy. *Leaves* as long as the ſtem, two lines broad, ſmooth, flat, ſtraight. *Spikes* three or four, half an inch long, brown or blackiſh, a little compreſſed; peduncles almoſt capillary, the length of the ſpikes; glumes brown, acuminate; bractes ſheathing. *Fruit* ſmooth, compreſſed, lenticular, yellowiſh, ſhorter than the glumes; ſtigmas three; gathered by Commerſon in the ſtraits of Magellan. 71. C. *brunnea*, Mart. 20. Lam. 27. Wahlen. 54. Thunb. Flor. Japon. p. 38. Schkuhr tab. X x. fig. 3. "Spikes peduncled, linear; male flowers at the top." *Stem* a foot high, triangular, ſmooth. *Leaves* linear, acute, ſtriated, keeled, entire, ſmooth, ſtraight, longer than the ſtem. *Spikes* about twelve, half an inch long, pointed, ſtraight, ſmooth, on capillary peduncles; glumes egg-ſhaped, acute; ſtigmas two. A native of Japan. 72. C. *ſubulata*, Wahlen. 69. "Spikes narrow, rather long, ſomewhat denſely flowered, male at the top; peduncles ſheathed; two-cleft; bractes foliaceous, very long, remote; glumes ending in an awn much longer than the fruit; fruit oval, triangular, depreſſed, beaked, bicuſpidate; ſtigmas three; leaves broad." A native of the Iſle of Bourbon. 73. C. *Forſteri*, Wahlen. 81. (C. debilis; Forſt. C. recurva; Schkuhr 100. tab. N. fig. 84.) "Spikes on long naked peduncles, cylindrical, pendulous, male at the baſe; bractes with rather long ſheaths, foliaceous, very long, remote; fruit oblong-ovate, attenuated, with an awl-ſhaped recurved beak; male ſpikes two; ſtigmas three. A native of New Zealand. 74. C. *atrata*, Linn. 26. Mart. 77. 31. Lam. 12. Wahlen. 114. Gooden. 36. Smith 28. Flor. Dan. 158. Schkuhr 41. tab. X. fig. 77. (Cyperoides alpinum ſpicis atris; Scheuchz. Agr. 481. tab. 11. fig. 1, 2.) "Diandrous; ſpikes egg-ſhaped, peduncled, at firſt upright, pendulous in fruit, peduncles ſcarcely ſheathed; male flowers at the bottom of the terminal ſpike; fruit compreſſed." *Root* perennial, fibrous. *Stem* a foot high and more, erect, triangular, ſtriated, leafy at the baſe; angles ſcarcely rough. *Leaves* ſhorter than the ſtem, bright green, broad, flat, rough at the edges. *Spikes* often four, egg-ſhaped, denſe, many flowered; terminal one with male flowers below, female above; the others with female flowers and a mixture of diandrous hermaphrodites; bractes foliaceous, embracing the ſtem but ſcarcely ſheathing, ſpreading; the loweſt often longer than the ſtem; peduncles triangular, ſmooth and even; glumes egg-ſhaped, black. *Fruit* imbricated, a little ſhorter than the glumes, broad-elliptical, compreſſed, yellow, without ribs, ſmooth, ſcarcely beaked, emarginate at the tip. *Seeds* triangular, ſhort, brown, ſtigmas three. A native of mountains in Wales, Scotland, and other parts of Europe. 75. C. *nigra*, Mart. 6. Allion. pedem. n. 2310. "Spikes erect, ſeſſile, ternate, terminal, black; ſtem triangular, leafy." Similar to the preceding, but differs from it in its erect, ſeſſile ſpikes. *Stem* from a finger's length to a foot high, ſtriated, longer than the leaves. *Spikes* three or four, egg-ſhaped, thick, cluſtered, the loweſt on a ſhort peduncle, with a longer bracte; the middle one ſometimes plainly male at the top; glumes egg-ſhaped, acute, black with a whitiſh edge. Allion. 76. C. *bicolor*, Mart. 62. Allion. pedem. n. 2311. See Hall. helv. n. 1369. Scarcely more than a finger's breadth in height. *Leaves* ſcarcely half the length of the ſtem, grooved in the upper part with a prominent nerve, in the lower part ſmooth. *Spikes* egg-ſhaped, the firſt on a very ſhort peduncle with a ſhort bracte, the others ſeſſile without a bracte; glumes egg-ſhaped, obtuſe, black with a whitiſh nerve. *Fruit* a little ſwelling, egg-ſhaped, obtuſe, greeniſh. Hall. helv. 1369. is quoted by La Marck as a ſynonym of atrata; and profeſſor Martyn ſuppoſes that both the laſt two are only varieties of that ſpecies. 77. C. *Buxbaumii*, Wahlen. 129. (C. polygama; Schkuhr 70. tab. X. G g. fig. 76. Buxbaum; Cent. 4. p. 33. tab. 59.) "Spikes pſeudandrogynous, nearly ſeſſile, oblong; bractes partly embracing the ſtem, foliaceous, diſtant; glumes nearly as long as the fruit, cuſpidate; fruit oval-oblong, rather obtuſe, triangular, depreſſed; orifice two-toothed; ſtigmas three. A native of Sweden and Lapland. 78. C. *bina*, Wahlen. 130. Schkuhr 26. tab. G. fig. 33. "Spikes pſeudandrogynous, two, nearly ſeſſile, oval; bractes partly embracing the ſtem, ſcaly, near together; glumes elliptical, obtuſe; fruit inverſely egg-ſhaped, triangular, pointed; orifice two-toothed; ſtigmas three." A native of Bohemia?

*** *Male and female flowers on diſtinct ſpikes; male ſpikes, in moſt ſpecies, one; in ſome, two or more.*

79. C. *digitata*, Linn. 20. Mart. 33. Lam. 38. Gooden. 18. Smith 19. Wahlen. 105. Schkuhr 63. tab. H. fig. 38. Eng. bot. 615. Leers tab. 16. fig. 4. (Gramen caryophyllatum; Loeſ. Pruſſ. 112. tab. 27. Bauh. Prod. 9. n. 23. Scheuchz. 448. tab. 10. fig. 14. Mich. gen. 65. tab. 32. fig. 9.) "Bractes membranous, rarely foliaceous, ſheathing; ſpikes linear looſe, erect; male ſpike ſhorter; leaves flat." *Root* perennial, fibrous, black, long and much branched. *Stems* ſix or eight inches high, aſcending, ſpreading, roundiſh or obſcurely triangular, ſmooth and even; ſheathed at their baſe by cylindrical, dark red, leafleſs ſcales. *Leaves* bright green, keeled; their edges rough near the baſe with teeth pointing backwards, ſmooth and even about the middle, and rough with teeth pointing forwards towards the tip; keel perfectly ſmooth; ſheaths red. *Spikes* about eight-flowered; male ſpike placed below the upper female one, ſo as to appear ſhorter, but often abſolutely longer; female ſpikes two or three; all growing in a finger-like manner; bractes half the length of the peduncles, ſheathing, oblique at the orifice, membranous, ending in a ſhort dagger-point, which ſometimes, but rarely, becomes foliaceous; glumes inverſely egg-ſhaped, retuſe, browniſh red, membranous and ſilvery at their edge, eſpecially the male flowers; keel green. *Fruit* triangularly club-ſhaped, green, pubeſcent, entire at the orifice; ſtigmas three. *Seed* acutely triangular. A native of moiſt woods, flowering in May. It appears to have been found no where in England but in Somerſetſhire and Yorkſhire. 80. C. *pedata*, Linn. 19. Mart. 28. [illegible] (Hall. helv. 1375. Gram. caryophyllum nemoroſum, ſpica multiplici, Bauh. pin. 4. Scheuchz. 450. Anguſtiſſimis foliis, Moriſ. hiſt. 3. p. 243. n. 12. Cyperoides Mich. gen. 65. tab. 32. f. 14.) "Male ſpikes ſeſſile, oblong; lower one axillary; leaves almoſt thread-ſhaped." Nearly allied to the preceding, but ſmaller, with narrower leaves and ſpikes nearer together, imitating a bird's foot. La Marck. *Root* perennial. *Stem* naked, ſlender, about the length of the leaves. *Leaves* four or five inches long, (a foot, Linn.) near a line broad, faſciculated, acute, ſtriated. *Spikes* one male, two female, nearly on a level; one female lower, proceeding, according to La Marck, from an oblong, membranous, reddiſh ſheath; according to Linnæus, from the axil of a leaf as long as the ſtem. *Fruit* ſlightly pubeſcent. A native of mountainous woods in Lapland, Switzerland, Dauphiny, and Piedmont. Wahlenberg conſiders the pedata of Schkuhr 62. tab. H. fig. 37. as only a variety of digitata; and aſſerts that the pedata of Linnæus is not now known to the Swediſh botaniſts. 81. C. *clandeſtina*, Gooden. 19. Smith 20. Wahlen. 103. Schkuhr 67. tab. K. fig. 43. (proſtrata, Mart. 69. Allion. pedem. v. 2. 267. humilis, Leyſer. Hal. 175. Villars Dauph. 2. 205. Schreb. Spic. flor. lipſ. n. 1013. Scarioſa, Lam. 37. Cyperoides montanum, Scheuch. 407. tab. 10. fig. 1.) "Bractes membranous, ſeldom foliaceous, ſheathing; female ſpikes remote, few-flowered, encloſed in the ſheaths; leaves channelled." *Root* perennial, fibrous. *Stems* in tufts, an inch or two long, rather erect, obſcurely triangular, ſmooth. *Leaves* three times as long as the ſtems, erect, deep green, very rough at the edges. *Male ſpike* terminal, ſolitary, erect, lanceolate, many-flowered; bractes ſheathing, membranous, obtuſe; glumes imbricated, lanceolate, brown, membranous and white at the edge; *females* two or three, lower, remote, alternate, peduncled, ſmall, few-flowered, (two, ſometimes one-flowered, Lam.) each concealed with its bracte. *Fruit* inverſely egg-ſhaped, triangular; orifice entire; ſtigmas three. *Seed* triangular. The leaves which overſhadow the ſtems at their firſt appearance are thoſe of the preceding year, which uſually continue green till their predeceſſors take their place. A native of mountains in Switzerland and Dauphiny. In England it has hitherto been found only on expoſed ſunny ſpots about St. Vincent's rocks near Briſtol. The ſingular circumſtance of the bracteal ſheaths encloſing the female ſpikes as well as their peduncles, induced Dr. Goodenough to call the ſpecies clandeſtina, a trivial name which is to be preferred as being diſcriminatively expreſſive, though it has not the claim of priority. 82. C. *alba*, Mart. 72. Wahlen. 104. Schkuhr 81. tab. O. fig. 55. Scop. carn. 1148. Allion. pedem. 2322. (Hall. helv. 1377. Scheuchz. tab. 10. fig. 4. 5. Mich. gen. 61. n. 79, 80. C. argentea, Villars Dauph. 2. 206.) "Spikes peduncled, white, ſheaths long, obtuſe; filaments and ſtyles long, white." *Stem* round, ſlender, with three white leafy ſheaths. The two upper *ſpikes* from one ſheath, the lower ſingle. *Glumes* of the male ſpike almoſt tranſparent: of the female ſpikes keeled, acuminate; anthers terminating in a lucid point; female flowers few. *Fruit* turgid, roundiſh, ſmooth, ſtriated, growing black in autumn. *Seed* triangular, ſhining, acuminate. Linnæus was either unacquainted with this ſpecies, or confounded it with digitata. Scop. 83. C. *Penſylvanica*, Lam. 36. "Spikes variegated with brown and white; male terminal, oblong; female ſeſſile, egg-ſhaped, either with or without a bracte." *Stem* nine or ten inches high, upright, very ſlender, triangular, leafy only at their baſe. *Leaves* ſcarcely half the length of the ſtem, leſs than a line broad, flat, ſtriated. *Male ſpike* terminal, upright, a little acute; glumes

oblong, obtuſe, ſmooth, reddiſh brown, membranous and white at their edges. *Female ſpike* a little below the male, ſeſſile, egg-ſhaped, ſhort, few-flowered, ſometimes without, and ſometimes with a bracte, ſcarcely the length of the ſpike; glumes ſimilar to thoſe of the male. At the baſe of the male ſpike there is ſometimes the rudiment of another female ſpike not diſtinctly ſeparated from it. A native of Pennſylvania and New York. 84. C. *ſupina*, Wahlen. 106. Wilden. (C. glomerata, Schkuhr 65. tab. I. fig. 41.) "Female ſpikes about two, nearly ſeſſile, globular; bractes ſomewhat embracing the ſtem, ſcaly, crowded; fruit nearly globular, beaked; orifice two-lobed; ſtigmas three; male ſpike ſlender; leaves very narrow." 85. C. *varia*, Wahlen. 107. "Female ſpikes few-flowered, nearly ſeſſile; male ſlender; bractes ſomewhat embracing the ſtem, ſcaly, rather near together; glumes acuminate, mucronate, rather long; fruit oval-ventricoſe, rather acutely triangular, a little hiſpid; beak awl-ſhaped, ſhortiſh, bifid; ſtigmas three; leaves very narrow." A native of North America. 86. C. *pilulifera*, Linn. Sp. Pl. 24. Mart. 28. Lam. 29. Gooden. 37. Smith 37. Eng. bot. 885. (C. montana, Linn. Sp. Pl. 21. Hudſ. 407? C. filiformis, Fl. Dan. tab. 1048. C. conglobata, Mart. 70. Allion. pedem. n. 2314. Hall. helv. n. 1372. Scheuch. tab. 10. fig. 8, 9.? Gramen cyperoides, Rai Syn. p. 421. n. 19 and 20. Pluk. Phyt. tab. 91. fig. 8.) "Bracteal ſheaths none; female ſpikes ſeſſile, crowded, roundiſh; glumes mucronate; fruit roundiſh, villous." *Root* perennial, fibrous. *Stem* often recumbent, incurved, about nine inches high, feeble, naked, rough near the top. *Leaves* deep green, rough at the edges and on the keel. *Bractes* briſtle-ſhaped, ſhort, triangular, ſcarcely at all ſheathing. *Male ſpike* lanceolate, acute; glumes of a ruſty brown colour, lanceolate, acute, with a green keel, and a membranous white edge. *Female ſpikes* two or three, ſeſſile, cloſe together, roundiſh, ſpreading; glumes egg-ſhaped, acute, coloured like thoſe of the male. *Fruit* ſhorter than the glumes, roundiſh, obſcurely triangular, green, villous on all ſides. *Seed* nearly globular, yellowiſh. It varies with blunt glumes, leſs conſpicuouſly keeled. Dr. Smith. This is certainly the C. montana of the Linnæan herbarium, and Dr. Smith concludes from the reference to Plukenet, that he deſcribed it from that author as his original pilulifera, without having a ſpecimen before him. Dr. Goodenough thinks it certain that he ſpake of one and the ſame plant under two names; in its more fruitful ſtate with three female ſpikes, calling it *pilulifera*, and in its more ſtarved appearance when produced on elevated dried plains, where it has only two, and ſometimes only one, *montana*. La Marck has a montana which he thinks may poſſibly be the montana of Linnæus, excluding the ſynonyms. It ſeems to differ from pilulifera in having ſhorter leaves, blackiſh ſpikes, and fruit more evidently downy, and quotes as probable ſynonyms, cyperoides anguſtifolium montanum, folliculis feminum villoſis, Scheuch. gram. 423. and Hall. helv. n. 1373. It was ſent him from Switzerland by M. Vahl. Wahlenberg, who with reſpect to Swediſh plants muſt be good authority, determines the pilulifera and montana of Linnæus to be different plants, and gives the following ſpecific characters. C. *pilulifera*, n. 112. Willdenow. Schkuhr 46. tab. I. fig. 39. "Spikes nearly ſeſſile, globular; male ſlender; bractes partly embracing the ſtem, ſomewhat foliaceous, attenuated, near together; glumes mucronate, rather long; fruit ſomewhat globular, acute, pubeſcent; ſtigmas three; ſtem feeble, finely ſerrated. 87. C. *montana*, Linn. Wahlen. 109. Schkuhr 58. tab. F. fig. 29. "Spikes rather few-flowered, nearly ſeſſile; bractes crowded, ſomewhat ſcaly, embracing the ſtem; keel cuſpidate; bractes pitch-coloured, mucronate, as long as the fruit; fruit oval-wedge-ſhaped, rather acutely triangular, a little rough; ſtigmas three; leaves very narrow." 88. C. *mucronata*, Mart. 71. Wahl. 40. Allion. pedem. n. 2318. Hall. helv. 1374. Mich. gen. tab. 32. fig. 3. Schkuhr 46. tab. K. fig. 44. "Spikes ſeſſile, near together, very ſhort; glumes lanceolate, mucronate." *Stem* a foot high, naked at the top. *Leaves* ruſh-like. *Spikes* generally three; male, longer, round; females two, five-flowered; glumes bay, ovate-lanceolate, pale about the edge; nerves yellow, ſhining; bracteal leaf of the lower ſpike with a long ſlender point, much longer than the ſpike. Haller. *Stigmas* two. Wahlen. 89. C. *tomentoſa*, Linn. Mant. 123. Mart. 25. Lam. 32. Smith 38. Leers. 200. tab. 15. fig. 7. Wahlen. 108. Schkuhr 51. tab. F. fig. 29. "Bracteal ſheaths very ſhort; female ſpikes nearly ſeſſile, cylindrical, obtuſe; glumes elliptical, acute; fruit downy." *Root* perennial, creeping. *Stem* a foot high, erect, naked, acutely triangular, angles near the top rough. *Leaves* ſhorter than the ſtem, erect, flat, bright green, rough on both ſides, and at the edges. *Bractes* foliaceous, a little ſpreading, ſcarcely longer than the ſtem. *Male ſpikes* lanceolate, rather obtuſe; glumes lancolate, of a ruſty brown colour, with a green keel, the upper ones ſlightly mucronate. *Female ſpikes* generally two, not very near together, cylindrical, obtuſe, various in length, on ſhort peduncles; glumes elliptic-egg-ſhaped, ſcarcely mucronate, of a ruſty brown colour, with a bright green keel. *Fruit* about the length of the keel, denſely imbricated, roundiſh, a little compreſſed, ſcarcely triangular, green, clothed on all ſides with denſe, ſhort down, which at firſt is white, and finally of a gold colour. *Seed* white, obſcurely triangular. Dr. Smith. *Stigmas* three. Wahlen. Found by Mr. Teeſdale in meadows near Merſton Merſey, Wiltſhire. La Marck's plant, which does not materially differ, was gathered in the neighbourhood of Paris. 90. C. *ſaxatilis*, Linn. Sp. Pl. 25. Wahlen. 140. (Cyperoides alpinum ſaxatile, Mich. gen. 63. tab. 32. fig. 4?) "Spikes three, egg-ſhaped, ſeſſile, alternate; male oblong." *Terminal ſpike* male, of a pale ruſty colour. *Female ſpikes* two, black, the lower one with a briſtle-ſhaped leaf, ſhorter than the ſpike; glumes the length of the piſtils; germs black, triangular; ſtyles black, bifid, long. A native of the mountains of Lapland and Switzerland. La Marck ſuppoſes that it ſcarcely differs from the preceding. Wahlenberg gives it the following character, which proves it diſtinct. "Spikes nearly ſeſſile, rather denſely flowered, very obtuſe; male oval; glumes circinate, white at the edge; bractes partly embracing the ſtem, with largiſh auricles, foliaceous, very narrow, diſtant; glumes nearly as long as the fruit; fruit oblong, oval upwards, flat on both ſides, rather acute, a little curved outwards; orifice equal; ſtigmas two." 91. C. *præcox*, Mart. 84. Lam. 31. Jacq. Auſt. tab. 446. Gooden. 22. Smith 36. Wahlen. 98. Schkuhr. 59. tab. F. fig. 27. (C. ſaxatilis, Hudſ. C. montana, Relh. 353. Lightf. 551. Gram. cyper. vernum minimum, Rai Syn. 421. Ger. em. 22. Moriſ. § 8. tab. 12. fig. 11.) "Bracteal ſheaths nearly as long as the peduncle; ſpikes egg-ſhaped, near together; glumes a little mucronate; fruit roundiſh, pubeſcent." *Root* creeping, and branching out into ſeveral leafy tufts. *Stem* aſcending, from three to ſix inches high, naked, obſcurely triangular, ſmooth. *Leaves* ſhort, rigid, recurved, a little revolute, roughiſh, eſpecially at the edges. *Bractes* erect, often wanting; ſheaths ſhort, dilated upwards. *Male ſpike* inverſely egg-ſhaped, rather obtuſe; glumes elliptical, of a ruſty colour, bluntiſh; anthers ſulphur-coloured. *Female ſpikes* generally two, near together, on ſhort peduncles, egg-ſhaped, nearly erect;

glumes broad, egg-ſhaped, rather pointed, of a ruſty colour, with a green keel. *Fruit* ſcarcely the length of the glume, roundiſh or ſomewhat pear-ſhaped, pubeſcent, green, brown at the tip. *Stigmas* three. *Seed* white. A native of dry expoſed paſtures and heaths, flowering in April. 92. C. *triſtachya*, Mart. 30. Wahlen. 101. Schkuhr tab. W w, fig. 109. Thunb. Jap. 38. "Spikes three, ſeſſile, linear, male longer." *Stem* four inches high, triangular, capillary, ſtriated, ſmooth, erect. *Leaves* only one or two, alternate, linear, ſmooth, reflected, ſhort. *Bractes* ſhorter than the ſpikes. A native of Japan. 93. C. *trigona*, Mart. 74. Allion. pedem. n. 2325. tab. 89. fig. 4. "Male ſpike peduncled; females ſeſſile, remote, triangular." *Stem* a foot high or more, triangular, ſtriated, ſmooth, leafy. *Leaves* dark green, ſtriated, linear, ſhorter than the ſtem. *Male ſpike* oblong; glumes bay, obtuſe. *Female ſpikes* three, axillary; upper one frequently androgynous; leaf of the loweſt very long. A native of Piedmont. 94. C. *folioſa*, Mart. 75. Allion. ped. n. 2328. Hall. helv. 1384. "Female ſpikes ſeſſile; loweſt peduncled; glumes very narrow." *Stem* a foot high, triangular. *Leaves* as long as the ſtem, about two lines broad, ſmooth, with rough edges. *Male ſpike* long, cylindric, ſlender, pale bay and white. *Female ſpikes* two, (ſometimes four) crowded, each with a long leaf. *Fruit* ſlender, with long beaks. Hal. A native of Piedmont and Switzerland. 95. C. *obeſa*, Mart. 77. Allion. ped. 233 . Hall. helv. 1387. "Female ſpikes ſeſſile, ternate; fruit egg-ſhaped, triangular." *Stems* four inches high, naked. *Leaves* ſhort, not above a line in breadth, rough. *Male ſpike* half an inch long, dark bay, obtuſe, broadiſh. *Female ſpikes* two or three, diſtant, ſhorter than the male, of the ſame colour, few-flowered. There is ſometimes an androgynous ſpike under the male. A native of Piedmont and Switzerland. 96. C. *globularis*, Linn. Sp. Pl. 22. Wahlen. 111. "Male ſpike oblong; female ſeſſile, egg-ſhaped, with a bracte ſhorter than the ſpike." Linn. "Spikes nearly ſeſſile, egg-ſhaped; male ſlender; bractes partly embracing the ſtem, ſomewhat foliaceous, diſtant; glumes ſhortiſh; fruit oval-ovate, acute, rough; ſtigmas three; ſtem flaccid; leaves very narrow." Wahlen. A native of Sweden and Lapland; common. 97. C. *alpina*, Wahlen. 113. Swartz. Liljeblad Suec. flor. (C. Vahlii, Schkuhr 72. tab. G g, fig. 94. C. montana, Flor. Dan. 403.) "Spikes three, on ſhort peduncles, ſomewhat globular, pſeudandrogynous; bractes partly embracing the ſtem, ſomewhat foliaceous, near together; glumes very black; fruit rather pubeſcent, pointed." A native of Lapland. Very variable and difficult to be characterized, but perfectly diſtinct. 98. C. *ericetorum*, Lam. 33. Pollich. pal. n. 886. Schkuhr Wahlen. 110. (C. approximata, Allion. ped. 2313. C. ciliata, Willden. Schkuhr 66. tab. 3. fig. 42. Hall. helv n. 1371. Scheuch. gram. 421. tab. 10. fig. 10.) "Male ſpike inverſely egg-ſhaped, obtuſe; female ſpikes ſeſſile, egg-ſhaped; fruit pubeſcent." *Stem* four inches high, triangular, almoſt naked. *Leaves* in tufts, rather rigid, keeled, about the length of the ſtem. *Male ſpike* terminal, ſhort, variegated with brown and white; glumes obtuſe, blackiſh brown, white and ſilvery at the edge. *Female* generally ſolitary, ſometimes two, alternate, near together; bracte of the lower one terminated by a ſhort, nearly awl-ſhaped leaf. A native of Switzerland and Germany, on dry hills. La Marck doubts whether it may not be the globularis of Linnæus; but Wahlenberg's deſcription of that ſpecies given above, proves the conjecture to be erroneous. 99. C. *Borbonica*, Lam. 34. "Female ſpikes erect. ſeſſile; upper ones crowded; male thicker, terminal; leaves ſword-ſhaped. *Stem* a foot high, leafy, enveloped at its baſe with the ſheaths of numerous root leaves. *Leaves* reſembling thoſe of ixia crocata, nearly as long as the ſtem, about three lines broad, ſtriated. *Female ſpikes* three or four, acute; lower one diſtant from the others, in the axil of a narrow leaf; glumes acute, reddiſh, with a green keel. Found by Commerſon in the Iſle of Bourbon. 100. C. *Virginiana*, (C. ſtricta, Lam. 35.) "Female ſpikes two, ſeſſile, erect, with male flowers at the top; male terminal, remote; ſtem naked." *Stem* about a foot high, ſlender, compreſſed above, triangular below, rough. *Leaves* as long as the ſtem, near two lines broad, ſtriated. *Male ſpike* terminal, an inch long; glumes obtuſe; brown with a white edge. *Female ſpikes* diſtant from the male, ſeſſile, upright, linear, preſſed cloſe, reddiſh brown, with ſome male flowers at the top; lower one with a bracteal leaf as long as the ſpike. A native of Virginia, Pennſylvania, &c. deſcribed by La Marck from a dried ſpecimen. 101. C. *nana*, Lam. 40. Scheuch. Gram. 437. tab. 10. fig. 12. "Spikes erect, variegated; male egg-ſhaped; lower female peduncled, axillary." *Stem* an inch and half, or two inches high, with three or four ſhort, upright, acute, ſheathing leaves. *Root leaves* ſtriated, ſlightly keeled, ſmooth, about the length of the ſtem. *Spikes* three or four; male terminal, upright; glumes oval, ſmooth, mucronate, brown, with a green keel, and a membranous, whitiſh edge; females upright, oblong, coloured like the male. A native of mountains in Switzerland. 102. C. *alpeſtris*, Mart. 76. Allion. ped. n. 2329. Hall. helv. n. 1385. (C. gynobaſis, Villars dauph. 2. 206. Wahlen. 99. Schkuhr 59. tab. G. fig. 35. "Loweſt female ſpike radical; fruit triangular, elongated." *Stems* from three to nine inches high, naked. *Leaves* in tufts, two lines broad, keeled, acuminate, ſmooth except at the tip. *Spikes* very ſmall; male four lines long; glumes egg ſhaped, obtuſe, with a yellow keel and white edge; upper female ſpike ſeſſile, an inch below the male, few-flowered; bracte ſheathing long, awned; lower one with about ſix flowers, on a peduncle, three inches long or more. There are ſometimes, but rarely, three female ſpikes. A native of Piedmont and Switzerland. The alpeſtris of La Marck agrees in ſome reſpects with the preceding, but as he ſays nothing of the great diſtance of the lower female ſpike from the others, from which circumſtance Villars took his trivial name, it muſt be a different plant. He received it from the neighbourhood of St. Maurice in the Valais, and as he gives no ſynonyms, certainly ſuppoſed it a nondeſcript. We ſhall call it for the preſent 103. C. *Lamarckii*, "Female ſpikes about three, erect; upper ones ſeſſile; fruit ſmooth, globular, mucronate." *Stem* ſeven or eight inches high, naked, ſlender, cylindrical, compreſſed, ſtriated. *Leaves* in tufts three or four inches long, glaucous, ſtriated, ſmooth. *Spikes* three, or four of a ruſſet colour; male terminal, half an inch long; ſcales rather obtuſe, membranes at the edges; the upper female ſpikes ſhort, nearly ſeſſile, each with a pointed bracte about its own length; loweſt larger, peduncled, in the axil of a very narrow bracteal leaf longer than the ſpike; glumes egg-ſhaped, rather blunt, ſmooth, ruſſet, membranous and white at the edge. *Fruit* ſmooth, almoſt globular, mucronate. 104. C. *tenuifolia*, Lam. 52. Poiret. Voyage en Barbarie. Vol. 2. p. 254. "Female ſpikes erect, few-flowered; lower ones diſtant on long peduncles; upper ones nearly ſeſſile; leaves very narrow." *Root* perennial, creeping, blackiſh, ſurrounded at the top with numerous brown filaments. *Stems* ſeveral, ſix or ſeven inches high, very ſlender, triangular, compreſſed, moderately leafy. *Leaves* very narrow, filiform ſmooth, green, keeled, a little folded in at the edges, longer than the ſtems. *Male ſpike* terminal, about half an inch long, upright, oblong, acute, of a ruſſet colour.

*Female* ſpikes upright, leſs than the male, few-flowered, of a ruſſet-green colour, diſtant from each other, upper one near the male with a ſcaly bracte; the two others peduncled and axillary; the loweſt in a very long, capillary peduncle, which ſprings almoſt from the bottom of the ſtem; glumes egg-ſhaped, ſcarcely acute, greeniſh and ſtriated on the back, red or ruſt-coloured at the edge near the tip. A native of Barbary on moiſt, elevated ground. This plant is nearly allied to the alpeſtris of Allioni, but differs in the breadth of the leaves, and colour of the glumes. 105. C. *hordeiformis*, Wahlen. 72. (C. hordeiſtichos; Villars, 2. n. 43. tab. 6.) "Spikes very thick; peduncles ſheathed; bractes foliaceous, very long; the loweſt nearly radical, the others rather near together; fruit egg-ſhaped, acuminate, ſomewhat beaked, very convex on one ſide, a little concave on the other, ſerrate-ciliated at the edges; orifice bifid; ſtigmas three; male ſpikes two." A native of Dauphiny. 106. C. *firma*, Wahlen. 100. Hoſt. Schkuhr 69. tab. O. Y, fig. 54. "Spikes ſtiff, oblong, rather many-flowered; peduncles naked; bractes ſomewhat foliaceous, rather remote; ſheaths ſhort; fruit oblong, lanceolate, with a ſlender beak, acutely and finely ſerrated at the edges; ſtigmas three, orifice one-lobed." A native of the Auſtrian alps. 107. C. *verna*, Wahlen. 102. Schkuhr 74. tab. L. *fig.* 46. "Spikes oval; peduncles naked; bractes foliaceous, diſtant; ſheaths very ſhort; glumes broad-ovate, obtuſe; fruit oval, pointed; orifice obtuſely one-lobed; ſtigmas three; ſtem acutely angular." A native of Switzerland. 108. C. *ferruginea*, Mart. 78. Wahlen. 84. Allion. ped. n. 2333. Scop. Carn. 1159. Hall. helv. 1390. Scheuch. 10. 6. (C. alpina, Schrank.) "Male ſpike acuminate; female two or three, ſlender, peduncled; glumes ruſt-coloured; fruit bifid." *Stem* half a foot high, pale green. *Male ſpike* an inch long, glumes long, narrow, acuminate, ruſt-coloured, with a green keel. *Female ſpikes* three or four; the firſt with a ſhort bracte, the ſecond with a leaflet as long as itſelf, the third with a longer leaflet; glumes green with a ruſt-coloured edge; ſtigmas three. A native of Switzerland, Piedmont, and, if Scopoli be right in thinking his plant the ſame as Haller's, of Carniola, though it is not alpine there as it is in the Griſons. 109. C. *ſempervirens*, Villars dauph. 2. 214. *Stems* eight or ten inches high, ſlender, hard. *Leaves* in tufts, long, hard but flexible, continuing through the winter till the new ones come up when they are completely bleached. *Spikes* three; male blackiſh, variegated with grey; females looſe, peduncled; glumes blackiſh-brown with a green keel. *Fruit* triangular, blackiſh, ſmooth, except near the top. *Seed* triangular, grey, elongated. A native of Dauphiny. Profeſſor Martyn gives it as a conjectural ſynonym of the preceding, becauſe Villars has referred to Scopoli and Haller with a mark of doubt. 110. C. *frigida*, Mart. 79. Wahlen. 83. Allion. ped. 2344. Hall. helv. n. 1391. Villars dauph. 2. 215. (C. variegata; Lam? C. fuliginoſa; Schkuhr. 76. tab. C. c, fig. 47.) "Female ſpikes three or four, two-rowed; fruit long, pointed." Mart. "Spikes three, nearly erect, brown and white; glumes membranous at the tip; fruit acuminate, roughiſh." Lam. *Stem* half a foot high and more, naked. *Leaves* a line broad or more, ſmooth, except at the edge. *Male ſpike* near an inch long, often fertile at the bottom; glumes ſharply lanceolate, ſhining bay, with a green or yellowiſh keel. *Female ſpikes* axillary, lower ones pendant. Hall. Villars ſays it differs little from his ſempervirens. La Marck refers to Haller and Allioni with a mark of doubt. He gives the following deſcription from a dried ſpecimen gathered on the mountains of Dauphiny. *Root* perennial, ſtrong, with greyiſh or brown fibres. *Stem* from ſeven to ten inches high, ſlender, naked. *Leaves* unequal in length, the largeſt five inches long, and little more than a line broad, ſtriated, ſmooth, hard, firm. *Male ſpike* terminal, upright, five or ſix lines long; glumes obtuſe, very membranous and white at the tip, brown on the back with a whitiſh line. *Female ſpikes* two, peduncled, eſpecially the loweſt, ſhort, brown, variegated, pendant when in fruit. *Fruit* egg-ſhaped, acuminate, compreſſed before they arrive at maturity, a little rough. 111. C. *rigida*, Mart. 82. Gooden. 38. Linn. Tranſ. vol. iii. tab. 22, fig. 10. Smith 39. Wahlen. 141. Schkuhr 47. tab. U, fig. 71. (C. n. 1378. Hall helv. C. fuſca; 73. Mart. C. ſaxatalis; Flor. Dan. tab. 159. Cypercides germanicum; Mich. gen. 61. tab. 32. fig. 4.) "Digynous; bracteal ſheaths none; ſpikes egg-ſhaped; upper ones ſeſſile; leaves ſomewhat recurved, rigid; fruit rather compreſſed." *Root* perennial, thick, creeping. *Stem* from three to ſix or ſeven inches high, often curved, naked, rigid, acutely triangular; angles rough. *Leaves* rigid, recurved, rather glaucous, rough at the edges and on the keel. *Bractes* foliaceous, ſhorter than the ſtem, often recurved, auricled at the baſe. *Male ſpike* ſhort, egg-ſhaped, rather obtuſe, thick, rarely two; glumes obtuſe, with a delicate greeniſh keel. *Female* often three, egg-ſhaped; two upper ones ſeſſile, near the male, lower rather remote, erect, on a ſhort peduncle; glumes elliptical, obtuſe, black, with a white edge and a fine green keel. *Fruit* longer than the glumes, denſely imbricated, elliptical, rather compreſſed, flattiſh on one ſide, ſmooth, brown outwards, ſometimes lengthened at the tip, and recurved; orifice always undivided; ſtigmas two, thickiſh. On the top of Snowden in Wales; Ben Lomond and other mountains in the highlands of Scotland, flowering in June and July. 112. C. *brachyſtachya*. Wahlen. 82. Schrank. Schkuhr 83. tab. P. fig. 58. "Spikes on long naked peduncles, very narrow, ſhort, looſely flowered; bractes ſheathing, ſomewhat foliaceous, rather remote; glumes ſhort, ſomewhat mucronate; fruit lanceolate; orifice two-toothed; ſtigmas three; ſtem briſtle-ſhaped; leaves very narrow, convolute." A native of Switzerland. 113. C. *pulla*, Gooden. Linn. Tranſ. vol. iii. tab. 17. Smith 29. Wahlen. 142. (C. fuſca; Schkuhr. 52. tab. C c. fig. 88. C. globularis var. Vahl.) "Digynous; bracteal ſheaths none; ſpikes egg-ſhaped; lower one peduncled; fruit elliptical-inflated, ſomewhat beaked, emarginate." *Root* perennial, creeping. *Stem* nearly erect, ſix or ſeven inches high, ſtriated, triangular; angles rough towards the top. *Leaves* nearly erect, flat, rough at the edge. Bracte foliaceous, embracing the ſtem ſcarcely ſheathing, rough at the edge. *Male ſpike* terminal, erect, lanceolate, many-flowered; females often two, remote, egg-ſhaped, erect; the lower on a long peduncle, the upper on a ſhort peduncle, with a very ſhort ſheath, often none; peduncle rough; glumes all elliptic-lanceolate, obtuſe, blackiſh brown, with a fine white edge and a faint nerve. *Fruit* ſpreading, longer than the glume, elliptical, ſmooth, not ribbed, pale at the baſe, blackiſh brown at the tip, ſhining. *Seed* triangular; ſtigmas two. A native of mountains in the highlands of Scotland, flowering in July. 114. C. *palleſcens*, Linn. Sp. Pl. 29. Mart. 34. Lam. 46. Wahlen. 121. Schkuhr 92. tab. K. k, fig. 99. Flor. Dan. 1050. Leers. 203. tab. 15. fig. 4. (Gram. cyper. Rai ſyn. 419. n. 8. Pluk. Phyt. tab. 34. fig. 5. Mich. gen. 61. tab. 32. fig. 13.) "Bracteal ſheaths very ſhort; ſpikes cylindrical, peduncled; fruit-bearing ones pendulous; fruit elliptical, inflated, obtuſe." *Root* perennial, fibrous. *Stem* a foot high or more, erect, leafy at the baſe, triangular; angles rather acute near the top, rough. *Leaves* flat, pale, ſomewhat hairy, roughiſh at the edges. *Bractes* foliaceous, erect, conſiderably longer than the ſtem, with very ſhort ſheaths. *Male ſpike* terminal, lanceolate, erect, denſe, pale ruſt-colour; females three, peduncled, firſt erect, afterwards pendulous; peduncles triangular, ſmooth, and even; glumes egg-ſhaped, acuminate, yellowiſh, with a green keel. *Fruit* the length of the glumes, elliptical, inflated, very obtuſe, awnleſs, without ribs, ſmooth, pale green. *Stigmas* three. *Seed* triangularly-inverſely egg-ſhaped. A native of moiſt paſtures and woods in England, and other parts of Europe, flowering in May and June. 115. C. *clavata*, Wahlen. 64. Thunb. in Herbar. "Spikes nearly cylindrical, thick; male club-ſhaped; bractes ſheathing the peduncle, foliaceous, remote; glumes nearly as long as the fruit, mucronate; fruit roundiſh, oval, gibbous, curved outwards, beaked; ſtigmas three; leaves very broad." β. C. cylindracea. "Spikes cylindrical, thickiſh; males ſeveral; bractes foliaceous, broad, and long." γ. C. triticea (C. clavata, Thunb. Prod. p. 14.) "Spikes oval, very thick, male at the top; glumes as long as the fruit, a little cuſpidate." A native of the Cape of Good Hope. 116. C. *flava*, Linn. Sp. Pl. 18. Mart. 21. Lam. 28. Wahlen. 61. Eng. Bot. 1294. Flor. Dan. tab. 1047. Leers, tab. 15. fig. 6. (Gramen paluſtre echinatum, Rai Syn. p. 421. n. 18. Ger. Em. 17. G. cyper. Moriſ. § 8. tab. 12. fig. 19.) Marſh hedgehog graſs. "Bracteal ſheaths ſhort, nearly the length of the peduncles; female ſpikes roundiſh; fruit beaked, curved downwards; ſtem nearly ſmooth." *Root* perennial, creeping. *Stem* often a foot high, erect, leafy below, triangular; angles generally ſmooth and even, ſometimes a little rough. *Leaves* bright green, erect, rather broad, flat, longer than the ſtem, rough on the edges and on the keel, marked with two rough lines on their upper ſide towards the extremity. *Bractes* foliaceous, much longer than the ſtem; upper ones ſpreading, deflexed, with a very ſhort ſheath; the loweſt with a longer ſheath, and leſs ſpreading. *Male ſpike* lanceolate, erect, denſe, very ſeldom more than one; female about three, roundiſh, egg-ſhaped, ſpreading; upper ones generally near together, moſt commonly ſeſſile; loweſt more remote, peduncled; peduncle a little ſhorter than the ſheath; glumes egg-ſhaped, tawny, with a green rib. *Fruit* longer than the glumes, ſpreading every way, egg-ſhaped, inflated, ſmooth, ribbed, cloven at the tip, triangular; angles not at all rough; ſtigmas three. *Seed* ſmall, triangularly-inverſely egg ſhaped, black. Common in boggy meadows, flowering in May and June. 117. C. *oederi*, Oeder, Roth, Hoffmann. Ehrh. Willd. Schkuhr 35. tab. f. (C. flava, β flaveſcens, Wahlen. C. extenſa, Relh. Flor. Cant.) "Bractes rather diſtant; fruit oblong-inverſely egg-ſhaped, a little inflated, with a ſhort awl-ſhaped beak, not recurved; orifice two-toothed; ſtem obtuſely angular; leaves narrow, the lower ones the longeſt, incurved at the edges." Wahlen. Common near Yarmouth. Mr. Dawſon Turner obſerves (ſee Botaniſts Guide, vol. ii. p. 75.), that he can find no ſatisfactory marks of diſtinction between this and the preceding ſpecies, and yet it is ſo conſtant in its appearance, in all ſituations, whether wet or dry, that though Schkuhr is inclined to conſider it only as a variety of flava, he cannot but believe it diſtinct. He adds, that Mr. Brunton pointed out to Dr. Smith the ſame leading diſtinction as was noticed by Dr. Roth, the fruit expanding in all directions, and not at all recurved. Mr. Turner ſuſpects that it has been miſtaken by many Britiſh botaniſts for the much more rare C. extenſa. 118. C. *extenſa*, Mart. 80. Gooden. 25. Linn. Tranſ. vol. ii. tab. 21. fig. 7. Smith 33. Wahlen. 65. Eng. Bot. 833. Sch. tab. X x. fig. 72. (Cyperoides echinatum majus, Dill. in Rai Syn. 421.) "Bracteal ſheaths and peduncles very ſhort; bractes very long; female ſpikes roundiſh; fruit egg-ſhaped; ſtem ſmooth." *Root* perennial, fibrous. *Stem* near a foot high, erect, or aſcending, ſometimes curved, obſcurely triangular, perfectly ſmooth. *Leaves* narrow, recurved, channelled, rough at the edges towards the point. *Bractes* foliaceous, very long, curved; ſheaths dilated, very ſhort. *Male ſpike* generally ſolitary, lanceolate, bluntiſh, ſometimes with a few female flowers in the lower part. *Female* two or three, near together, almoſt ſeſſile, erect, egg-ſhaped, rarely cylindrical, finally roundiſh; glumes all broad egg-ſhaped, three-nerved. *Fruit* longer than the glumes, erect, but a little ſpreading, egg-ſhaped, ribbed, ſmooth at the edges, and every where deſtitute of pubeſcence: ſtigmas three. *Seed* triangular, gibbous. A rare native of the ſea-coaſt, flowering in June. 119. C. *fulva*, Mart. 81. Gooden. 26. Linn. Tranſ. vol. ii. tab. 20. fig. 6. Smith 32. Wahlen. 62. Eng. Bot. 1295. Sch. 86. fig. 67. "Bracteal ſheaths long, but ſhorter than the peduncle; female ſpikes egg-ſhaped; fruit beaked, ſtraight; ſtem rough." *Root* perennial, creeping. *Stem* near a foot high, erect, ſlender, triangular; angles at leaſt near the top acute, and very rough. *Leaves* upright, narrow, ſhorter than the ſtem, rough at the edges and on the keel, but not on the upper ſide. *Bractes* foliaceous, upright, ſhorter than the ſtem; ſheaths long, browniſh at the tip. *Male ſpike* linear, erect, denſe, many-flowered; glumes egg-ſhaped, obtuſe, membranous, and white at the edge, with an obſcure nerve of the ſame colour. *Female* two, rarely three, egg-ſhaped, erect, rather remote, peduncled; peduncles about half as long again as the ſheaths; glumes egg-ſhaped, brown, ſomewhat membranous at the edge, never awned, with a pale obſcure nerve. *Fruit* longer than the glumes, browniſh-green, pointing upwards (not recurved), beaked, ſmooth, except at the edges of the beak, cloven at the top; ſtigmas three. *Seed* yellowiſh-brown, twice as large as that of C. flava. It is diſtinguiſhed from the next ſpecies by its rough ſtem, glumes without awns, and longer-beaked, rough-edged fruit. A native of marſhy ground, flowering in June and July. 120. C. *diſtans*, Linn. Sp. Pl. 33. Mart. 39. Lam. 47. Wahlen. 63. Flor. Dan. 1049. Eng. Bot. 1234. Sch. 87. tab. T. and Yy. fig. 68. (Hall. Helv. n. 1382. Rai Syn. 420. n. 16.) "Sheaths elongated, nearly as long as the peduncles; ſpikes oblong, very remote; glumes pointed; ſtem ſmooth." *Root* perennial, fibrous. *Stem* from 12 to 18 inches high, nearly upright, weak, bluntly triangular, or rather flattened on one ſide only, ſmooth, except ſometimes near the top. *Leaves* ſhort, rather broad, flat, rough at the edges. *Bractes* ſimilar to the leaves, remote; ſheaths moderately long, almoſt entirely concealing the peduncles. *Male ſpike* lanceolate, obtuſe; glumes inverſely egg-ſhaped, obtuſe, ſharply keeled, very ſlightly pointed. *Female ſpikes* two or three, ſeldom four, upright, oblong, egg-ſhaped, peduncled; lower peduncles half as long again as the ſheath, upper ones about its length; glumes broad, of a ruſty hue, tipped with a ſhort point; keel three ribbed. *Fruit* longer than the glumes, egg-ſhaped, brown, ſmooth, with many uniform ribs, and a ſhort cloven beak; ſtigmas three. *Seed* triangular, brown, appearing granulated, under a high magnifier. A native of marſhes, chiefly near the ſea, flowering in June. 121. C. *binervis*, Smith. Linn. Tranſ. vol. v. p. 268. Smith. Flor. Brit. 35. Eng. Bot. 1235. Wahlen. 97. (C. diſtans, Lightf. 561.) "Sheaths elongated, ſhorter than the peduncles; ſpikes cylindrical, remote, often compound; glumes pointed; fruit with two principal ribs." Larger than the preceding, for which it has been miſtaken by many botaniſts. *Stem* a foot and a half, ſometimes three feet high, erect, firm, bluntly triangular, ſmooth, except towards the top. *Leaves* upright, broadiſh, acuminate, rather glaucous, rough at the edges, and on the keel. *Bractes* reſembling the leaves, elongated, upright, remote, with rather long ſheaths. *Male ſpike* attenuated both ways, often an inch and half long; glumes denſely imbricated, elliptical, obtuſe, with a ſhort point, blackiſh; keel ſharp, green. *Female ſpikes* three or four, rarely five, cylindrical, erect; lower ones very remote, on longer peduncles, and often compound or branched at the baſe; all of them ſometimes with male flowers at the top; glumes egg-ſhaped, black, pointed; keel green, ſmooth, except at the point. *Fruit* longer than the glumes, egg-ſhaped, ſcarcely beaked, ſmooth, ſhining, purpliſh within and at the tip, pale without, with two principal green ribs, beſides ſeveral ſmall ones running longitudinally at ſome diſtance from the margin; ſtigmas three. Common in many parts of England and Scotland, but not generally underſtood, flowering in June. 122. C. *ſecalina*, Wahlen. 66. Willd. Schkuhr, tab. S. fig. 65. "Spikes broad lanceolate; peduncles ſheathed; bractes long, foliaceous, lower ones very remote; ſheaths ſhort; fruit oblong, with a long acuminate beak, convex on one ſide, a little concave on the other, preſſed cloſe, ſerrate-ciliated at the edges; orifice bifid; ſtigmas three." A native of Auſtria. 123. C. *heteroſperma*, Wahlen. 67. "Spikes ſomewhat thread-ſhaped, ſtraight; flowers ſcattered; peduncles ſheathed; bractes foliaceous, long, remote; fruit oval-ventricoſe, elongated at the baſe, attenuated at the top, curved outwards; orifice quite entire; ſtigmas three." A native of North America. 124. C. *juncea*, Mart. 91: Scop. Carn. n. 1163. Mich. Gen. 58. n. 19. "Spikes very remote; male longer than the females, which are nearly ſeſſile; fruit cloven, triangular, ſmooth; ſeed triangular." *Stem* a foot high. *Leaves* ſcarcely two lines broad. Upper female ſpike ſometimes with male flowers at the tip; lower with a leaf longer than the ſpike. 125. C. *panicea*, Linn. Sp. Pl. 30. Mart. 35. Lam. 57. Wahlen. 96. Schkuhr 93. tab. L l. fig. 100. Eng. Bot. 1505. "Sheaths elongated, about half the length of the peduncles; female ſpikes rather looſe, diſtant; fruit inflated; ſtem ſmooth." *Root* perennial, creeping. *Stem* from 10 to 15 inches high, erect, obtuſely triangular, ſmooth. *Leaves* glaucous, ſhort, rather erect, rough at the edges and top of the keel. *Bractes* foliaceous, acute, ſhorter than the ſtem; ſheaths long, furrowed, pale, or yellowiſh. *Male ſpikes* one or two, lanceolate, acute, denſe; glumes ruſty brown, obtuſe, various in breadth, with a green keel. *Female ſpikes* generally two, ſometimes with male flowers at the top, remote, erect, on ſlender peduncles twice as long as the ſheaths; glumes looſely imbricated, egg-ſhaped, ruſty brown, acute, awnleſs, membranous at the edge, with a green keel; ſtigmas three. *Fruit* egg-ſhaped, longer than the glumes, inflated, bluntiſh, entire, ſmooth, obſcurely ribbed, of a light greeniſh, or yellowiſh hue. *Seed* ſhort, triangular, brown, frequently infeſted with the diſeaſe called ſmut, which turns it into ſooty duſt. Dr. Smith. A native of moiſt ground, flowering in May and June. 126. C. *recurva*, Mart. 70. Hudſon p. 413. 2. Ed. Flor. Dan. 105. Eng. bot. 1506. (C. glauca; Scop. Carn. v. 2. 223. Pollich v. 2. 594. C. limoſa β; Leers 201. tab. 15. fig. 3. C. flacca; Wahlen. 115. Schreb. Schkuhr 98. tab. O. P. fig. 57. a. b. Gram. cyp. foliis caryophyllis, ſpicis pendulis; Rai Syn. p. 418. n. 5. Moriſ. §. 8. tab. 12. fig. 14.) "Sheaths ſhort; female ſpikes cylindrical, pendulous; fruit elliptical, triangular, roughiſh; root creeping." *Root* perennial, ſheathed with brown ſcales. Whole herb glaucous. *Stem* from eight to eighteen inches high, erect, convexly triangular, rough upwards. *Leaves* ſhorter than the ſtem, erect, broadiſh, flat, rough-edged. *Bractes* foliaceous, erect, nearly as long as the ſtem; ſheaths ſhort, with a ſmall appendage on each ſide. *Male ſpikes* various, moſtly ſolitary, ſometimes two perfectly diſtinct and both peduncled, when ſolitary often compound, with one or two ſpikelets, ſeſſile at its baſe; glumes inverſely egg-ſhaped, blunt, brown with a pale keel. *Female ſpikes* two or three; ſometimes with male flowers at the top, the upper one ſometimes nearly ſeſſile, the next on a longiſh peduncle, the loweſt often on a very long one ſpringing from the very bottom of the ſtem, all at firſt erect, afterwards pendulous, cylindrical, very denſe; glumes egg-ſhaped, ſomewhat pointed, blackiſh, with a white edge and yellowiſh nerve; ſtigmas three. *Fruit* imbricated, elliptical, bluntly triangular, ſwelling, entire, more or leſs downy or rough, of a ruſty green, ſoon becoming black. *Seed* ſhort, triangular. Common on moiſt ground, flowering in May and June. 127. C. *uſtulata*, Wahlen. 92. (C. atrofuſca; Schkuhr 90. tab. Y. fig. 82.) "Spikes oval; peduncles naked, curved backwards; bractes looſely ſheathing, ſcarcely foliaceous, diſtant; fruit oval, acuminate, flattiſh on both ſides, acutely angular, beaked, black; orifice two-toothed; ſtigmas three; male ſpike oblong, recurved. A native of mountains in Sweden, and Iceland. 128. C. *latifolia*, Wahlen. 94. Schkuhr 78. tab. M. fig. 49. "Spikes very narrow, rather looſely flowered; peduncles partly naked; bractes ſcarcely foliaceous, remote; ſheaths very long; fruit elongate-egg-ſhaped, triangular, curved outwards at the tip, quite entire; ſtigmas three, leaves very broad. A native of Virginia, in the herbarium of Thunberg. 129. C. *piloſa*, Wahlen. 95. Schkuhr 78. tab. M. fig. 49. "Spikes linear, looſely flowered; peduncles naked; bractes ſheathing, foliaceous, remote; fruit ſomewhat oval, acute; orifice tranſparent, two-lobed; ſtigmas three; leaves ciliated." A native of Moravia. 130. C. *limoſa*. Linn. Sp. Pl. 27. Mart. 32. Lam. 43.? Smith 27. Gooden. 34. Wahlen. 122. Schkuhr tab. T t. fig. 107. Flora dan tab. 646. (Cyperoides ſpica pendula, breviore, ſquamis e ſpadiceo vel fuſco rutilante viridibus; Scheuchz. Agr. 443. tab. 13. fig. 13.) "Sheaths very ſhort, ſcarcely any; female ſpikes egg-ſhaped, pendulous; fruit elliptical, compreſſed; root creeping." Dr. Smith. *Root* perennial, throwing out ſuckers; fibres cloathed with a thick down. Whole herb rather glaucous. *Stems* aſcending, ſcarcely a foot high, triangular, ſtriated, rough, leafy at the baſe. *Leaves* linear, narrow, flat, ſhorter than the ſtem, rough at the edges, ſheathed at the baſe with brown ſcales. *Bractes* erect, reſembling the leaves but ſmaller; ſheaths brown, ſlightly emarginated, membranous and white at the edge. *Male ſpike* terminal, erect, lanceolate, reddiſh brown; glumes egg-ſhaped, acute." *Female* one or two, peduncled, drooping, finally pendulous, egg-ſhaped, many-flowered, denſe, handſome; glumes broadly elliptical, ſomewhat pointed, green at the back, deep gold-coloured at the edge; peduncles very long, triangular, ſmooth. *Fruit* imbricated, a little longer than the glume, elliptical, compreſſed, ribbed, ſmooth, entire, ſcarcely beaked; ſtigmas three. *Seed* elliptical, triangular, a little compreſſed, brown. A native of turfy bogs in England, and other parts of Europe. 131. C. *laxa*, Wahlen. 93. "Spikes oblong-elliptical, rather denſely flowered, pendulous; peduncles naked; bractes foliaceous, rather narrow, remote; ſheaths rather long; glumes obtuſe, as long as the fruit; fruit oblong-elliptical, rather obtuſe, triangular, depreſſed; angles obtuſe; orifice very entire; ſtigmas three; ſtem flaccid. A native of the turfy borders of lakes in Lapland. Female ſpikes ſimilar to thoſe of the preceding ſpecies. 132. C. *cæſpitoſa*, Linn. Sp. Plan. 34. Mart. 38. Smith 42. Wahlen. 139. Eng. bot. 1507. Schkuhr 48. tab. B b. fig. 85. c. d. (Gram. caryophylleum; Dill. in Rai Syn p. 418. n. 6.) "Digynous; bractes auricled, not ſheathing; ſpikes ſeſſile, cylindrical, obtuſe; fruit permanent." *Root* creeping, but ſhort, forming denſe, entangled tufts. *Stems* from nine to twelve inches high, erect, acutely triangular, roughiſh upwards. *Leaves* erect, almoſt as tall as the ſtem, narrow, acute, of a bright not glaucous green, rough at the edges and keel. *Bractes* like the leaves, but much ſmaller, without any ſheath, accompanied at the baſe by a pair of round black auricles, which are largeſt in the ſmaller bractes. *Male ſpike* almoſt always ſolitary, lanceolate, erect; glumes brown, obtuſe, narrowiſh, with a green nerve. *Female ſpikes* two or three; crowded, ſeſſile, erect, cylindrical, ſhortiſh, obtuſe; glumes elliptical, obtuſe, cloſe, black, with a green nerve. *Fruit* elliptical, broad, compreſſed, ribbed, green, ſmooth, permanent after it is ripe; ſtigmas two. *Seed* compreſſed. Dr. Smith. A native of moiſt ground in Sweden and England. 133. C. *ſtricta*, Mart. 83. Gooden. 40. Linn. Tranſ. V. 2. tab. 21. fig. 9. Smith 43. Wahlen. 138. Schkuhr 49. tab. V. fig. 73. (C. cæſpitoſa; Hudſ. p. 412. Lightf. 561. β. C. acuta, and Leers 204. tab. 16. fig. 1. Hall. helv. n. 1400. on the authority of Davall. C. elata; Mart. 86. Allion. pedem. n. 2344. Gram. cyper. Rai Syn. p. 418. n. 4. Loeſ. Pruſſ. 116. tab. 30.) "Digynous; bractes ſlightly auricled, not ſheathing; ſpikes nearly ſeſſile, cylindrical, elongated, acute; fruit deciduous." *Root* perennial, creeping. Whole herb rather glaucous, double the ſize of the preceding. *Stem* about two feet high, erect, ſharply triangular; rough upwards. *Leaves* erect, ſtraight, ſhorter than the ſtem, rough on the edges and keel; root-leaves embracing the ſtem, with ſheaths ſplit into threads after the manner of open network. *Bractes* ſimilar to the leaves, ſeſſile, erect, ſtraight, accompanied at the baſe by two oblong auricles which ſoon diſappear; ſheath none. *Spikes* on ſhort peduncles, erect, an inch and half or two inches long, linear-lanceolate, rather near together, very denſe, many-flowered; all the glumes elliptic-lanceolate, obtuſe, preſſed cloſe, black, with a green nerve; male ſpikes often two; females generally three, often with male flowers at the top; ſtigmas two. *Fruit* imbricated, egg-ſhaped, acute, compreſſed, ribbed, green, ſmooth, deciduous as ſoon as ripe. *Seed* ſimilar to that of the preceding ſpecies. A native of marſhy places in various parts of Europe. 134. C. *japonica*, Mart. 40. Lam. 51. Thunb. flor. japon. 38. "Spikes monoicous, peduncled, erect; female ones peduncled, egg-ſhaped; male terminal, linear." *Root* fibrous. *Stem* about ſeven inches high, leafy, triangular, erect, weak, ſmooth. *Leaves* alternate, ſheathing, ſmooth, erect; lower ones ſhorter than the ſtem; upper ones over-topping it. *Male ſpike* terminal, linear, longer than the others. *Female ſpikes* two or three, erect, egg-ſhaped, furniſhed with bractes. A native of the iſland of Niphon; flowering in June. La Marck juſtly obſerves, that from this deſcription the ſpikes are improperly ſaid to be monoicous. 135. C. *plantaginea*, Lam. 49. "Male ſpike ſhort, dark purple; female ſpikes remote, erect, ſlender; ſtem ſheathed, leaves ribbed." *Root-leaves* in thick tufts, oblong-lanceolate, flat, about an inch broad, ribbed like thoſe of plantane, purple at their baſe. *Stems* ſlender, ſtraight, jointed, higher than the leaves, and furniſhed in all their length with numerous alternate, naked, pointed, purple ſheaths, of which only the lower terminate in ſhort leaves. *Male ſpike* more than half an inch long, terminal, oblong-egg-ſhaped, ſtraight, nearly black or dark purple; glumes ſmooth, oblong-egg-ſhaped. *Female ſpikes* four or five, ſtraight, very ſlender, diſtant from each other, on ſhort peduncles which are partly concealed by the ſheath; glumes looſely imbricated, ſmooth, membranous, acuminate, purpliſh at the tip. Suppoſed to be a native of South America; cultivated in the open air at Paris, where it flowers early in the ſpring. 136. C. *laxiflora*, Lam. 50. "Female ſpikes filiform, axillary, erect; flowers diſtant; leaves flat." *Stems* in a tuft, from ſeven to nine inches high, leafy. *Leaves* alternate, ſtraight, flat, like thoſe of juncus piloſus, ſmooth, two or three lines broad; root-leaves ſhorter than the others. *Male ſpike* terminal, ſtraight, pale or yellowiſh, ſcarcely an inch long; glumes lanceolate-egg-ſhaped, membranous. *Female ſpikes* three, an inch long, alternate, axillary, ſtraight, filiform, peduncled; glumes alternate, diſtant, mucronate, membranous, whitiſh. A native of New York, Pennſylvania, and Virginia. 137. C. *praſina*, Wahlen. 118. "Spikes on rather ſhort peduncles, linear, elongated at the baſe, looſe; bractes partly embracing the ſtem, foliaceous, rather diſtant; glumes oval-elliptical, mucronate; fruit oblong, depreſſed, pointed; orifice two-toothed; ſtigmas three; ſtem acutely angular." A native of North America. 138. C. *leonura*, Wahlen. 120. "Spikes peduncled, ſlender, and tapering, zig-zag, nodding; bractes partly embracing the ſtem, foliaceous, diſtant, very long; glumes with a long diverging awn, fruit ſomewhat globular, pointed; orifice quite entire; ſtigmas three." A native of Pennſylvania. 139. C. *Chinenſis*, Wahlen. 88. Mart. 93. Lam. 54. Retz. Obſ. Faſc. iii. p. 42. "Spikes erect; male terminal; female four, peduncled; fruit acuminate." *Stem* ſeven or eight inches high, triangular, ſmooth. *Leaves* longer than the ſtem, rough at the edges. *Female* ſpikes reſembling thoſe of the next ſpecies, but are upright, remote, ſolitary, more ſlender, and are each furniſhed with a ſlender bracte ſcarcely the length of the ſpike. A native of China. 140. C. *pſeudo-cyperus*, Linn. Sp. Pl. 32. Mart. 37. Lam. 53. Wahlen. 117. Smith 26. Eng. Bot. tab .242. Schkuhr 25. tab. M m. fig. 102. (Gram. Cyper. p. 419. n. 12. Moriſ. § 8. tab. 12. fig. 5.) "Bractes ſcarcely ſheathing; ſpikes cylindrical, pendulous, many-flowered; fruit ſpreading, furrowed, beaked, cloven." *Root* perennial, fibrous. *Stem* a foot high or more, erect, leafy, ſharply triangular; rough at the angles. *Leaves* pale green, ſheathing, rough above, and at the edges. *Bractes* leſs than the leaves, and ſcarcely ſheathing. *Peduncles* very long, triangular, ſlender, rough, ſometimes two from a bracte. *Spikes* cylindrical, many-flowered, denſe; male erect, red; female about four, on peduncles about their own length, greeniſh, at firſt erect, but ſoon pendulous; glumes egg-ſhaped, with long, very rough awns. *Fruit* ſpreading, lanceolate, triangular, ribbed, ſmooth, beaked, cloven; ſtigmas three. *Seed* elliptical, triangular, white. Not very uncommon in wet ſhady places, flowering in June. 141. C. *crinita*, Lam. 55. "Spikes long, briſtly, rather pendulous; glumes briſtly, ſeveral times longer than the fruit." *Stem* about two feet high, triangular, leafy. *Leaves* ſtriated, long, three or four lines broad; upper ſtem ones longer than the ſtem. *Spikes* about five; male an inch and an half long, terminal, linear, with ſometimes a few female flowers at the baſe; glumes narrow, linear-awl-ſhaped, yellowiſh or reddiſh; females near three inches long, alternate, axillary, peduncled, drooping; glumes very narrow, linear-briſtle-ſhaped, ciliated, ſpreading, much longer than the fruit. *Fruit* roundiſh-egg-ſhaped, ſmooth, angular, ſlightly mucronate. A native of Virginia. 142. C. *Micheli*, Wahlen. 89. Hoſt. Schkuhr 84. tab. P. and V v. fiſ. 59. (C. ampullacea, Wulfen.) "Spikes thickiſh, ſhort; peduncles ſheathed; bractes ſomewhat foliaceous, rather remote; glumes acuminate, as long as the fruit; fruit broad, inverſely egg-ſhaped, with a rather long bicuſpidate beak; ſtigma three." A native of Moravia. 143. C. *xanthophyſa*, Wahlen. 73. "Spikes ſix-flowered, very thick; peduncles ſomewhat ſheathed; bractes foliaceous, very remote; fruit oblong-conical, inflated, beaked, diverging; orifice bifid; ſtigmas three. A native of North America. 144. C. *folliculata*, Linn. 31. Mart. 36. Wahlen. 74. Schkuhr 73. tab. N. fig. 52. Linn. Tranſ. vol. vii. tab. 9. fig. 4. (Gram. Cyp. Pluk. Mant. 96. tab. 419. fig. 1.) "Spikes terminal, peduncled, male and female; fruit awl-ſhaped, the length of the ſpike." *Stem* two feet high, triangular. *Leaves* narrow. *Male ſpike* terminal, oblong, peduncled, accompanied in the ſame axil by a female ſpike, conſiſting of ſeven or eight conic-awl-ſhaped, ſpreading, ſeed-veſſels each as long as the ſpike itſelf, big with the ſeed, Linn. The figure in the Linnæan Tranſactions, taken from a ſpecimen in the poſſeſſion of Mr. Rudge, and correſponding with one in the herbarium of ſir Joſeph Banks, has two female ſpikes, as has alſo Plukenet's figure, quoted by Linnæus. Found by Kalm in Canada. 145. C. *intumeſcens*, Rudge in Linn. Tranſ. vol. vii. p. 97. tab. 9. fig. 3. (C. folliculata, Lam. 48? C. lurida, Wahlen.) "Female ſpikes few-flowered; fruit inflated, egg-ſhaped, with a long pointed beak." *Stem* erect, triangular; angles rather obtuſe, ſmooth, but rough above the lower bracte. *Leaves* longer than the ſtem, broad, dark green, rough at the edges and on the keel. *Male ſpikes* terminal, linear, on a long peduncle. *Female ſpikes* with looſely imbricated flowers on very ſhort peduncles; glumes oblong-egg-ſhaped, acute, half the length of the fruit. *Fruit* oblong-egg-ſhaped, much inflated, erect, ſtriated, with a long acute beak, cloven at the orifice; ſtigmas three. *Seeds* egg-ſhaped, triangular, ſmooth, acuminate, yellow. A native of Carolina. 146. C. *pendula*, Mart. 87. Hudſ. p. 411. Gooden. 20. Smith 21. Curtis Flor. Lond. tab. 63. Schkuhr 85. tab. Q. fig. 60. (C. agaſtachys, Linn. jun. Supp. 414. Ehrt. Phyt. n. 19. Wahlen. 76. C. maxima, Lam. 56. Scop. Carn. ii. n. 1166. Allion. Flor. Ped. n. 2341. Hall. Helv. n. 1396. Gram Cyper. Rai Syn. p. 420. n. 13. Moriſ. § 8. tab. 12. fig. 4. Barel. Icon. tab. 45.) "Sheaths elongated, nearly the length of the peduncle; ſpikes cylindrical, very long, nodding; fruit crowded, egg-ſhaped, acute." *Root* perennial, fibrous. *Stem* from three to ſix feet high, erect, firm, leafy, ſmooth, triangular; angles roughiſh towards the top. *Leaves* broad, deep green, rigid, hard, rough at the edges and on the keel, rather glaucous underneath. *Bractes* foliaceous; lower ones very long, hanging down in a curve, ſheathing; ſheaths nearly the length of the peduncles. *Spikes* from five to ſeven, peduncled, curvilineally pendulous, cylindrical, many-flowered, very denſe; the higheſt male, ſometimes with female flowers at the top; the reſt commonly female; glumes lanceolate, acuminate, brown, with a green keel. *Fruit* egg-ſhaped, triangular, rather inflated, ſmooth, beaked, at length emarginate; ſtigmas three. *Seed* triangular, brown. A native of woods and moiſt hedges in many parts of Europe, flowering in May and June. 147. C. *ſtrigoſa*, Mart. 88. Hudſ. p. 411. Gooden. 21. Smith 22. Eng. Bot. 994. Schkuhr 30. tab. N. fig. 53. (C. leptoſtachys, Mart. 92. Linn. Sup. 414. Ehrt. Phyt. n. 48. Wahlen. 68. Gram. Cyper. Rai Syn. p. 419. n. 11.) "Sheaths elongated, nearly equal to the peduncle; ſpikes filiform, looſe, a little drooping; fruit lanceolate, triangular, ribbed." *Root* perennial, fibrous. *Stem* two feet high, erect, ſlender, leafy, triangular, ſmooth. *Leaves* light green, broadiſh, thin, rough on the edges and keel. *Bractes* like the leaves, ſhorter than the ſtem; ſheath nearly as long as the peduncle, crowned by a tubular membrane. *Spikes* ſix or eight, peduncled; the higheſt male, the reſt female; glumes lanceolate, greeniſh. *Fruit* lanceolate, triangular, acute, ribbed, ſmooth, green; ſtigmas three. *Seed* elliptical, triangular. A native of woods and hedges in ſeveral parts of England, but not common, flowering in April and May. 148. C. *ſylvatica*, Mart. 89. Hudſ. p. 411. Gooden. 31. Smith 23. Flor. Dan. 404. Eng. Bot. 995. Schkuhr 94. tab. L l. fig. 101. (C. veſicaria, β. Sp. Pl. C. drymeia, Linn. jun. Sup. p. 414. Ehrt. Phyt. n. 58. Wahlen. 79. C. patula, Lam. 45. Pollich. v. ii. 597. C. capillaris, Leers 202. tab. 15. fig. 2. Hall. Helv. n. 1395. Gram. Cyper. Rai Syn. p. 419. n. 10. Moriſ. § 8. tab. 12. fig. 9.) "Sheaths half the length of the peduncle; ſpikes ſlender, a little looſe, drooping; fruit egg-ſhaped, triangular, beaked." *Root* perennial, fibrous. *Stem* two or three feet high, erect, leafy, ſmooth, convexly triangular. *Leaves* bright green, rough above, very rough on the edges and keel. *Bractes* like the leaves, with longer ſheaths. *Spikes* ſix or eight, ſoon drooping, ſlender, rather looſe; one, rarely two, male; all with ſlender peduncles more than half the length of the ſheath; glumes egg-ſhaped, acuminate, membranous, white, with a rough green keel. *Fruit* egg-ſhaped, triangular, with a long beak, ſmooth, emarginate at the tip; ſtigmas three. *Seed* triangular, brown. It is diſtinguiſhed from the preceding by the ſtructure of its fruit, which has three prominent angles, but no intermediate ribs, and ends in a long cloven beak. Linnæus made it only a variety, and has celebrated its utility to the Laplanders, who uſe it carded and dreſſed as a wadding to protect them from cold. Common in woods and thickets, flowering in May or June. 149. C. *depauperata*, Mart. 85. Gooden. 30. Wahlen. 86. Smith 24. Eng. Bot. 1098. (C. ventricoſa, Curt. Flor. Lond. tab. 68. C. triflora, Willd. Phytog. tab. 1. fig. 2. Cyperoides, Moriſ. tab. 32. fig. 5. C. veſicarium humile, locuſtis rarioribus, Tourn. Inſt. 130. confirmed by his herbarium.) "Sheaths much ſhorter than the peduncles; female ſpikes diſtant, erect, few-flowered; fruit inflated, beaked." *Root* perennial, fibrous. *Stem* a foot and half high, erect, leafy, obſcurely triangular, ſtriated, ſmooth. *Leaves* with long ſheaths, pale green, rough on the edges and keel. *Bractes* like the leaves, but with ſhorter ſheaths which cloſely unfold the ſlender peduncles of the female ſpikes, ſometimes for a third part of their length, and ſometimes for more than half. *Male ſpike* terminal, erect, many-flowered, linear, cloſely imbricated; glumes elliptical, ruſt-coloured, with a white membranous edge and a green keel. *Female ſpikes* from three to five, remote, looſe, erect; peduncles triangular, rough; flowers from two to four or five, erect; glumes inverſely egg-ſhaped, pointed, with a green keel. *Fruit* egg-ſhaped, triangular, ribbed, ſmooth, rather long-beaked, with a membranous nearly entire orifice, finally becoming inflated; ſtigmas three. *Seed* inverſely egg-ſhaped, triangular. A native of woods but rare, flowering in May and June. 150. C. *griſea*, Wahlen. 129. "Spikes on naked peduncles, with ſix looſely-ſet flowers; bractes ſheathing, long, foliaceous, very remote; glumes cuſpidate; fruit oblong-oval, triangular, rather acute; orifice quite entire; ſtigmas three. Native country unknown; preſerved in the herbarium of Swartz. 151. C. *valeſiaca*, Wahlen. 87. Suter Flor. helv. 2. n. 57. Schkuhr tab. B b b. fig. 117. "Spikes two-flowered at the baſe, male at the top; peduncles long, naked, flaccid; bractes ſheathing, long, foliaceous, remote; the loweſt radical; fruit broad, inverſely egg-ſhaped, roundiſh, ending in a point; ſtigmas three; male ſpike flaccid; leaves narrow." A native of Switzerland. 152. C. *capillaris*, Linn. Sp. Pl. 28. Mart. 33. Lam. 44. Smith 25. Wahlen. 91. Schkuhr 82. tab. O. fig. 56. Flor. Dan. 168. Scop. Carn. tab. 59. (Cyperoides alpinum; Seguier. Veron. vol. 3. tab. 3. fig. 1.) "Sheaths half the length of the peduncles; female ſpikes egg-ſhaped, rather looſe, drooping; fruit acuminate." *Root* perennial, fibrous. *Stem* erect, from three to five inches high, roundiſh, ſlender, ſtriated, ſmooth. *Root-leaves* ſometimes not half the length of the ſtem, narrow, acute, flattiſh, rough on the edges towards the tip. *Male ſpike* erect, linear, of a ſilvery-brown colour, with about ten flowers. *Female ſpikes* two or three, nodding or pendulous, egg-ſhaped, ſhort, with fewer flowers; all the glumes egg-ſhaped, brown, membranous and white at the tip. In an early ſtage of the infloreſcence, all the ſpikes ſeem to proceed almoſt in an umbellate form from the ſheath of a common bracteal leaf which involves half the length of the peduncles; but as the fructification advances, the ſtem elongates and each appears with its proper, but ſhorter, bracteal leaf and ſheath. In this ſtate it is figured in Flora Danica. *Fruit* egg-ſhaped, triangular, acuminate, a little inflated; ſtigmas three. *Seed* elliptical, acutely triangular. A native of mountains in Scotland and other parts of Europe, flowering in July and Auguſt. 153. C. *caſtanea*, Wahlen. 90. "Spikes thickiſh, ſhort, rather denſely flowered; peduncles long, naked, curved backwards; bractes looſely ſheathing, foliaceous, diſtant; glumes ſhort; fruit oblong, attenuated, ſomewhat diverging; orifice one-lobed; ſtigmas three; leaves hairy." A native of North America, preſerved in the herbarium of Turner. 154. C. *flexilis*, Rudge. Linn. Tran. vol. 7. p. 98. Tab. 10. fig. 1. "Female ſpikes oblong-egg-ſhaped, pendulous; fruit egg-ſhaped, beaks acuminate." *Stem* feeble, triangular, ſmooth. *Leaves* ſhorter than the ſtem, erect, thin, hairy at the edges and on the keel. *Male ſpike* near an inch long, terminal, erect, ſlender. *Female ſpikes* three or four, on long peduncles, oblong-egg-ſhaped, finally pendulous, two near the ſummit of the ſtem; the others remote with longer bracteal leaves; glumes ſhorter than the fruit, egg-ſhaped, acute, hairy at the edge. *Fruit* oblong-egg-ſhaped, beaked, cloven; ſtigmas three, glandular. *Seeds* egg-ſhaped, triangular, ſmooth. A native of Newfoundland. 155. C. *tenuis*, Rudge in Linn. Tranſ. vol. 7. p. 97. tab. 9. fig. 2.) "Female ſpikes filiform, looſe, pendulous; fruit oblong, with a long-pointed beak." *Stem* ſlender, feeble, triangular, angles not rough. *Leaves* longer than the ſtem, pale green, hiſpid at the edges. *Male ſpike* terminal, erect, linear. *Female ſpikes* zig-zag, about four, three near the top of the ſtem, the other remote; peduncles capillary; glumes oblong, ſmooth, acute, half the length of the fruit. *Fruit* oblong, with a long, ſlender, cloven beak; ſtigmas three. 156. C. *acuta*, Linn. Sp. Pl. 35. Mart. 41. Gooden. 43. Smith 44. Wahlen. 136. Schkuhr 50. tab. F f. fig. 92. b. (C. gracilis, Curt. Flor. Lond. tab. 62. Mart. 96. C. verna α; Lam? Gram. cyperoides majus anguſtifolium; Rai Syn. p. 417. n. 2.) "Digynous; ſpikes filiform; drooping in flower, erect in fruit; fruit elliptical, obtuſe, entire at the orifice." *Root* perennial, creeping far. *Stem* varying in length with the moiſture of the ſituation, ſometimes two feet high and more, drooping at the ſummit when in flower, afterwards becoming erect, acutely triangular; angles rough. *Leaves* bright green, erect, curved near the tip, rough on the edges and keel. *Spikes* nearly ſeſſile, filiform, ſlender, elongated, denſe, many-flowered; glumes oblong, acute, awnleſs, black with a white nerve; male ſpikes two or three; female three or four, often with female flowers at the top, the lower ones at length becoming peduncled; ſtigmas two, white. *Fruit* imbricated, elliptical, obtuſe, compreſſed, ribbed, green, ſmooth, deciduous. *Seed* ſmall, inverſely egg-ſhaped, double-keeled, not triangular. Common on the banks of ditches and rivers, flowering in May. 157. C. *paludoſa*, Gooden. 42. Smith 45. Eng. bot. 807. Wahlen. 127. Schkuhr 101. tab. O o. fig. 103. (C. acuta, Curt. Lon. tab. 61. Hudſ. γ. Lightf. β. verna γ. Lam? Gram. cyperoides minus anguſtifolium, Dill. in Rai Syn. p. 418.) "Spikes cylindrical, rather obtuſe, erect; the female with awn-pointed glumes; the male with blunt ones; fruit elliptical, emarginate." *Root* perennial, creeping far. Whole herb glaucous. *Stem* a foot and half or two feet high, erect, acutely and irregularly triangular; angles very rough. *Leaves* rather broad, erect, rough on the margin and keel. *Bractes* foliaceous, not ſheathing, rarely auricled, ſometimes longer than the leaves. *Spikes* cylindrical, bluntiſh, erect; male about three; glumes oblong, blunt, brown, ſhining, with a green keel; female about three, on ſhort peduncles, often with male flowers at the top; glumes lanceolate, acute, often with a rough awn, brown, with a green keel; ſtigmas three. *Fruit* imbricated, elliptic-lanceolate, rather acute, ribbed, finally emarginate. *Seed* triangular. Common on the banks of rivers and ditches, flowering in May. 158. C. *riparia*, Curt. Flor. Lond. tab. 60. Gooden. 41. Smith 46. Wahlen. 126. Eng. bot. tab. 579. Schkuhr 102. tab. Q q. fig. 105. (C. acuta, Hudſ. Lightf. C. rufa, Lam. 58. Cyperoides aquaticum maximum; Mich. gen. 57. n. 10. 11. tab. 32. fig. 67. Gram. cyper. cum paniculis nigris; Rai Syn. 417. n. 1. Moriſ. tab. 12. fig. 1.) "Spikes erect; males triangular; females cylindrical; glumes of both acuminate; fruit beaked, forked at the tip." *Root* perennial, widely creeping, thick. *Stem* three feet high, erect, firm, acutely triangular; angles very rough, cutting like a fine ſaw. *Leaves* broad, erect, deep green above, a little glaucous underneath, rough on the edges and keel. *Bractes* foliaceous, longer than the ſtem, a little ſheathing; ſheaths often with rounded, pale auricles. *Male ſpikes* from three to five, erect, triangular, acute, dark brown; glumes lanceolate, acuminate or awned, brown; with a keel of the ſame colour. *Female ſpikes* three or four, erect, more or leſs peduncled, cylindrical, often with male flowers at the top; glumes egg-ſhaped, leſſening ſuddenly into a rough awn, brown with a paliſh keel; ſtigmas three. *Fruit* imbricated, rather ſpreading, egg-ſhaped, inflated, with many ribs and a ſhort cloven beak. *Seed* triangular, ſmall, white. Common on the banks of rivers, flowering in April and May. The laſt three ſpecies which appear to have been confounded by Linnæus and moſt other botaniſts, were firſt clearly diſtinguiſhed, and their ſpecific differences ſettled by Mr. Curtis. 159. C. *geminata*, Wahlen. 116. Schkuhr 53. tab. W. p. fig. 75. "Spikes in pairs, on long peduncles, cylindrical, pendulous; males ſeveral; bractes embracing the ſtem, foliaceous, long, diſtant; fruit ovate-globular, pointed; ſtigmas three." A native of New Zealand? Forſter. 160. C. *Micheliana*, Smith. Linn. Tranſ. vol. 5. p. 270. Flor. brit. 47. (Cyperoides, Mich. gen. 62. tab. 32. fig. 12.) "Spikes erect, cylindrical; female ones peduncled; all the glumes obtuſe, awnleſs; fruit inverſely egg-ſhaped, very obtuſe." *Stem* erect, a foot or a foot and half high, triangular, ſtriated, ſcarcely rough. *Leaves* erect, acuminate, rough at the edges, with a ſmoothiſh keel. *Bractes* foliaceous, erect, longer than the ſtem, ſcarcely ſheathing, auricled at the baſe; auricles large, rounded, connate, brown, pale at the tip. *Spikes* cylindrical, rather obtuſe, erect; *males* three or four, nearly ſeſſile, ſlender; glumes very obtuſe, awnleſs, glaucous-green, with a thin, membranous, white edge; *females* two, on long peduncles, rather thick, the upper one with male flowers at the top, the lower one ſometimes compound at the baſe; glumes elliptical, very obtuſe, awnleſs, brown, with a white membranous edge, and a yellowiſh blunt keel; ſtigmas three. *Fruit* much ſhorter than the glumes, inverſely egg-ſhaped, triangular, dilated, almoſt ribleſs, ſmooth, greeniſh, very blunt at the top, undivided. *Seed* triangular, ſhort, brown, with pale angles, reſembling that of C. recurva, to which it is nearly allied, but differs in its numerous male ſpikes, and in its fruit, which is very ſmooth, ſhorter than the glumes, compreſſed, and not at all gibbous. Found by profeſſor James Beattie jun. near Aberdeen: before that time it had been obſerved only by Micheli, whoſe figure had long been a ſtumbling block to botaniſts. It has been found ſince in Yorkſhire near Beverley and Ripon. 161. C. *lævigata*, Smith. Linn. Tranſ. vol. v. p. 272. Flor. brit. 48. Eng. bot. 1387. Wahlen. 80. (C. patula, Link. Schkuhr 97. tab. B b b, fig. 116. C. æthiopica, Schkuhr 91. tab. Z. fig. 83.) "Spikes cylindrical; female one peduncled; ſheaths very long; glumes pointed; fruit triangular, with a cloven beak." *Root* perennial, fibrous. *Stem* erect, from two to four feet high, triangular, perfectly ſmooth, leafy below. *Leaves* erect, broadiſh, bright green, ſmooth, with long ſheaths. *Bractes* foliaceous, erect, higher than the ſtem, acuminate, the upper ones rough at the edges, lower ones only at the tip; ſheaths of the lower ones very long, but ſhorter than the peduncles; of the upper ones ſometimes very ſhort. *Spikes* cylindrical, elongated, acute, ſlender, erect; males often two, glumes lanceolate, acute, often pointed; females two or three, on long, capillary, very ſmooth peduncles; glumes lanceolate, pointed, ruſt-coloured, green on the back, rough at the point; ſtigmas three. *Fruit* longer than the glumes, lanceolate, triangular, a little ſpreading, ribbed, not inflated, green, ſmooth; leſſening into a compreſſed, deeply cloven beak. *Seed* filling the tunic, triangular, ſhort, brown, pedicelled. Firſt found in Great Britain by Mr. Mackay, near Glaſgow. It has ſince been gathered in various parts of England and Wales. Schkuhr had it from the Iſle of Bourbon, and therefore named it, but as Dr. Smith obſerves, not happily, æthiopica. 162. C. *trifida*, Wahlen. 123. Cavanilles Icon. vol. v. tab. 465. "Spikes nearly ſeſſile, ſomewhat lanceolate, very thick; males ſeveral; bractes partly embracing the ſtem, foliaceous, broad and long, rather diſtant; glumes rather long, truncate, retuſe, with a long ciliated awn; fruit oblong-egg-ſhaped, two-toothed; ſtigmas three." A native of Falkland Iſlands. 163. C. *veſicaria*, Mart. 42. Lam. β. Linn. Sp. Pl. 36. Smith 49. Wahlen. 124. Flor. Dan. 647. Eng. bot. 779. Schkuhr 103. tab. S ſ. fig. 106. (C. inflata, Hudſ. Lightf. Gram. cyper. Dill. in Rai Syn. n. 14. Moriſ. tab. 12. fig. 6. "Female ſpikes cylindrical, ſhortiſh, nearly ſeſſile; ſheaths none; fruit inflated, beaked, cloven." *Root* perennial, creeping. *Stem* erect, two feet high, triangular, with very ſharp and rough angles. *Leaves* erect, bright green, narrow, acuminate, rough at the edges. *Bractes* foliaceous, higher than the ſtem, ſeſſile, without ſheaths. *Male ſpikes* from one to three, filiform, ſlender, acute; glumes linear-lanceolate, rather acute. *Female ſpikes* three or four, nearly ſeſſile, rather ſpreading, cylindrical, about an inch long, obtuſe; glumes lanceolate, or linear-lanceolate, acute, brown, with a green keel; ſtigmas three. *Fruit* thickly ranged in ſeveral rows, ſpreading, longer than the glumes, egg-ſhaped, acuminate, ribbed, inflated, very ſmooth, yellowiſh, and ſhining when ripe, cloven at the tip. *Seed* ſmall, triangular, ſhort, ſeſſile, crowned with the long permanent ſtyle, deprived of its ſtigmas. A native of marſhy ground, chiefly in mountainous countries, flowering in May. β. C. plumbea, Wahlen. "Spikes thick; bractes foliaceous, very long, a little remote; ſcales ovate-oblong, ending in a point longer than the fruit; fruit oval-ovate, acuminate; orifice forked." A native of Caucaſus, in the herbarium of Swartz. 164. C. *ampullacea*, Mart. 97. Gooden. 45. Smith 50. Wahlen. 125. Schkuhr 104. tab. T t. fig. 107. (C. veſicaria, Lam. 59. α. Hudſ. Lightf. C. roſtrata, Dr. Stokes in Withering Ed. 2. Sibthorp. Abbot. Gram. cyp. Rai Syn. p. 419. n. 9. Moriſ. tab. 12. fig. 8.) "Female ſpikes cylindrical, elongated, nearly ſeſſile; ſheaths none; fruit inflated, with a linear, cloven beak." *Root* perennial, creeping. *Stem* erect, ſometimes two feet high, triangular; angles ſmooth below, rough above the loweſt ſpike. *Leaves* erect, narrow, glaucous, acute, rough at the edges and on the keel near the tip. *Bractes* foliaceous, erect, narrow, the loweſt often overtopping the ſtem; ſheaths none. *Male ſpikes* two or three, rather remote, filiform, acute; glumes elliptic-lanceolate, blunt, brown, membranous at the edge, with a yellow keel. *Female ſpikes* two, rarely three, more than twice as long as thoſe of veſicaria, and much more ſlender, blunt, lower ones on ſhort peduncles; glumes more acute than thoſe of the male; ſtigmas three. *Fruit* imbricated, ſpreading, longer than the glumes, almoſt globular, inflated, ribbed, ſmooth, yellowiſh, with a linear cloven beak. *Seed* ſmall, elliptical, triangular, ſeſſile, tipped with the long ſtyle. Common in Scotland and the northern counties, more rare in the ſouth, flowering in May. 165. C. *rotundata*, Wahlen. 78. (C. globularis, Vahl. Schkuhr 71. tab. G g. fig. 93.) "Spikes on ſhort peduncles, oval; bractes ſomewhat foliaceous, diſtant; ſheaths very ſhort; glumes nearly as long as the fruit, obtuſe; fruit ſomewhat globular, ſhining, acuminate, ſomewhat two-lipped; ſtigmas three; ſtem round; leaves convolute." A native of ſub-Alpine mountains in Lapland. 166. C. *pumila*, Mart. 44. Lam. 43. (Wahlen. 71. Thunb. Flor. Jap. 39. Schkuhr tab. Y y. fig. 112.) "Male ſpikes two, terminal, ſeſſile; female two, peduncled, oblong, erect." *Stem* very ſhort, ſcarcely any. *Leaves* linear, attenuated, convolute, ſmooth. *Male ſpikes* linear; the lower one half the length of the other. *Female ſpikes* ſmooth. *Fruit* ſmooth, inflated, egg-ſhaped, beaked; ſtigmas three. Scarcely to be diſtinguiſhed from C. veſicaria, except by its almoſt total want of a ſtem, the ſpikes appearing to riſe directly from the ſurface of the ground. A native of Japan. 167. C. *hirta*, Linn. Sp. Pl. 37. Mart. 43. Lam. 61. Wahlen. 70. Smith 51. Eng. bot. 685. Schkuhr 105. tab. U u. fig. 108. (Gram. cyper. Rai Syn. p. 418. n. 7. Moriſ. tab. 12. fig. 10.) "Hairy; ſpikes ſhort, cylindrical, remote, ſheaths nearly as long as the peduncle; glumes awned; fruit hairy." *Root* perennial, creeping far, with downy fibres. *Stem* about two feet high, acutely triangular; angles rough. *Leaves* ſcarcely ſo tall as the ſtem, erect, flat, acuminate, moſt hairy underneath, rough at the edges; ſheaths long, generally very hairy upwards, but in watery places they ſometimes become ſmooth. *Bractes* like the leaves, as long as the ſtem; ſheaths hairy, incloſing nearly the whole peduncle. *Male ſpikes* two, rather remote, unequal in ſize, lanceolate; glumes egg-ſhaped, pointed, brown, hairy on the outſide, with a yellow keel. *Female ſpikes* three, remote, peduncled, erect, cylindrical, ſhort, rather looſe; glumes ſmooth, egg-ſhaped, with long awns, a broad membranous white edge and green keel. *Fruit* looſely imbricated, egg-ſhaped, acute, ribbed, hairy on both ſides, ſomewhat beaked, deeply cloven; ſtigmas three. *Seed* inverſely egg-ſhaped, triangular, tipped with the permanent ſtyle. Common in marſhy ground; flowering in May and June. 168. C. *faſciculata*, Wahlen. 128. Link Flor. Luſ. Schkuhr 99. tab. Z z. fig. 114. "Spikes nearly ſeſſile, linear; males ſeveral; bractes partly embracing the ſtem, foliaceous, long; glumes elliptical, long; fruit oval, beaked, ciliated at the edges; orifice ſomewhat divided;

ſtigmas three." A native of Portugal. 169. C. *filiformis*, Linn. Sp. Pl. 23. Mart. 27. Smith. 52. Wahlen. 77 Schkuhr 69. tab. K. fig. 45. (C. tomentoſa, Lightf. Hudſon. C. hirta, Flor. dan. tab. 379. excluſive of the ſeparate ſpike, which is C. hirta.) "Spikes egg-ſhaped; ſheaths nearly as long as the peduncles; glumes pointed; fruit downy; leaves channelled, ſmooth." *Root* perennial, creeping. Whole herb ſmooth. *Stem* two feet high, erect, ſlender, round, ſmooth, ruſh-like, except towards the top, where it often has three rough angles. *Leaves* upright, ſtraight, narrow, channelled, without any ſharp keel, pointed, rough at the edge. *Bractes* like the leaves, overtopping the ſtem; ſheaths ſhort, but nearly as long as the peduncles, ſurmounted by ſmall auricles. *Male ſpikes* two, rarely one, rather remote, unequal in ſize, lanceolate; glumes elliptic-oblong, rather acute, blackiſh, with a yellow nerve. *Female ſpikes* two, rarely one, rather remote, egg-ſhaped, erect; glumes like thoſe of the male, but often ſlightly awned, ſmooth. *Fruit* imbricated, egg-ſhaped, ribbed, blackiſh, clothed with ſhort, tawny down, ending in a ſhort cloven beak; ſtigmas three. *Seed* elliptical, triangular, terminated by the ſhort ſtyle. Dr. Smith, to whom we are almoſt entirely indebted for the ſpecific characters and deſcriptions of all the Britiſh ſpecies. A native of England and Scotland, but rather rare, flowering in June. 170. C. *gigantea*, Rudge in Linn. Tranſ. vol. vii. p. 99. "Male ſpikes round, erect; females larger, turgid, fruit inflated, globular, beaked, acuminate, ſpreading." *Stem* erect, ſtriated, triangular, ſmooth. *Leaves* broad, dark green much longer than the ſtem, hiſpid at the edges and on the keel, ribbed; ſpaces between the ribs knotty. *Male ſpikes* three; two upper ones near together; lower one more diſtant; glumes denſely imbricated. *Female ſpikes* three, far exceeding in ſize thoſe of every other ſpecies; the upper one a little incurved, ſeſſile; the others alternate, peduncled, pendulous; flowers looſely imbricated, divaricated; glumes oblong-egg-ſhaped, awned, keeled, white and tender at the edge, half as long as the fruit. *Fruit* globular, much inflated, ſtriated, looſely imbricated, divaricated, beaked with a long awn; orifice with two teeth; ſtigmas three; ſeed triangular, ſmooth. A native of Carolina. 171. C. *paleacea*, Wahlen. 131. Schreb. in Muhlem. Act. Americ.? "Spikes cylindrical; males ſeveral; peduncles long, reclined; bractes partly embracing the ſtem, foliaceous, diſtant; glumes terminated by a long ſerrated point; fruit roundiſh, pointed; orifice emarginate; ſtigmas two; ſtem lax." A native of North America. 172. C. *maritima*, Wahlen. 132. Flor. dan. 704. Schkuhr tab. W. fig. 74. "Spikes on long peduncles, pendulous, cylindrical; males ſeveral; bractes partly embracing the ſtem, foliaceous, diſtant; glumes with long points; fruit nearly orbicular, pointed; orifice emarginate; ſtigmas two; leaves broadiſh." A native of the ſea coaſt in Norway. 173. C. *cuſpidata*, Wahlen. 133. "Spikes on ſhortiſh peduncles, oblong-cylindrical; bractes partly embracing the ſtem, foliaceous, ſomewhat diſtant, remote from the male ſpike; glumes with rather long points; fruit ſomewhat orbicular, pointed; orifice emarginate; ſtigmas two; leaves ſoft, a little incurved at the edges." A native of muddy ſhores in Norway. 174. C. *ſalina*, Wahlen 134. "Spikes on ſhortiſh peduncles, oblong-cylindrical; bractes partly embracing the ſtem, foliaceous, rather remote; fruit ſomewhat orbicular, rather large, pointed; orifice emarginate; ſtigmas two; leaves ſoft, incurved at the edges; ſheaths very long, nearly equal." A native of the ſea-coaſt of Norway. 175. C. *aquatilis*, Wahlen. 135. "Spikes on ſhort peduncles, ſomewhat linear, thickened and club-ſhaped above; bractes partly embracing the ſtem, foliaceous, long, rather remote; fruit ſomewhat lenticular, rather ſmall, pointed; orifice quite entire; ſtigmas two; ſtem firm, obtuſely angular; leaves ſtiff, incurved at the edges; the loweſt ſheath rather ſhorter." A native of the banks of rivers in Lapland C. nardifolia. "Spikes nearly ſeſſile, ſhort; male linear; bractes foliaceous, diſtant; glumes rounded, rather thick, nearly as long as the fruit; fruit egg-ſhaped, flattiſh on both ſides, rather acute; orifice protruded; leaves very narrow, ſomewhat convolute." A native of alpine marſhes in Lapland. 176. C. *hiſpida*, Wahlen. 137. Schkuhr 51. tab. 8. fig. 64. "Spikes nearly ſeſſile, cylindrical, very denſely flowered; males ſeveral; bractes partly embracing the ſtem, foliaceous, long, rather remote; glumes as long as the fruit, mucronate; fruit inverſely egg-ſhaped, hiſpid at the edges, with a ſomewhat two-toothed tip; ſtigmas two; leaves broad." A native of Barbary.

Carex *lithoſperma*; Linn. Syſt. nat. See Scleria Flagellum.

Carex, in *Geography*, an iſland ſituate in the Perſian gulf.

CAREY, Henry, in *Biography*, a poet and muſician, who, perhaps, among philoſophers, men of ſcience, and artiſts of the firſt claſs, may be deemed ſomewhat too facetious to be allowed a record here. But as he had the power of exciting mirth without profligacy, indecorum, or licentiouſneſs, which none of his buffoon predeceſſors, ſuch as Cornyſhe, Coryat, Tom Brown, Tom d'Urfy, George Alexander Stevens, &c. could do; we think that, at leaſt as long as many of his works are ſtill in uſe, he ſhould not be plunged into the gulf of oblivion. For though he was not a deep muſician, or a great poet, he had genius and abilities in both theſe arts ſufficient to intereſt and amuſe the public by his productions, if not in a ſublime manner, yet in a way not diſgraceful to himſelf, or his admirers. This being premiſed as an apology for the hero of this article, and for his biographers, we ſhall proceed to detail the principal events of his profeſſional life.

Of his birth and parentage we know nothing; and of his education are only certain that he was not a regular bred muſician. It has been ſaid, indeed, that he had his firſt leſſons from a German of the name of Witchinſon Lennert; that Roſcingrave had been kind to him; and that he was, in ſome ſort, a diſciple of Gemminiani. But the reſult of all theſe inſtructions did not, as his friend Lampe, a man of truth, uſed to ſay, enable him to make a baſe to his own ballads.

Poor Carey has been under-rated by his biographers, in ranking him as a man of humour, a writer of ballads, and an inventor of melodies, below Tom D'Urfy. *Carey*'s humour may ſometimes be *low*, but it was never groſs or immoral; and d'Urfy's was nothing elſe. For in the ſix volumes of "Pills to purge Melancholy," there is ſcarcely an innocent ſong to be found.

The firſt we hear of *Carey* was, that he produced two farces in the year 1715, one of which, *the Contrivances*, is ſaid in the *Biographia Dramatica*, to be a very entertaining piece, which had good ſucceſs in its day."

In 1730, it appears, that when *Miſs Rafter*, afterwards the celebrated Mrs. Clive, firſt appeared on the ſtage of Drury-Lane as a ſinger, it was at the benefit of *Harry Carey*, who ſeems to have been her ſinging-maſter. The manner in which this benefit was announced in the *Daily Poſt*, December 3d, is ſo ſingular that we ſhall tranſcribe the paragraph for the amuſement of our readers. After naming the play, which was *Greenwich Park*, and the additional entertainments of ſinging; particularly a dialogue of Purcell by Mr. Carey and Miſs Rafter, and a cantata of Mr. Carey's by Miſs Rafter, there is an apology from Carey, for "the tragedy of half an act" not being performed ; but a promiſe is made of indemnification by the entertainments between the acts. The editor of the paper then adds ; " but at our friend Harry Carey's benefit to-night, the powers of muſic, poetry, and painting, aſſemble in his behalf, he being an admirer of the three ſiſter arts : the body of muſicians meet in the Haymarket, whence they march in great order, preceded by a magnificent moving organ, in form of a pageant, accompanied by all the kinds of muſical inſtruments ever in uſe from Tubal Cain to this day ; a great multitude of bookſellers, authors, and printers, form themſelves into a body at Temple-bar, whence they march with great decency to Covent-garden, preceded by a little army of printers' devils, with their proper inſtruments : here the two bodies of muſic and poetry are joined by the brothers of the pencil ; when, after taking ſome refreſhment at the Bedford Arms, they march in ſolemn proceſſion to the theatre, amidſt an innumerable crowd of ſpectators."

Poetry and muſic, in high antiquity, formed but one profeſſion, and many have been the lamentations of the learned that theſe ſiſter arts were ever ſeparated. Honeſt Harry Carey and Jean Jaques Rouſſeau are the only bards in modern times who have had the addreſs to reconcile and unite them. The *Honeſt Yorkſhireman* of Carey and the *Devin du Village* of Rouſſeau are indiſputable proofs that popular ſtrains, at leaſt, if not learned and elegant muſic, may be produced by the writer of a dramatic poem. Carey, without muſical learning, invented many very pleaſing and natural melodies, which neither obſcured the ſenſe of the words, nor required much ſcience to hear. But either from the ambition of the ſinger, or expectations of the audience, muſic is not ſuffered to remain ſimple long upon the ſtage ; and the more plain and ancient the melodies, the more they are to be embelliſhed by every new performer of them. The tunes in the *Beggar's Opera* will never appear in their original ſimple garb again.

In 1732, he produced the words of two ſerious operas ; *Amelia* and *Teraminta*. The firſt of theſe was ſet by Lampe, and the ſecond by the late Mr. Smith, Handel's diſciple, friend, and ſucceſſor, in ſuperintending the performance of oratorios.

In 1734 his mock tragedy of half an act, called *Chrononhotonthologos*, was firſt performed at the little theatre in the Haymarket ; a piece of humour that will always be in ſeaſon, as long as extravagance and bombaſt ſhall dare to tread the ſtage.

In 1736, and for ſeveral ſubſequent years, his little Engliſh opera, entitled *The Honeſt Yorkſhireman*, was almoſt always in conſtant run.

The year 1737 was rendered memorable at Covent garden theatre by the ſucceſs of the burleſque opera of the *Dragon of Wantley*, written by Carey, and ſet by Lampe, " after the Italian manner." This excellent piece of humour had run twenty-two nights, when it was ſtopped, with all other public amuſements, by the death of her Majeſty Queen Caroline, November 20th, but was reſumed again on the opening of the theatres in January following, and ſupported as many repreſentations as the *Beggar's Opera* had done, ten years before. And if Gay's original intention in writing his muſical drama was to ridicule the opera, the execution of his plan was not ſo happy as that of Carey ; in which the mock heroic, tuneful monſter, recitative, ſplendid habits, and ſtyle of muſic, all conſpired to remind the audience of what they had ſeen and heard at the lyric theatre, more effectually than the moſt vulgar ſtreet tunes could do ; and much more innocently than the tricks and tranſactions of the moſt abandoned thieves and proſtitutes. Lampe's muſic to this farcical drama, was not only excellent fifty years ago, but is ſtill modern and in good taſte.

In 1738 *Margery, or the Dragoneſs* ; a ſequel to *the Dragon of Wantley*, written with equal humour, and as well ſet by Lampe, came out ; but had the fate of all ſequels. When the novelty of a ſubject is faded away, and the characters have been developed, it is difficult to revive the curioſity of the public about perſons and things of which opinions are already formed. The *Dragoneſs* appeared but few nights, and was never revived.

*Nancy*, or *the parting Lovers*, was produced after theſe, and likewiſe ſet by Lampe ; but the occaſional ſongs and cantatas which he wrote and ſet to muſic himſelf, are innumerable. His burleſque birth-day ode, turned the odes of Cibber into ridicule as effectually as Pope's Dunciad could do. And his ballad of *Sally in our Alley*, had the honour of being praiſed by Addiſon for the poetry, and Gemminiani for the tune. But though poor Carey was a ſucceſsful poet and muſician, he was always indigent and heavy on the hands of his friends. He ſeems to have been profeſſionally active, he taught muſic at ſmall boarding ſchools and private houſes upon low terms, and had no particular vice or extravagance laid to his charge ; but whether his embarraſſed circumſtances, domeſtic unhappineſs, the malignity of rival but leſs ſucceſsful writers, or from whatever cauſe, in a fit of inſanity or deſpondency, Oct. 4, 1743, at his houſe in Warner Street, Cold bath fields, he terminated with a cord a life which he had innoxiouſly, and not uſeleſsly, ſpent.

This preciſe date of his fatal cataſtrophe totally invalidates the claims that have been made of late by his ſon for the honour of having written and ſet the loyal and national ſong at the time of the rebellion in 1745, *God ſave great George our King!* which we have cogent reaſons to believe was written for king James II. while the prince of Orange was hovering over the coaſt. And when he became king, who durſt own or ſing it ? We are certain, that in 1745, when Dr. Arne harmonized it for Drury lane theatre, and C. B. for Covent-garden, the original author of the melody was wholly unknown.

CAREY'*s*, *chicken*, or *gooſe*, *Mother*, in *Ornithology*. See PROCELLARIA *gigantea*.

CARFA, in *Geography*, a town of Arabia ; 176 miles N.W. of Jamama.

CARFAGNANO, or CASTEL-NUOVO DI CARFAGNANO, a town of the duchy of Modena, and capital of a lordſhip, which is partly in the Modeneſe, partly in the Bologneſe, and partly in the republic of Lucca ; 18 miles N. of Lucca, and 37 S.S.W. of Modena.

CARGADORS, a name given by the Dutch to a kind of brokers, who make it their ſole buſineſs to find freight for ſhips which want lading, and veſſels for merchants or paſſengers who want conveyance to ſuch or ſuch a place.

CARGO, the lading or freight of a ſhip. See FREIGHT.

CARGO, *fortable*, is that which contains ſomething of every ſort neceſſary to furniſh the tradeſmen of the place it is ſent to, with parcels fit to fill their ſhops, and invite their cuſtomers. Officers and ſailors on board a veſſel are allowed to carry a ſmall cargo, or " pacotille," not exceeding a certain bulk or weight, for their own account, without paying any freight.

CARGO is ſometimes alſo uſed for an invoice of the goods wherewith a ſhip is laden. See INVOICE.

CARGO alſo denotes a weight uſed in Spain and Turkey, amounting to about 300 Engliſh pounds.

CARGOU, in *Geography*, a ſmall iſland in the Perſian gulf, near the coaſt of Farſiſtan.

CARHAIX, a town of France, in the department of Finiſterre, and chief place of a canton in the diſtrict of Chateaulin, ſeated on the Yer, in a fruitful country, that feeds great numbers of cattle, with plenty of game; 6½ leagues S. of Morlaix. The place contains 1734, and the canton 13,464 inhabitants; the territory comprehends 322½ kiliometres and 9 communes.

CARHAM, a village of England, in the county of Northumberland, which deſerves notice on account of the ſingular events that have occurred in its vicinity. Near this place a battle was fought between the Engliſh and the Danes, in which 11 biſhops and 2 Engliſh counts were ſlain, beſides a great number of ſoldiers. Here likewiſe was fought, in 1018, a battle between the Engliſh and the Scots, in which the latter were victorious. In the 24th year of Edward I. an abbey was burned here by the Scots, under the command of Wallace; and in the 44th year of Edward III. 1370, ſir John Lilburn was defeated near this place by the Scots, under the command of ſir John Gordon, and taken priſoner with his brother. Carham is diſtant 5 miles E. of Kelſo, and 28 N.W. of Alnwick.

CARIA, in *Ancient Geography*, a province of Aſia, occupying the ſouth-weſtern part of Aſia Minor, or Anatolia. It is bounded on the north by Ionia, Lydia, and the river Mæander, which ſeparated it from Ionia; on the eaſt by Great Phrygia and part of Lycia, its natural boundaries being high mountains; and on the ſouth and weſt by the ſea. Geographers, however, are not agreed about its preciſe limits. Their different opinions may be ſeen in Cellarius's Ancient Geography. This country was for ſome time called Phœnicia, becauſe the Phœnicians had conſiderable eſtabliſhments in it; but it is ſaid to have taken the name of Caria from Car, the brother of Lydus; and it comprehended a ſmall province, forming a kind of peninſula towards the ſouth-weſt, called *Doris*, which ſee. The interior of this country preſents ſome chains of mountains; the chief of which were Latmus, on the weſt towards Miletus, and the Montes Calindici, towards the ſouth-eaſt near Calinda. The principal towns of Caria were Miletus, Myndus, Halicarnaſſus, Ceramus, Bergaſa, and Cnidus, which were ſituated along the weſtern coaſt. The Rhodians poſſeſſed a part of this country towards the ſouth, under the name of *Peræa*, which ſee. In the interior of the country are found Alabanda, Apollonia, and Antiochia ad Mæandrum, Aphrodiſias, Stratonice, Alinda, Pedaſus, and, towards the ſouth, Caminus, Calinda, &c. Caria was leſs cultivated than it might have been, becauſe the inhabitants employed themſelves very much in maritime concerns. Its mountains, however, furniſhed numerous flocks, and its wool was held in high eſtimation.

The Carians claimed the honour of being aborigines, (though ſome authors aſcribe their origin to the Pelaſgi, and others to the Cretans), and traced their name and origin to Car, the brother of Lydus and Myſus; and they thought this genealogy was confirmed by the antiquity of the temple of Jupiter the Carian, built at Mylaſes, where, from time immemorial, they aſſembled in common with the Lydians and Myſians. Hence they concluded that they had the ſame anceſtors with theſe people, according to the report of Herodotus. Homer, ſays Stephanus Byzantinus, repreſented the Carians as barbarians, becauſe they were enemies to the Ionians; but the epithet βαρβαροφωνους, which this ancient poet applies to them, ſhews, that he referred to their language, and not to their political conduct. The Carians multiplied themſelves to ſuch a degree under the government of the deſcendants of Car, that they extended their eſtabliſhments to the neighbouring iſlands. Accordingly they took poſſeſſion of the iſle of Rhodes, belonging to the Phœnicians; and thus the acceſs of this warlike nation to the other iſlands of the Ægean ſea was facilitated. Thucydides ſays, that Minos II. drove the Carians from the iſlands of the Cyclades; but Herodotus informs us, that Minos allowed them the poſſeſſion of theſe iſlands, together with unmoleſted liberty to cultivate them, and an exemption from tribute, on condition of their furniſhing his fleet with a number of veſſels. In proceſs of time different colonies of Greeks were introduced into Caria, and the original inhabitants were obliged to retire into the mountains, and to fortify themſelves againſt the acceſs of their enemies. At length the ſterile ſoil of their mountainous retreat reduced them to a ſtate of poverty, which rouſed their courage; and they conſtructed veſſels and traverſed the ſea, and thus acquired a degree of power, which gave them the rank of a maritime empire. Euſebius refers this period to the interval that elapſed from the 11th to the 27th olympiad. Diodorus Siculus fixes the epocha of the maritime power of the Carians immediately after the taking of Troy, and pretends, that by means of their veſſels they got poſſeſſion of the iſle of Leſbos. Herodotus ſays, that they very much contributed to the perfection of the military art by their ingenious inventions. The Carians, who were both a maritime and military people, aſſiſted in eſtabliſhing Pſammetichus on the throne of Egypt, and he recompenſed their ſervices in a very liberal manner. Thus attached to the intereſt of his houſe, they ſuccoured Apries, the laſt of the deſcendants of this prince, when Egypt attempted to emancipate themſelves from his power, and for ſome time reſiſted the attacks of all his enemies; but when Apries fell, they were obliged to ſubmit to the conqueror. Amaſis, conceiving that they would afford him very conſiderable ſupport, engaged them in his cauſe, by aſſigning to them a territory in the diſtrict of Memphis, the capital of his dominions. They evinced their attachment to Pſammetichus, the ſon and ſucceſſor of Amaſis, when Cambyſes undertook the conqueſt of Egypt. Accordingly they joined his army: but when the Perſians proved victorious, the ſurviving Carians retired into their own country, which had ſuffered much from its conteſts with the kings of Lydia. Alyattes was the firſt of all the ſucceſſors of Gyges who formed the project of reducing the Carians to his dominion; but he probably did not ſucceed, as Herodotus reckons Caria in the number of the provinces annexed to the empire of Lydia by the arms of Crœſus. After various ſtruggles in defence of their country and their liberty, they were at laſt obliged to ſubmit to the Perſians, upon the reduction of Miletus. In the expedition of Xerxes againſt Greece, the Carians aſſiſted him with 70 veſſels, which were annexed to his naval armament. Lygdamis, to whom, according to Pauſanias, the Lacedæmonias erected a ſtatue, aſcended the throne of Caria towards the 83d olympiad, and was ſucceeded by Hecatomnus, who made Mylaſa the capital of his kingdom. He was allowed by the Perſian court to poſſeſs the kingdom of Caria till his death, which happened in the 99th or 100th olympiad. His ſucceſſors reigned 42 years. Artemiſia, the ſecond of that name, married Mauſolus her brother, according to Arrian, who pretends that cuſtom authoriſed ſuch marriages in Caria. This prince reunited the whole of Caria under his dominion, and fixed his reſidence at Halicarnaſſus, which ſurpaſſed in magnificence all the cities of Caria. Mauſolus made ſucceſsful attacks on the Ionians, Lydians, and Lycians; and under his conduct the Carians got poſſeſſion of the iſland of Rhodes. At the death of Mauſolus, in the 4th year of the 106th olympiad, B.C. 353, the Rhodians threw off the yoke of the Carians; but Artemiſia, the ſiſter and widow of this prince, reduced them to their allegiance, and alſo the inhabitants of the iſland of Cos, who had imitated their neighbours in their revolt. At the death of Artemiſia, Idrieus aſſumed the reins of government, and when he died, the Carians conferred the crown on Ada, his ſiſter and wife. Diodorus Siculus ſays, that the Perſian court gave the inveſtiture of the kingdom to a ſatrap; but Ada courageouſly reſiſted him, and at length, deprived of her dominions, ſhe retired to the fortreſs of Alinda, which ſhe maintained till the arrival of Alexander in Aſia. When Alexander had gained the battle of the Granicus, he penetrated into Caria, and re-eſtabliſhed Ada in poſſeſſion of her kingdom. Arrian ſays that Ada adopted Alexander; but Plutarch ſuggeſts, that this conqueror adopted Ada, and always called her his mother.

Caria, a town of Aſia Minor, in a country of the ſame name. Ptolemy places it in Lycia. *Caria* was alſo an epiſcopal town of Aſia, placed upon the Mæander.

Caria, a name given by Arrian to a maritime country of Scythia, on the Euxine ſea. It was an eſtabliſhment of Carians, on this ſide of the Boryſthenes, and at a diſtance from the Tanais.

Caria, in *Entomology*, the name by which ſeveral travellers diſtinguiſh thoſe miſchievous inſects that infeſt the Eaſt Indies, Africa, and other parts of the world, and which are known among modern naturaliſts by the name of *Termites*, and white ants. See Termes.

CARIABAD, in *Geography*, a town of Hindooſtan, in the ſoubah of Oude; 40 miles N. of Lucknow.

CARIACO, a large gulf in the province of Comana, Terra Firma, South America. On the northern ſide at its mouth is Fort St. Yago, in N. lat. 10° 7′. W. long. 63° 30′; and on the ſouthern ſide cape Bordones.

CARIACOU, the chief of the ſmall iſles dependent on the iſland of Grenada, in the Weſt Indies; ſituate about 4 leagues from Iſle Ronde, which is equally diſtant from the north end of Grenada. N. lat. 12° 30′. W. long. 61° 22′. It contains 6913 acres of land, and in general is fertile and well cultivated, producing in ſeaſonable years a million of pounds of cotton for exportation, beſides corn, yams, potatoes, and plantains ſufficient for the maintenance of its negroes. The cultivation of ſugar has been found leſs ſucceſsful in this iſland than cotton, though it ſtill continues to be made on two plantations. The number of inhabitants in 1779 was 5000; but they have ſince decreaſed. See Grenada. Cariacou forms a 7th pariſh belonging to Grenada; and by an act paſſed in 1784, a ſtipend is provided for a clergyman in this pariſh. The pariſh town of this iſland is Hillſborough.

Cariacou, in *Zoology*, a ſpecies of *Cervus*, which ſee.

CARIAMA, in *Ornithology*, the name of a Braſilian bird, deſcribed by Marcgrave in his Hiſtory of Braſil: this is the creſted ſcreamer, *Palamedea criſtata* of modern naturaliſts.

CARIANERS, or Carayners, in *Geography*, a people of ſingular deſcription that inhabit different parts of the Birman empire, particularly the weſtern provinces of Dalla and Baſſien, ſeveral ſocieties of whom alſo dwell in the diſtricts adjacent to Rangoon. None of them are to be found higher up than the city of Prome. They are a ſimple innocent race, ſpeaking a language diſtinct from that of the Birmans, and entertaining rude notions of religion. They lead altogether a paſtoral life, and are the moſt induſtrious ſubjects of the ſtate: their villages form a ſelect community, from which they exclude all other ſects, and never reſide in a city, nor intermingle, nor marry with ſtrangers. They profeſs, and ſtrictly obſerve, univerſal peace, not engaging in war, nor taking part in conteſts for dominion; and thus they are placed in a ſtate of ſubjection to the ruling powers. Agriculture, the care of cattle, and the rearing of poultry, are almoſt their only occupations. A great part of the proviſions conſumed in the country is raiſed by the Carianers, who particularly excel in gardening. The oppreſſion which they have lately ſuffered has induced numbers of them to withdraw into the mountains of Arracan. They have traditional maxims of juriſprudence for their internal government, but they are without any written laws; cuſtom, with them, conſtitutes the law. Some of them learn to ſpeak the Birman tongue, and a few can read and write it imperfectly. They are timorous, honeſt, mild in their manners, and very hoſpitable to ſtrangers. Symes's Embaſſy to Ava, vol. ii. p. 109.

CARIATA, in *Ancient Geography*, a town of Aſia, in Bactriana, deſtroyed by Alexander.

CARIATI, Nuova, in *Geography*, a town of Naples, in the province of Calabria Citra, ſituated on the S.W. coaſt of the gulf of Tarento; 25 miles N. of St. Severino. N. lat. 30° 38′. E. long. 16° 6′. At the diſtance of 2 miles S.W. of the former is *Cariati Vecchia*, in the ſame province, the ſee of a biſhop, ſuffragan of St. Severino. It is farther from the ſea, towards the river Caneta. Cariati is a principality belonging to the family of Spinelli, one of the moſt opulent feudatory families, divided into ſeveral branches, and poſſeſſed of very capital fiefs in Calabria. The founder of this family was John Baptiſt Spinelli, who was very much diſtinguiſhed by Ferdinand the Catholic, on his arrival at Naples, and enabled to purchaſe Cariati and other conſiderable eſtates, ſince augmented by the prudence of his deſcendants. The city is ſmall, and thinly inhabited, on account of the weakneſs of its ſituation, and dread of the Turks, who, before a treaty was concluded with the Porte, were continually ravaging this coaſt. Its cathedral is a very heavy Gothic ſtructure, dedicated to St. Peter, and the only pariſh. The ſurrounding hills are gay, and pleaſingly covered with fruit-trees; the woods behind them produce manna of excellent quality; much Turkey wheat is cultivated in the lands below, and extenſive paſtures afford luxuriant and wholeſome ſuſtenance to a great ſtock of oxen, buffaloes, ſheep, goats, and ſwine.

CARIATIDES, or Cariates, in *Architecture*. See Caryatides.

CARIBALDI. See Garibaldi.

CARIBBEAN sea, in *Geography*, that part of the Atlantic ocean, which is bounded on the north by the iſlands of Jamaica, St. Domingo, Porto Rico, and the Virgin iſlands, on the eaſt by the Caribbean iſlands, on the ſouth by the country of Terra Firma, and on the weſt by the Muſketto ſhore.

CARIBBEE islands, a range of iſlands extending in a kind of ſemicircular form, from Tobago in the ſouth to Porto Rico in the north, and encloſing as it were between them and the main land the Caribbean Sea. They were diſcovered by Columbus in his ſecond voyage, in November, 1493; and thus called by him from the name which the natives of Hiſpaniola gave to their ancient poſſeſſors. The term Caribbee or Charaibean is ſtrictly applicable only to the *windward* iſlands, which were inhabited by the Caribbees or Charaibes; and the four large iſlands of Cuba, Jamaica, Hiſpaniola, and Porto Rico, are denominated *leeward* iſlands. But Engliſh mariners appropriate both terms to the Caribbee iſlands only, ſubdividing them according to their ſituation in the courſe of the trade wind; the windward iſlands terminating by their arrangement with Martinico, and the leeward commencing at Dominica, and extending to Porto Rico. The Caribbee iſlands are eminently fertile, and in a commercial view highly advantageous; their chief poſſeſſors are the Engliſh and French. Barbadoes, Antigua, St. Chriſtopher's, St. Vincent, Dominica, Grenada, Montſerrat, Nevis, and the Virgin iſles are Britiſh; and the French poſſeſs Martinico, Guadaloupe, St. Lucia, Tobago, and ſome iſlets. To the Danes belong St. Croix, St. Thomas, and St. John, parts of the Virgin group; the Swedes hold St. Bartholomew; and the Dutch St. Euſtatius. Of the whole group lying between the 58th and 66th degrees of W. longitude, and the 11th and 19th degrees of N. latitude, Barbadoes and Guadaloupe are the moſt important; and the latter, including Grand Terre, and Baſſe Terre, is the moſt conſiderable in ſize. For a farther account of each iſland, ſee its appropriate article.

CARIBBEES, or Charaibes, the ancient poſſeſſors of moſt of the iſlands above mentioned. Columbus in his firſt voyage received information, that ſeveral of theſe iſlands were inhabited by a people of this name, who were fierce, ſavage, and predatory, the terror of the mild and inoffenſive inhabitants of Hiſpaniola, and who delighted in the horrid banquet of human blood. In his ſecond expedition, he found this information to be juſt, and was himſelf a witneſs of their intrepid valour. In their habitations, when he landed at Guadaloupe, he found relicts of thoſe feaſts which they had made upon the bodies of their enemies taken in war; and at the ſame time, he releaſed ſeveral of the natives of Porto Rico, who, having been brought captives from thence, were reſerved as victims for the ſame horrid purpoſe. See Cannibal. The ſame character for valour and intrepidity has been invariably maintained by theſe people in all ſubſequent conteſts with the inhabitants of our continent; and even, in our own times, they have made a gallant ſtand in defence of the laſt territory which the rapacity of the Europeans had left in their poſſeſſion. M. de Chanvalon, an intelligent and philoſophical obſerver, who viſited Martinico in 1751, and reſided there ſix years, gives the following deſcription of the Caribbees. "It is not the red colour of their complexion, it is not the ſingularity of their features, which conſtitutes the chief difference between them and us. It is their exceſſive ſimplicity; it is the limited degree of their faculties. Their reaſon is not more enlightened or more provident than the inſtinct of brutes. The reaſon of the moſt groſs peaſants, that of the negroes brought up in the parts of Africa moſt remote from intercourſe with Europeans, is ſuch that we diſcover appearances of intelligence, which, though imperfect, is capable of increaſe. But of this the underſtanding of Caraibs ſeems to be hardly ſuſceptible. If ſound philoſophy and religion did not afford us their light; if we were to decide according to the firſt impreſſion which the view of that people makes upon the mind; we ſhould be diſpoſed to believe that they do not belong to the ſame ſpecies with us. Their ſtupid eyes are the true mirror of their ſouls; it appears to be without functions. Their indolence is extreme; they have never the leaſt ſolicitude about the moment which is to ſucceed that which is preſent." Voyage à la Martinique, p. 44, 45, 51. M. de la Borde, Tertre, and Rochefort, confirm this deſcription. Mr. Edwards (ubi infra) very properly obſerves, that M. Chanvalon ſeems to have formed his judgment of all the Charaibes from the few with whom he had any communication, and that he makes no allowance for their degradation in a ſtate of captivity and ſervitude; though he admits this circumſtance and ſtrongly urges it in favour of the African blacks in the Weſt Indies. The Caribbees evidently appear by the marked diſtinction of their character to be a ſeparate race from the inhabitants of the larger iſlands. Their language is totally different; and among themſelves, they have a tradition, that their anceſtors came originally from ſome part of the continent, and having conquered and exterminated the ancient inhabitants, took poſſeſſion of their land, and of their women. Hence they call themſelves "Banaree," which ſignifies a man come from beyond ſea. Accordingly, the Caribbees ſtill uſe two diſtinct languages, one peculiar to the men, and the other to the women; nor has the language of the men any thing common with that ſpoken in the large iſlands; whereas the dialect of the women conſiderably reſembles it. The tradition derives from this circumſtance conſiderable confirmation. The Caribbees themſelves imagine, that they were a colony from the "Galibis," a powerful nation of Guiana, in South America. But as their fierce manners approach nearer to thoſe of the people in the northern continent, than to thoſe of the natives of South America; and as their language has ſome affinity to that ſpoken in Florida, their origin ſhould be deduced rather from the former than the latter. In their wars, they ſtill obſerve their ancient practice of deſtroying all the males, and preſerving the women either for ſervitude or for breeding. Rochefort in his account of the Antilles, publiſhed in 1658, conjectures, that they ſprung originally from Florida, and deſcribes them as a colony of Apalachian Indians, who, being driven from the continent, arrived at the windward iſlands, and exterminating the ancient male inhabitants, took poſſeſſion of their lands, and of their women. But being unable to ſubdue the inhabitants of the larger iſlands, theſe retained their diſtinctive manners and character. Mr. Edwards agrees in opinion with thoſe, who trace their origin to a South American colony. To this purpoſe he ſays, that there anciently exiſted many numerous and powerful tribes of Charaibes on the ſouthern peninſula, extending from the river Oronoko to Eſſequebe, and throughout the whole province of Surinam, even to Braſil, ſome of which ſtill maintain their independence. With one of theſe tribes ſir Walter Raleigh formed an alliance, in his romantic expedition to Guiana in 1595; and he aſſures us, that the Charaibes of that part of the continent ſpoke the language of Dominica. Mr. Edwards, indeed, inclines to the opinion of Hornius, who aſſigns to theſe people an oriental anceſtry, that migrated to the weſt acroſs the Atlantic; and in confirmation of this opinion he alleges a ſimilarity in the language of the Charaibes to the ancient oriental dialects, and alſo a ſtriking reſemblance in their cuſtoms and manners to thoſe of the inhabitants of the eaſt. The word "Charaibe," he ſays, in the Arabic language, ſignifies a robber or deſtroyer, an appellation frequently beſtowed by the natives on the invaders of their country. As there were prieſts or prophets in Braſil under the appellation of Charaibes, they might have been called קרב איש, as men who offer קרבן, *corban*, an offering (ſee Lev. i. 2.); and κορυβας is the Greek for a prieſt of Cybele, or one of the Corybantes. But if the national name be derived from the warlike and predatory life of the Charaibes, we may derive it from חרב, ſignifying in Syr. and Arab. to *lay waſte*. The noun denotes a ſword or ſpear, and חרבה *Sam. war*.

Mr. Edwards has given us an highly intereſting deſcription of theſe ſavages; their national manners, habits, education, and ſuch political and religious inſtitutions as ſavages could fabricate; of all which we ſhall preſent our readers with the following conciſe epitome, referring to the author himſelf (ubi infra) for a more ample detail. Every trait in the character of a Charaibe marks him for a foreigner. The antipathy which this fierce race bears to the unoffending and more cultivated natives of the larger iſlands of Hiſpaniola,

paniola, Cuba, and Jamaica; his robuſt and muſcular form, his towering, independent ſpirit, diſdainful of reſtraint, and impatient under calamity; his dreadful feaſt on the human fleſh of captives, whilſt towards his own brethren he is faithful, kind, affectionate, and peaceable; and the inciſions which he makes on his ſcarified body, painted alternately with black and crimſon, to render him terrific to his enemies in battle;—all conſpire to proclaim him an *exotic*, tranſplanted either by deſign or accident from ſome diſtant clime, and bearing with him to his new abode the interminable impreſſions of his primitive *caſt*. A Charaibe youth is educated amidſt accumulated toils and ſufferings. One of the earlieſt maxims inculcated on his tender mind was to bear exquiſite pain without murmuring:—like the Spartan youth at the altar of Diana, he was ſcourged until agonizing nature was nearly exhauſted; but no ſigh was heard, no tear was ſeen to fall; for, if the ſeverities which he ſuſtained occaſioned the leaſt ſign of weakneſs or ſenſibility, he was diſgraced for ever. Public honours and national rewards crowned the fortitude that never ſhrunk from inflicted torture:—above all things, he was taught to cheriſh an inexorable hatred, and an inſatiable thirſt of revenge, againſt his natural enemy, the *Arrowauks* (which ſee), the inhabitants of Hiſpaniola, Cuba, and Jamaica. When more mature years called the Charaibe to the field, ſtripes, burning, and ſuffocation, conſtituted the teſt of him who was to lead the national troops to action. His heart thus hardened, and his nerves thus ſteeled, he beheld the unbounded carnage of his foes without the leaſt remorſe, nor checked his ſavage ſquadrons in the career of their ſanguinary vengeance. Of their political maxims, one very prominent but diſguſting feature is diſplayed in that abject vaſſalage in which the Charaibes keep their women. They are mere houſehold drudges through life, and are denied even the privilege of eating in the preſence of the tyrant huſband. Mr. Edwards, on this ſubject, very juſtly obſerves, that the firſt viſible proof that a people are emerging from ſavage manners is a diſplay of tenderneſs towards the female ſex. As the ſucceſsful warrior was allowed to appropriate to himſelf as many of the captives as he thought fit, and his countrymen preſented to his choice the moſt beautiful of their daughters in recompence of his valour; this laſt mentioned teſtimony of public eſteem and gratitude probably gave riſe to the inſtitution of polygamy, which prevailed univerſally among the Charaibes, and ſtill prevails among thoſe of South America. This inſtitution, ſays Mr. E., is the more excuſable, as their women, from religious motives, carefully avoided the nuptial intercourſe after pregnancy. Their females, on attaining the age of puberty, were diſtinguiſhed by a ſort of buſkin, or half boot, made of cotton, which ſurrounded the ſmall of each leg. In other reſpects both males and females appeared naked. Their hair, which was of a ſhining black colour, was dreſſed and adorned with peculiar attention; and the men, in particular, decorated their heads with feathers of various colours. On the death of a relation or friend, they cut it ſhort like their ſlaves or captives, to whom the privilege of wearing long hair was rigorouſly denied. Like moſt other nations of the New Hemiſphere, they nicely eradicated the incipient beard, and all ſuperfluous hairs on their bodies. On the birth of a child, its head was confined between two ſmall pieces of wood, placed one before and the other behind, which, being firmly bound together, elevated the forehead, and occaſioned this and the back part of the ſkull to reſemble two ſides of a ſquare. They reſided in villages, which reſembled an European encampment; and their cabins were built of poles fixed circularly in the ground, drawn to a point at the top, and covered with leaves of the palm-tree. In the centre of the village was a building, larger than the reſt, which ſerved as a kind of hall, or ſtate-houſe, where their youth were animated to emulation, and trained to martial enterpriſe by the renown of their warriors, and the harangues of their orators.

Few arts and manufactures can be ſuppoſed to flouriſh among ſavages; yet the Caribbees ingeniouſly manufacture a ſubſtantial kind of cotton cloth, which they ſtain with various colours, and of which they make kamenoes, or hanging-beds; they alſo fabricate ornamental veſſels of baked clay; they work very elegant baſkets of the fibres of the palmetto-leaf; and their bows and arrows are finiſhed with ſingular ſkill and neatneſs. Among the Caribbees of the continent, there was no diviſion of land, every one cultivating in proportion to his exigencies. Their food, both vegetable and animal, except in the circumſtance of their eating human fleſh, ſeems to have been much the ſame with that of the natives of the larger iſlands. However, they held the fleſh of ſome animals in abhorrence; ſuch as that of the peccari, or Mexican hog, the manati or ſea-cow, and the turtle. They ſcrupled alſo to eat the eel, abundantly ſupplied by ſeveral of their rivers. In ſome of theſe reſpects they manifeſt a conformity to the cuſtoms of the Jews. It is a ſingular circumſtance, that on the birth of the firſt ſon, the father retired to his bed, and faſted with a ſtrictneſs that often endangered life. A ſimilar practice has been recorded concerning the Tybarenians of Aſia, and the Iberians of Spain, and is ſtill obſerved by the people of Japan. This ceremony of faſting was ſucceeded by rejoicing, drunkenneſs, and debauchery. They indulged extraordinary grief for their dead; they not only deſpoiled their hair, but when the maſter of the family died, the ſurviving relations, after burying the corpſe in the centre of his own dwelling, with many demonſtrations of unaffected grief, quitted the houſe altogether, and erected another in a diſtant ſituation. It was their cuſtom to place the dead in the grave in a ſitting poſture, with the knees elevated to the chin. As to their religious opinions and practices, we may obſerve, that they entertained the expectation of a future ſtate, and pleaſed themſelves with the fond conceit that their departed relatives were ſecret ſpectators of their conduct, ſympathizing in their ſufferings, and participating in their welfare. But regarding the ſoul as ſuſceptible of the ſame impreſſions and obnoxious to the ſame paſſions, as when allied to the body, they deemed it a religious duty to their deceaſed heroes, to ſacrifice at their funerals ſome of their captives which had been taken in battle. Immortality, without military glory, was conſidered by them as a curſe; to the brave and virtuous, as to their wives and captives, they allotted a kind of Mahometan paradiſe; but to the degenerate and cowardly they aſſigned a ſtate of puniſhment ſomewhere beyond the mountains, and an ignominy aggravated by captivity and ſervitude among the Arrowauks. The life of the Charaibe is not paſſed without acts of devotion paid to the univerſal Father. In every cottage is erected a ruſtic altar, compoſed of banana leaves and ruſhes, on which they offer to the Deity the earlieſt of their fruits, and the choiceſt of their proviſions. His religion, in fact, however, is a religion of horror; in part, perhaps, the reſult of the tremendous irregularities of the climate. They mark an avenging deity, amid the madneſs of the hurricane, and amid the convulſions occaſioned by frequent earthquakes. In the loud thunder of the tropic, the voice of the incenſed deity is heard, while his arm in imagined vengeance launches the lightning which fires the ſtanding fields of corn, and annihilates the promiſing harveſt. Accordingly, beſide the worſhip which they paid to benevolent deities, they not only believed in the exiſtence of demons and evil ſpirits, but offered to them alſo by the hands of their "Boyez," or pretended magicians, ſacrifices and worſhip; wounding themſelves, on ſuch ſolemnities, with an inſtrument made of the teeth of the agouti, which inflicted horrible gaſhes; conceiving, perhaps, that the malignant powers delighted in groans and miſery, and were to be appeaſed only by human blood. Robertſon's America, vol. ii. Edwards's Hiſt. of the Weſt Indies, vol. i.

CARIBEANA. See Paria and *New* Andalusia.

CARIBOU, an iſland towards the eaſt end of Lake Superior, in North America, S.W. of Montreal bay. N. lat. 47°. W. long. 85° 30′.

CARIBOU, in *Zoology*, an American animal of the ſtag kind. See Cervus *caribou*.

CARICA, in *Botany*, Linn. Gen. 1127. Schreb. 1536. Mart. Mil. (Papaya, Plum. p. 20. Tourn. Inſt. p. 659. Juſſ. p. 399. Vent. vol. iii. p. 521. Gært. 707. Papayer, Encyc. Method.) Claſs and order, *diœcia decandria*. Nat. ord. *Tricoccæ*, Linn. *Cucurbitaceæ*, Juſſ.

Gen. Ch. Male. *Cal.* very ſmall, with five teeth. *Cor.* monopetalous, funnel-ſhaped; tube ſlender, long, gradually leſſening downwards; border five-cleft; ſegments lanceolate-linear, obtuſe, obliquely and ſpirally revolute. *Stam.* filaments ten, at the top of the tube of the corolla; five alternate ones ſhorter; anthers oblong. Female. *Cal.* perianth ſmall, five-toothed, permanent. *Cor.* pentapetalous, Linn. Gært. five-cleft, Juſſ. Vent. Lam. petals or ſegments lanceolate-linear, very long, erect below the middle, reflected and twiſted above. *Piſt.* germ ſuperior, egg-ſhaped; ſtyles ſhort; ſtigmas five, oblong, expanding; widened, truncate, and crenulate at the ſummit. *Peric.* berry large, five-furrowed, one-celled, fleſhy. *Seeds* numerous, attached to five receptacles in the middle of the berry, oleaginous, egg-ſhaped, pointed, encloſed in a brittle, wrinkled tunic or aril.

Eſſ. Ch. Male. *Cal.* very ſmall, five-toothed. *Cor.* five-cleft, funnel-ſhaped. *Filaments*, in the tube of the corolla, alternately ſhorter. Female. *Cal.* five-toothed. *Cor.* five-petalled, or deeply five-cleft. *Stigmas*, five. *Berry* one-celled, many ſeeded.

Species, 1. C. *papaya*, Linn. Sp. Pl. (C. *vulgaris*, Encyc. Meth. Papaya carica, Gært. tab. 122. fig. 2. Lam. Illuſt. Pl. 821. Papaya-maram, Rheed. Mal. tab. 15. fig. 1. Ambapaya, tab. 15. fig. 2. Ababaye of the Caribs.) Common papaw tree. "Lobes of the leaves ſinuated." Somewhat the habit of a palm. *Root* perpendicular, whitiſh, ſpongy, of a diſagreeable taſte and ſmell. *Stem* twenty feet high, a foot thick, naked almoſt to the top, marked almoſt its whole length with the ſcars of fallen leaves, of a tender ſubſtance like that of the banana, ſolid towards the baſe, hollow in its upper part. *Leaves* on petioles near two feet long, the lower ones almoſt horizontal, upper ones erect, deeply divided into ſeven, nine, or eleven ſinuated and gaſhed lobes, alternate, near together. *Flowers* axillary, white, ſweet-ſcented; males in ſlender, pendulous racemes, two or three feet long; pedicels ſhort; females numerous, on ſhort ſimple peduncles. *Fruit* about the ſize of a ſmall melon; various in its form, ſometimes angular, and flattened at both ends, ſometimes oval or round, and ſometimes pyramidal, yellow when ripe; containing a yellow ſucculent pulp of a ſweetiſh taſte and aromatic ſmell. It is ſeldom eaten raw, but, when boiled, is eſteemed a wholeſome ſauce to any kind of freſh meat. It is alſo ſometimes pickled in vinegar, and is frequently preſerved in ſugar, and ſent to Europe with other tropical ſweetmeats. When ripened in our ſtoves, it does not acquire its proper flavour, and is even ſaid by Miller to be deteſtable. The whole plant abounds with a milky acrid juice. Male-flowers are occaſionally found on the female plants, and female on the male ones. A native of both the Eaſt and Weſt Indies. 2. C. *poſopoſa*, Linn. Sp. Pl. Feuillée Per. tab. 39. fig. 1. "Lobes of the leaves entire." *Stem* more frequently branched than that of the preceding. *Lobes* leſs divided, and often entire. A native of Surinam and Peru. 3. C. *ſpinoſa*, Gmel. Syſt. Nat. Encyc. Method. Aubl. Guian. ii. p. 908. tab. 346. "Leaves digitate; leaflets quite entire; ſtem with harmleſs ſpines." *Trunk* branched at leſs than a third of its height. *Leaflets* ſeven, ſmooth, pointed, green above, whitiſh underneath. *Berry* yellow, egg-ſhaped, ſmooth, marked with ſeveral longitudinal furrows; fleſh yellow, ſucculent. A native of Guiana and Brazil.

The firſt ſpecies only has been cultivated in Europe. It is eaſily propagated by ſeeds brought from its native climate, which ſhould be ſown in a hot bed early in the ſpring. When the plants are near two inches high, they ſhould be tranſplanted ſeparately into ſmall pots filled with a light, gentle, loamy ſoil, and plunged into a hot-bed of tanner's bark. As they advance in growth they will require larger pots and when they are too tall to remain under frames, they muſt be placed in the tan-bed of the ſtove, where they will grow to the height of near twenty feet in three years, and produce flowers and fruit. In every period of their growth they ſhould be ſparingly watered. Mart. Mil.

N. B. The annona triloba, trifid fruited cuſtard-apple, is alſo called the papaw-tree in the ſouthern ſtates of North America.

Carica, among *Ancient Naturaliſts*, denotes a kind of fig peculiar to Syria; ſometimes alſo the dried fig. It is alſo uſed in ancient writers to denote the fruit of the palm tree, otherwiſe called *cariata*, which was ſent annually by clients, on New Year's day, as a preſent or acknowledgment to their patrons.

Carica, in *Zoology*, a ſpecies of *Murex*, which ſee.

CARICATO, *Ital.* loaded; a term in *Muſic*, uſually applied to the baſe finger in an Italian burletta, as *Buffo caricato*; to a ſong of which the accompaniments are too full; or to any thing crowded or overcharged. See Chargé.

CARICATURA, in *Painting*, a loading, or exaggeration of the defects of an object repreſented, with a concealment of the beauties or advantages of it; yet ſo as ſtill to preſerve a reſemblance.

The word is Italian, formed of *carica*, a *load*, *burden*, or the like.

CARICOUS *Tumour*, in *Surgery*, is a fig-like excreſcence, (uſually named *ficus* by the moderns,) ſituated near the anus or pudendum, and frequently ariſing from illicit amours. See Ficus.

The etymology of the term *caricous* has been ſometimes miſtaken. It is derived from *carica*, a dried fig, and does not mean the ſame as καρυκοιδὲς; although the editors of a new medical and phyſical dictionary, copying the error of Quincy, ſay that "the caricous tumour is called by Hippocrates καρυκειδὲς:" whereas, this latter word (according to Galen, Suidas, Erotian, Heſychius, Philocrates, and others), denotes a kind of luxurious *ragoût*, compoſed of blood and various condiments, invented by the Lydians, and which Varinus ſuppoſes obtained the name of καρύκη, becauſe it was of a blackiſh colour, reſembling boiled walnuts. Vide Gorrhæi Def. Medic. Lexic. Schrevelii, and Œcon. Hippoc. Fœſii.

CARICUM, a cathæretic application for cleanſing for-did ulcers and eroding fungous fleſh. See Hippocrates de Ulceribus; and καρικὸν, in Galen's Exegeſis. It is prepared of black hellebore, ſandarach, *ſquama æris*, waſhed lead, ſulphur, orpiment, and cantharides; theſe being mixed, are made up with oil of cedar into a liquid medicine. Sometimes there is added arum, in decoction or juice, or the powder of it mixed with honey. The dry medicine or powder, for the ſame purpoſe, is prepared of the ſame ingredients, omitting the oil of cedar, and the honey: it is alſo made of black hellebore and ſandarach only.

CARICUS, in *Ancient Geography,* a river of the Peloponneſus, in Laconia.

CARIDES, or Carida, a town of Aſia Minor in Phrygia. Steph. Byz.

CARIDIEN, in *Geography,* an iſland of Aſia, in the Indian ſea, near the weſt coaſt of the iſland of Ceylon; 12 miles long and two wide. N. lat. 8° 30′. E. long. 79° 55′.

CARIEBOEF *mountains,* a ridge of mountains in the weſtern part of North America. N. lat. 58° 45′. W. long. 115°.

CARIES, in *Surgery,* is a term which implies a corruption or putridity of ſome part of the animal body: this word was uſed by the older ſurgeons, and eſpecially by thoſe of the middle age, to denote a foul or corroding ulcer of the genitals, ariſing from impure coition; but we now almoſt excluſively apply it to a diſſolution of the bony ſtructure, either in an actually dead ſtate, or tending to death. The moſt general diſtinction of *caries,* is into the *dry* and the *moiſt.*

The former ſpecies may beſt be compared with a dry Gangrene of the ſoft parts. The bone is white, dry, and dead, but otherwiſe ſmooth and even; no appearance of putreſcence, matter, or exulceration is viſible; only it is obſerved, that the bone is incapable of adhering to the ſurrounding ſoft parts, or when ſeparated from them, of again forming an adheſion with them. In the majority of caſes, this caries begins at the ſurface; much more rarely in the internal ſubſtance, of the bone. Sometimes it changes into the humid caries.

The *humid caries* is, with reſpect to a bone, the ſame as an ulcer with regard to the ſoft parts. In this diſeaſe the bone is yellow, brown, or black, corroded, uneven, partly conſumed, and a fetid matter iſſues from it. It is diſtinguiſhable into the *occult,* and the *open* caries.

In the firſt, the bone is ſtill covered with ſoft parts, and the external integuments are either entire, or there exiſts already an ulceration, which nevertheleſs does not lay the bone bare. In the firſt caſe the integuments over the diſeaſed part of the bone are waſted, relaxed, oedematous, red or livid; without, however, being inflamed. The patient conſtantly feels gnawing, lancinating pains in the bone below the part, which are increaſed by external preſſure; and when the diſeaſe of the bone is of any conſiderable extent, the patient is generally affected alſo with a ſlow hectic fever.

In the ſecond caſe, the ulcer in the ſoft parts is generally very obſtinate and of a foul appearance, without any manifeſt cauſe; it diſcharges a great quantity of very ill-conditioned matter, and it is relaxed and ſurrounded with fungous excreſcences. All endeavours to heal it prove ineffectual, or if it does ſkin over, it ſoon breaks out again; and frequently, when the cauſe of this obſtinacy is not diſcovered, theſe ulcers are conceived to be of a malignant and cancerous kind.

The open humid caries may be known by the more or leſs copious diſcharge, which has an intolerable and peculiar fœtor, ſtaining linen with black ſpots, and diſcolouring the ſilver probes that are introduced into it, and in which generally ſmall black particles are ſeen to float. The ulcer in the ſoft parts is relaxed, uninflamed, ſpongy, and much inclined to bleed, and the bone is entirely bare, ſoft, uneven, corroded, brown or blackiſh. Sometimes a great quantity of fungous fleſh grows out of the bone itſelf, which eaſily bleeds, covers the bone, and thus renders both the diagnoſis and the cure of the diſeaſe more difficult. This ſpecies of caries may be compared with fungous ulcers of the ſoft parts. In another ſpecies of caries, the bone ſeems to be gradually converted into muſcular ſubſtance.

The humid caries begins either in the inner part of the bone or at its ſurface. In the former caſe, the patient firſt experiences for a long time violent pains in the bone, which are not increaſed by external preſſure; after which, the bone becomes ſwelled, the diſeaſe makes its way through the bone, attacks the ſoft parts, and terminates in an open caries. This ſpecies of caries, which begins in the interior ſubſtance of the bone is far more dangerous than that which commences on its external ſurface; in other reſpects there is no material difference between the two ſpecies; for the internal caries is frequently produced by external cauſes, and the external caries may ſometimes proceed from internal cauſes. Caries is ſometimes combined with an enlargement of the bone, and that moſt frequently when the caries begins in the centre of the bone; however it occurs alſo not unfrequently in the caries which begins externally. This ſwelling, nevertheleſs, does not alter the character and manner of treating the caries; it may occur as well in a mild as in a malignant caries, and ſometimes after the original diſeaſe has been cured, the ſwelling may remain during the life of the patient.

Beſides theſe, ſeveral other ſubdiviſions of the caries may be enumerated; ſuch as,

1. The *gangrenous caries,* which is a variety of the dry caries. The colour of the bone is not much changed at firſt, but when the exfoliation begins, it becomes greyiſh, afterwards brown, and finally black. The exfoliation takes place more eaſily than in the other ſpecies of caries, after the manner of a perceptible exfoliation. The ſame alſo happens here which is obſerved in the ſeparation of gangrenous ſubſtance in the ſoft parts. (See the Art. Gangrene.)

2. Another variety of the humid caries is the *worm-eaten caries* of Petit, which may be compared with an ulcer of the ſoft parts, having many cavities, and when the diſcharge proceeds from corrupted marrow; or with an abſceſs, the matter of which oozes out through a number of ſmall orifices in the ſkin. The bone becomes ſpongy, and full of holes, but it is not very black. The diſcharge is copious, and generally it blackens ſilver probes. Portions of the bone ſeparate themſelves; however, no regular exfoliation takes place, unleſs this ſpecies of caries is changed by art into the above-mentioned gangrenous caries. The bone is gradually deſtroyed and conſumed by the ſuppuration, and it becomes ſo brittle that it can hardly be touched without breaking.

3. *The fungous caries* is in all reſpects ſimilar to the preceding, except that ſpongy fleſh, which readily bleeds, grows out of the carious bone.

4. The *phagedænic caries.* In this diſeaſe, the perioſteum is thickened, the bone becomes ſoft, and from its carious ſurface a fungous ſubſtance, of a red or yellow colour, ſprouts forth. When the diſeaſe ſpreads deeper, it gradually deſtroys all the oſſeous fibres. This ſpecies is diſtinguiſhed from the fungous caries mentioned above by the circumſtance, that in the latter the ſpongy fleſh proceeds from the holes of the bone, the edges of which, though diſcoloured, ſtill remain hard and oſſeous: whereas, in the phagedænic caries,

the oſſeous fibres diſappear wherever the fungous fleſh ſprouts out; ſo that, were we to depend entirely on the probe, it would be very difficult to determine whether the bone were carious or not. For when we rub it under the ſpongy fleſh, with the end of the probe, its ſurface, though uneven, does not ſeem to be very rough, neither can any conſiderable diſcoloration be perceived in it.

5. The *ſcrofulous caries* is diſcovered on opening a ſcrofulous abſceſs, when frequently the bone beneath, though of the natural colour and ſmooth, is found to be detached from all connection with the ſoft parts. Being now expoſed to the air, it gradually becomes diſcoloured, which circumſtance, as well as that it no where adheres to the ſubjacent parts, ſufficiently evinces that the circulation in it is interrupted. Another ſpecies of ſcrofulous caries is that which occurs in white ſwellings of the joints. (See White Swelling.)

6. The *cancerous caries* commences with an enlargement of the bone; which in ſome parts is ſoft, and its internal ſubſtance neither fibrous nor cellular, but ſeemingly compoſed of an irregular accumulation of oſſeous matter. It is covered with a tendinous or cartilaginous ſubſtance, from which a ſmooth fungous excreſcence grows out, and exudes a limpid, acrid and fetid ichor. The patient complains much of deep-ſeated, pulſating, and very acute pain; and the ulcer bleeds profuſely in conſequence of the gradual corroſion of the veſſels at its ſurface. This ſpecies of caries may be compared with a cancer of the ſoft parts, to which it alſo is frequently ſuperadded, when the cancer has ſpread itſelf as deep as the bone. (See Cancer.)

As a ſpecies of caries, may alſo be mentioned that gradual wearing away and conſumption of the bones, which takes place when they are expoſed to conſtant preſſure; as for example, in aneuriſms, hydrocephalus internus, &c.

The Necrosis is, indeed, generally conſidered as a diſeaſe of the bones diſtinct from caries; however, it may not improperly be looked upon as a ſpecies of the dry caries, with a total privation of the living principle.

In all caſes in which an ulceration of a bone diſcharges a large quantity of matter, the ſurgeon muſt not reſt till he has diſcovered and ſufficiently opened the ſource from whence the diſcharge proceeds. The humid caries ſpreads itſelf conſtantly farther and farther; and that the more rapidly, and in a more violent degree, the looſer the bone is, and the more the diſcharge of matter is obſtructed by any cauſe. Moreover, the conſequences of the humid caries are as various, and of the like nature, as thoſe of ulcers; for not only the functions of the diſeaſed part, but alſo thoſe of the neighbouring organs, are always more or leſs affected; the patient is weakened by the daily loſs of fluids; his blood is vitiated by the abſorption of the matter, and a hectic fever is produced, with a conſtant ſtate of erethiſm.

The moſt frequent cauſes of the dry caries are external injuries, whereby a bone is laid bare; and in conſequence of a deficiency of nutritious fluid, the acceſs of the external air, or the contact of vitiated juices, it loſes the living principle and dries up. In ſuch caſes it retains its vital powers longer in young ſubjects than in old. Sometimes this ſpecies of caries takes place ſpontaneouſly; probably when any pernicious acrimony, eſpecially of the arthritic or venereal kind, is depoſited upon the perioſteum.

The humid caries is produced by cauſes ſimilar to thoſe of ulcers in muſcular parts; and may even be produced by ſuch ulcers, when they penetrate as far as the bone. This caries may therefore be divided into as many ſpecies, as there are reckoned of ulcers, with reſpect to their cauſes; and of local cauſes the moſt frequent are the denudation, contuſion, and violent concuſſion of the bone.

The danger in caries depends, as in ulcers, upon the abſorption of unhealthy matter, the daily loſs of fluids, and the conſequent hectic fever; but in caries, the abſorption of matter takes place to a much greater degree, and is more pernicious, as the diſeaſe is deeper ſeated, and the matter extremely acrid and corrupted.

The prognoſis depends upon the ſituation or condition of the bones, the extent of the caries, its cauſe, and its duration. (See Ulcer.)

The dry caries requires for its cure that the dead ſubſtance be ſeparated from the living; and this is done either by a perceptible or imperceptible exfoliation, which is effected either by a chirurgical operation or the efforts of nature. When the ſurgeon foreſees that an exfoliation is about to take place, he muſt open the ulcer in the fleſh ſufficiently, and keep it open, in order that he may be able to extract the ſeparated portions of bone. But in an imperceptible exfoliation this is not neceſſary. A perceptible exfoliation generally takes place when the dead portion of bone is ſtrong and thick; but a thin layer of dead bone commonly exfoliates imperceptibly, as do looſe and ſpongy bones: hard and firm bones commonly exfoliate perceptibly. In young ſubjects the bone is more readily comminuted, and the imperceptible exfoliation is much more frequently obſerved, than in old ones. (See Exfoliation.)

In the perceptible exfoliation, the dead portion of bone firſt becomes whitiſh and dry; after ſome time it ſeems gradually to raiſe itſelf, and yields a ſort of hollow ſound, when ſtruck upon with a probe; at length a fiſſure is formed in the circumference of the dead part, which ſeparates the dead from the living portion of the bone. This fiſſure gradually becomes wider, and at the ſame time the piece of bone becomes more and more elevated; new fleſh is found between the living and dead bone, which as it riſes ſeparates the dead portion, until at length it grows looſe, and finally falls off. The bone beneath is then found covered with granulations which in ſome degree ſupply the place of the loſt portion of the bone, and in time become oſſified.

The exfoliation is entirely a work of nature, but the ſurgeon muſt promote it. He muſt firſt endeavour to remove the internal cauſe of the caries; then (if the exfoliation be judged inevitable), deſtroy completely the life of the diſeaſed portion of bone, and promote its ſeparation. The internal cauſes of caries are to be removed in the ſame manner as thoſe of ulcers. Externally may be applied ſtrong brandy, and various tinctures prepared with it. The diſeaſed portion of the bone is to be kept conſtantly wet with pieces of lint dipped in ſpirituous liquids. But when the diſeaſed portion of bone is ſo thick and ſtrong that it cannot be penetrated by theſe fluid applications, another mode of treatment is neceſſary. There are three different methods according to which we may proceed; but, of theſe, that which is moſt adapted to the peculiar circumſtances of the caſe muſt be choſen.

We may either burn the bone by applying a red-hot iron, or we may bore a number of holes, the more the better, (by means of a perforator or ſmall trephine), but ſo as never to pierce the ſound portion; in order that the above-mentioned remedies may be able to penetrate into and entirely dry out the bone; or we may remove, by means of a ſcraper, ſo much of the bone, that the remaining layer may eaſily be penetrated by drying remedies. It is however well to be attended to, that when the life of the bone is entirely deſtroyed, the drying remedies ſhould no longer be employed, as they then will anſwer no purpoſe, and at the commencement of the exfoliation will even be hurtful. Moreover theſe remedies ſhould come into contact with the whole circumference of the diſeaſed portion of the bone, but (if poſſible) not with any of the ſound part.

The firſt of theſe objects muſt be attained by laying bare the whole diſeaſed portion of the bone by means of inciſions; and the ſecond, by not laying the bone bare further than it is diſeaſed, or by covering the denuded ſound portion with lint ſpread with ſome emollient ointment, alſo by not inbuing the lint with ſo large a quantity of the drying remedies as will come into contact with the ſound parts, and by not uſing theſe remedies longer than is neceſſary. It is alſo particularly requiſite, when a red-hot iron is to be applied, that the carious part ſhould previouſly be well dried out, in order that the heated fluid may not come into contact with and deſtroy the ſound portion of the bone.

As ſoon as the life of the diſeaſed portion of the bone is completely deſtroyed, the ſurgeon uſually employs ſuch remedies as promote the exfoliation, ſuppuration, and growth of the new fleſh; ſuch, for example, as the balſ. Arcæi, either alone, or mixed with a little oil of turpentine, the ung. altheæ, or reſinæ flavæ, &c. Theſe remedies are applied warm; but in order that they may be able to penetrate to the living part of the bone, holes are bored into different parts of the diſeaſed portion with the perforator; and the more numerous and large theſe perforations are the better. Every hole, however, ought to penetrate as far as the living part, and we are directed by many ſurgeons to continue boring till ſome blood appears. As ſoon as this has been done, the bone muſt be covered with warm emollient applications. Should the exfoliation not take place under this treatment, we may conclude either that the diſeaſed portion of the bone is not entirely deprived of its life, in which caſe the application of the drying remedies muſt be repeated, or the cure is impeded by ſome internal cauſe, which muſt be diſcovered and removed. When the diſeaſed bone begins to grow looſe, it will be proper to ſhake it gently from time to time, without exciting, however, either pain or bleeding, in order to accelerate its ſeparation; and when the exfoliation has been completed, the ulcer is to be treated like a ſimple, clean abſceſs.

A much more ſpeedy and perfect cure, however, may be effected when the ſurgeon performs the ſeparation himſelf. This is particularly neceſſary when the diſeaſed portion of bone is very thick; but it is only admiſſible, when we have a free and unobſtructed acceſs to the whole circumference of the diſeaſed bone. According to the difference of the ſituation and form of the bone, the ſeparation of it is performed in different ways. When only a thin layer of bone is diſeaſed, it may be ſcraped off with the ſcraper, or with the exfoliative trepan, or ſtill more conveniently with a piece of glaſs. A thick layer of bone is to be ſeparated with the chiſel and hammer; and that this may be done without uſing great force, or producing a violent concuſſion, the bone muſt be previouſly bored through with the perforator; we muſt alſo only attempt to chiſel off ſmall pieces at a time; and that the whole of the diſeaſed portion has been removed, we may know by the whole ſurface of the bone becoming red and bloody. When the bone is flat, and diſeaſed through and through, we may apply the trepan, and in cylindrical bones we may ſometimes ſaw off the diſeaſed portion. A bone that is diſeaſed throughout muſt be extracted. As ſoon as the whole of the diſeaſed portion has been ſeparated the remaining part is to be treated like a ſimple wound, and the bone is to be dreſſed with emollient warm applications, under the uſe of which it generally becomes covered with fleſh in a ſhort time. In order that it may not again become diſeaſed, it muſt be carefully defended againſt the cold, air, and ſpirituous ſubſtances. In many caſes the ſurgeon cannot remove the whole of the diſeaſed portion of the bone, and in this caſe he muſt combine the two methods of cure with each other; that is, he muſt remove the greater part of the diſeaſed bone, entirely deſtroy the life of that which is left behind, by the application of the remedies formerly mentioned, then perforate according to Beloſte's method, and dreſs the part with emollient applications.

The method of cure in the humid caries is nearly the ſame as that uſed in the dry; only in the former it is neceſſary that the diſcharge ſhould be diminiſhed, its condition improved, and at length that it ſhould be dried up; ſince, till that has been done, no exfoliation can take place. If it proceeds from an internal cauſe, this muſt, if poſſible, be removed. Thus a cure is frequently obtained; however not always, for often the caries remains in conſequence of local cauſes, in which caſe it muſt be treated as a local diſeaſe. In this caſe the ſurgeon muſt promote the evacuation of the matter by every means in his power; he muſt lay the bone ſufficiently bare by means of inciſions; the limb muſt be kept in a dependent poſition; and the ulcer covered with light dreſſings, in order that the thinner part of the diſcharge may run through; and in general every thing which might occaſion a ſtagnation and accumulation of the matter in the ulcer muſt be moſt carefully avoided. But when the bone ſwells, and a quantity of matter is diſcharged from the ulcer, diſproportionate to its apparent magnitude, ſo that we have reaſon to conclude the matter ſtagnates in the fungous ſubſtance, or hollow of the bones, and there carries on its ravages in ſecret, the bone muſt be laid open in time by means of the trepan or perforator. Moreover, in all caſes of humid caries, it is very uſeful to dreſs the ulcer with ſponge or dry lint.

When the caries penetrates deep into the bone, we may apply ſpirituous tinctures and fomentations externally; but in uſing theſe remedies, the directions which we have formerly given are to be obſerved.

Of the internal remedies which contribute to improve the condition of the diſcharge, aſa fœtida has been recommended in the form of pills as one of the moſt efficacious; as it generally deprives the matter in a few days of all its fetor and acrimony, and thus ſometimes is alone ſufficient to produce the exfoliation and cure. In obſtinate caſes of caries, good effects have been produced by the uſe of lime-water, hemlock, oak-bark, cinchona, and opium taken freely; but we are, nevertheleſs, too often diſappointed in our expectations from medicine, and no one plan will be efficient in all ſuch caſes. And, whatever plan may be adopted, it will be at the ſame time particularly neceſſary to breathe a pure air, and uſe an appropiate diet.

When the cauſe of the caries has been removed, and the condition of the diſcharge improved, the exfoliation and cure are ſometimes promoted by the judicious application of a bandage to the part.

Should the means that have already been mentioned be found inadequate to produce the deſired effect, the ſurgeon is obliged to have recourſe to more powerful ones; in order thereby to convert, as it were, the humid caries into the dry, and to accelerate the exfoliation and cure; for this purpoſe a red-hot iron is often our only reſource. As an excellent remedy againſt caries, Mr. Lentin recommends phoſphoric acid, prepared according to Gren's method. One part of this to be mixed with ſeven parts of diſtilled water, and applied to the bone itſelf, or uſed as an injection. Internally, the pure phoſphoric acid has been adminiſtered, in doſes of 10, 15, to 20 drops, thrice a day, in water, or a linctus.

Sometimes Mr. Lentin added a little myrrh to it, for external application; or mixed the phoſphoric acid with an infuſion of ſabine, ſcordium, or cort. ſalicis.

When the diſeaſed bone is covered with much fungous fleſh, this muſt firſt be removed by means of cauſtic applications, in order that it may not obſtruct the operation of the red-hot iron on the bone. When the caries penetrates ſo deep into the bone that the operation of the cautery does not extend quite through it as far as the bone, a part of the diſeaſed portion may be removed with the ſcraper, or the chiſel and hammer. In flat bones, under which important parts are ſituated, as, for example, the cranium, the application of the red hot iron muſt either be omitted or performed with great caution. When any of theſe means have been applied to a ſufficient extent, the ſurgeon muſt treat the diſorder as a dry caries. If exfoliation does not commence within the ſpace of about 20 days, the remedies muſt be renewed. When exfoliation has completely taken place, and the bone ſituated below the ſeparated portion becomes covered with ſound fleſh, the cure is completed; but if it remains bare, or is covered with fungous fleſh, it is ſtill diſeaſed, and muſt be touched either with Beloſte's liquor, or the actual cautery.

When the caries is of great extent, and penetrates deep into the bone, the beſt method will be to remove the diſeaſed portion of the bone, either entirely or in part, by means of chirurgical inſtruments; and the manner in which this may moſt conveniently be done, will depend upon the circumſtances of each particular caſe. If the caries be entirely confined to the ſurface of the bone, the damaged portion may be removed with the ſcraper, or the exfoliating trepan, or a piece of glaſs. The chiſel and hammer are required when it penetrates deep into the bone; the trepan may be uſed when it penetrates into the medullary cavity, or the cellular ſubſtance of the bone. If the whole bone be diſeaſed throughout, the external teguments muſt be laid open, and the bone extracted. In other particulars the ſurgeon has to proceed in the manner above directed.

Caries ſometimes renders it neceſſary that the limb ſhould be amputated; namely, when a bone of one of the extremities is either entirely, or particularly at the joint, carious through and through; and eſpecially when the muſcular and more important parts are in a great meaſure affected by the diſeaſe of the bone, and either corroded or deſtroyed, as may happen in what is named the Cancerous caries. It has, however, been obſerved, that, after this operation has been performed, the diſorder often breaks out in ſome other part, and renders all medical aſſiſtance ineffectual. If, on the contrary, the muſcular parts have ſuffered but little, although the bone is very carious, amputation ought not to be performed; but all that the ſurgeon can and ought to do, will be to lay bare the whole of the diſeaſed bone by inciſions, and to ſeparate it from the ſoft parts with the ſcalpel, and from the ſound portion of the bone with the ſaw. In theſe caſes, nature ſometimes ſupplies the portion of the bone that has been loſt, and though this ſhould not happen, the operation above mentioned is ſtill preferable to amputation in this particular caſe.

Neither is amputation always admiſſible when the caries proceeds from ſome internal cauſe, and this has not been removed. It muſt alſo be avoided when the patient is already greatly exhauſted by the diſeaſe: however, the ſurgeon need not be deterred by the mere preſence of hectic fever; as this ariſes principally from the irritation or abſorption of matter, and diſappears, together with its cauſe, after the operation has been performed. It alſo happens, not unfrequently, in caſes of old caries, in which the conſtitution has become accuſtomed to the diſcharge, that troubleſome ſymptoms ſupervene upon amputation, which perhaps may be prevented by means of iſſues.

When the carious bone is covered with a great deal of fungous fleſh, deſiccative remedies and preſſure muſt be applied; and ſhould theſe not prove ſufficient to extirpate it, we muſt uſe a cauſtic, or the actual Cautery. In theſe caſes there is generally alſo ſome internal cauſe preſent, which we muſt endeavour to remove by means of appropriate internal remedies. In that ſpecies of caries in which the bone is converted into a kind of fleſhy ſubſtance, the internal and external uſe of lime-water has been found beneficial; the ſurgeon muſt, however, always attend at the ſame time to the internal cauſe. See Osteosarcosis.

Concerning that ſpecies of caries which begins in the internal ſubſtance of the bone, ſee Spina *Ventoſa* and Necrosis; and for the venereal caries, ſee Syphilis. Likewiſe, concerning carious teeth, we refer to the article Teeth. See alſo *Diſtortion of the* Spine.

Although we have here laid down the rules of practice, which the generality of ſurgeons follow in the treatment of caries, it muſt ſtill be acknowledged that no ſubject in the whole compaſs of the art is more liable to obſcurity and debate. The modes of treatment adopted by one ſurgeon, will be often regarded as either uſeleſs or pernicious by another; ſo that while we are obliged to deſcribe certain plans of chirurgical management, it is with a full conviction that no one method will be univerſally approved. The following remarks of M. Boyer, of Paris, are ſubmitted to our readers, as deſerving their attention, and as being among the lateſt with which the public have been favoured by any ſyſtematic writer.

"There is perhaps," ſays he, "no diſeaſe in which the indications of cure are more vague than in caries, and none in which the treatment is leſs regular. The ancients preſcribed unctuous or relaxing applications, but they preferred acrid irritating ſubſtances, ſuch as the powder of euphorbium, tincture of aloes and myrrh, oil of turpentine, mineral acids, cauſtic alkali, or even the actual cautery. Monro, Tenon, and, in imitation of them, ſome modern practitioners, have preferred the uſe of unctuous and emollient applications; but, in order to diſcover the preferable mode of treatment, it is neceſſary to take a cloſe view of the evil againſt which it is to be directed. We muſt then conſider, that a bone affected with caries is a prey to a morbid action of its own parts, and that this action creeps from one part to another, and pervades the whole with greater or leſs rapidity, if art does not come to the aſſiſtance of nature to arreſt its progreſs.

"If the caries be produced by ſome affection of the ſyſtem, this ſhould be aſcertained and combated with appropriate remedies. Thus the uſe of mercurial and ſudorific medicines arreſts the progreſs of caries proceeding from the venereal diſeaſe, and aids nature in ſeparating the unſound from the ſound part. The uſe of ſpirituous drinks, vegetable diet, and acids, removes at once ſcurvy and the caries, to which it had given riſe, &c. &c. But if it has been occaſioned by an external cauſe, or if it has remained after the internal one has been removed, ſo as to be reduced to the ſtate of a mere topical affection, its progreſs may be arreſted, and the ſeparation of the diſeaſed parts facilitated by the uſe of ſuch ſubſtances as ſtimulate the parts, or ſuch as abſorb and neutralize the fluids which tend to propagate the morbid action. Thus the deſiccation of a carious ulcer has been effected by the uſe of an abſorbing powder and pledgets of lint that had been dipped in tincture of aloes and myrrh.

"If theſe remedies be found ineffectual, recourſe muſt be had to more active ones: a pledget of lint dipped in a ſolution of nitrate of ſilver, may be applied on the carious part, and renewed every day. This portion of the bone is by this means quickly dried up, and reduced to the ſtate of a ſimple necroſis; the propagation of the morbid action is arreſted, and nature effects a ſeparation of the diſeaſed parts. It will not be amiſs, however, to move frequently the dried piece, and it may be neceſſary to prevent the fungous fleſh from ſpreading ſo as to impede the exfoliation. The ulcer heals after the exfoliation has taken place, and the cicatrix is more or leſs deep, and of a red colour, not blackiſh and livid, as a cicatrix formed over a diſeaſed bone.

"If the caries be very humid, that is, if a great quantity of ſanies flow from it, theſe remedies, even the mercurial nitrate, will be of no effect. The ſanies waſhes the pledget, and dilutes the cauſtic ſo much, that its action is conſiderably enfeebled. Cauſtic potaſh would be ſubject to the ſame inconvenience. In theſe caſes, the actual cautery is a remedy to be preferred to all others: by its action the carious part is in an inſtant reduced to the ſtate of an inorganic dry ſubſtance, and the caries thus converted into necroſis. This remedy is applicable to every caſe of humid caries where the ſurrounding ſoft parts have not a manifeſt tendency to cancer. Sometimes, however, the ſoft parts ſurrounding a carious bone have that tendency in ſo advanced a degree, that the actual cautery would neceſſarily occaſion the developement of that morbid ſtate. The general rules to which the uſe of the actual cautery may be reduced are as follow:

"In the firſt place, all the carious part of the bone muſt be laid bare, whether by cutting away the ſoft parts, or deſtroying them by cauſtic. The latter method being tedious, inconvenient, and uncertain, ſhould not be uſed unleſs when the patient will not ſubmit to the uſe of the knife. The bone being in this manner laid bare and ſcraped, the ſurgeon provides himſelf with ſeveral cauterizing irons of the ſame form, becauſe the application of one is ſeldom ſufficient. It will alſo be neceſſary to provide a number of canulæ when the cautery is to be applied on a bone from about which the ſoft parts cannot be completely raiſed, as, for inſtance, on the os coccygis, or ſacrum: by means of theſe canulæ, the hot iron can be introduced without injuring the ſoft parts. In every caſe it will be neceſſary to protect the ſurrounding parts as much as poſſible from the action of the cautery.

"The iron, whatever may be its ſize, ſhould be heated white, as the hotter it is the more rapid and leſs painful is its action. On the inſtant of its application, a black thick ſmoke riſes from the ſurface of the burning bone, the ſmell of which reſembles exactly that of burning horn: the great quantity of ſanies quickly diminiſhes the heat; for which reaſon a ſecond is to be immediately applied with the ſame precautions; and a third, if the two preceding have not burned deep enough. Care ſhould be taken to extirpate the diſeaſe by burning every part that is affected; and if the uſe of the cautery has not always had the ſucceſs expected from it, the failure of it is to be attributed to the timidity of the operator. A carious bone becomes worſe by the application of the actual cautery, if the evil be not entirely rooted out; juſt as a cancerous tumour becomes irritated, and makes a more rapid progreſs, if imperfectly cauterized.

"The actual cautery acts by evaporating the noxious fluids in which the carious bone was immerſed; by changing the caries into necroſis, and by irritating the ſubjacent ſound parts, and exciting that action of the veſſels by which the dead part of the bone muſt be thrown off.

"It is almoſt ſuperfluous to remark here, that this operation cannot be undertaken with any hope of ſucceſs, if the internal cauſe of the caries ſtill exiſt." Boyer's Diſeaſes of the Bones, vol. i. p. 334, & ſeq. edit. Lond. 1804.

CARIGE, in *Ancient Geography*, a town of India, on this ſide of the Ganges. Ptolemy.

CARIGNAN, in *Geography*, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Sedan, formerly a provoſtſhip, called "Ivoy," belonging to the dukes of Luxemburg, the dukes of Burgundy, and the houſe of Auſtria, but at length ceded to Louis XIV., who changed the name, and erected it into a duchy; three leagues E.S.E. of Sedan. The place contains 1500, and the canton 10,923 inhabitants: the territory comprehends 225 kiliometres and 27 communes.

CARIGNANO, a town of Piedmont, in the diſtrict of Savigliano, and capital of a principality, to which it gives name, ſeated on the Po, over which it has a handſome bridge. It gives the title of princes to a collateral branch of the houſe of Savoy. This town was plundered and burned by the French in 1536, and in 1544, the fortifications, except the citadel, were razed, and moſt of the churches deſtroyed. It is about 10 miles S. of Turin. N. lat. 44° 30′. E. long. 7° 25′.

CARIGNANO, a town of the iſland of Sardinia; 15 miles W.N.W. of Terra Nuova.

CARIGUE, an iſland in the river Shannon, on the coaſt of the county of Kerry, Ireland, oppoſite to Scattery Iſland. Near it are the ruins of Carrigfoil caſtle, once a place of great ſtrength, the lands belonging to which were granted to Trinity College, Dublin.

CARIGUEIA, in *Zoology*. See DIDELPHIS *Opoſſum*.

CARIGUEIBEIU. See MUSTELA *braſilienſis*.

CARILLÆ, in *Ancient Geography*, a town of Italy, mentioned by Silius Italicus, and ſuppoſed to belong to the Picentini, who inhabited the diſtrict now called Principato Citra.

CARILLONS, a ſpecies of chimes frequent in the Low Countries, particularly at Ghent and Antwerp, and played on a number of bells in a belfrey, forming a complete ſeries or ſcales, of tones and ſemitones, like thoſe on the harpſichord and organ. There are pedals communicating with the great bells, upon which the *carilloneur* with his feet plays the baſe to ſprightly airs, performed with the two hands upon the upper ſpecies of keys. Theſe keys are projecting ſticks, wide enough aſunder to be ſtruck with violence and velocity by either of the hands edgeways, without the danger of hitting the neighbouring key. The player is provided with a thick leather covering for the little finger of each hand, to guard againſt the violence of the ſtroke. Theſe carillons are heard through a large town.

*Carillon* is likewiſe the name of a ſmall keyed inſtrument to imitate a peal of hand bells. The tones are produced by box hammers ſtriking iron bars of different lengths. Handel uſed to accompany his air in Milton's Allegro, "Or let the merry bells ring round," on this inſtrument. And in Saul, the chorus "Welcome, welcome, mighty king."

CARILLONEUR, the muſician who plays the carillons, or chimes with hands and feet; an office of extreme labour, peculiar to Holland and the Netherlands.

CARILLONEUR of Buffon, in *Ornithology*, the chiming thruſh, TURDUS *tintinnabulatus*.

CARILOCUS, in *Ancient Geography*, now *Charlieu*, a town of Gaul, belonging to the Ædui. Ptolemy.

CARIM-CURINI, in *Botany*, Rheed. Mal. See JUSTICIA *echolium*.

CARIMGOLA, Rheed. Mal. See PONTEDERIA *vaginalis*.

CARIMON, in *Geography*, one of the chief towns in the kingdom of Yohor, which occupies the ſouthern extremity of the Cherſoneſe, in the peninſula of Malaya, or Malacca.

Carimon *Java*, a cluſter of iſlands in the Indian Sea. S. lat. 5° 48′. E. long. 109° 15′.

CARIMPANA, in *Botany*, Rheed. Mal. See Borassus *flabelliformis*.

CARIM-TUMBA, Rheed. Mal. See Nepeta *malabarica*.

CARINA, a Latin term, properly ſignifying the keel of a ſhip, or that long piece of timber running along the bottom of a ſhip, from head to ſtern; upon which the whole ſtructure is built, or framed.

Carina is alſo frequently uſed for the whole capacity or bulk of a ſhip; containing the hull, or all the ſpace below the deck. Hence the word is alſo ſometimes uſed, by a figure, for the whole ſhip.

Carina is alſo uſed in the ancient *Architecture*. The Romans gave the name carina to all buildings in the form of a ſhip, as we ſtill give the name nave to the middle or principal vault of our Gothic churches, becauſe it has that figure.

Carina, among *Anatomiſts*, is uſed to denote the *ſpina dorſi*. As likewiſe for the fibrous rudiments, or embryo of a chick, appearing in an incubated egg. The carina conſiſts of the entire *vertebræ*, as they appear after ten or twelve days incubation. It is thus called, becauſe crooked, in form of the keel of a ſhip.

Carina, in *Botany*, Eng. keel. A name given to the loweſt petal of a papilionaceous flower which generally encloſes the ſtamens and piſtil, in alluſion to its ſhape, which has ſome reſemblance to that of a boat. It ſometimes conſiſts of two diſtinct pieces, but is generally ſimple, attached to the receptacle, and firmly locked in with the other petals by two long claws. A leaf, a ſcale, and a nectary are alſo ſaid to be carinated, or keel-ſhaped, when they are longitudinally hollow above, and have a correſponding, ſharpiſh protuberance underneath.

Carina is alſo uſed by ſome *Chemiſts*, for the twentieth part of a drop.

Carinæ were weepers, or women hired, among the ancient Romans, to weep at funerals: they were thus called from *Caria*, the country whence moſt of them came.

Carina, in *Ancient Geography*, a town of Aſia, placed by Ptolemy in Media.—Alſo, a town of Aſia Minor in Myſia, or in the Æolide; mentioned by Herodotus.—Alſo, a town of Aſia, in Phrygia, towards Galatia. Pliny.—Alſo, a mountain of the Iſle of Crete, which, according to Pliny, was nine miles in circuit.

CARINACOU, in *Geography*. See Cariacou.

CARINANA, Carinena, or Sarignena, a town of Spain in Arragon, about 4½ miles from Longaris, containing 2036 inhabitants, and two convents.

CARINENTA, in *Entomology*. See Papilio.

CARINI, in *Ancient Geography*, a people of Germany, being part of thoſe who were comprehended under the general name of Vandals, and whoſe habitation was near the Codanus Sinus. Pliny.—Alſo, a people of Germany, in the vicinity of the Helvetians.—Alſo, a people of ancient Britain, called *Careni*, which ſee.

Carini, in *Geography*, a town of Sicily, pleaſantly ſituate in a fertile valley, ſurrounded by high rocks, and in a well cultivated diſtrict, abounding in wine, grain of various kinds, olives, and all ſorts of fruit. The town is ſingularly neat, contains 4000, (Swinburne,) or 7000, (De Non,) inhabitants, and gives title of prince to the family of Grua, who inhabit an old Gothic caſtle ſeated on a rock. It is diſtant one mile from the ſea-ſhore, and 18 miles from Palermo. The adjacent territory produces a great quantity of excellent manna, as well as oil and wine. A long ridge, like a rampart, and ſome remnants of a wall, are ſaid to indicate the ſite of "Hiccara," a city mentioned by Thucydides, as the birth-place of Lais, the moſt celebrated courtezan in Grecian hiſtory, who was carried off when Nicias the Athenian general landed here in his way from Italy, plundered the town, and ſold the inhabitants for ſlaves. Near the land, at ſome diſtance round the bay of Carini, lies the Iſole delle Femine, formerly a place of baniſhment for criminals.

CARINISH Point, a cape of Ireland weſt of Ballydonegan bay, in the county of Cork, and a little eaſt of Durſey Iſland. It is more frequently called Carinam. N. lat. 51° 34′. W. long. 10° 1′.

CARINOLA, a town of Naples, in the country of Lavora, the ſee of a biſhop, ſuffragan of Capua; 15 miles N. E. of Capua.

CARINTHIA, a duchy of Auſtria, bounded to the eaſt by Stiria, to the north by the ſame, and the archbiſhopric of Salzburg, to the weſt by Tyrol, and to the ſouth by the republic of Venice and Carniola. It derives its name from the ancient Carni, who were a colony of the Celtes, called in later times Carantani and Carinthi; and it was formerly a part of Carnia and Noricum. The country is very mountainous and woody. Its principal mountains are St. Ulrich, St. Helena, St. Veit, St. Laurence, and the mountain of Loihl, which ſeparates Carinthia from Carniola. There are alſo others, no leſs lofty, that lie towards Tyrol. Theſe mountains yield very good iron; the iron-mines near Frieſach on the north, and in the tract among the ſprings of the Lyſer, being particularly famous. In the diſtrict of Villach are found rich lead mines, a beautiful blue granite, and fire marble, or lumachelli. The fertile dales of this country produce wheat and other corn, but not enough for the ſupply of the inhabitants. Carinthia has a number of lakes, the largeſt of which is that called Wordtſee, eight miles long, and abounding in fiſh, and alſo many rivers, the principal of which are the Drau, iſſuing out of Tyrol, and traverſing Carinthia from eaſt to weſt; the Gail, the Moll, the Lyſer, the Glan, the Gurk, and the Lavant. The cities of Carinthia, of which Clagenfurth is the capital, are eleven; its market-towns 25; its villages, &c. 28,000; its houſes 49,000; its convents 20; clergy 1010; nobles 386; burghers and tradeſmen 4,753; peaſants 27,013; herds of oxen 50,000; proteſtants, with Upper Stiria, 17,000. The inhabitants are partly deſcended from the ancient Germans, and partly from the Wends. The archbiſhop of Salzburg, and the biſhop of Bamberg, have conſiderable territories in this country. The principal manufactures of the country are thoſe of iron and ſteel. In 1282 the emperor Rudolph I. conferred this duchy as a fief on the count of Tyrol, who entered into a compromiſe with Albrecht of Auſtria, by virtue of which, it was to deſcend, on the extinction of his male iſſue, to the heirs of Albrecht; and when this happened, in the year 1331, the emperor Lewis of Bavaria recognized this duchy to the Auſtrian duke Otto, who, in 1335, was inveſted with it. The duchy is governed by a land-captain; and to the military ſtate of the houſe of Auſtria it has been accuſtomed to contribute annually 637,695 florins. Chriſtianity was introduced into this duchy in the 7th century; and the whole country acknowledges the Roman Catholic church, though it contains many proteſtants and adherents to the Lutheran doctrine.

Carinthia is divided into Lower and Upper. The principal towns of Lower Carinthia, are Clagenfurth, the capital, St. Veit, Frieſach, Volken, St. Andree, Wolfsberg, and Gurk; and thoſe of Upper Carinthia are Villach and Gmund.

CARINUS, in *Biography*, a Roman emperor, was the eldeſt ſon of the emperor Carus, who, ſoon after his father's election, in the year 282, was admitted, together with his brother Numerian, to a participation of the imperial power; and both, being arrived at manhood, were honoured with the title of Cæſars. Carinus was extremely vicious from his youth, and devoted to diſſolute pleaſures. He was, however, valiant and active; and, therefore, when his father departed for the proſecution of the Perſian war, the young prince was directed, firſt to ſuppreſs ſome troubles which had ariſen in Gaul, and afterwards to fix the ſeat of his reſidence at Rome, and to aſſume the government of the weſtern provinces. Upon the death of Carus, near the cloſe of the year 283, the two brothers, Numerian and Carinus, were unanimouſly acknowledged as Roman emperors. Born and educated in a private ſtation their ſudden elevation required an uncommon ſhare of virtue and prudence; but Carinus was ſingularly deficient in theſe qualities. On his arrival at Rome from the Gallic war, he abandoned himſelf to the luxury of the capital. He blended in his character effeminacy with cruelty, a love of pleaſure with a groſs and indiſcriminating taſte, and an indifference to public eſteem with conſummate vanity. In the courſe of a few months he ſucceſſively married and divorced nine wives, moſt of whom he left pregnant; and whilſt he wallowed in the groſſeſt pleaſures, he beheld with inveterate hatred thoſe who might remember his former obſcurity, or cenſure his preſent conduct. He baniſhed, or put to death, the friends and counſellors of his youth; and whilſt he affected an arrogant and regal demeanour among the ſenators, he ſelected his favourites, and even his miniſters, from the dregs of the populace. The palace, and even the imperial table, were filled with ſingers, dancers, proſtitutes, and all the various retinue of vice and folly. Before the death of his father, the conduct of Carinus had filled him with ſhame and regret, and he determined to ſet him aſide, and to adopt in his place the brave and virtuous Conſtantius, who was at that time governor of Dalmatia. But a ſudden death prevented the execution of his purpoſe, and afforded his worthleſs and degenerate ſon an opportunity of diſplaying to the Romans the extravagancies of Elagabalus aggravated by the cruelty of Domitian. The unreſtricted profuſion with which he indulged his propenſity to every kind of pleaſure, ſupplied him with the means of exhibiting the Roman games of the theatre, the circus, and the amphitheatre, with uncommon ſplendour; and the vain prodigality which he manifeſted in this way was enjoyed by the Roman people with ſurpriſe and tranſport. Upon the death of Numerian, Diocletian was elected emperor by the Roman army, aſſembled at Chalcedon; and the new emperor, fully apprized of the general diſſatisfaction occaſioned by the conduct of Carinus, made preparation for a civil war. In the ſpring of the year 285, the forces of the Eaſt and Weſt encountered each other in the plains of Margus, a ſmall city of Mœſia (now Servia), in the neighbourhood of the Danube. The Eaſtern army had been reduced in number, and its ſtrength had been exhauſted; ſo that it was not in a condition to contend with the legions of Europe. Its ranks, on the firſt onſet, were broken, and Diocletian deſpaired of the purple and of life. But the advantage which Carinus had obtained by the valour of his ſoldiers, he ſoon loſt by the infidelity of his officers. A tribune, whoſe wife the licentious emperor had ſeduced, ſeized the opportunity of revenge, "and by a ſingle blow, (ſays Gibbon,) extinguiſhed civil diſcord in the blood of the adulterer." Crevier's Rom. Emp. vol. ix. Gibbon's Hiſt. vol. ii. chap. 12.

CARIOLE, a name given by the Canadians to a ſledge, by which they tranſport themſelves over the ſnow, from place to place, in the moſt agreeable manner, and with a degree of celerity that appears almoſt incredible; for, with the ſame horſe, it is poſſible to go 80 miles in a day, ſo light is the draft of one of theſe carriages, and ſo favourable is the ſnow to the feet of the horſe. This cariole will hold two perſons and a driver, and is uſually drawn by one horſe. Its ſhape is varied according to the fancy and taſte of the owner. Some are open, and others covered. The former is commonly like the body of a capriole, put upon two iron runners or ſlides, ſimilar in ſhape to the rim of a pair of ſkates: the latter conſiſts of the body of a chariot put on runners in the ſame manner, and entirely covered with furs. The carioles glide over the ſnow ſo ſmoothly and with ſo little noiſe, that it is neceſſary to have a number of bells attached to the harneſs, or a perſon continually ſounding a horn to guard againſt accidents. The rapidity of the motion, and the ſound of theſe bells and horns, conduce much to cheerfulneſs, for you ſeldom ſee a dull face in a cariole. Weld's Travels, vol. i. p. 392.

CARIOPHYLLUM *Saxeum*, in *Zoology*, one of the ſynonymous names of *madrepora faſcicularis*, Gmel.

CARIOUS, the ſtate of a bone putrefied or rotten. See Caries.

CARIPI, a kind of cavalry in the Turkiſh army. The caripi, to the number of about 1000, are not ſlaves, nor bred up in ſeraglios or ſeminaries, like the reſt; but are generally Moors, or renegado Chriſtians, who, having followed adventures, and being poor, and having their fortune to ſeek, by their dexterity and courage have arrived at the rank of horſe guards to the grand ſignior. They march with the Ulufagi on the left hand, behind him: their pay is twelve aſpers per day.

The word *caripi* ſignifies *poor* and *ſtranger*; an appellation ſaid by Chalcondylas to have been given them, becauſe chiefly brought out of Egypt, Africa, &c.

CARI-PIRA, in *Ornithology*, one of the ſynonyms of the great frigate bird; *pelecanus aquilus*, Linn. which ſee.

CARIPOUS, in *Geography*, a people of South America, inhabiting a country to the north of the river Amazon; who are at perpetual war with the Caribbees.

CARIS, in *Ancient Geography*, now *le Cher*, a river of Gaul, called alſo *Carus*.—Alſo, one of the names of the iſle of Cos.—Alſo, a town of Phrygia. Steph. Byz.

CARISBROOK *Caſtle*, in *Geography*, an ancient caſtle in the iſle of Wight, near Newport, where king Charles I. was impriſoned thirteen months. It has a governor and a garriſon.

CARISSA, in *Botany*, Linn. Mant. 52. Schreb. 413. Lam. Ill. 330. Willd. 473. Juſſ. 149. Vent. vol. ii. 431. (Calac. Encyc. Nouv. Hiſt.) Claſs and order, *pentandria monogynia*. Nat. ord. *Contortæ*, Linn. *Apocinæ*, Juſſ.

Gen. Char. *Cal.* very ſmall, five-cleft, acute, permanent. *Cor.* monopetalous, funnel-ſhaped; tube much longer than the calyx, cylindrical, ſomewhat ventricoſe at the throat; border five-cleft, ſpreading; ſegments oblong, acute, ſhorter than the tube. *Stam.* filaments five, very ſhort at the top of the tube; anthers oblong, within the throat. *Piſt.* germ ſuperior, roundiſh; ſtyle thread-ſhaped, the length of the tube; ſtigma thickiſh, ſlightly bifid. *Pericarp.* berry ſomewhat globular, ſmall, two-celled; partition thin, membranous. *Seeds* ſolitary, or two together, egg-ſhaped, ſomewhat compreſſed.

Eſſ. Char. *Calyx* ſhort. *Corolla* funnel-ſhaped. *Berry* two-celled. Lam. Illuſt.

* *Thorny.*

Species, 1. C. *carandas*, Linn. Mant. p. 52. Lam. Illuſt. Pl. 18.

Pl. 118. fig. 1. (Echites ſpinoſa, Burm. Ind. 69. Carandas, Rumph. Amb. vii. p. 57. tab. 25. Lycium Malabaricum, Pluk. Alm. tab. 305. fig. 4.) "Leaves elliptical, obtuſe." Linn. "Leaves egg-ſhaped, mucronate, reticularly veined; ſegments of the corolla lanceolate." Willd. A ſhrub. *Stem* fifteen feet high, much branched; branches generally furniſhed at their knots with ſtraight, ſtiff, oppoſite, ſpreading ſpines, often ſimple, ſometimes bifid, not perfectly axillary. *Leaves* oppoſite, entire, ſmooth, a little coriaceous, on very ſhort petioles. *Flowers* white, reſembling thoſe of the common jaſmine; peduncles generally trifid. *Berry* dark red, of a pleaſant acidulous flavour. La Marck, from a dried ſpecimen. The ſpecimen from which Willdenow formed his deſcription has mucronate leaves; but in La Marck's figure they are perfectly obtuſe and entire. A native of the Eaſt Indies, where it is made into an excellent ſweetmeat. Loureiro found, on the eaſt coaſt of Africa, a plant which he ſuppoſes the ſame; but, if his deſcription be accurate, it muſt not only be a different ſpecies, but will require a ſmall alteration in the generic character. It is a ſmall tree, about ſix feet in height, with twiſted, ſpreading, dichotomous branches; branched, not ſimply; dichotomous ſpines; egg-ſhaped, acute leaves, and a *one-celled* berry, containing many roundiſh imbricated ſeeds. 2. C. *ſalicina*, Lam. Encyc. and Illuſt. "Leaves lanceolate, oblong, mucronate, growing narrower towards the petiole." A ſhrub. *Leaves* ſmooth, ſhining, veined, only half as broad as in the preceding ſpecies, and reſembling thoſe of the almond tree; petioles longer. *Spines* oppoſite, ſtraight, ſimple, ſpreading horizontally. *Flowers* ſmaller. A native of the Eaſt Indies, communicated by Sonnerat, but perhaps only a variety. 3. C. *ſpinarum*, Linn. Mant. 559. Lam. Ill. pl. 118. f. 2. (Spina ſpinarum, Rumph. Amb. vii. p. 76. tab. 19. fig. 1.) "Leaves egg-ſhaped, acute, veined; ſegments of the corolla lanceolate-oblong." A ſhrub, five or ſix feet high, much branched, ſpreading. *Branches* ſlender, cylindrical, dichotomous, ſomewhat zig-zag. *Spines* in pairs, oppoſite, generally ſimple, ſometimes bifid, ſituated at the bifurcations and knots of the ſtem. *Leaves* ſcarcely an inch long, reſembling thoſe of the myrtle, oppoſite, egg-ſhaped, acute, entire, coriaceous, ſmooth, ſhining above, finely veined, on very ſhort petioles, ſo as to appear nearly ſeſſile. *Flowers* terminating, from two to five together on each petiole; tube of the corolla red, cylindrical, a little ſwelling about the middle; border white, ſpreading; ſegments five, lanceolate, acute. *Berry* blackiſh, about the ſize of a pea, egg-ſhaped, two-celled. *Seeds* two in each cell, elliptical, convex on one ſide, flat on the other. La Marck. A native of the Eaſt Indies. Loureiro found a plant in Cochinchina, which he ſuppoſed to be the ſame, and for which, in conjunction with another obſerved by him in Africa, he formed a new genus. But it differs ſo much, not only from the deſcription of Linnæus, but alſo from that of La Marck given above, which was taken from dried ſpecimens both in flower and fruit, that it muſt be a different plant. See Stigmarota. 4. C. *edulis*, Willd. 3. (Antura, Forſkal. Deſc. 63.) "Leaves egg-ſhaped, acute, without veins; branches villous near the top; ſegments of the corolla lanceolate-linear." A native of Arabia Felix. 5. C. *arduina*, Lam. Encyc. and Ill. (Arduina biſpinoſa, Linn. "Leaves heart-egg-ſhaped, mucronate, nearly without veins, evergreen; ſpines bifid at the tip. See Arduina. La Marck is the firſt who obſerved that the arduina and cariſſa of Linnæus are properly one genus, to which opinion Juſſieu has acceded.

** *Without thorns.*

6. C. *inermis*, Willd. 4. "Leaves egg-heart-ſhaped, mucronate, without veins," Vahl. Symb. iii. p. 43. *Leaves* three times as broad as thoſe of C. ſpinarum, rounded at the baſe. *Flowers* larger; ſegments of the calyx briſtle-ſhaped. A native of the Eaſt Indies. 7. C. *mitis*, Willd. 5. Vahl Symb. tab. 59. "Leaves lanceolate, attenuated." A native of the Eaſt Indies.

Carissa, in *Ancient Geography*, a town of Aſia Minor, in Paphlagonia. Pliny and Ptolemy.

Carissa *Regia*, ſurnamed *Aurelia*, a town of Spain, in the department of the Gades. The ruins are found in a place called Cariza.

CARISSIMI, in *Antiquity*, a quality or appellation given by the emperors of Conſtantinople to preſidents, governors of provinces, and others.

Carissimi, Giacomo, in *Biography*, a Roman muſical compoſer of the 17th century, whoſe productions were not only the delight of his contemporaries, but are ſtill ſought and hoarded by the curious as precious relics. He was, very early in life, appointed maeſtro di capella to the German college at Rome, in preference to all other candidates. Alberto delle Valle, an excellent judge of muſic, ſpeaking of the compoſitions of Cariſſimi, which he heard at Rome, without knowing his name, ſays, that he had heard the veſpers performed on Eaſter-Monday, by the nuns only, at the church *dello Spirito Santo*, in florid muſic, with ſuch perfection as he never in his life had heard before; and on the laſt Chriſtmas-eve, in attending the whole ſervice at the church of St. Apollinare, where every part of it was performed agreeably to ſo ſolemn an occaſion; though, by arriving too late, he was obliged to ſtand the whole time in a very great crowd, he remained there with the utmoſt pleaſure, to hear the excellent muſic that was performed. In the beginning, he was particularly enchanted by the *Venite exultemus*, which was more exquiſite than words can deſcribe. "I know not," ſays Valle, "who was the author "of it, but ſuppoſe it to have been the production of the "Maeſtro di Capella of that church." There was no maſter in Italy at this time, 1640, whoſe compoſitions this deſcription will ſo well ſuit, as thoſe of the admirable Cariſſimi, who was now, in all probability, the Maeſtro di Capella in queſtion; though ſo young, that his fame was as yet unfledged; however, it was in compoſing for this church that he acquired that great and extenſive reputation which he enjoyed during a long life, and which his offſpring, or muſical productions, ſtill deſervedly enjoy.

Kircher, in his Muſurgia, (tom. i. p. 603.) deſcribes his muſic and its effects in terms of high panegyric; and ſpeaks of him as a maſter then living, 1650, who had long filled the place of compoſer to the *Collegio Apollinare* with great reputation. He began to flouriſh about the year 1635, and, according to Mattheſon, was living in 1672. His productions are very numerous, though it does not appear that he ever compoſed for the theatre.

His ſacred and ſecular cantatas, and motets, have always had admiſſion into every collection of good muſic. It has been often aſſerted by muſical writers that he was the inventor of cantatas; but it has already been ſhewn, that theſe *ſcene da camera*, or monodies, had a more early origin. Cariſſimi, however, muſt be allowed not only the merit of transferring the invention from the chamber to the church, where he firſt introduced cantatas on ſacred ſubjects, but of greatly improving recitative in general, rendering it a more expreſſive, articulate, and intelligible language, by its approximation to ſpeech and declamation.

Many of Cariſſimi's works are preſerved in the Britiſh Muſeum, and in Dr. Aldrich's collection at Chriſt-church, Oxford.

There is ſomething intereſting in the moſt trivial compoſitions of this admirable maſter, and in his works may certainly be traced more traits of fine melody than in thoſe of any compoſer of the 17th century. Of twenty-two of his cantatas preſerved in the Chriſt-church collection, Oxon, there is not one which does not offer ſomething that is ſtill new, curious, and pleaſing; but moſt particularly in the recitatives, many of which ſeem the moſt expreſſive, affecting, and perfect, that we have ſeen. In the airs there are frequently ſweet and graceful paſſages, which more than a hundred years have not impaired. It is, however, in the *diviſions* of this, and of all old muſic, that the time when it was compoſed, and the changes of taſte, are chiefly diſcoverable. Theſe are the faſhionable forms and trimmings, which ſoon give way to others; but the principal ground-work, or materials, if good at one time, would not loſe their value at another.

Beſides Cariſſimi's numerous ſecular cantatas, duets, trios, and four-part ſongs, his compoſitions for the church, where he firſt introduced inſtrumental accompaniments, diſcover more genius, elegance, and deſign, than thoſe of any preceding or contemporary compoſer. Stradella's untimely death perhaps only prevented him from writing as much, and as well, as Cariſſimi.

Kircher, the contemporary of Cariſſimi, after a juſt eulogium on his compoſitions in general, and telling us that he had the power of exciting in his hearers whatever affection he pleaſed, ſpeaks of his oratorio of Jephtha, and the new and admirable effects produced in it by his knowledge of harmony, modulation, and happy expreſſion of the paſſions. The chorus in his ſacred drama, *Plorate filiæ Iſrael,* which follows the *lamento della figlia di Jepte,* is as remarkable for the accuracy of fugue and imitation, as for its plaintive expreſſion.

According to Mattheſon, the famous German compoſer, Kerl the younger was ſent by the emperor from Vienna to Rome, in 1649, to receive leſſons from Cariſſimi; who is ſaid to have acquired a conſiderable fortune by the exerciſe of his profeſſion, and to have lived to the age of 90.

He appears to have been the favourite compoſer and model of Dr. Aldrich, who was poſſeſſed of a complete collection of his works, which he ſcored with his own hand, and ſeems to have ſtudied with great attention. And Purcell manifeſtly formed his ſtyle on the productions of Cariſſimi and Stradella, particularly in his recitative and ſecular ſongs.

Cariſſimi was not only a man of ſuperior genius and abilities, but a bold contrapuntiſt: as we find, in one of his maſſes, ſeveral new harmonies which were thought unwarrantable more than a century after his deceaſe, in 1672. He is much, and juſtly, praiſed by Kircher, in his Muſurgia; his compoſitions were greatly admired by Dr. Aldrich, who adapted Engliſh words to ſeveral fine movements in his maſſes, which were long performed in the chapel of Chriſt-church college, Oxford.

In a maſs, in the key of C, we have a 7th *per ſaltum,* unprepared, and unreſolved on the 8th, the baſe deſcending a 3d.

The ſymphony to this maſs reſembles ſo much the overture ſtyle of Lulli and Handel, that primogeniture ſeems to entitle him, and not Lulli, to the invention. Lulli was born in 1633, and, in 1649, when Cariſſimi was celebrated by Kircher, and organiſt of the college Apollinare, Lulli was but 16.

Salvini ſays that this great contrapuntiſt, when he heard himſelf praiſed for his flowing, majeſtic, noble, and facile ſtyle of compoſition, uſed to exclaim: "Hah! how difficult it is to acquire this facility!" knowing ſo well the pains he had taken in acquiring it: and who, adds Signorelli on this paſſage, will deny that in the poetry of Metaſtaſio, there is that natural flow and facility of which Horace deſcribes:

Ut ſibi quivis
Speret idem, ſudit multum, fruſtraque laboret,
Auſus idem.

Beauty, in works of art, is acquired by great pains and labour, ſays an old Greek, Πάντα χὰλεπὰ τὰ καλὰ. The gods ſell to mortals whatever is excellent and beautiful, at the price of immenſe labour and ſweat of their brows. Epicharmes, the comic philoſopher.

CARISTI, in *Ancient Geography*, a people of Spain, placed by Ptolemy in the Tarragonnenſis, aſſigning to them the town of Sueſtaſium. M. d'Anville places them on the northern coaſt of Hiſpania Citerior.

CARISTIA. See Charistia.

CARISTO, Castel Rosso, in *Geography*, a town of European Turkey, in the iſland of Negropont; the ſee of a Greek biſhop, ſuffragan of Negropont. It is ſituated at the ſouthern extremity of the iſland; 54 miles S.E. of Negropont.

CARISTUM, in *Ancient Geography*, a town of Italy in Liguria, placed by Livy in the territory of the Statillionates. It was little ſouth of Dertona.

CARITAS. The *poculum caritatis*, or grace-cup, was an extraordinary allowance of wine, or other liquors, wherein the religious at feſtivals drank, in commemoration of their founder and benefactors.

CARITHNI, in *Ancient Geography*, a people of Germany, placed by Ptolemy between the Vangiones and the Viſpes.

CARITY, in *Geography*, a river of Scotland, which runs into the Eſk, in the county of Forfar.

CARIUM, or Curium, in *Ancient Geography*, a place in the iſland of Cyprus, where was the foreſt of Apollo.

CARIUS, or Corius, a river of Aſia, in Carmania, the mouth of which is placed by Ptolemy near the Perſian gulf.

CARIUS, in *Mythology*, an epithet of Jupiter among the Mileſians, probably appropriate to the worſhip of the Carians.

CARK, or Carke, in *Commerce*, a certain quantity, or meaſure, of wool equal to a thirtieth part of a sarplar.

CARL. See Churl.

Carl *Guſtavadſt*, or Eschilstuna, in *Geography*, a town of Sweden, in the province of Sudermania; 54 miles W. of Stockholm.

CARLAT, Le, a town of France, in the department of the Arriege, and diſtrict of Mirepoix; 22 miles N. of Taraſcon.

Carlat, a town of France, in the department of the Cantal; 5 miles S. E. of Aurillac.

CARLENTINI, a town of Sicily, about 2 miles from Lentini, containing 3000 inhabitants, built by Charles V. with a view of making it the head-quarters of his troops in Italy, and almoſt ruined by an earthquake. It was placed on an eminence to be out of the reach of the unwholeſome vapours of the marſhes. The houſes are ſo low, that the ſtreets ſtill reſemble a camp.

CARLEPONT, a town of France, in the department of the Oiſe, and diſtrict of Compiegne; 4 miles S. of Noyon.

CARLETON, George, in *Biography*, a learned biſhop in the 17th century, was born at Norham in Northumberland, in 1559, and was chiefly indebted for his education, firſt in grammar learning and afterwards at the Univerſity of Oxford, to the care and liberality of Bernard Gilpin. After having continued many years in the univerſity, where he diſtinguiſhed himſelf as a logician, orator, and poet, and more eſpecially as a divine, he was advanced, without any previous eccleſiaſtical preferment, to the biſhoprick of Landaff, to which he was elected in 1617, and conſecrated in 1618. In this year he was ſent by king James I. to the ſynod of Dort, and took an active part in the defence of epiſcopacy. Having given ſatisfaction by his conduct on this occaſion, he was immediately on his return, in 1619, promoted to the ſee of Chicheſter, where he remained till his death in 1628. He was a perſon of ſolid judgment and various reading, and extolled by Camden for his proficiency in divinity, and in other polite parts of learning. To the Papiſts he was a bitter enemy, and with regard to the doctrine of predeſtination a rigid Calviniſt: he wrote ſeveral books both in Latin and in Engliſh, of which the principal are his "Heroici Characteres," or Heroic Characters, Oxon. 1603. 4to.; "Tythes examined, and proved to be due to the clergy by a divine right," Lond. 1606 and 1611, 4to.: "Juriſdiction royal, epiſcopal, papal, wherein is declared how the Pope hath intruded upon the juriſdiction of temporal princes, and of the church, &c." Lond. 1610, 4to.; "Conſenſus Eccleſiæ Catholicæ contra Tridentinos, de Scripturis, eccleſia, fide, et gratia, &c." Lond. 1613. 8vo. "A thankful remembrance of God's mercy," &c. Lond. 1614, which paſſed through ſeveral editions; "Aſtrologimania" againſt judicial Aſtrology, Lond. 1624. 4to; "Vita Bernardi Gilpini, &c." Lond. 1626, 4to., publiſhed in Engliſh, Lond. 1629, 4to. and 1636, 8vo. &c. &c. He was alſo concerned in the Dutch Annotations, and in the new Tranſlation of the bible, undertaken by order of the ſynod of Dort, but not compleated and publiſhed till the year 1637. The ſon of the biſhop by his firſt wife, Mr. Henry Carleton, embraced the cauſe of the houſe of Commons in the civil war with king Charles I., accepted a commiſſion in the parliamentary army, and ſhewed himſelf to be an enemy to the biſhops. He was choſen repreſentative for Arundel in Suſſex, in the ſhort Parliament, which met at Weſtminſter in 1640. Biog. Brit.

**Carleton, Dudley,** viſcount Dorcheſter, an eminent ſtateſman in the 17th century, was the ſon of Anthony Carleton eſq. and born at his father's ſeat in Oxfordſhire in 1573. Having finiſhed his education, at Weſtminſter ſchool and at Chriſt-church College, Oxford, he travelled abroad for further improvement. After his return, he became ſecretary to Sir Thomas Parry, ambaſſador in France, and in 1603 he occupied the ſame office in the houſe of the earl of Northumberland. About this time he was alſo gentleman-uſher at court. In the firſt parliament of king James, he was repreſentative of the borough of St. Mawes in Cornwall, and diſtinguiſhed himſelf as an active member and an able ſpeaker. In 1605 he accompanied Lord Norris into Spain, and at the cloſe of this year he was ſummoned home under a ſuſpicion of being concerned with his former patron, the earl of Northumberland, in the gunpowder-plot; and though on his arrival he was confined, he was very honourably diſcharged. In 1610, he was appointed ambaſſador to the court of Bruſſels, but that embaſſy not taking place, he was ſent in the ſame capacity to Venice, and previouſly received the honour of knighthood. During this embaſſy, he eſtabliſhed the character of an able negociator, and was a principal agent in concluding a treaty between the king of Spain and the duchy of Savoy. He was alſo inſtructed to invite the republic of Venice to accede to the league between the king of Great Britain and the proteſtant Princes of the union in Germany: but his propoſal was not accepted. Soon after his arrival in England from Venice, in 1615, he was appointed ambaſſador to the States-General: and in this office he ſpent the moſt active period of his life, from 1616 to 1628. He was the laſt who poſſeſſed the privilege of a ſeat in the council of ſtate for the United Provinces, which queen Elizabeth had obtained for her ambaſſadors. Upon his arrival in Holland he was ſoon involved in the diſpute between the Arminians and Calviniſts, which then agitated that country; and the part he took in the politics which gave riſe to the ſynod of Dort, evinced his attachment to the Palatine cauſe and the public liberty of Germany. Many circumſtances occurred in the courſe of this embaſſy which rendered his ſituation peculiarly difficult and trying; but during the progreſs of them he conducted himſelf with great firmneſs and prudence, although the diſputes at home between Charles and his parliament, and their diſlike to his favourite miniſter, the duke of Buckingham, thwarted ſome of the principal plans in which he was engaged. In 1725, ſir Dudley Carleton returned to England, and was appointed vice-chamberlain of his majeſty's houſehold: and, at the ſame time, he was joined with the earl of Holland in a negotiation at the court of France, which terminated only in partial ſucceſs. Upon his return to England he found parliament much agitated by the miſmanagement of public affairs; and being choſen as a repreſentative for the borough of Haſtings, he endeavoured to allay the ferment that occurred during the proſecution of his patron, the duke of Buckingham. His conduct, however, on this occaſion, gave great offence to the friends and ſupporters of liberty in parliament; but it was very acceptable to an arbitrary court, and procured for him one of the rewards to which he aſpired, a ſeat in the houſe of peers, by the title of baron Carleton of Imber-court, in the county of Surry. Soon after, he was ſent as ambaſſador extraordinary to France, for the purpoſe of excuſing and juſtifying the diſmiſſal of the queen of England's French ſervants. In this unpleaſant negotiation he manifeſted his uſual prudence and addreſs. In 1627 it became neceſſary for him again to reſume his character of ambaſſador in Holland; but he found the States-General very differently diſpoſed towards this country than they were during his former embaſſy, nor was he admitted as he had before been into their councils, the ambaſſador from England having been deprived, by a particular reſolution, of his ſeat in the council of ſtate. He remained, however, in Holland, conducting a variety of intereſting negotiations, till he was recalled in 1628. Soon after his arrival he was created viſcount Dorcheſter, and ſecretary of ſtate. In this capacity he was a principal agent in compleating the treaties with France and Spain, and in conducting ſeveral foreign tranſactions, for which he was better qualified than for the internal concerns of the nation, which were now become very intricate and diſordered. He ſeems to have been inclined to arbitrary maxims of government, and to have acquieſced in the dangerous meaſures of Buckingham, Laud, and others, which widened the breach between the king and parliament. He did not live, however, to witneſs the diſaſtrous extremity in which they terminated; for having long ſtruggled with the diſorders occaſioned by frequent returns of the ſtone and gravel, he died in February 1631-32, in the 59th year of his age, and was interred in Weſtminſter abbey, where a handſome monument is erected to his memory. Carleton wrote a number of letters, ſpeeches, &c. on political topics; but the moſt valuable of his remains is a ſeries of diſpatches while abroad, from which a ſelection of "Letters to and from Sir Dudley Carleton during his Embaſſy in Holland, from January 1615-16 to December 1620," was publiſhed by lord Hardwicke, in one volume 4to. in 1757, with an hiſtorical preface: a ſecond edition appeared in 1775. Theſe letters, allowing for ſome party prejudices, contain a clear, curious, and intereſting account of Dutch affairs, during the period to which they refer, and ſundry valuable materials for modern hiſtory. Biog. Brit.

CARLIN, Carline, or Caroline, in *Commerce*, a ſmall ſilver coin, current in Naples and Sicily, equivalent to about four-pence Engliſh.

CARLINA, in *Botany* (quaſi Carolina, ſo called, ſays Caſpar Bauhin, from a tradition that the root was ſhewn by an angel to Charlemagne as a certain remedy for the plague, which prevailed in his army) Dodonæus, Lobel, Cluſius, Cæſalpinus, &c. Tournef. cl. 14. §. 5. gen. 2. Linn. gen. 929. Schreb. 258. Willd. 1437. Juſſ. 173. Vent. 2. 497. Gært. 940. Carline thiſtle. Claſs and order, *Syngeneſia polygamia æqualis*. Nat. Ord. *Compoſitæ capitatæ*; Linn. *Cinarocephalæ*, Juſſ.

Gen. Ch. *Calyx common* ſwelling, imbricated; ſcales numerous, looſe, acute; inner ones diſpoſed in a circle, very long, ſpreading, gloſſy, coloured, forming a kind of ray to the common flower. *Florets* monopetalous, funnel-ſhaped, equal, androgynous; tube ſlender; border five-cleft. *Stam.* Filaments five, capillary, very ſhort; anthers united into a hollow cylinder. *Piſt.* Germ ſhort; ſtyle filiform, the length of the ſtamens; ſtigma oblong, bifid or entire. *Peric.* none, except the permanent contracted calyx. *Seeds* ſolitary, roundiſh; down divided into ſomewhat chaffy, branched, and feathery rays. *Recep.* chaffy; chaff cleft at the tip into ſeveral ſegments.

Eſſ. Ch. Calyx radiated with long, coloured, marginal ſcales.

Sp. 1. C. *acaulis*, Lam. 1. Bauh. Pin. 380. Tourn. 500. (C. acanthifolia, Willd. 2. Mart. 8. Allion. ped. 571. tab. 51. C. chardouſſes, Vill. delph. 3. p. 30. Chamæleon albus, Cluſ. hiſt. 2. p. 155. Lob. ic. 2. p. 4.) "Flower very large, nearly ſeſſile; leaves broad, toothed, hoary." Lam. *Root* biennial, thick, oblong, fibrous. *Leaves* petioled, oblong, ſomewhat ſinuated, toothed, ſpinous at the edges, cottony and white on both ſides, ſpreading widely on the ground. *Flower* from four to ſix inches in diameter; outer ſcales of the calyx very ſpinous; inner ones white above, purpliſh underneath; receptacle thick and fleſhy. A native of dry hills in Italy, Spain, Germany, and the ſouth of France. 2. C. *cauleſcens*, Lam. 2. Bauh. Pin. 380. Tourn. 500. (C. elatior, Cluſ. hiſ. 2. p. 155. C. acaulis, Willd. 1.) "Stem one-flowered; flower rather large; leaves long, narrow, pinnate, green on both ſides; pinnæ gaſhed and toothed." Lam. *Root* perennial. *Stem* from ſix to ten inches high, reddiſh, ſlightly cottony, leafy, generally ſimple and one-flowered. *Leaves* very long, eſpecially the lower ones, divided to the midrib. *Flower* terminal, conſiderably ſmaller than that of the preceding ſpecies. A native of a ſandy ſoil in ſheltered ſituations on the Alps and other countries in Southern Europe. Linnæus conſidered theſe two plants as varieties of the ſame ſpecies, as did alſo Haller and Scopoli, but La Marck aſſerts that they are perfectly diſtinct. Both of them have a fleſhy receptacle which is eaten by the inhabitants of their native mountains, and is ſaid to equal that of the artichoke in flavour, while at the ſame time it exceeds it in ſize. It is, however, not likely to rival that eſculent on the tables of the luxurious, as it has been found not to flouriſh in cultivated ground. The roots of both ſpecies are aromatic, and are alſo uſed for food when young and tender, but in adult plants they acquire an acrimonious quality, and are then recommended as a diuretic, ſudorific, and alexipharmic medicine. The doſe of the root, when dry, is from one to two drams; when freſh, from two drams to half an ounce, but is more frequently given in a decoction than in ſubſtance. Allion. and Boſc. 3. C. *adgregata*. Willd. 3. Waldſt. and Kitaib. pl. rar. Hung. "Stems ſimple, one-flowered, numerous, aggregate; leaves pinnatifid, ſmooth; ſegments pinnatifid, divaricated, ſpinous." Willd. Root perennial. A native of rocky mountains in Croatia. 4. C. *lyrata*, Willd. 4. Thunb. prod. 141. "Leaves lyrate." A native of the Cape of Good Hope. 5. C. *lanata*, Linn. Spec. 2. Mart. 2. Lam. 2. Willd. 5. (C. flore purpuro-rubente, Tourn. 500. Acarna flore purpuro rubente, Bauh. pin. 379. Rai. hiſt. 289. A. atractylidis folio, Bar. ic. 483.) "Stem bifid, calyxes blood-red, terminal; the firſt axillary, ſeſſile." Linn. "Stem often bifid; the intermediate flower ſeſſile; leaves hoary, lanceolate, toothed, ſpinous." Willd. Whole plant whitiſh and a little cottony. *Root* annual, ſmall, fibrous, yellowiſh, odorous, and rather bitter. *Stem* ſeven or eight inches high, leafy. *Leaves* oblong, edged with yellowiſh ſpines; lower ones gaſhed and pinnatifid; upper ones ſlightly toothed. *Flowers* ſurrounded by ſpinous bractes reſembling the leaves, but ſhorter; outer leaflets of the calyx lanceolate, with only a terminal ſpine; radiating ones reddiſh purple, eſpecially underneath. A native of dry and rocky ground in Italy, Spain, and the South of France. 6. C. *involucrata*, Willd. 6. Deſf. atl. 2. p. 251. Poiret. itin. 2. p. 234. "Stem often bifid; intermediate flower ſeſſile; leaves pinnatifid, toothed, ſpinous, ſmooth." Willd. *Root* perennial. *Stem* a foot high, firm, erect. *Leaves* rigid. *Flowers* ſurrounded by a leafy involucre; ray of the calyx yellow; down ſeſſile, feathery; receptacle chaffy; chaff yellow, longer than the florets. On a dry ſoil the ſtem is often one-flowered. A native of Algiers. 7. C. *corymboſa*, Linn. 3. Mart. 3. Lam. 4. Willd. 7. (C. umbellata apula, Tourn. 500. Acarna, Col. Ecphr. 1. tab. 27. Acarna capitulis parvis luteis in umbella, Bauh. Pin. 379. Rai hiſt. 289.) "Stem many-flowered, ſometimes divided; flowers ſeſſile; ray of the calyx yellow." Linn. "Stem many-flowered, ſmoothiſh; leaves lanceolate, pinnatifid, toothed, ſmooth; flowers in a corymb." Willd. *Root* perennial. *Stem* a foot high or more, cylindrical, reddiſh, moderately cottony, generally ſimple. *Leaves* alternate, oblong, rather narrow, ſometimes a little cottony, pale green. *Flowers* terminal, from three to five, cluſtered. A native of dry ground in Italy and Provence. 8. C. *ſulphurea*, Willd. 8. Deſf. atl. p. 251. tab. 224. "Stem dichotomous, woolly; leaves lanceolate, toothed, ciliated with ſpines pubeſcent; flowers axillary, nearly ſeſſile." Willd. Root annual. Ray of the calyx ſulphur-coloured. A native of barren hills about Algiers. 9. C *hiſpanica*, Lam. 5. (Atractylis, Barrel. ic. 594.) "Stem often divided; branches one-flowered; flowers yellow, terminal." Lam. Whole plant ſmooth. *Stem* from ſix to ten inches high, leafy, ſtriated, or angular. *Leaves* alternate, a little pinnatifid, toothed, green, ſpinous. *Florets* bright yellow; ray of the calyx ruſſet-yellow. A native of Spain. 10. C. *vulgaris*, Linn. 4. Mart. 4. Lam. 7. Willd 9. Eng. Bot. 1144. Gært. tab. 163. fig. 1. Lam. Illuſ. pl. 662. "Stem many-flowered, corymboſe; flowers terminal; ray of the calyx white; Linn. Stem many-flowered, corymboſe, pubeſcent; leaves lanceolate, toothed, ſpinous, pubeſcent underneath." Willd. Whole plant rigid. *Root* biennial, ſpindle-ſhaped. *Stem* a foot high, leafy, furrowed, more or leſs leafy. *Leaves* alternate, ſinuated, very ſpinous, veiny, moſt, woolly underneath. *Flowers* erect; outer calyx-leaves very ſpinous; inner ones longer, linear, ſmooth, yellowiſh white, poliſhed, permanent; florets purpliſh; anthers with two briſtles at their baſe; ſcales of the receptacle much reſembling the inner ones of the calyx. The leaves and flowers do not decay immediately after the ſeeds are ripened, but often remain battered and bleached through the whole winter. Dr. Smith. *Receptacle* concave, chaffy; ſcales of the chaff towards the bottom membranous, keeled, entire, ſeveral neighbouring ones united together, ſo as to leave a hollow in the middle; towards the top cut into numerous briſtle-ſhaped ſegments, the length of the calyx. *Seeds* ſmall, oblong, narrower downwards, ſomewhat compreſſed, or obſoletely angular, inclining to aſh-coloured, crowned with a white chaffy ring, and clothed with white ſilky hairs which are produced beyond the tip; down twice as long as the ſeed, feathery; rays filiform, two or three often cohering a conſiderable part of their length, and appearing branched, all united at the baſe into a ring. Gært. In very rocky ſituations the whole plant is ſmaller, and bears only one flower. A native of dry heaths and paſtures in England, and throughout Europe, flowering in June and July. 11. C. *racemoſa*, Linn. 5. Mart. 5. Lam. 6. Willd. 10. (C. ſylveſtris minor hiſpanica, Cluſ. Hiſt. 2. p. 159. Tourn. 500. Acarna flore luteo patulo, Bauh. Pin. Atractylis hiſp. Bar. Ic. 593.) "Flowers ſeſſile, lateral, very few." Linn. "Stem ſometimes divided; flowers axillary, ſeſſile; leaves lanceolate, toothed, ſpinous, pubeſcent; floral leaves three-nerved." Willd. *Root* annual. *Stem* five or ſix inches high, ſlender, ſimple, leafy, ſomewhat cottony. *Leaves* rather narrow, whitiſh green. *Flowers* yellow. A native of a dry ſoil in Spain and Provence. 12. C. *pyrenaica*, Linn. Sp. Pl. 11. Mart. 6. Lam. 8. Willd. 11. (Carduus tomentoſus, pyrenaicus, ſpinoſiſſimus, flore albo, Burſ. 21. 43. Carduus carlinoides, Gouan. Illuſt. 62. tab. 23?) "Stem many-flowered; leaves decurrent." Linn. *Leaves* oblong, pinnatifid, cottony on both ſides, but moſt ſo underneath, armed with ſtrong, yellow ſpines. *Flowers* terminal, cluſtered; inner calyx-ſcales narrow, lanceolate, ſcarious, white, not forming an open radiating crown as in the other ſpecies of this genus, and rather indicating an affinity to the cardui; florets reddiſh, ſcarcely ſhorter than the calyx. A native of the Pyrenées, introduced into Kew garden in 1788 by Dr. John Sibthorp. 13. C. *atractyloides*, Linn. Sp. Pl. 7. Mart. 8. Lam. 9. (C. polycephalos, polyacanthæ vulgari ſimilis, æthiopica; Pluk. Al. 86. tab. 273, fig. 4. Good. Lam.) "Stem branched; calyx ſpines ciliated." Linn. *Stem* ſomewhat woody, full of pith, clothed near the top with a very ſhort greyiſh down. *Leaves* alternate, a little pinnatifid, toothed, very ſpinous. *Flowers* terminal, floſcular, yellowiſh; calyx ſcales narrow-lanceolate, ſpinous, large, radiating, but not ſcarious and coloured as the European ſpecies. A native of the Cape of Good Hope, communicated to La Marck by Sonnerat. 14. C. *gorterioides*, Lam. 10. "Whole plant cottony and very white; leaves oblong, deeply cut; teeth narrow, ſpinous; flowers ſmall, lateral, and terminal." Lam. *Leaves* alternate, oblong, rather narrow, pinnatifid; pinnules with narrow teeth, each terminated by a thorn. *Flowers* ſmall, yellowiſh; calyx ſpinous; inner ſcales not ſcarious; florets deeply divided. La Marck obſerves that this ſpecies muſt belong to the ſame genus as the preceding, but that they do not well accord with the true Carline thiſtles. A native of the Cape of Good Hope, communicated by Sonnerat. 15. C. *xeranthemoides*, Linn. jun. Sup. p. 349. Mart. 7. Lam. 11. Willd. 12. "Stem ſhrubby, branched, tomentous; leaves linear awl-ſhaped; ferratures ſpineſcent; panicles terminal; ray yellow." A handſome ſhrub. *Stem* cylindrical; branches nearly ſimple, but divided at the top into leafy peduncles. *Leaves* ſcattered, not decurrent, green and ſmooth above, white with wool underneath. *Flowers* in terminal panicles, ſurrounded by a few bracteal leaves, reſembling thoſe on the ſtem, but without ſpines, and cottony, and not longer than the calyx; inner ſcales of the calyx rather long, recurved, awl-ſhaped, ſpiny; ray bright yellow; ſcales a little ſerrated; florets the ſize of the ray. Obſerved by Maſſon in Barrancas, about Chaſna.

The foreign ſpecies may be propagated by ſowing the ſeeds in the ſpring, on a bed of freſh, undunged earth; they ſhould be afterwards thinned, but not tranſplanted. Moſt of them will flower the ſecond year, but they ſeldom ripen their ſeeds in England, and are not eaſily preſerved.

CARLINGS, in *Ship-building*, ſquare pieces of timber ranging fore and aft between the deck-beams, into which they are ſcored; and ſerving to ſtrengthen the ſhip, and ſuſtain the ſmaller beams.

Carling *knees*, thoſe timbers between the ſides of a ſhip and the hatchway ſerving to ſupport the deck on both ſides.

CARLINGFORD, in *Geography*, a market and poſt town of the county of Louth, Ireland, on the ſouth-weſtern ſide of the bay called from it. This town was formerly diſtinguiſhed both as a place of ſtrength, and as a ſea-port. The caſtle, founded on a ſolid rock waſhed by the ſea, is ſaid to have been built by king John; but Cox, with more probability, attributes it to one of the Bourkes or Bourghos, who were earls of Ulſter. The town was afterwards walled, and is often mentioned in the hiſtorical memoirs of Ireland. It was alſo a place of good inland trade, and ſome commerce; but it has conſiderably declined, and is now remarkable only for its fine-flavoured oyſters. Carlingford is a corporate town governed by a mayor and burgeſſes, and before the union was repreſented in paliament, but was not of ſufficient importance to retain this privilege. It is 11 miles N.E. of Dundalk and 51 N. of Dublin. N. lat. 54° 1′. W. long. 6° 9′.

Carlingford *Bay*, or *Lough*, a large, well ſheltered harbour on the eaſt coaſt of Ireland, which has good ground, and water ſufficient for the largeſt veſſels; but there are ſeveral rocks and ſhoals, that muſt be carefully attended to when great ſhips are brought into this harbour. There is a bar on the eaſt ſide of Blockhouſe iſland, extending about half a mile, on which the leaſt water is eight feet. The weſt ſide, between Blockhouſe iſland and Balaghan point, is altogether rocks and ſhoals, not to be attempted. Carlingford is on the weſt ſide of the bay, which is ſhallow, and dries before low water, but ſmall veſſels may lie ſafe near the town, on ſoft mud. Newry, which has a ſmall river and canal that joins the bay, derives the chief benefit of this harbour. N. lat. 54° W. long. of the north-eaſtern point 6° 1′. M'Kenzie.

CARLISLE, a city of Cumberland, England, is noted in the hiſtoric annals of Great Britain as being the ſcene of repeated ſieges and warlike operations between the Engliſh and Scottiſh nations. It was alſo a place of ſome conſequence during the Anglo-Roman dynaſties. "Its Roman colonization," ſays Camden, "appears plainly from the various evidences of antiquity occaſionally dug up, and from the frequent mention of it in the writers of thoſe days: and even after the ravages of the Picts and Scots, it retained ſomething of its ancient ſplendour, and was accounted a city." Soon after the Romans had quitted the iſland, Carliſle was entirely abandoned to the northern invaders, and by them completely ruined and laid waſte. In this ſtate of deſolation it remained till the reign of Egfrid, king of Northumberland, who ordered it to be rebuilt, and encompaſſed it with a wall. He afterwards beſtowed it on the celebrated St. Cuthbert, who viſited his new acquiſition in the year 686, and, according to Bede, "was carried by the towns-people to ſee their walls, and a fountain, or well, of admirable workmanſhip, conſtructed therein by the Romans." St. Cuthbert was biſhop of Lindisfarn; and by Egfrid's grant, Carliſle became an appendage to that ſee, and ſo continued till the year 1133, when Henry I. conſtituted it a ſeparate biſhopric. During the incurſions of the Danes, in the eighth and ninth centuries, Cumberland was expoſed to frequent ravages, and this city underwent its full ſhare of calamity, for it was wholly conſumed by fire; its inhabitants were maſſacred, and its walls overthrown. "Its very foundations," ſays Dr. Todd, "were buried in the earth, ſo that, it is ſaid, large oaks grew upon them; and this is not only atteſted by our hiſtorians, but alſo evinced by ſome diſcoveries that have lately been made of large unhewn oak trees buried ten or twelve feet below ground." In this deſolate ſtate the city remained nearly 200 years, when Walter, a prieſt, and follower of William the conqueror, repaired a few of the ruined habitations, and attempted to re-eſtabliſh a religious inſtitution, that had either been founded by St. Cuthbert, or about his time: on this occaſion the conqueror iſſued a mandate, that the inhabitants of Cumberland, but particularly of Carliſle, ſhould be ſubject to the epiſcopal juriſdiction of Durham; from "the predeceſſors of whoſe dioceſan they had received chriſtianity." When William Rufus returned from his intended attack on Malcolm, king of Scotland, about the year 1094, he made a viſit to this city, and perceiving its importance as a frontier ſtation, gave orders that it ſhould be completely reſtored, and entruſted the execution of his plan to the above Walter, under whoſe direction ſeveral public edifices were built, a ſtrong fortreſs erected, and the whole defended by a wall of circumvallation. Theſe buildings are ſuppoſed to have been raiſed by Flemiſh artificers, a colony of whom was ſettled here by Rufus, but ſoon afterwards removed to North Wales, and the iſle of Angleſey, and its place occupied by a body of South Britons, who were directed to cultivate the neighbouring lands, and to teach the natives the art of rendering the fertility of the ſoil conducive to their ſubſiſtence. From this era, Carliſle may be regarded both as a military ſtation, and a city; and for ſeveral centuries its vicinity to Scotland occaſioned it to experience many viciſſitudes. Having been ceded by Stephen to the Scottiſh king, David, about the year 1136, it was made a place of retreat by the latter, after his defeat in the dreadful battle of the Standard, in 1138; and here alſo he received the pope's legate, Alberic, by whoſe influence all the female captives that were brought into Carliſle, were ſet at liberty. "He alſo obtained from the Scottiſh leaders a ſolemn promiſe, that in future incurſions, they would ſpare the church, and withhold their ſwords from the aged, from women, and infants; an injunction which humanity dictated, but which the ſavage cuſtoms of the contending nations had not before admitted into the modes of warfare." Carliſle, from this period to the time of Edward I., was ſubjected to ſeveral diſaſtrous events. The 35th year of that monarch, 1307, will be ever memorable in the annals of this city, from the parliament that met here January 20, and continued ſitting till the Palm Sunday following, during which period ſeveral important acts were paſſed, and laws made to promote the expedition which the king was then meditating againſt the Scots. Edward remained at Carliſle till June 28, when he proceeded towards Scotland, but, being ſeized with a flux, expired at Burgh-on-Sands, on the ſeventh of the following month. In 1338, Carliſle was beſieged by the Scots, and the ſuburbs burnt; as was frequently the caſe during the contentions between the rival houſes of York and Lancaſter. The wealth of the city was ſo much reduced by theſe repeated outrages, that Edward IV. remitted to the inhabitants one half of the ancient annual rent of 80 pounds paid to the crown, and alſo granted them the lordſhip of the royal fiſheries at Carliſle. The war between Charles I. and his parliament once more involved this city in the horrors of a ſiege, and the general diſtreſs was increaſed by the calamity of famine. The blockade commenced October 9, 1644, and continued till the enſuing June, when the place ſurrendered to general Leſley, who commanded for the parliament. During the intermediate time, the wants of the inhabitants and garriſon were ſo great, that not only horſes, but even dogs and rats were eaten; and hemp-ſeed was ſubſtituted for bread till that alſo was conſumed; the city was then given up on honourable terms. The laſt occurrences of this nature, of which Carliſle was the ſcene, were thoſe which accompanied the rebellion in 1745, when it ſurrendered, after a ſhort ſiege, to the forces of the pretender. The ſituation of Carliſle is extremely ſine; it ſtands on a gentle riſing ground, in the midſt of extenſive and fertile meadows, terminated by the diſtant mountains, and watered by the Eden, the Caldew, and the Peteril. The two former of theſe rivers flow on different ſides of the city; and their banks and contiguous meadows afford a number of pleaſant walks to the inhabitants. In high floods in the winter ſeaſon the low lands are ſometimes inundated, and the city at thoſe periods appears like a promontory, or iſland riſing from the midſt of a vaſt lake. The improvements that have been effected at Carliſle, ſince the union with Scotland, are exceedingly numerous. It was then more celebrated for the ſtrength of its walls, and fortreſs, than either for the neatneſs of its buildings, or the reſpectability of its inhabitants; but as the proſpect of future commotions vaniſhed, manufactures were introduced, and a taſte for improvement accompanied the increaſe of wealth. This being attended with an augmented population, alterations and improvements were rapidly made. At the commencement of the laſt century, the dwellings of the inhabitants were moſtly formed of wood, clay, and laths, exhibiting ſingular ſpecimens of poverty and vitiated taſte. The gable ends fronted the ſtreets; and the diminutive windows, projecting porches, and clumſy oaken doors, faſtened together with large wooden pins, correſponded in form with the gables. The ſtreets were badly paved; and the gutters, or rather trenches, on each ſide, were ſo wide and deep, that ſmall bridges were in many parts placed over them for the convenience of paſſengers. Theſe obſtructions have been in a great meaſure removed, many of the houſes have been rebuilt with propriety and even elegance, and many new ones erected in the modern ſtyle. Some very material improvements are now making in the entrance to the city. The ſpace included within the walls is ſomewhat in the form of an irregular triangle; the buildings, however, extend conſiderably beyond theſe limits, but are chiefly ſpread in the vicinity of the city gates which are three in number, and reſpectively denominated from their contiguity to the Engliſh, Iriſh, and Scottiſh kingdoms. The Engliſh gate is connected with the building called the citadel, which is of an oblong ſhape, having a round tower at each end, with ſlender openings for the diſcharge of arrows. Theſe openings are ſingularly conſtructed, the apertures diverging outward, but gradually decreaſing to the inner ſide, where they become narroweſt. The towers are low, but apparently of great ſtrength; and, together with the gateway, were built by Henry VIII. The city walls are principally formed of ſquared ſtone, and on the ſouth and eaſt ſides ſupported by numerous buttreſſes. Various flights of ſteps lead to the top, whence the proſpects are in many parts extenſive and intereſting. The public buildings are various; yet thoſe which chiefly engage the curioſity of the viſitant, are the caſtle, and the cathedral. Theſe edifices, or at leaſt certain parts of them, are of conſiderable antiquity, but have undergone many viciſſitudes, and experienced various alterations.

The *caſtle* ſtands at the north-weſt angle of the city, and conſiſts of an outward and inward ward. Within the latter is the great tower, dungeon, or citadel of the caſtle. This is of a ſquare form, and very lofty, with walls of vaſt thickneſs, and conſtructed according to the modes of defence employed before the invention of cannon. It has ſince been ſtrengthened according to the modern ſyſtem, and defended by a half-moon battery and a very large platform, mounted with cannon under cover of the outward wall. The outer ward contains the governor's houſe; and in one of the gates of the caſtle the old portcullis is ſtill remaining. This fortreſs was made the priſon of the unfortunate queen Mary, for ſome time after her landing at Workington, and the apartments wherein ſhe was lodged are ſtill ſhewn.

The *cathedral* was erected at various periods, and diſplays ſpecimens of different ſtyles of architecture. Some part of it is apparently as old as the Saxon times, but the greateſt portion is more modern. Several parts of the building are extremely beautiful; but on the whole it appears to much diſadvantage, having "been curtailed of its fair proportion" in the civil wars, at which period about 30 yards of the nave was pulled down to erect guard-houſes and batteries. The opening was afterwards cloſed with a wall, and the ſpace within the wall, and the tranſept fitted up as the parochial church of St. Mary, as the entire weſt end had formerly been; and divine ſervice is regularly performed in it. The arches in this part of the cathedral, and in the tranſept, are circular, and the ſhafts extremely maſſive; the height of each being only 14 feet two inches, while the circumference is 17 feet and a half. The choir was begun by biſhop Welton in the reign of Edward III., and finiſhed by the ſucceeding biſhops, Appleby, and Strickland. The expences were chiefly defrayed by ſubſcription; and indulgences and remiſſions of penance were alſo granted to ſuch of the laity as ſhould by money, materials, or labour, contribute to the pious work; copies of various orders and letters patent iſſued for the occaſion are preſerved in the biſhop's regiſter. Several ancient monuments are remaining in the cathedral, ſuppoſed to be for the biſhops Welton, Appleby, and two or three others, but uncertain for whom; and on the north ſide of the choir, near the altar, is a curious monumental braſs plate, erected to the memory of biſhop Henry Robinſon, who was born in this city about the year 1556, and became celebrated for his piety and learning. The whole ſtructure, and indeed moſt of the buildings in this city, are compoſed of a coarſe, but durable, kind of red free-ſtone. Biſhop Tanner remarks, that "this is the only epiſcopal chapter in England of the order of St. Auſtin." Before the diſſolution of the monaſteries, ſeveral religious houſes were eſtabliſhed in this city; and ſome few remains are yet viſible. The cathedral itſelf ſeems to have belonged to a priory. The chapter-houſe and cloiſters ſtood on the ſouth ſide of the catheral, but were pulled down during the civil wars. The only church in Carliſle, beſides that of St. Mary's in the cathedral, is St. Cuthbert's; this is a plain modern building erected in 1778, on the ſite of the ancient ſtructure, which appears to have been originally built before the deſtruction of the city by the Danes. The other edifices for religious worſhip are three meeting-houſes for Proteſtant diſſenters, one for Quakers, one for Methodiſts, and a Catholic chapel. The three principal ſtreets range nearly in the ſhape of the Roman Y, and meet at the *market place*, where the town-hall, moot-hall, and council-chamber are ſituated. Here the aſſize courts and quarter ſeſſions are held, and moſt of the public buſineſs is tranſacted. The corporation records are alſo kept here; and the repreſentatives for the city elected. In this diſtant part of the kingdom, priſoners are frequently obliged to remain without trial ſeveral months, as the aſſizes are only held once a year. Near the gaol are ſome buildings called charity houſes, where decayed freemen, and widows of freemen, are permitted by the corporation to live rent-free. The poor are maintained in a workhouſe erected by ſubſcription about the year 1760; prior to that time, they were either farmed out, or had a weekly allowance at their own houſes. A diſpenſary was inſtituted July 1, 1782, for the relief of the indigent ſick, and upwards of 15,000 perſons are computed to have been relieved ſince its eſtabliſhment. Carliſle has received many royal grants, and been inveſted with great privileges by different monarchs, but nearly all the original charters have been conſumed by the fires that have ſo frequently deſolated the city. Charters of confirmation have been granted by Edward III., Henry VII. and VIII., and every ſucceeding ſovereign, to the reign of Charles I., who ordered ſome alteration to be made in the mode of electing the different officers. The city was firſt repreſented in parliament 23 Edward I.: the members are choſen by the free burgeſſes, who are about 700 in number. The population and buildings of Carliſle and its ſuburbs, have increaſed in a very rapid manner during the preceding century; but the augmentation has principally been made within the laſt 40 years. By the return made under the late population act, the number of houſes was found to be 1338, of inhabitants 10,221. In the year 1761 various new works were eſtabliſhed; a company from Newcaſtle began the calico printing buſineſs which has progreſſively increaſed ever ſince, and now furniſhes employment to many hundreds of men, women, and children. There are four print fields, which employ a thouſand perſons, and pay upwards of 20,000l. to the revenue annually. Beſides theſe, there are eight other manufactories; and ſome of them execute every branch, from preparing the raw materials, to the completion of checks, callicoes, muſlins, and all kinds of fancy-work. A brewery has been eſtabliſhed, and three others have been lately erected; a ſoap manufactory has alſo been built; and ſo greatly has the trade of the city increaſed, that the duty paid on licences and exciſeable articles amounts to more than 110,000l. yearly. Its growing importance is evinced by the eſtabliſhment of two banks, both of which have been opened within a few years. Carliſle is 303 miles N.W. from London; and has two weekly markets, Wedneſday and Saturday. Hutchinſon's hiſtory of Cumberland, 2 vols. 4to.

**Carlisle**, the chief town of Cumberland county, in the ſtate of Pennſylvania, North America, pleaſantly and ſalubriouſly ſituated in the poſt-road from Philadelphia to Pittſburg, 125 miles W. by N. from the former, and 178 E. from the latter. The town contains about 400 houſes, chiefly of ſtone and brick, and about 1500 inhabitants. The ſtreets interſect one another at right angles; and the public buildings are a college, court-houſe, and gaol, and four edifices for the public worſhip of the Preſbyterians, Germans, Epiſcopalians, and Roman Catholics. Dickinſon college has a principal, three profeſſors, a philoſophical apparatus, and a library conſiſting of about 3000 volumes. Its revenue ariſes from 4000l. in funded certificates, and 10,000 acres of land. N. lat. 40° 12′. W. long. 77° 12′.

Carlisle *Bay*, a bay on the weſt ſide of the iſland of Barbadoes, in which ſtands *Bridge-town*, which ſee.—Alſo, a bay of the iſland of Antigua; three miles W. of Falmouth. —Alſo, a bay on the ſouth coaſt of the iſland of Jamaica. N. lat. 17° 47′. W. long. 77° 6′.

CARLISLES *Lagoon*, a bay, on the north coaſt of the iſland of Egmont, or New Guernſey, in the Southern Pacific Ocean, between How's Point and Portland's Iſland. S. lat. 10° 42′. E. long. 164° 16′.

CARLOCK, Carlick, or Charlock, a provincial term ſometimes made uſe of to ſignify the weed charlock. See Charlock.

Carlock, in *Commerce*, a ſort of fiſh-glue, or iſinglaſs, imported from Archangel. It is made with the ſturgeon's bladder; and is uſed for clarifying wine, as alſo in dying. The beſt comes from Aſtracan, a city in Muſcovy, at the mouth of the river Wolga, where they catch great quantities of ſturgeon.

CARLOMAN, in *Biography*, eldeſt ſon of Charles Martel, ſucceeded his father in 741 to the dominion of Auſtraſia. After many warlike expeditions, which were attended with ſucceſs, and in which he diſplayed equal courage and ability, he conceived a diſguſt with the world, and determined on religious retirement. Accordingly, he made a journey to Rome with a ſplendid retinue, and having in his own name, and in that of his brother Pepin, preſented magnificent gifts to the holy ſee, he received the clerical tonſure from the hands of pope Zachary in 747. He afterwards retired to a monaſtery on mount Soracte, where he became a monk of the order of St. Benedict; and withdrawing for greater privacy to the abbey of mount Caſſin, he ſpent his remaining days in the offices of the convent, and the exerciſes of devotion. He died at Vienne in Dauphiny in 755.

Carloman was alſo the ſon of Pepin the Short, and younger brother of Charlemagne, and was conſecrated at Soiſſons, in 768, to the ſovereignty of Auſtraſia, Burgundy, and part of Aquitaine. Being on ill terms with his brother, a ſerious conteſt between them was expected to have taken place; but it was prevented by the death of Carloman in 771, which left his brother ſole poſſeſſor of the French monarchy.

Carloman was alſo the ſon of Lewis II., called the Stammerer, and, in conjunction with his brother Lewis III., ſucceeded his father in 879. France was at this time diſtracted by inteſtine competitions for power; and whilſt Carloman, aſſiſted by his brother, was beſieging Vienne, in a conteſt with Boſon, who had eſtabliſhed the kingdom of Arles, or Provence, Lewis was called upon to reſiſt the Normans, who made inroads on the northern ſide, and died in 882. Carloman, in conſequence of this event, was declared king of France, and abandoning the ſiege of Vienne, marched into Picardy, where with a ſum of money he purchaſed the retreat of the Normans. He was ſoon afterwards wounded in hunting the wild boar, and died in 884, at the early age of 18, before the conſummation of a marriage, which he had contracted with a daughter of Boſon.

Carloman was alſo king of Bavaria, and in 876 ſucceeded his father Lewis I. king of Germany in the ſovereignty of Bavaria, compriſing, beſides that province, Bohemia, Moravia, Carinthia, Auſtria, Sclavonia, and part of Hungary. With the deſign of annexing Italy to his dominions, he marched his army into the country, but after a partial ſucceſs in Lombardy, he was induced by a falſe alarm to abandon the accompliſhment of his purpoſe, though he retained the title of king of Italy. He died of a palſy in 880. Mod. Un. Hiſt. vol. xix.

CARLONI, Giov. Batista, an eminent painter of hiſtory, was a native of Genoa, and having proſecuted the ſtudy of his art at Rome and in the ſchool of Paſſignano at Florence, he became one of the moſt fertile, original, and ſeducing machiniſts of Italy. The moſt ſplendid works of this artiſt, and of his brother Giovanni, are the freſcoes of the cathedral del Guaſtato at Genoa, which exhibit a wonderful effect of colouring. He ſurvived his brother 50 years, and diſtinguiſhed himſelf by this novel ſtyle in the churches and collections of Liguria and Lombardy. His powers were very various; and he is ſaid to have poſſeſſed equal felicity in oil and freſco, colour and deſign, velocity and correctneſs. He had inceſſant employment, and was unrivalled in diligence and perſeverance. After a prolonged life of 86 years, he died in 1680. Pilkington by Fuſeli.

CARLOS, in *Geography*, a fort on the north coaſt of Terra Firma, ſeated on an iſland which commands the channel between the gulf of Venezuela and that of Maracaybo on the ſouth, little more than 20 miles N. from the town of Maracaybo.

Carlos, a town of Veragua, in New Spain, 45 miles S.W. from Santa Fé, ſituated in a large bay, having a number of ſmall and deſert iſlands at its mouth. N. lat. 7° 40′. W. long. 82° 10′.

Carlos St., a town of North America, in the province of Nicaragua, ſeated on a river which runs from the lake of Nicaragua into the Caribbean Sea. N. lat. 11° 46′. W. long. 66° 40′.—Alſo, a town of the iſland of Cuba; 62 miles E. of Havannah.

CARLOSA, a town in the interior part of Braſil, on the ſouth-eaſt ſide of St. Francis river, and north by weſt from Villa Nova. S. lat. 15°.

CARLOSTADIANS. See Carolostadians.

CARLOTTA, La, in *Geography*, a town of Spain, in the province of Andaluſia, built in 1769 for German and Italian emigrants; 15 miles S. of Cordova.

CARLOVINGIANS, in *Hiſtory*, the title by which the French kings of the ſecond race have been diſtinguiſhed, and which was firſt derived from Charles Martel, (ſee his article,) and commenced with his ſon Pepin in 752, and terminated with Louis V. in 987. They reckon 14 kings of this family. The mutual obligations, ſays Gibbon, (Hiſt. vol. ix. p. 150. &c.) of the popes and the Carlovingian family, form the important link of ancient and modern, of civil and eccleſiaſtical hiſtory. On the part of the popes, the moſt eſſential gifts which they conferred on the Carlovingian race were the dignities of the kings of France, and of patrician of Rome. See Pepin and Charlemagne. On the other hand, the gratitude of the Carlovingians was adequate to their obligations, and their names have been conſecrated as the ſaviours and benefactors of the Roman church. Her ancient patrimony of farms and houſes was transformed by their bounty into the temporal dominion of cities and provinces; and the donation of the *Exarchate*, (which ſee,) was the firſt fruits of the conqueſts of Pepin.

CARLOW, or Catherlogh, in *Geography*, a county in the province of Leinſter, Ireland, which lies between Kildare on the north, Queen's county on the north-weſt, Wicklow on the north-eaſt, Wexford on the ſouth-eaſt, and Kilkenny on the ſouth-weſt and weſt. It is 26 Iriſh miles (33 Eng.) in length from north to ſouth, and 23 (29 Eng.)

at its greateſt breadth, but it narrows to the ſouth in the form of a wedge. It contains 137,050 Iriſh acres, or 214 ſquare miles, (220,098 acres, or 344 ſquare miles Engliſh meaſure,) and 8763 houſes, which, at five to each houſe, would give a population of about 44,000, which is certainly a moderate computation. The number of pariſhes is 50, none of which are wholly impropriate; but in conſequence of unions they form only 17 benefices, all in the dioceſe Leighlin. Some idea may be formed of the religious ſtate of the county from four of theſe benefices being without a church, and only one of them having a glebe houſe. The number of members which repreſent it in the imperial parliament are three, two for the county, and one for the town of Carlow. The river Barrow, which is navigable, runs through this county from north to ſouth, and for many miles forms its weſtern boundary. The woody hills which ſkirt the northern part preſent a beautiful and varied ſcenery. The river Slaney alſo croſſes it in its paſſage from Wicklow to Wexford. That part of Carlow which lies on the weſt of the Barrow is covered with rough and high hills. Another mountainous tract continues all along the bounds of Wexford, beginning at the north with the high and rocky mount Leinſter, and terminating in that which is called Blackſtairs. But the champaign country is very rich and fertile. When Mr. Young was in this county in 1776, he obſerved cultivation riſing up the ſides of the mountains; he found alſo that the hiring tenant was in general the occupier, and that the average rent of the county was 15s. per acre, which was about the average rent of the whole iſland. Rents, however, have probably riſen conſiderably in conſequence of the improved ſtate of the county with reſpect to inland navigation. The mineralogy of the county is very imperfectly known, but from the account of Mr. D. Stewart, publiſhed in the Tranſactions of the Dublin Society, by which he was employed, there appears to be abundance of marl, lime-ſtone, gravel, great variety of clays, ſome of them light and ſoapy, ſome iron ore, and a great deal of oxyd of manganeſe.

Carlow was made a county by king John during his viſit to Ireland in 1210, having been before called *Hydrone*, and *Hy-Cavanagh*. It was part of the territory, of which Strongbow acquired the ſovereignty by his marriage with Eva daughter of the king of Leinſter, confirmed to him by king Henry as ſupreme lord of Ireland; and it was afterwards held by his deſcendants, the earls Mareſchel. The principal towns are Carlow, Leighlin-bridge, and Tullow.

The above article is chiefly taken from Dr. Beaufort's excellent memoir accompanying his map of Ireland; but Mr. Young's tour, and other works, have been conſulted. No ſtatiſtical account of Carlow has been yet publiſhed.

Carlow, a borough and poſt town, and the aſſize town of the county of the ſame name, ſituated on the river Barrow. It was formerly called Catherlogh, or Catherloch, i. e. *the fortreſs in the lake*, and gave name both to the county and barony in which it is placed. It was early fortified, ſome ſay by king John, others by John Conſtable of Cheſter, and Hugh de Lacy, whilſt the building of the caſtle is attributed to Eva, the wife, or Iſabel, the daughter of Strongbow. It was certainly deemed of ſome conſequence as a fortreſs, and therefore had its full ſhare of the calamities which have for ſo many centuries devaſtated Ireland. It does not appear, however, to have been large. Boate ſpeaks of it with contempt, but it has ſince increaſed, and was, at the union, deemed worthy of ſending a burgeſs to the imperial parliament. It has a manufacture of a coarſe kind of woollen cloth, but it is not conſiderable. The junction, however, of the grand canal with the Barrow, and the improved navigation of this river, will probably occaſion the further increaſe of the town. The appearance it makes is cheerful, from the number of white houſes ſcattered up and down in the neighbourhood. It is regularly built, has ſome good public edifices, and has a neatneſs ſuperior to moſt towns in Ireland. The caſtle is a fine ruin overhanging the Barrow. The Roman Catholics have a large ſeminary here. Carlow is 39 Iriſh miles S.W. of Dublin, on the great ſouthern road, in N. lat. 52° 50'. W. long. 6° 58'. Dr. Beaufort's Book of Roads, &c.

CARLOWITZ, a military town of Sclavonia, in which the Greek biſhop of Sclavonia reſides; famous for the peace concluded there with the Turks in 1699, and alſo for its red wine.

CARLSBAD, a town of Bohemia, in the circle of Saatz, on the river Eger, celebrated for its baths of hot water, diſcovered in 1370 by the emperor Charles IV. as he was hunting; 56 miles W. of Prague.

Carlsbad, or Caroline *Waters*. Theſe very ſingular and celebrated hot mineral waters have engaged (as they deſerved) the attention of many naturaliſts and chemiſts. They are ſituated at the town of Carlſbad in Bohemia, on the banks of the river Toepel, or Teply, which joins the Eger, a tributary to the Elbe, and were firſt brought into high repute by the emperor Charles IV. about the year 1370.

There are ſeveral ſprings of this water within a ſmall compaſs, of which the principal one, called the *Prudel*, (or *Furious*,) iſſues out with great vehemence in a large body through a natural vault or incruſtation of ſtalactite, which it has formed by long depoſition.

The temperature of this fountain is invariably 165° Fahr. at all ſeaſons, and hence it always ſends forth a conſiderable body of ſteam. Some of the other ſprings are only 120° to 125°. The taſte of this water is ſtrongly alkaline, ſaline, rather bitter, and ſtrongly chalybeate. It has ſcarcely any ſmell, and contains nothing ſulphureous.

This water is remarkable for a very rapid depoſition of carbonat of lime as it cools, which forms a very hard and beautiful ſtalactite, or petrifaction, that incruſts any wood, moſs, &c. which happens to remain in it for a day, and ſoon choaks up any pipe through which it is conducted. Along with the carbonat of lime, the iron which it holds is alſo precipitated, forming with the former a beautifully variegated ſtalactite, which takes a high poliſh.

This water has been analyſed by ſeveral eminent chemiſts, and particularly by Bergman, and by Dr. Becher in his elaborate treatiſe on this ſpring, and more lately by Klaproth. The latter only we ſhall give, which however agrees very nearly with the others.

Carlſbad water contains carbonat of ſoda, ſulphat of ſoda, muriat of ſoda, and, when ſtill hot, carbonat of lime held in ſolution by carbonic acid, ſilex, carbonat of iron, and a portion of uncombined carbonic acid.

It will not be unintereſting to give in a few words the method by which this excellent chemiſt proceeded in the analyſis of this very compounded water.

A given quantity, quite hot from the ſpring, was firſt included in a retort of known capacity, and brought to boil, and the boiling continued till no more air-bubbles were given out. The gas was carefully collected over water, and when examined, was found by the teſt of lime-water to be pure carbonic acid, excepting the portion of common air of the veſſels. This way, however, was not quite ſo accurate as if a mercurial bath had been employed.

The exiſtence of iron in this water, (as in the Bath water,) is only ſenſible to teſts when applied immediately at the ſpring itſelf. Under theſe circumſtances, if ſome of the freſh water is put into a bottle containing a ſlice of the gall-nut, a very ſenſible purple colour is produced immediately. But on cooling, the minute quantity of iron which it contains ſeparates as a fine flocculent whitiſh-brown oxyd, and the teſt of galls no longer produces any effect.

To diſcover the actual quantities of the ingredients, 100 cubic inches of the water were gradually evaporated to a ſmall bulk, during which, an earthy ſediment ſubſided, which was ſeparated by the filtre. This ſediment was digeſted with muriatic acid, which diſſolved only a part, and left a looſe ſlimy earth, which proved to be ſilex. The muriatic ſolution was then treated with pruſſiat of potaſh, which cauſed a blue precipitate of pruſſiatic iron to ſubſide, after which, the lime that remained in the ſolution was thrown down by carbonated alkali. The pruſſian blue therefore indicated the quantity of *oxyd of iron* in the water, and the carbonated alkali reproduced the *carbonat of lime.*

It then remained to ſeparate the ſalts from the clear ſolution, being the water leſſened to a few ounces by evaporation.

It having been proved by previous teſts that the water contained a naked alkali, probably carbonat of ſoda, and a ſalt with ſulphuric acid, and another with muriatic acid, the baſis of which was not an earth, but an alkali, there remained little doubt but that ſoda was the baſe in all, (no other freed alkali being ever found in mineral waters.) The only object that remained, therefore, was to eſtimate the actual quantity of uncombined carbonat of ſoda, and the quantity of the ſulphuric and muriatic acids.

Previous experiments having been made on the power of a given ſulphuric acid to ſaturate ſoda, ſome of the ſame acid was added to the water till an accurate ſaturation of the naked alkali was produced, by which the quantity of the latter was diſcovered. The whole was then decompoſed by acetited barytes, and the ſulphuric acid of the ſulphat of barytes formed thereby conſiſted therefore of the portion of acid added to ſaturate the uncombined ſoda, and of that which already exiſted in the water in the form of ſulphat of ſoda. By ſubtracting the former portion from the whole quantity of acid indicated by the ſulphat of barytes produced, the remainder was the acid belonging to the ſulphat of ſoda in the water originally, whence the proportion of this ſalt could alſo be eſtimated. Laſtly, the quantity of muriated ſoda was found by precipitating the muriatic acid by nitrated ſilver.

From theſe experiments it is concluded, that a hundred cubic inches of the Carlſbad water contain,

| | grains. |
|---|---|
| Of dry carbonated ſoda, - - - - - | 39 |
| (equal to 107$\frac{1}{2}$ gr. when cryſtallized.) | |
| Of dry ſulphat of ſoda, - - - - - | 70$\frac{1}{2}$ |
| (equal to 168 gr. cryſtallized.) | |
| Of muriat of ſoda, - - - - - - | 34$\frac{1}{2}$ |
| Carbonat of lime, - - - - - | 12 |
| Silex, - - - - - - | 2$\frac{1}{2}$ |
| Oxyd of iron, about - - - - | $\frac{1}{8}$ |
| | 158$\frac{3}{4}$ |

Of carbonic acid, 32 cubic inches.

The cubic inch of water here uſed is equivalent to 290 grains of diſtilled water.

The average quantity of water daily drank by the viſitors is not leſs than about five pints, divided in about fourteen cups. The uſual time ſpent in the uſe of the water is about four weeks. The water is uſed in a great variety of diſorders. It is highly ſerviceable in dyſpeptic complaints, obſtructions of the abdominal viſcera, diſeaſes of the kidnies, and urinary paſſages, and of the uterine ſyſtem in females.

The actual quantity of ſaline matter which is conſtantly poured out with the water, (almoſt the whole of which is waſted) is very enormous when the eſtimate is carried to the ſupply of water during a year. Dr. Becher eſtimates the main ſpring alone to throw out hourly 705 eimers, each eimer being about half a cubic foot; and hence in the year it will throw out 3,087,900 cubic feet. Theſe contain the following quantities of ſalts, (reduced to pounds avoirdupois.)

| | |
|---|---|
| Cryſtallized carbonat of ſoda, | 746,884 |
| ———— ſulphat of ſoda, | 1,132,923 |
| Muriat of ſoda, - - | 238,209 |

beſides earths and iron, and alſo 992,529 cubic feet of carbonic acid gas.

It is eſtimated alſo that the water of all the other ſprings united, equals that of the great ſpring, whence the above numbers may be doubled, and this large quantity has been annually poured out, for a certainty, during 430 years, to the year 1800.

No other advantage is made of this ſpring by way of manufacture, except that annually ſome hundred pounds of ſulphat of ſoda are prepared from it.

CARLSBRUN, in *Geography*, a town of Bohemia, in the circle of Chrudim; 6 miles S. of Leutmiſchl.

CARLSBURG, a village of Germany, in the circle of Franconia, and biſhopric of Wurzburg, with a caſtle, built by Charles the Bald, ſituate on the Maine, oppoſite to Carlſtadt.

CARLSCRONA, or CARLESCROON, a ſea-port town of Sweden, in the province of South Gothland, which derives its origin and name from Charles XI. who laid the foundations of a new town in 1680, and removed the fleet from Stockholm to this place, on account of the advantageous ſituation, and ſecurity of the harbour. The greater part of the town ſtands upon a ſmall rocky iſland, which riſes gently in a bay of the Baltic; the ſuburbs extend over another ſmall rock, and along the mole cloſe to the baſon, where the fleet is moored. The way into the town from the main land is carried over a dyke, and along two wooden bridges joined by a barren rock. The town is ſpacious, conſiſting of ſome houſes of brick, but moſtly of wood, and one or two handſome churches, and containing about 18,000 inhabitants. The ſuburbs are fortified towards the land by a ſtone wall. The entrance into the harbour, which is naturally difficult, on account of a number of ſhoals and rocky iſlands, is ſecured from the attack of an enemy's fleet by ſtrong forts, built on two iſlands, under the batteries of which all veſſels muſt paſs. A dock, planned by Polhem, has been hollowed in the ſolid rock; it was begun in 1714, and finiſhed in 1724; but having been found too ſmall, it has been ſince enlarged, and is capable of receiving a ſhip of the firſt rate. Its dimenſions are 190 Swediſh feet in length, 33 in depth, and 46 in breadth; and it contains 300,000 cubic feet of water, of which it is uſually emptied in 10 hours, by the labour of 90 men, who are employed at the ſame time in pumping, and relieved every half hour. As this is at preſent the only receptacle of ſhips under repair, new docks have been projected and begun upon a ſtupendous plan; in the execution of which it was propoſed to conſtruct 30 docks, for building and laying up the largeſt ſhips, at the extremity of the harbour. A baſon, capable of admitting two men of war, was deſigned to communicate, by ſluices, with two ſmaller baſons, from each of which it was propoſed to extend five rows of covered docks; each row being ſeparated by walls of ſtone, and each dock provided with ſluice-gates, ſo as to be filled or emptied by means of pumps. Cloſe to the docks, it has been intended to conſtruct magazines for naval ſtores, and to incloſe the whole with a ſtone wall. This project was begun in 1757, and reſumed by Guſtavus III. At the commencement of the works, 25,000l. were annually expended; but the ſum has been ſince leſſened to about 6000l. per annum, and the number of docks reduced to 20. The primary intention of this grand plan was to obtain dry docks, for the purpoſe of keeping the whole fleet entirely covered from wind and weather. Difficulties have, however, occured, which have retarded the completion of this work; and in many years they have only finiſhed one dock, the bottom and ſides of which are of hewn granite, with rows of granite pillars that ſupport the roof: ſo that it bears rather the appearance of a colonnade to a temple than a receptacle for ſhips.

The ſhips are built at Carlſcrona chiefly by Engliſh artiſts; and as the provinces of Blekinge and Skone, though they abound with oaks, do not furniſh enough for a continued ſupply, the Swedes procure their ſhip-timber from Germany. From their own territories they are ſupplied with maſts and deals, pitch and tar, and the greater part of the flax uſed in the navy; the ropes and ſails are manufactured from Riga hemp. They caſt cannon, and make gunpowder with Swediſh ſaltpetre. The harbour of Carlſcrona is large and commodious, with depth of water ſufficient for ſhips of the firſt rate to carry their lower tier of guns. This town is the 10th in order of the towns that vote in the diet. N. lat. 56° 20′. E. long. 15° 26′ 15″. Coxe's Travels, vol. iv.

CARLSFELD, a mine-town of Germany, in the circle of Erzgebirg, ſeated on the river Wiltzſch. It was founded in 1678.

CARLSGRAF CANAL. See CANAL.

CARLS-INſEL, *Great and Little*, or *Charles's iſlands*, lie about a Swediſh mile from the coaſt of the iſland of Gothland; in which was formerly a quarry of marble, uſed for building the churches of Gothland.

CARLSKAMN, or CARLSHAVEN, Lat. *Caroli portus*, a ſea-port of Sweden, in the province of Blekinge, on the Baltic, built in 1658 by Charles X. and improved and fortified by Charles XI. In this town are a woollen manufacture, a forge for copper, and a timber-yard. It has the 19th vote in the diet, contains about 1200 inhabitants, and is diſtant 22 miles W. from Carlſcrona.

CARLSMARCKT, a town of Sileſia, in the principality of Brieg; ſeated on the river Stover, and 9 miles E. of Brieg.

CARLSRUHE, or KARLSRUH, a town of Germany, in the circle of Swabia and margraviate of Baden, ſituated in a foreſt, where the prince has a fine palace and gardens. It was founded by the margrave, Charles-William, in 1715, and is conſtructed on a regular plan. It conſiſts of one principal ſtreet, about an Engliſh mile in length, which is at a conſiderable diſtance in front of the palace, and in a direction parallel with it. All the other ſtreets go off at right angles from this, and are ſo arranged, that the view in each of them is terminated by the front of the palace. The houſes are as uniform as the ſtreets, being all of equal ſize and height. Here are four churches, two for Roman Catholics and two for Proteſtants, a ſynagogue for the Jews, and about 400 houſes. The margrave of Baden has contrived every means in his power to introduce induſtry and manufactures among his people. Accordingly there is a conſiderable number of Engliſh tradeſmen in this place, employed in manufactures ſimilar to thoſe of Birmingham, and inſtruct the inhabitants in that buſineſs. Here are alſo many watchmakers from Geneva, whom the prince has engaged to ſettle in the town by granting them various privileges. Carlſruhe is diſtant 2½ miles N.W. from Durlach, and 11 S. from Philipſburg.

CARLSTADT, a town of Sweden, in the province of Warmeland, built on the iſland of Tingwalla, formed by the two branches of the Clara-Elb river, which, after encompaſſing it, unite and fall into the lake Wenner. The iſland is 12 miles, and the town 1½ mile in circumference. It was built by Charles IX. whoſe name it bears. The ſtreets are broad and ſtraight; and, excepting the cathedral and ſchool, the houſes are conſtructed of wood painted. It is a biſhop's ſee; and the epiſcopal palace, which is likewiſe of wood, but not painted, has a front ſo extenſive, and with ſo many windows, that it appears like a manufactory. The town contains 1500 inhabitants, who carry on a commerce of iron and wood acroſs the Wenner, and import ſugar, tea, and ſpices. It has a linen and woollen manufacture, and in its vicinity is a medicinal ſpring. In the order of the diet it has the 38th voice, and is a place of conſiderable trade. N. lat. 51° 21′. E. long. 13° 18′.

CARLSTADT, a town of Germany, in the circle of Franconia, and biſhopric of Wurzburg, on the Maine; 12 miles N.W. of Wurzburg.

CARLSTEIN. See MARSTRAND.

CARLUCAT. See CARLUS.

CARLUDOVICA, in *Botany*. Boſc. Nouv. Dict. Flor. Peruv. pl. 31. Claſs and order, *monœcia polyandria*. Nat. order, *palmæ*.

Gen. Ch. *Cal.* ſpathe univerſal; leaflets four, lanceolate, concave, ſtriated, enveloping one another, caducous, terminated by four or five points; ſpathe common cubical, four-flowered; ſpathe proper oval, crowned with numerous round teeth. *Cor.* none. *Stam.* in the male flowers numerous, very ſhort, inſerted into the receptacle. *Piſt.* in the female flowers; germ cubical, hollowed at the top into two furrows croſſing each other; ſtyles four, filiform, very long; ſtigma reſembling an anther. *Peric.* berry cubical, one-celled. *Seeds* numerous, ſmall, oblong, even. The male and female flowers are intermingled on the ſame ſpadix.

CARLUS, or CARLUX, in *Geography*, a town of France, in the department of the Dordogne, and chief place of a canton in the diſtrict of Sarlat; 6 miles E. of Sarlat. The place contains 619, and the canton 5863, inhabitants: the territory comprehends 122½ kiliometres and 15 communes.

CARMACÆ, in *Ancient Geography*, a people of European Sarmatia, placed by Pliny in the vicinity of the Palus Mæotis.

CARMAGNOLA, in *Geography*, a fortified town of Piedmont, in the marquiſate of Saluzzo, which formerly gave the title of count to the eldeſt ſon of the marquis. The name is a diminutive of Carmagna, which was a town in its neighbourhood, that ſunk in ſize and importance, whilſt the latter, by an acceſſion of its inhabitants, increaſed. In the war between the French and Imperialiſts, 1691, it was fortified by the former, and made one of the ſtrongeſt places on the frontiers of Piedmont. The four fauxbourgs built by the French at ſome diſtance from the town are well peopled, and divided into four pariſhes. Within the walls Carmagnola has only one pariſh; and the whole number of inhabitants in the fauxbourgs and the town is eſtimated at 6500. The market is well ſupplied, and much frequented by perſons from the adjacent countries, as well as by the Piedmonteſe themſelves. It is 11 miles S.S.E. of Turin, and 13 N.N.E. of Saluzzo. N. lat. 44° 42′. E. long. 7° 34′.

CARMANA, in *Ancient Geography*, a town of Aſia, the capital of Carmania, according to Ptolemy, ſituated in the interior of the country, in Carmania properly ſo called, but not far from the deſert.—Alſo, an iſland, near the coaſt of Carmania. Steph. Byz.

CARMANDA, *Elmeſetana*, a large and flouriſhing town of Syria, ſituated on the banks of the Euphrates, according to Xenophon, who relates, that the army ſtationed on the oppoſite bank, furniſhed itſelf with ſubſiſtence in this city by paſſing the river on rafts. It was ſituated W. S. W. of Anatho.

CARMANIA, a country of Aſia, ſituate between Perſia on the north-weſt, and Gedroſia on the ſouth-eaſt; and reckoned by ſome geographers a province of Perſia, taken in its greateſt extent. According to Ptolemy, Carmania is divided into Carmania the Deſert, and Carmania Proper. The former is bounded on the north by Parthia; on the weſt by Perſia; on the eaſt by Drangiana; and on the ſouth by Carmania Proper. The latter has on the ſouth the Indian Ocean; on the weſt Perſia and the Perſian Gulf: on the eaſt Gedroſia, and on the north Carmania the Deſert. It was inhabited by the Iſatichæ, Zuthi, Gadanopydres or Ganandopydnæ, Camelobоſci, Agdonites or Agdioutes, Rhudianæ, Æres, Charadnæ, Paſargadæ, and Armozæi. The ancient cities were Carmana, now Kerman, Alexandria, Armuza or Armozus, on the ſhore of the gulf, giving name to a promontory, and to the iſland of Ormuz, &c. &c. Its rivers were Arapis, Carius, Archidana, Saganus, and Andanis. Its promontories were Armozus and Carpella. Among its mountains Ptolemy diſtinguiſhes that which was called Mons Semiramidis, and another under the name of Mons Strongalus. Its dependent iſles, in the Perſian Gulf, were Sugdiana and Vorocchtha, or Oaroćta; and in the Indian Ocean Polla, Carminna and Liba.

Ptolemy makes a very marked diſtinction between Carmania Deſert and Carmania Proper, and the difference between them, indicated by nature, is allowed by Ammianus Marcellinus. As to the firſt, the appellation given to it by Ptolemy was ſtrictly appropriate; as it had ſcarcely a town or village in it; its ſoil being an inhoſpitable ſand, its air hot and unhealthy, and the whole province almoſt deſtitute of water. Carmania Proper, on the other hand, was a much more fertile country, producing a variety of very large trees, with the exception, however, of olives. Strabo. lib. xv. It was watered by ſeveral rivers, particularly the Andanis, mentioned by Ptolemy and Pliny; although it was mountainous, its mountains had mines of copper and iron. Pomponius Mela, who lived under Tiberius and Claudius, gives a very unfavourable account of the condition of the Carmanians, and of their mode of life; for, ſpeaking of the Carmanians who navigated the Perſian Gulf, he ſays they were deſtitute of cloathing, corn, cattle, and houſes; that they covered themſelves with the ſkins of fiſhes, and eat their fleſh, and that their whole bodies were hairy. Probably this deſcription relates to what Pomponius Mela had heard concerning the inhabitants of the coaſt of Gedroſia, who were denominated "Ichthyophagi."

In more modern times, however, the province of Carmania has been remarkable for producing ſheep, which bear the fineſt wool in the world; and they are ſaid to have this peculiar property, that, having fed upon new graſs from January to May, their fleeces fall off of themſelves, and leave the ſheep quite naked; when the wool is gathered and beaten, the coarſe ſeparates and the fine only remains. The Gaurs have reſerved this manufacture to themſelves, which conſiſts in girdles much eſteemed through the Eaſt, and in a ſort of ſerges, as ſoft and almoſt as fine as ſilk. The iſle of Ormus is dependant on this province. See KERMAN and ORMUS.

CARMANICUS SINUS, or Gulf of Carmania, the name given by Ptolemy to the Perſian Gulf: the ſea which waſhed the coaſts of Carmania was called *Carmanium Pelagus*; and the ancient name of mount *Pangæus* was, according to Plutarch, *Carmanius Mons.*

CARMANOR, a name which, according to Plutarch, *(De Fluv.)* was given to the river Inachus; and mount *Tmolus* was, as he ſays, denominated *Carmanorius mons*, from Carmanor, the ſon of Bacchus, who had there loſt his life in hunting.

CARMARA, a town of India, placed by Ptolemy on this ſide of the Ganges.

CARMATHIANS, or KARMATIANS, in *Hiſtory*, an Arabian ſect, which bore an inveterate malice againſt the Mahometans, and which began to occaſion diſturbances in the year of the Hegira 277, A. D. 890. It is ſaid to have derived its origin from an Arabian preacher of the name of Carmath, in the neighbourhood of Cufa, who aſſumed the lofty and incomprehenſible ſtyle of the guide, the director, the demonſtration, the word, the holy ghoſt, the camel, the herald of the Meſſiah, who had converſed with him in a human ſhape, and the repreſentative of Mohammed, the ſon of Ali, of St. John the Baptiſt, and of the Angel Gabriel. In his myſtic volume, the precepts of the Koran were refined to a more ſpiritual ſenſe; he relaxed the duties of ablution, faſting, and pilgrimage; allowed the indiſcriminate uſe of wine and forbidden food; and nouriſhed the fervour of his diſciples by the daily repetition of 50 prayers. The idleneſs and ferment of the ruſtic crowd awakened the attention of the magiſtrates of Cufa; a timid proſecution aſſiſted the progreſs of the new ſect; and the name of the prophet became more revered after his perſon had been withdrawn from the world. Carmath, or Karmata, contrived by his fanaticiſm to form a very large party of followers, out of whom he choſe 12, as his apoſtles, to govern the reſt, and to propagate his doctrines. The governor of the province ſeized the prophet, and committing him to priſon, ſwore that he ſhould die; but a damſel belonging to the governor, overhearing this menace, took the key of the dungeon from under her maſter's head as he ſlept, and having releaſed the priſoner, returned it to the place from which ſhe had taken it. His adherents took this occaſion of reporting, that God had taken the prophet, who had made his eſcape, into heaven. He appeared afterwards in another province, and declared to his followers, that it was not in the power of any one to do him hurt; notwithſtanding which, his courage failing him, he retired into Syria, and was not heard of any more. His ſect, however, continued and increaſed; and his 12 apoſtles diſperſed themſelves among the Bedoweens, "a race of men," ſays Abulfeda, "equally devoid of reaſon and of religion;" and by the ſucceſs of their preaching, they threatened Arabia with a new revolution. The Carmathians were ripe for rebellion, ſince they diſclaimed the title of the houſe of Abbas, and abhorred the wordly pomp of the caliphs of Bagdad. They were ſuſceptible of diſcipline, ſince they vowed a blind and abſolute ſubmiſſion to their Iman, who was called, in their apprehenſion, to the prophetic office by the voice of God and the people. Inſtead of the legal tithes, he claimed the fifth of their ſubſtance and ſpoil; the moſt flagitious crimes were no more than the type of diſobedience; and the brethren were united and connected by an oath of ſecrecy. After a bloody conflict, they prevailed in the province of Bahrein, along the Perſian Gulf; the tribes of the deſert were ſubject to the ſceptre, or rather to the ſword, of Abu Said and his ſon Abu Taher; and theſe rebellious Imams could muſter in the field 107,000 fanatics. The mercenaries of the caliph were diſcomfited in every action; the cities of Racca and Baalbec, of

Cufa and Baſſora, were taken and pillaged; Bagdad was filled with conſternation; and the caliph trembled behind the veils of his palace. Abu Taher advanced with 500 horſe to the gates of the capital; but being appriſed of his danger, and adviſed to make his eſcape, the intrepid Carmathian replied to his cautious and timid friend, ſent to him by order of the enemy, "Your maſter is at the head of 30,000 ſoldiers; three ſuch men as theſe are wanting in his hoſt;" at the ſame inſtant, turning to three of his companions, he commanded the firſt to plunge a dagger into his breaſt, the ſecond to leap into the Tigris, and the third to caſt himſelf headlong down a precipice. They obeyed without a murmur. "Relate," continued the Imam, "what you have ſeen; before the evening your general ſhall be chained among my dogs." Before the evening, the camp was ſurpriſed and the menace executed. The rapine of the Carmathians was ſanctified by their averſion to the worſhip of Mecca; they robbed a caravan of pilgrims, and 20,000 devout Moſlems were abandoned on the burning ſands to a death of hunger and thirſt. Another year they ſuffered the pilgrims to proceed without interruption; but in the feſtival of devotion, Abu Taher ſtormed the holy city, and trampled on the moſt venerable relics of the Mahometan faith. Thirty thouſand citizens and ſtrangers were put to the ſword; the ſacred precincts were polluted by the burial of 3000 dead bodies; the well of Zemzem overflowed with blood; the golden ſpout was forced from its place; the veil of the Caaba was divided among theſe impious ſectaries, and the black ſtone, the firſt monument of the nation, was borne away in triumph to their capital. After this deed of ſacrilege and cruelty, they continued to infeſt the confines of Irak, Syria, and Egypt; but the vital principle of enthuſiaſm had withered at the root. Their ſcruples or their avarice again opened the pilgrimage of Mecca, and reſtored the black ſtone of the *Caaba* (which ſee); and it is needleſs to inquire into what factions they were broken, or by whoſe ſwords they were finally extirpated. It will be ſufficient to obſerve, that the ſect of the Carmathians may be conſidered as one viſible cauſe of the decline and fall of the empire of the caliphs. D'Herbelot, art. *Carmath.* Sale's Koran, Prelim. Diſcourſ. p. 184. Gibbon's Hiſt. vol. x. p. 74, &c. See Abudhaher.

CARMEAUX, in *Geography*, a town of France, in the department of the Tarn; two leagues N. of Alby.

CARMEL, in *Ancient Geography*, a mountain of Paleſtine, or as it has been otherwiſe called Syria or Phœnicia, ſituate in the pachalic of Saide or of Acre, commanding the bay of Acre to the ſouth, and forming one of the moſt remarkable head-lands on the whole coaſt of the Mediterranean. It is in the form of a flattened cone, and very rocky, and, as Volney ſays, about 2000 feet high. This mountain is ſuppoſed to have derived its name from its fertility; the word *Carmel*, according to its Hebrew import, ſignifying the "vine of God" and denoting a fruitful ſpot, or a place planted with fruit trees. To this purpoſe Volney informs us, (Travels in Egypt and Syria, vol. ii. p. 228), that among the brambles are ſtill found wild vines and olive-trees, which prove that induſtry had formerly been employed even on this ungrateful ſoil. To the ſouth of this mountain, which extends eaſtward from the ſea as far as the plain of Jezreel, or Eſdraelon, the country preſents a chain of rugged mountains, on the tops of which are many oaks and fir-trees, which furniſh a retreat for wild boars and lynxes. At the foot of this mountain, north, runs the brook Kiſhon, and a little farther the river Belus. Joſephus makes Carmel a part of Galilee; in the diviſion of the holy land made by Joſhua, it fell to the lot of the tribe of Aſher; but this tribe having remained in captivity with the other tribes of Iſrael, it returned to the Phœnicians, its original maſters, according to St. Jerome.

Carmel is not only the name of the mountain, but of a city which is ſaid to have been built upon it, and of a heathen deity worſhipped in it, without either temple or ſtatue, as Tacitus ſays, (Hiſt. l. ii. c. 78.), and having only an altar upon which ſacrifices were offered to the deity. It is ſuppoſed, however, that there muſt have been ſome temple upon it, ſince Jamblichus (in Vit. Pythag.) informs us, that this place was the favourite retreat of Pythagoras, who ſpent much time alone in the temple. Accordingly the Greeks called it Ὄρος καὶ ἱερὸν Διός, the mountain and temple of Jupiter. Suetonius ſays, that Veſpaſian aſcended this mountain, and offered a ſacrifice to the deity of the place, when he came into Syria in order to ſubdue the Jews who had revolted. This mountain has been celebrated and revered among chriſtians on account of its having been the reſidence of Elijah, who is ſuppoſed to have lived in a cave, which is there ſhewn, before he was taken up into heaven; and in the ſummit of it is a chapel dedicated to this prophet, which affords an extenſive proſpect over the ſea and land. This is alſo ſaid to have been the ſcene, where Elijah called for a fire from heaven, which conſumed the divine ſacrifice, thus convincing the Iſraelites of their folly in heſitating between their God and Baal. (1 Kings, xviii.) On this account the Chriſtians began, from the earlieſt ages, to manifeſt a more than ordinary veneration for it; and both the mountain and cave of Elijah, as well as the place where they ſay his garden was, are viſited and reverenced not only by Chriſtians and Jews, but alſo by the Mahometans. We are likewiſe told, that a church with a monaſtery was erected on this mountain in ſome of the early ages of Chriſtianity, and that when, by the lapſe of time and the fury of its enemies, it was decayed and almoſt deſtroyed, a new one was afterwards erected by the zeal of a Calabrian prieſt, who founded the order of the Carmelites, ſince ſpread through all the Roman Catholic countries, and of whom there is ſtill a certain number, living in this ancient monaſtery. See Carmelites.

Carmel was alſo a city of Paleſtine in the ſouthern part of the tribe of Judah, ſeated on a mountain of the ſame name, which was part of a long chain of mountains, that paſſed through the ſouthern part of Paleſtine and near the lower coaſt of the Aſphaltite lake, and bounded the country of the Amalekites. This city was the reſidence of Nabal the carmelite, Abigail's huſband; and it was on this mountain that Saul returning from his expedition againſt Amalek, erected a trophy. (1 Sam. xv. 11.)

Carmel, *Knights of Mount*, are a military order of knights Hoſpitallers, inſtituted in 1607, by Henry IV. of France, under the title, habit, and rule of *our Lady of Mount Carmel*, and in conſequence of a bull of pope Paul V. in 1608, united to the order of St. Lazarus of Jeruſalem, with all its commanderies, priories, and other goods for its endowment. The founder propoſed it to conſiſt of one hundred French gentlemen, who ſhould be obliged, in times of war, to march cloſe to the kings of France, as their guard. Authors are much divided, whether to call this a new inſtitution, or a reſtoration of that of St. Lazarus; though it is generally accounted a new inſtitution. See Lazarus.

Carmel, in *Geography*, a townſhip of America, in Dutcheſs county, New York. By the ſtate cenſus of 1796, 237 of its inhabitants were electors.

Carmel *water*, in *Geography*, a river of Scotland, which runs into the Irvine, in Renfrewſhire.

CARMELITE Water. See Carmes, *Eau de.*

CARMELITES, or *White Fryars*, or the *order of our Lady of Mount Carmel*, an order of religious, making one of the four tribes of mendicants, or begging friars; and taking both the name and origin from *mount Carmel*, (above deſcribed), formerly inhabited by the prophets Elijah and Eliſha, and by the children of the prophets; from which this order pretend to deſcend in an uninterrupted ſucceſſion.

The manner in which they make out their antiquity has ſomething in it too ridiculous to be rehearſed. Some among them pretend they are deſcendants of J. C. who, as well as the virgin Mary, are ſaid to have aſſumed the habit and profeſſion of Carmelites. Others go farther, and make Pythagoras a Carmelite, and the ancient Druids regular branches of their order. The learned Jeſuit, Papebroch, was accuſed before the tribunal of the Roman pontiff, by the Carmelites, on account of his having called in queſtion the dignity and high antiquity of their order. The conteſt on this ſubject was long and tedious; but it was ſo far determined, or at leaſt ſuſpended, in the year 1698, by Innocent XII., that ſilence was impoſed upon the contending parties; although the Carmelites affirm to this very day, that the prophet Elijah was the parent and founder of their ancient community.

Phocas, a Greek monk, ſpeaks the moſt reaſonably; he ſays, that in his time, viz. in 1185, Elijah's cave was ſtill extant on the mountain; near which were the remains of a building, which intimated there had been anciently a monaſtery; that ſome years before, an old monk, a prieſt of Calabria, whoſe name was Berthold, by revelation, as he pretended, from the prophet Elijah, fixed there, and aſſembled ten brothers. In 1205, Albert, patriarch of Jeruſalem, gave the ſolitaries a rigid rule; which Papebroch has ſince printed. This rule conſiſted of 16 articles; one of which confined them to their cells, and enjoined them to continue day and night in prayer; another prohibited the brethren having any property; another enjoined faſting from the feaſt of the holy croſs till Eaſter, except on Sundays; abſtinence at all times from fleſh was enjoined by another article; one obliged them to manual labour; and another impoſed upon them a ſtrict ſilence from veſpers till the tierce the next day. In 1217, or according to others, 1226, pope Honorius III. approved and confirmed this rule; though it was afterwards mitigated by Innocent IV. On the concluſion of the peace between the emperor Frederic II. and the Saracens in 1229, the Carmelites quitted the Holy Land, under Alan the fifth general of the order. Some of them were ſent to Cyprus, in 1238, and founded a monaſtery in the foreſt of Fortania. Some Sicilians at the ſame time returned to their own country, and founded a monaſtery in the ſuburbs of Meſſina. St. Louis brought ſome of theſe Carmelites with him from the Holy Land into France. Many of the popes gave them the title of "Brothers of the Bleſſed Virgin."

The Carmelites came into England in the year 1240, and erected a great number of monaſteries. Their firſt houſes were at Alnwick in Northumberland, and Ailesford in Kent. In England and Wales they had about forty houſes. This order is eminent for the devotion of the ſcapulary, for its miſſions, and for the great number of ſaints with which it has ſtocked the Romiſh church. In the 17th century, there were four canonizations in this order, viz. of S. Thereſa, S. Andrew Corſin, S. Mag. de Pazzi, and S. J. de la Croix.

In the 16th century St. Thereſa, a Spaniſh lady of an illuſtrious family, undertook the difficult taſk of reforming the Carmelite order, which had departed much from its primitive ſanctity, and of reſtoring its neglected and violated laws to their original credit and authority. Her aſſociate in this arduous attempt was Johannes de Santa Cruſa, and her enterpriſe was not wholly deſtitute of ſucceſs, notwithſtanding the oppoſition ſhe met with from the greateſt part of the Carmelites. Hence the order was, during the ſpace of 10 years, divided into two branches; of which one followed a milder rule of diſcipline, while the other embraced an inſtitute of the moſt ſevere and ſelf-denying kind. The former, viz. *Carmelites of the ancient obſervance*, were called the *mitigated*, or *moderate*; and the latter, or thoſe of the *ſtrict obſervance*, were called *Bare-footed Carmelites.*

The *ancient obſervance* has only one general, under whom are forty provinces; and the congregation of Mantua, which has a vicar-general.

*Bare-footed* Carmelites are a reform of the ancient *Carmelites*, ſet on foot in 1540, by St. Thereſa; ſo called from their going bare-footed.

She began with the convents of nuns, whom ſhe reſtored to the primitive auſterity of the order, which had been mitigated by Innocent IV. in 1245, and at length carried the ſame reform among the friars. Pius V. approved the deſign, and Gregory XIII. confirmed the reform in 1580; at the particular deſire of Philip II., king of Spain. This ſeparation of the bare-footed Carmelites from thoſe of the ancient obſervance was confirmed, in 1587, by Sixtus V., and completed, in 1593, by Clement VIII., who allowed the former to have their own chief, or general. But, after having withdrawn themſelves from the others, theſe auſtere friars quarrelled among themſelves, and in a few years their diſſenſions arrived at ſuch a height, that they were divided anew, by the pontiff laſt mentioned, into two communities, each of which was governed by its reſpective general, and had its peculiar conſtitutions: the one *the congregation of Spain*, divided into ſix provinces; the other called *the congregation of Italy*, comprehending all the reſt, not depending on Spain.

The habit of the Carmelites was at firſt white, and the cloak laced at the bottom with ſeveral liſts. But pope Honorius IV. ordered it to be changed for that of the Minims. Their ſcapulary is a ſmall woollen habit of a brown colour, thrown over their ſhoulders. Inſtead of linen ſhirts, they wear linſey-wolſey, which they change twice a week in the ſummer, and once a week in the winter.

CARMELO, in *Geography*, a river on the coaſt of New Albion, S.E. of Franciſco bay. N. lat. 36° 55′.

CARMELUM Promontorium, in *Ancient Geography*, a maritime point of mount Carmel near *Caipha*. See Acre.

CARMELUS, in *Mythology*, a deity of the Syrians, who inhabited the vicinity of mount Carmel. He had an altar, but no temple. Tacitus (Hiſt. II. 78.) ſays, that a prieſt of this deity predicted to Veſpaſian, that he ſhould be emperor.

CARMEN, an ancient term among the Latins, uſed, in a general ſenſe, to ſignify a verſe; but in a more peculiar ſenſe to ſignify a ſpell, charm, form of expiation, execration, &c. couched in a few words, placed in a myſtic order, on which its efficacy depended.

Pezron derives carmen from the Celtic *carm*, the ſhout of joy, or the verſes which the ancient bards ſung, to encourage the ſoldiers before the combat; adding, that the Greek χαρμη ſignifies combat and joy; which is true: but then it does not come from the Celtic *carm*, but from χαιρω, I rejoice.

Some fetch the origin of the poetical *carmina*, or verſes, hence; and ſay, they took that name from their reſemblance to theſe ſpells: others, on the contrary, ſay, that the ſpells had their origin from the poetical verſes, and took their name from their reſemblance to thoſe: it is at leaſt certain, that many of the ancient charms, wherewith diſeaſes were ſuppoſed to be cured, were metrical verſes, to which, in thoſe ages, greater efficacy was aſcribed than to mere words or proſe.

Vigenere, again, derives *carmen* from *Carmenta*, becauſe that propheteſs couched her predictions in verſes, or ſhort periods: but others ſay, the propheteſs took the name *Carmenta* from *carmen*, on the ſame account.

Carmen, was anciently a denomination given to precepts, laws, prayers, imprecations, and all ſolemn formulæ, couched in a few words, placed in a certain order, though written in proſe.

In which ſenſe it was, that the elder Cato wrote a "Carmen de moribus," which was not in verſe, but proſe.

Carmen *ſaliare*, a ſet of ancient verſes compoſed by Numa, ſung by the salii, accompanied by the claſhing of *Ancylia*, or ſacred bucklers. See Ancyle.

Carmen alſo denotes a form of prayer, or words whereby divers among the ancients devoted themſelves. Such was that of the Decii, ſpoken of by Pliny, Hiſt. Nat. lib. xxxviii. cap. 2.

Carmen, or *Karmoe*, in *Geography*, an iſland near the weſt coaſt of Norway, about 14 miles long and two broad. N. lat. 59° 30′. E. long. 5° 29′.

CARMENIAN Wool, a denomination given to a kind of goat's hair, brought from Carmenia, or Carmania, a country of Aſia Minor. See Carmania.

CARMENTALIA, a feaſt among the old Romans, cebrated annually on the 11th of January, in honour of *Carmenta*, or *Carmentis*, a propheteſs of Arcadia, mother of Evander, with whom ſhe came into Italy, 60 years before the Trojan war. After her death ſhe was admitted into the number of the *Dii indigetes* of Rome. Dionyſius Hal. and Plutarch ſay, that Carmenta was the "Themis" of the Greeks. The ſolemnity was alſo repeated on the 15th of January, which is marked in the old calendar by *Carmentalia relata*. This feaſt was eſtabliſhed on occaſion of a great fecundity among the Roman dames, after a general reconciliation with their huſbands, with whom they had been at variance, in regard of the uſe of coaches being prohibited them by an edict of the ſenate.

The women celebrated this feaſt: he who offered the ſacrifices was called *Sacerdos Carmentalis*.

Authors are divided about the origin of the word *Carmenta:* Vigenere ſays, the propheteſs was ſo called *quaſi carens mente*, out of her ſenſes; by reaſon of the enthuſiaſm ſhe frequently fell into. Others ſay, ſhe took her name from *carmen*, verſe; becauſe her prophecies were couched in verſes: but Vigenere, as before noted, maintains *carmen* to be derived from *Carmenta*.

CARMENTALIS Porta, in *Ancient Geography*, a gate of Rome, ſituated on the banks of the Tiber, at the foot of the Capitol, in the place called "Montanara." It was alſo called *Scelerata*, becauſe the 300 Fabians, defeated by the Etruſcans, on the banks of the Cremera, made their eſcape from Rome through this gate.

CARMES, Eau de, the Carmelite water, or compound balm water, famous in France, and moſt parts of Europe for its extraordinary cordial virtues. It is ſaid to be extremely reviving, to be good in all ſorts of fits, apoplexies not excepted; and to relieve the gout when it attacks the ſtomach. The Carmelites at Paris, who make conſiderable advantage by vending this water, keep the preparation of it a great ſecret. See Melissa.

CARMINATIVE, in *Medicine*, a denomination formerly applied to thoſe articles of the Materia Medica, which poſſeſs the property of diſpelling wind from the ſtomach.

The origin of this abſurd term has been aſcribed to thoſe times of ignorance and ſuperſtition, when the practice of medicine, in the hands at leaſt of ſordid and deſigning men, was intimately connected with magic, jugglery, and other modes of deception; among which, incantations in verſe (*carmina*), repeated during or previouſly to the adminiſtration of the remedies, were frequently reſorted to. In ſeveral nervous diſorders, eſpecially in ſlight hyſterical complaints, and in ſome of the forms of *dyſpepſia*, or indigeſtion, the operation of medicines of this claſs is extremely quick, their effects are obvious and unequivocal, and the relief which they afford is very conſiderable: hence they were peculiarly adapted for the accompaniment of incantations. It is not improbable, however, that the term may have been originally adopted in a metaphorical ſenſe. A medicine operating thus quickly, and producing almoſt inſtantaneous relief, might be ſaid to operate *like a charm;* and it might therefore be figuratively, but quaintly denominated *carminative*. The word is ſcarcely to be found in the medical language of the preſent day.

The ſubſtances included under this denomination, are of an aromatic or gratefully ſtimulant nature; conſiſting chiefly of the eſſential oils of vegetables, either pure, or ſuſpended in water by diſtillation, or combined with volatile ſalts or other ſtimulants; of the leſs active forms of the æthers, or the dulcified ſpirits, as they were formerly called, &c. The ſtomach when greatly diſtended with wind, becomes unable to relieve itſelf (like the bladder, after a long retention of the urine), partly in conſequence of the weakened ſtate of the over-ſtretched fibres of its muſcular coat, and partly, perhaps, from a contraction of the *cardia*, or upper orifice. For, however difficult it may be to explain it, the fact is well known, that a loſs of power to act, and a morbidly increaſed or ſpaſmodic action, are both conſequences of the debility of the muſcular fibre. The mode of operation of the *carminative* medicines, therefore, on the contractile coats of the ſtomach, by which it is relieved from the diſtenſion of wind, conſiſts chiefly in exciting to a certain degree of action the diſtended and weakened muſcular coat, by which the accumulated *gas* is propelled through the upper orifice; but partly alſo in reſolving any ſlight ſpaſmodic contraction of that orifice, which may exiſt. For as debility produces, ſo ſtimulants counteract, both the diminiſhed and the morbidly great action of the muſcular ſtructure.

CARMINE is a beautiful red precipitate of the colouring matter of *Cochineal*, which ſee.

CARMINIANUM, in *Ancient Geography*, *Carmignano*, a place of Italy, near Aletium, over againſt Lupia, and before Tarentum, in Meſſapia.

CARMONA, in *Geography*, a town of Spain, in the province of Andaluſia; it was known to the ancients by the name of Carmo, placed in Bætica, to the ſouth of Ilipa, and north-eaſt of Hiſpalis, and eſteemed by Cæſar one of the ſtrongeſt towns of the country. Philip IV. in conſideration of a preſent of 40,000 ducats, gave it the title of city. It is built on a declivity, looking down upon a rich valley, which is bounded by diſtant hills, excepting only to the ſouth, where a wide opening gives a paſſage to the Guadalquivir. It contains 12,685 perſons, and includes 7 pariſh churches, with 5 convents for men, 2 for women, and 2 hoſpitals; and they reckon in this place more than 100 oil mills: about 20 miles N.E. from Seville, and 40 S.W. from Cordova. N. lat. 37° 24′. W. long. 5° 37′.

Carmona, a town of Italy, in Friuli, in the county of Goritz, ſeated on a mountain near the river Indri, and belonging to the houſe of Auſtria. N. lat. 46° 15′. E. long. 5° 37′.

CARMONA, in *Botany*, Boſc. Nouv. Dict. Cavanilles. Claſs and order, *pentandria digynia*.

Gen. Ch. *Cal.* permanent, with five acute ſegments. *Corol.* monopetalous: tube ſhort; border with five acute diviſions. *Stam.* five. *Piſt.* germ ſuperior, globular; ſtyles two: ſtigmas ſimple. *Peric.* drupe globular; nut with five cells and five ſeeds.

Sp. C. *heterophylla*, Cav. Pl. 438. A ſhrub. *Leaves* alternate, faſciculated on tubercles, oval, oblong, ſometimes entire, ſometimes three-toothed, dotted with white above, villous underneath, on very ſhort petioles. *Flowers* red, in axillary, villous racemes. A native of the Marianne iſlands. According to Ventenat, it is nearly allied to Ehretia.

CARMOYLE ROAD, in *Geography*, an anchorage in Belfaſt loch, on the north-eaſtern coaſt of Ireland, where large veſſels, which load or unload at that port, uſually lie.

CARMULLA, a town of Hindooſtan, in the ſoubah of Dowlatabad; 70 miles N. from Viſiapour, and 88 E. from Poonah. N. lat. 18° 40′. E long. 75° 22′.

CARMYLISSUS, in *Ancient Geography*, a town of Aſia Minor, in Lycia, ſituated in a ſmall valley, at the foot of mount Anticragus; mentioned by Strabo.

CARNA, in *Botany*, Rheed. Mal. 1. p. 107. tab. 59. See LAURUS *Caſſia*.

CARNA, in *Geography*, a town of Arabia Felix, according to Ptolemy and Strabo, the latter of whom ſays, that it was the largeſt town belonging to the Minoeans, a people who inhabited the coaſt of the Red Sea, and who were neighbours to the Sabæans.—Alſo, a town of Phœnicia, the "Carne" of Pliny.

CARNABADIUM, in the *Materia Medica* of the ancients, a name given to a drug frequently mentioned by the Greek and Arabian writers.

CARNABAT, in *Geography*, a town of European Turkey, in the province of Romania; 50 miles W. of Burgas.

CARNABORU, a town of Poland, in the palatinate of Red Ruſſia; 60 miles S. of Halicz.

CARNAC, or KARNAC, a village of Egypt, about $1\frac{1}{4}$ mile below Luxor (which ſee), conſiſting of miſerable cottages, which ſerve as a foil to the magnificence of the ſplendid ruins by which they are ſurrounded. Theſe comprehend obeliſks, ſome of which are very beautiful and well preſerved, rows of ſphinxes, and a number of termini, compoſed of baſaltes, with a dog or lion's head, of Egyptian ſculpture, which ſeemed to ſerve as avenues to ſome principal building; mutilated ſtatues; walls covered with hiſtorical engraving, which is a repreſentation of men, horſes, chariots, and battles; porticoes of great elevation; colonnades of immenſe ſize; and colours of aſtoniſhing brilliancy; granite and marble; and ſtones of prodigious dimenſions, ſupported by capitals, and forming the roof of magnificent buildings, &c. &c. Bruce ſuggeſts, that Luxor is Dioſpolis, and that Carnac, together with that place, conſtituted the "Jovis Civitas magna" of Ptolemy.

CARNÆ, or CARNAPÆ, in *Ancient Geography*, a people placed by Pliny in the European Sarmatia, near the Cimmerian Boſphorus.

CARNAL MANAZEL, in *Geography*, a town of Arabia; 40 miles E.S.E of Mecca.

CARNALIS, in *Ancient Geography*, a town of Aſia, placed by Ptolemy in Armenia Minor.

CARNALLOCH, or CAIRN LOUGH, in *Geography*, lies in the country of Antrim, Ireland, near the mouth of the ſmall river Glenevy, which falls into Glenarm bay; 2 miles N. of Glenarm, and 108 N. of Dublin.

CARNAMART, a river of the county of Galway, Ireland, which falls into the bay of Galway; it has ſeveral branches, one of which proceeds from Loughrea. This river is partly ſubterraneous, and it forms a turlogh; i.e. a ſpot which in winter appears as a lake, but in ſummer is dried up, and reckoned a good ſheep-walk.

CARNAPOLE, a factory on the Malabar coaſt of India, S.S.E. from Cochin.

CARNARIUM, a charnel-houſe, or repoſitory for the bones of the dead.

CARNASA, or CARSANA, in *Ancient Geography*, a town of India, on this ſide of the Ganges. Ptolemy.

CARNATIC, or CARNADA, in *Geography*, a country of Hindooſtan, lying along the coaſt of Coromandel, from cape Comorin, in N. lat. about 8° to about 16°. It is bounded on the north by the country of Golconda, on the eaſt by the bay of Bengal, and on the weſt by the Myſore, Dindigul, and Travencore. The dominions of the late Mahomed Ally, nabob of the Carnatic, and an ally of the Eaſt India company, commence on the ſouth of the Guntoor Circar, called alſo Mortizanagur and Condavir, and extend along the whole coaſt of Coromandel to cape Comorin; including Tanjore, Marawar, Tritchinopoly, Madura, and Tenivelly, all being appendages of the Carnatic. Under this deſcription, the Carnatic is not leſs than 570 Britiſh miles in length from north to ſouth, but no where more than 120 wide, and commonly no more than 75. "Such a long narrow tract of country," ſays major Rennell, "bordered by an active and powerful enemy, whoſe territories are, moreover, of a compact form, and his force more readily collected, muſt always be ſubject to have its diſtant provinces cut off from its aſſiſtance; or, if it divides its force, for their ſeparate defence, the ſafety of the whole will be endangered." The Carnatic, ſays this ingenious geographer, anciently comprized all that part of the peninſula that lies ſouth of the Gondegama and Toombuddra rivers, from the coaſt of Coromandel eaſtward to the Gaut mountains weſtward, and divided into *Balla-gaut* (which ſee), and *Payen-gaut*; the former being the weſtern part, and the latter the eaſtern part, or the Carnatic, according to its preſent definition. The revenue of the nabob is ſtated at about a million and a half ſterling per annum; out of which he was accuſtomed to pay a ſubſidy of 160,000l. per annum, to the Eaſt India company, towards the expence of their military eſtabliſhment. The evils attendant on the improvident conduct of the nabob have been ſeverely felt in paſt times, and meaſures have been adopted for guarding againſt them in future. This nabob has been one of the moſt ancient, and was ſuppoſed to be one of the moſt faithful, allies of the Britiſh nation in India: and Mahomed Ally is ſaid to have been eſtabliſhed in the government of Arcot (the capital of the Carnatic), and its dependencies, chiefly by the active co-operation of the Britiſh power in India. During the war, in 1780, a combination was formed againſt the Carnatic, between the French and the famous Hyder Ally, and his ſucceſſor Tippoo Sultan; and they had made ſome progreſs towards the conqueſt of it, till they were ſtopped by the interpoſition of Great Britain. In conſequence of this event, it became neceſſary that an adequate military eſtabliſhment ſhould be maintained by Great Britain for the defence of that country; and, in 1787, a regular contract was ſettled to that effect; the nabob Mahomed Ally agreeing to pay an annual ſubſidy for the ſupport of the troops, amounting to 15 lacks of pagodas. After the war, in

1792, between Great Britain and the late Tippoo Sultan, it was repreſented to the marquis Cornwallis, that the nabob was unable to diſcharge theſe pecuniary engagements, and an indulgent modification of that treaty was framed, which reduced the ſubſidy to nine lacks of pagodas. In both treaties, however, it was ſtipulated, that the nabob ſhould contract no alliances, nor enter into correſpondence with any European or other power, without the knowledge and concurrence of the Britiſh government. Upon the death of Mahomed Ally, in 1793, he was ſucceeded by his eldeſt ſon Omdat ul Omrah. The ſecond ſon of the nabob, viz. Azum ul Omrah, whoſe fate is unknown to us, left behind him a ſon Azeem ul Dowlah, who was kept a priſoner in the palace of the nabob at Chepauk, till the death of his uncle, the late nabob. The nabob Omdat ul Omrah profeſſed that he ſucceeded to the poſſeſſion of the territories of his father under all the obligations of the treaties of 1787 and 1792, and a reciprocal friendſhip ſubſiſted, for ſome time, between him and the Engliſh company. Nevertheleſs, after the fall of Seringapatam, in 1799, the original records of Tippoo Sultan, as well as his official correſpondence, fell into the hands of the Britiſh government; and it was diſcovered, that the nabobs Mahomed Ally and his ſucceſſor, Omdat ul Omrah, had carried on with Tippoo Sultan a correſpondence, inconſiſtent with, and tending to the ſubverſion of, the alliance between the nabob of the Carnatic and the India company, and incompatible with the ſecurity of the Britiſh power in the peninſula of India. Hence it was concluded, that theſe princes had placed themſelves in the ſituation of enemies to Great Britain. As the nabob approached his end, inſtructions, dated the 5th and 6th of July, 1801, were iſſued by the government of the Eaſt India company, and a party of troops was ſtationed at the palace of Chepauk, for the purpoſe of carrying them into effect. On the death of the nabob, an attempt was made to adjuſt the affairs of the Carnatic, under the direction of lord Clive, governor of Madras. In the mean while Omdat ul Omrah, the nabob, died; and the Britiſh agents were informed that he had appointed his reputed ſon, Taje ul Omrah, commonly called Ally Huſſein, then about the age of 18, to be his ſole heir. In the courſe of the negociation that enſued, it was alleged, on the part of the Britiſh agents, that the only adequate ſecurity for the rights and intereſts of the Britiſh government in the Carnatic was the entire and excluſive adminiſtration of the civil and military authority. To this propoſition it was objected, that if this was to be the baſis of the arrangement, the ſtation of nabob of the Carnatic muſt be annihilated, and all the power transferred into the hands of the company. On the other hand, it was replied, that the condition now propoſed actually exiſted in the treaties of 1787 and 1792; and that the object of the propoſed arrangement was to ſecure the rank, dignity, and ſplendour of the nabobs of the Carnatic, inſtead of exerciſing the full rights acquired by the Britiſh government. Ally Huſſein, with the advice of his two khans, expreſſed his diſapprobation of the terms propoſed; and when the treaty with him was brought to this termination, it was reſolved, if poſſible, to open a negociation with the prince Azeem ul Dowlah; the conſequence of which was, that the prince affixed his ſignature to a Perſian draft of the propoſed treaty, on the baſis of that rejected by Ally Huſſein, binding himſelf to execute a more formal treaty, at the period of his intended inſtallation; and on the following day he was formally introduced to the governor of Madras, as the future nabob of the Carnatic, and conducted to the palace appointed for his reſidence. Thus the whole ſubſtantial power of the Carnatic was veſted in the hands of the India company, and a proclamation was iſſued expreſſing the nature and terms of the arrangement. The treaty bears date the 31ſt of July, 1801, and enjoins that a permanent ſyſtem for the collection of the revenue, and for the adminiſtration of civil and criminal judicature, under the ſole and undivided authority of the honourable company, exerciſed by the governor in council of Fort George, ſhall be eſtabliſhed throughout every village, [illegible], and province, of the entire territories of the Carnatic.

The Britiſh poſſeſſions in the Carnatic are confined, chiefly, to the tract called the "Jaghire," which extends along the coaſt, about 108 Britiſh miles, and 47 inland, in the wideſt part. Its revenue is reckoned 150,000l. Beſides the Jaghire, there are lands dependent on Cuddalore; but the amount is not conſiderable. The whole amount of the land revenue dependent on Madras, including the circars, is ſtated at 725,000l. per annum. The principal towns of the Carnatic are Arcot, the capital, Madras, Ongole, Pondicherry, Cuddalore, Tanjore, Tritchinopoly, Madura, and Tenivelly. The principal rivers are the Pennar, the Paliſar, and the Cauvery. The Carnatic abounds with forts and fortreſſes of various kinds. Carnatic-gur and Doby-gur are two noted fortreſſes on the ridge of hills on the weſt of Arnee.

CARNATION, in *Botany*. See DIANTHUS *caryophyllus*.

CARNATION, *Spaniſh*. See CÆSALPINIA *veſicaria*.

CARNATION-*graſs*, in *Agriculture*, a term applied to the finer ſorts of graſſes, probably from their having this kind of colour in their flowers.

CARNATION-*tree*. See CACALIA *kleinia*.

CARNATION, among *Dyers*, red roſe-colour, for which take liquor of wheat-bran a ſufficient quantity, alum three pounds, tartar two ounces; boil them, and enter twenty yards of broad cloth; after it has boiled three hours, cool and waſh it: take freſh clear bran-liquor a ſufficient quantity, and madder five pounds; boil and ſadden according to art.

The Bow-dyers know that the ſolution of jupiter, or delved tin, being put in a kettle to the alum and tartar, in another proceſs, makes the cloth, &c. attract the colour into it, ſo that none of the cochineal is left, but the whole is abſorbed by the cloth.

CARNATION, *Fleſh-colour*, in *Painting*, is underſtood of all the parts of a picture in general, which repreſent fleſh; or thoſe parts of the human figure which are naked, and without drapery.

Titian and Corregio, in Italy, and Rubens and Van-Dyke in Flanders, excelled in carnations.

It may be here obſerved, that the word carnation is not properly uſed for any particular part of the perſon painted, but for the whole nudity of the piece. See COLOURING.

CARNATUS, in *Ancient Geography*, a river of Aſia Minor, in Cataonia.

CARNAWL, in *Geography*, a town of Hindooſtan, in the country of Sirhind; 7 miles N.W. of Delhi.

CARNCHUINAIG, a mountain of Scotland, near Kincardine, in the county of Roſs.

CARNE, in *Ancient Geography*, a town of Aſia, ſituated on the confines of Phœnicia and Syria, placed by Steph. Byz. in the former, and by Pliny in the latter. Strabo calls it Caranos, and makes it a ſea-port of the Aradians.—Alſo a town of Aſia Minor, in the Æolide. Steph. Byz.

CARNE, in *Geography*, a ſmall poſt town in the county of Donegal, province of Ulſter, Ireland, in the northern part of the peninſula of Iniſhowen; 133 Iriſh miles N.W. from Dublin, and about 18 N.W. from Londonderry. N. lat. 55° 16′. W. long. 7° 9′.

Carne, a fiſhing town, or rather village in the peninſula of the Mullet, county of Mayo, Ireland, not far from the iſthmus that joins it to the other part of the county. See Mullet. N. lat. 54° 14′. W. long. 9° 50′.

CARNEA, in *Ancient Geography*, a place of Paleſtine in Batanæa, north-eaſt of mount Galaad, and ſouth-eaſt of Tiberias.

CARNEADES, in *Biography*, an eminent Greek philoſopher, the founder as well as an illuſtrious ornament of the third or new academy, was a native of Cyrene in Africa, and born, according to the moſt probable ſuppoſition, in the 3d year of the 141ſt Olympiad, B. C. 214. He received his firſt inſtructions with regard to the art of reaſoning from Diogenes the ſtoic, and when he became a member of the academy, he attended the lectures of Egeſinus, and from him acquired the art of diſputing which had been introduced by Arceſilaus. As the ſucceſſor of Egeſinus in the chair of the academy, he contributed to reſtore its declining reputation. Having occaſion to viſit Rome, in company with Diogenes the ſtoic and Critolaus the peripatetic, on an embaſſy for obtaining the mitigation of a fine inflicted upon the Athenians, by the Sicyonians under the authority of the Romans, for having laid waſte Oropus, a town of Bœotia, Carneades and his aſſociates exhibited many ſpecimens of Grecian learning and eloquence, not before known in that city. Carneades excelled in the vehement and rapid, Critolaus in the correct and elegant, and Diogenes in the ſimple and modeſt kind of eloquence. The former having one day harangued, with great variety of thought and copiouſneſs of diction, in praiſe of juſtice, before Galba and Cato the cenſor, undertook next day, with a view of eſtabliſhing his doctrine of the uncertainty of human knowledge, to refute all his former arguments. He attracted the attention and excited the admiration of his auditors by the ſubtlety of his reaſoning, and the fluency of his language; and the popularity which he acquired alarmed Cato to ſuch a degree that he perſuaded the ſenate to haſten the return of theſe philoſophers to their own ſchools, leſt the Roman youth ſhould loſe their military character in purſuit of Grecian learning. In his own ſchool the reputation of Carneades, both as an orator and a philoſopher, was ſo great, that other philoſophers, when they had diſmiſſed their ſcholars, came to hear him. So intent and indefatigable was his application to ſtudy, that at his meals he often forgot to take the food that was ſet before him. Whilſt he did juſtice to the merit of Chryſippus the ſtoic, he ſtrenuouſly oppoſed him; and he uſed to ſay, that if there were no Chryſippus, there would be no Carneades, thus acknowledging he owed a conſiderable degree of his reputation as a diſputant to the abilities of his opponent. He poſſeſſed extraordinary powers of voice, and was accuſtomed to ſpeak ſo loud, that he needed ſome ſtandard by which to regulate it; but his maſter told him that he had ſuch a meaſure or ſtandard in the number of his hearers. As he grew old, he was greatly diſturbed by the apprehenſions of dying, and frequently lamented, that the ſame nature which had compoſed the human frame could diſſolve it. After a life prolonged to very advanced age, he cloſed it in his 85th, as ſome ſay, or according to Cicero and Valerius Maximus, in his 90th year. For an account of the doctrine of the new academy, as it was eſpouſed and taught by Carneades, ſee Academy. Although he oppoſed the doctrine of the Stoics concerning the gods, he did it, as Cicero ſays, not with a view to deſtroy the belief of ſuperior powers, but merely to prove, that their theological ſyſtem was unſatisfactory. Avowing likewiſe his repugnance to their opinion, concerning fate, he aſſumed, on the ground of experience, the exiſtence of a ſelf-determining power in man, and hence inferred, that all things did not happen, as the Stoics maintained, in a neceſſary ſeries of cauſes and effects, and conſequently, that it is impoſſible for the gods to predict events dependent on the will of man. As the foundation of morals, he taught, that the ultimate end of life is the enjoyment of thoſe things, towards which we are directed by the principles of nature. Brucker's Hiſt. Phil. by Enfield, vol i. Gen. Dict.

CARNEDDE, in *Britiſh Antiquity*, denote heaps of ſtone ſuppoſed to be Druidical remains, and thrown together on occaſion of confirming and commemorating a covenant. Gen. xxxi. 46. They are very common in the iſle of Angleſey; and were alſo uſed as ſepulchral monuments, in the manner of *tumuli:* for Mr. Rowland found a curious urn in one of theſe carnedde. Whence it may be inferred that the Britons had the cuſtom of throwing ſtones on the deceaſed. From this cuſtom is derived the Welſh proverb, *Karn ar dy ben*, ill betide thee. Rowland's Mona Antiqua Reſtaurata. See Barrow and Burial.

CARNEIA, in *Antiquity*, a feſtival in honour of Apollo, ſurnamed Carneus, held in moſt cities of Greece, but eſpecially at Sparta, where it was firſt inſtituted in the 26th olympiad.

The reaſon of the name, as well as the occaſion of the inſtitution, is controverted. It laſted nine days, beginning on the 13th of the month Carneus or Carnius, which ſee. The ceremonies were an imitation of the method of living and diſcipline uſed in camps.

CARNEL. The building of ſhips firſt with their timber and beams, and after bringing on their planks, is called *carnel-work*, to diſtinguiſh it from clinch-work.

Veſſels alſo which go with mizzen-ſails inſtead of mainſails, are by ſome called *carnels*.

CARNELIAN. See Chalcedony.

CARNERA, in *Geography*, one of the ſmaller Cape Verd iſlands, which is little more than a rock.

CARNERO, a cape in the South Sea near Santa Maria, on the coaſt of Peru. S. lat. 1° 35′. W. long. 77° 20′.

CARNESS, a cape of Scotland, on the north coaſt of the iſland of Pomona; 2 miles N. of Kirkwall.

CARNESVILLE, the chief town of Franklin county, in the ſtate of Georgia, America, 100 miles N.W. of Auguſta; containing a court-houſe and about 20 dwelling houſes.

CARNEW, a ſmall town of the county of Wicklow, Ireland, near the county of Wexford. It makes a deſpicable appearance, but ſome linen and much coarſe woollens are manufactured in the neighbourhood of it, and its fairs are much frequented. It is 44 miles South from Dublin. N. lat. 52° 42′. W. long. 6° 31′.

CARNEY, a diſeaſe in horſes, wherein their mouths become ſo furred that they cannot eat.

CARNI, in *Ancient Geography*, a people who were ſeparated from Norica by the Carnic or Julian Alps. According to Ptolemy they had three cities, "Forum Julium," "Concordia," and "Aquileia." Hence it appears that they occupied a part of the ſtate of Venice. Oroſius ſays that they were a Gauliſh nation; and he concurs with the epitome of Livy in ſaying that they were vanquiſhed in the year of Rome 635, by the conſul Quintus Martius Rex.

CARNIA, a name given to the territory at the bottom of the Adriatic gulf, inhabited by the Carni. It correſponded to the Venetian Friuli and a ſmallpart of Carniola. —Alſo, a town of Aſia Minor, in Ionia. Steph. Byz.

CARNICOBAR, in *Geography*, the northernmoſt iſland of that cluſter in the bay of Bengal, called *Nicobars*. It is low, of a round figure, about 40 miles in circumference, and at a diſtance appears as if it were entirely covered with trees; though there are upon it ſeveral well cleared and delightful ſpots. The ſoil is a black kind of clay, and marſhy; producing, however, abundantly and with little care, moſt of the tropical fruits, ſuch as pine-apples, plantains, papayas, cocoa-nuts, and areca-nuts; beſides excellent yams, and a root called "cachu." The only quadrupeds upon the iſland are hogs, dogs, large rats, and a large animal of the lizard kind, called by the natives "tolonqui." Of poultry they have only ſome few hens. The ſnakes, of various kinds, are numerous, and their bites are frequently fatal to the inhabitants. The timber is plentiful, and of various ſorts; ſome of it is very large, and affords excellent materials for building or repairing ſhips. The natives are low in ſtature, but well made and ſurpriſingly active and ſtrong; they are copper-coloured, and their features have a caſt of the Malay. The women, in particular, are very ugly. The men cut their hair ſhort, and the women ſhave their heads, and wear no covering but a ſhort petticoat, made of a ſort of ruſh or dry graſs, which reaches half-way down the thigh. The men have only narrow ſtrips of cloth tied tight about their middle. The ears of perſons of both ſexes are pierced when young, and by ſqueezing into the holes large plugs of wood, or hanging heavy weights of ſhells, they render them wide and diſagreeable in their appearance. They have enormous appetites, and are addicted to exceſſive drinking of arrack; and much of their time is ſpent in feaſting and dancing. Their favourite food is pork, eaten almoſt raw, and their hogs, fed on the cocoa-nut and ſea-water, are remarkably fat; but they have plenty of ſmall ſea-fiſh, which they ſtrike with their lances. Their common drink is cocoa-nut milk, and a liquor called "ſoura," which oozes from the cocoa-nut tree after cutting off the young ſprouts or flowers. This is ſuffered to ferment, and thus becomes intoxicating. Whilſt the old people ſmoke tobacco and drink ſoura, the young ſing and dance. Their only muſical inſtrument is a hollow bamboo, about 2½ feet long, and three inches in diameter; along the outſide of which is ſtretched from end to end a ſingle ſtring made of the threads of a ſplit cane, and the place under the ſtring is hollowed a little, to prevent it from touching. This inſtrument is played upon in the ſame manner as a guitar; it produces but few notes, and is generally accompanied with the voice. Their houſes are commonly built upon the beach, and form villages, each of which conſiſts of 15 or 20; and each houſe contains a family of 20 perſons and upwards. Theſe habitations are raiſed upon wooden pillars, about 10 feet from the ground; their form is round, and having no windows, they appear like bee-hives covered with thatch. They enter them below by a trap-door and with the help of a ladder, which they draw up at night; thus, and alſo by bending round the pillars a ſmooth kind of leaf, they ſecure their houſes from being infeſted with ſnakes and rats. The flooring is made of thin ſtrips of bamboo, which are laid at ſuch diſtances as to admit light and air. The art of making cloth is unknown to the inhabitants of this iſland; but they procure this as well as hatchets and hanger-blades, in exchange for their cocoa-nuts, which are reckoned the beſt in this part of India. They have no money, nor do they allow any value to the coin of other countries, except for the purpoſe of ornaments; and accordingly the young women ſometimes hang ſtrings of dollars about their necks. The cloth they purchaſe, beyond that which they want for their own conſumption, is intended for the Choury market. *Choury* is a ſmall iſland to the ſouth of theirs, to which a large fleet of their boats ſails every year about the month of November, to exchange cloth for canoes, which they cannot make at home. This voyage is performed by means of the ſun and ſtars; for they have not any knowledge of the compaſs. In their diſpoſition there are two remarkable qualities; viz. an entire neglect of compliment and ceremony, and an averſion to diſhoneſty. From their frequent intercourſe with ſtrangers they have in general acquired the barbarous language of the Portugueſe, ſo common over India; their own tongue has a ſound quite different from moſt others, their words being pronounced with a kind of ſtop, or catch in the throat, at every ſyllable. They have no notion of a God; but they firmly believe in a devil, and worſhip him from fear. When they are threatened with a ſtorm, they imagine, that the devil intends them a viſit, upon which they perform many ſuperſtitious ceremonies. When a man dies, his whole live ſtock, cloth, hatchets, fiſhing lances, and every moveable thing in his poſſeſſion, are buried with him; and his death is lamented by the whole village. His wife, according to cuſtom, muſt conſent to have a joint cut off from one of her fingers; and if ſhe refuſes, ſhe muſt ſubmit to have a deep notch cut in one of the pillars of her houſe. Polygamy is not known in this iſland; and they puniſh adultery, by cutting from the man's offending member a piece of the foreſkin, proportioned to the frequency or enormity of the crime. Among theſe people there ſeems to ſubſiſt a perfect equality. Reſpect is paid to age, but they have no appearance of the exerciſe of authority one over another. Their ſociety ſeems to be cemented by mutual obligations continually conferred and received. N. lat. 9° 11′. E. long. 93° 18′. Aſiatic Reſearches, vol. ii.

CARNICULA is uſed by ſome for a caruncle, more particularly for that fleſhy ſubſtance which inveſts the teeth.

CARNID, in *Natural Hiſtory*, a name given by Averrhoes to what is called ZARNICH by more ancient writers.

CARNIERES, in *Geography*, a town of France, in the department of the North, and chief place of a canton, in the diſtrict of Cambray; the place contains 718, and the canton 14,110 inhabitants; the territory comprehends 122½ kiliometres, and 16 communes.

CARNIFEX, among the Romans, the common executioner. By reaſon of the odiouſneſs of his office, the carnifex was expreſsly prohibited by the laws from having his dwelling houſe within the city; but lived without the "Porta Metia," or "Eſquilina," near the place deſtined for the puniſhment of ſlaves, called "Seſtertium," where were erected croſſes and gibbets, and where alſo the bodies of ſlaves were burnt, or thrown out unburied. The carnifex, (according to ſome,) was anciently keeper of the priſon under the triumviri capitales, who had only the ſuperintendence, or care of it; hence, "tradere ad carnificem," to impriſon. In middle age writers carnifex alſo denotes a butcher.

Under our Daniſh kings, the carnifex was an officer of great dignity; being ranked with the archbiſhop of York, earl Goodwin, and the lord ſteward. Flor. Wigorn. ann. 1040. *Rex Hardicanutus Alfricum Ebor. Archiep. Goodwinum comitem, Edricum diſpenſatorem, Thrond ſuum* carnificem, *et alios magnæ dignitatis viros Londinum miſit.* Spelm. Gloſſ. p. 125.

CARNIFICATION, in *Surgery*, is the converſion of bone into fleſh; of which proceſs many examples are referred to, and deſcribed by medical writers: but in fact, this phenomenon conſiſts only in the abſorption of the phoſphate of lime, or oſſeous matter of a bone, leaving the fibrous ſubſtance, and conſequently producing a flexibility of the bone. This is not ſtrictly a tranſmutation of bone into fleſh, but merely a removal of one of the component parts of bone; viz. that which gives firmneſs and ſtability to the oſſeous ſyſtem. See Mollities *Oſſium*, and the article Bone.

CARNIOLA, *duchy of*, in *Geography*, a country of Auſtria, bounded on the north by Carinthia and Stiria, on the weſt by Friuli, the county of Gorz, and the Adriatic Sea, on the ſouth by part of Iſtria and the Adriatic, and on the eaſt by Dalmatia and Croatia. Its name "Krain," or "Crania," was probably derived from Carnia, for which the appellation Carniola was ſubſtituted, and uſed as early as the 8th century. This duchy, in its greateſt extent, meaſures about 120 miles from eaſt to weſt, and about 100 from north to ſouth. The country is moſtly mountainous; ſome of the mountains being naked, others clothed with wood, and many of them continually covered with ſnow. The principal of theſe mountains are the Caleberg, the Lobel, or Lybel, ſeparating Carniola from Carinthia, and affording from its ſummit a very fine proſpect, the Rum-berg, the Carſt, or Karſt, the Birnhaumer-wald, anciently "Alpes Juliæ," and "Alpes Carnicæ," (ſee Alps); alſo a high and woody mountain extending from the riſe of the Saue, through Carniola, into the Turkiſh dominions, and containing in its leaſt breadth three German miles, and the high mountain of Nanas, lying between Wipach and St. Veit. Among the mountains of this country there are many fruitful vallies and fields, which yield not only good paſturage, but excellent crops of corn, hemp, flax, and millet. It affords likewiſe good fruit for cyder and perry, cheſnuts, walnuts, olive trees, oranges, lemons, citrons, almonds, figs, &c. and vines, the grapes of which ſupply very good red and white wine. The country alſo breeds horned cattle and horſes in great plenty, and furniſhes all ſorts of fowl and veniſon, and alſo many kinds of fiſh. The mountains yield iron, lead, and copper. The Carniolian marble is reckoned beautiful. Carniola abounds with immenſe caves, and other natural curioſities. The chief rivers are the Saue, the Laybach, the Gurk, and the Culpa; and the principal inland lakes are the Feldeſſer and Wocheiner, and alſo Circkknitzer Sea. It has 21 cities, Laybach being the capital, 35 market-towns, 200 caſtles, 4000 villages, and other ſettlements, 38 convents, 134 pariſhes, 66,200 inhabited houſes, and 6275 uninhabited houſes, 75,788 families, 1504 clergy, 401 nobles, 2069 burghers and tradeſmen, and 48,600 peaſants. The common people, who are robuſt and hardy, are of Sclavonian extraction, but the nobility are, for the moſt part, German. Among the common inhabitants, occupying different parts of the country, there is a great difference of manners, dreſs, and language. The two principal languages are the Sclavonic or Windiſh, and the German. The Chriſtian doctrine was introduced into Carniola about the latter half of the 8th century; and the Lutheran doctrine was admitted in the 16th century; but the inhabitants are now principally Roman Catholics, beſides ſome members of the Greek church. The exports from Carniola are iron, ſteel, quickſilver, red and white wine, olive-oil, cattle, ſheep, cheeſe, linen, a kind of woollen ſtuff called "mahalan," Spaniſh leather, honey, ſhip-timber, and every kind of wood-work, ſuch as boxes, diſhes, trenchers, ſpoons, knives, &c. The Slavi, called alſo Winds, or Wends, took poſſeſſion of this country after the year 548. In the time of Charlemagne and his poſterity, it was governed by the dukes of Friuli, and afterwards by thoſe of Carinthia; but under Otto II. it became a peculiar margraviate, probably derived from Otto I. The ſovereignty of this duchy was afterwards conferred on Frederic II., duke of Auſtria and Stiria, and in 1231, the country raiſed itſelf into a duchy. Afterwards, Albrecht I. mortgaged it to the Carinthian duke Meinhard, but in 1335 it reverted again, together with Carinthia, to the houſe of Auſtria, to which it has been ever ſince united. Towards the maintenance of the military power of the houſe of Auſtria, Carniola contributes annually 363,171 florins, 56 kruitzers. This duchy is divided into Upper Carniola, which enjoys a wholeſome air and freſh ſprings, of which Laybach is the capital; Lower Carniola, containing many fruitful vallies and tracts, and yielding an excellent wine, called "marchevein," the chief town of which is Gurkfeld, or Kerſko; Middle Carniola, abounding with villages, though mountainous and deficient in water, the capital of which is Gottſchee; Inner Carniola, mountainous, yielding little corn, but furniſhing much good wine, the chief town of which is Tybein, or Duin; and Auſtrian Iſtria, very fertile in wine, oil, corn, and other articles of ſubſiſtence, and conſiſting of the county of Mitterburg, the ſeigniory of Caſtua, the town of St. Veit, the territory of Trieſt, of Idria, that of Tulmino, the county of Gorz, that of Gradiſca, and the territory of Aquileja.

CARNION, in *Ancient Geography*, a ſtrong city of Gilead, in Paleſtine, belonging to the half tribe of Manaſſeh, on the other ſide of Jordan. It was to this city that Timotheus ſent all the women, children, and luggage, when Judas Maccabeus was in full march againſt him. Hither alſo, after the defeat of his army, and the loſs of 30,000 men, thoſe who eſcaped the ſlaughter, being cloſely purſued by the victorious army of Judas, retreated, and many of them ſought refuge in the temple of Atargatis. Judas, however, burnt the temple and thoſe who were ſheltered in it; and then ſetting fire to the reſt of the city, they all periſhed likewiſe, either by the flames, or by his ſword, to the number of 25,000. 2 Macab. xii.

Carnion, or Carnium, a town of Peloponneſus, in Laconia. Polybius.—Alſo, the name of a ſmall ſtream on the ſouthern part of Arcadia, which ran from the ſouth-eaſt to the north-weſt, and diſcharged itſelf into the river Gatheatas.

CARNITZ, in *Geography*, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania; 5 miles N. of Greiffenberg.

CARNIVAL, or Carnaval, a ſeaſon of mirth and rejoicing, obſerved with great ſolemnity by the Italians, and particularly at Venice.

The word is formed of the Italian *carnavale;* which Du Cange derives from *carn-a val*, becauſe the *fleſh* is then put into the *pot*, in order to make amends for the ſeaſon of abſtinence enſuing. Accordingly, in the corrupt Latin, he obſerves, it was called *carnelevamen*, and *carniſprivium;* as the Spaniards ſtill denominate it, *carnes tollendas*.

The carnival time commences from Twelfth-day, and holds till Lent. Feaſts, balls, operas, maſquerades, ridottos, concerts of muſic, intrigues, marriages, &c. are chiefly in carnival time. During the carnaval, St. Mark's place is the grand ſcene of riot and folly, where mountebanks and various other impoſtors are allowed to erect their ſtages, and to practiſe on the credulity of the crowds who aſſemble round them. See Venice.

CARNIVOROUS, in *Zoology*, an epithet generally applied to animals of every deſcription that ſubſiſt for the moſt part, or entirely, on animal food. In a more limited ſenſe we underſtand by carnivorous animals, thoſe only of a ſavage and voracious nature, aſſimilating in our ideas ſome inſtinctive ferocity of character in the manners of thoſe creatures when ſeeking and attacking their prey, as well as actually feeding on fleſh. We naturally conſider, for this reaſon, among the principal carnivorous animals the lion, the tiger, and the wolf; or among birds, the eagle, and the kite, with a hoſt of other rapacious creatures, upon which nature has beſtowed pre-eminent advantages of courage, ſtrength, and arms to aid them in ſeizing upon, and tearing into pieces, thoſe animals on which they feed: they have either formidable canine teeth, or fangs; claws, or talons; the quadrupeds poſſeſſing both, and the birds the latter: fiſhes with very few exceptions are carnivorous, but their only offenſive weapons are the teeth, or in ſome ſpecies the ſpines and prickles diſpoſed on various parts of the body. Quadrupeds that ſubſiſt both on fleſh and vegetables are more or leſs deficient with reſpect to thoſe characters by which carnivorous quadrupeds are known; and thoſe ſtill more ſo that ſubſiſt entirely on roots, barks, fruits, graſs, or other vegetables: the brutæ have no cutting teeth either in the upper or lower jaw; the pecoræ have them only in the lower jaw; and the front teeth of the belluæ are obtuſe:—the food of thoſe animals is vegetables.

Deſmareſt, and other modern French writers on zoology, form a diſtinct ſubdiviſion of their carnaſſiers, (an order of quadrupeds comprehending moſt of the Linnæan feræ,) under the title of carnivores. This ſubdiviſion compriſes the three families of martins, cats, and dogs, in the following order. The *firſt family*, **Mustelins**, or martes, contains five genera; namely, ſurikate, mangouſte, marte, mouffette, and loutre. Surikate is a genus formed only of a ſolitary ſpecies, viverra tetradactyla of Linnæus; the mangouſte conſiſts of Linnæan viverræ, and marte of animals ſeparated from both of the Linnæan genera, viverra and muſtela. Mouffette conſiſts of viverra mephitis, Linn. and other Linnæan ſpecies of viverra; and the laſt genus, loutre, compriſes part of the muſtelæ of Linn., and lutra of Erxleben. The *ſecond family* are **Felins**, comprehending the two genera, chat (*felis*, Linn.) and civette, (*viverra*, Linn.) The *third family*, **Cynosiens**, contain three genera, hyène, (*canis*, Linn.) fennec, conſiſting only of one ſpecies, (*canis cerdo*, Linn.) and chien, (*canis* of Linnæus,) including the common dog, *familiaris*, wolf, *lupus*, and fox, *vulpes*.

Carnivorous animals are characteriſed both by their internal organization and their capacity and inclination for the deſtruction of their prey; their teeth are ſharp and pointed, even though ſituated in the back part of the mouth; and theſe teeth, denominated *canine*, are ſo long in moſt of the beaſts of prey, that they paſs a conſiderable way beyond each other when the jaws are cloſed. The diſtribution of the enamel which is confined to the ſuperficies of the teeth, renders them extremely hard, and this circumſtance, joined to an extraordinary bulk of thoſe muſcles, employed in raiſing the lower jaw, give to carnivorous quadrupeds the power of breaking the ſtrongeſt bones. The rapacious birds are diſtinguiſhed by a ſharp hard bill, furniſhed on each ſide with a pointed proceſs, by which they are enabled to tear aſunder the parts of the animals they feed upon.

As the digeſtion of animal ſubſtances is accompliſhed in a ſhort time, the ſtomach of the carnivorous tribes has a ſimple figure without any proceſſes or ſeparations of its cavity to retain its contents, or to delay their paſſage into the inteſtines; and as animal food furniſhes but little excrement, the inteſtinal canal is ſhort, and either totally unprovided with thoſe dilatations, which are ſo remarkable in vegetable eaters, or poſſeſſes them only in a ſlight degree.

Carnivorous animals are further diſtinguiſhed by the extraordinary ſtrength of their members, which are commonly furniſhed with ſharp claws; theſe are ſo contrived, both in the beaſts of prey, and the accipitrine birds, that they turn inwards by the flexion of the limb, or the action of ſeizing any thing, and are retracted by the extenſion of the toes; thus giving facility and certainty to the capture and retention of fugitive animals.

The ſenſes of *viſion* and *ſmell* are particularly acute in the carnivorous tribes, as it is by means of them that they diſcover or ſeek out their prey.

Carnivorous animals are uſually cruel and treacherous in their diſpoſitions; they are even unſocial with reſpect to their own ſpecies; and hence it is that their numbers are ſo few in compariſon to that of the graminivorous kind: if it were not for this wiſe ordinance of nature, the defenceleſs orders of animals would ſoon be devoured, and the carnivorous would become the prey of each other.

It is a diſpute among naturaliſts, whether or not man be naturally carnivorous? Some contend that the fruits of the earth were intended as his ſole food; and that it was neceſſity in ſome places, and luxury in others, that firſt prompted him to feed upon his fellow-animals. Pythagoras and his followers looked on it as a great impiety; and ſtrictly abſtained from all fleſh, from the notion of a metempſychoſis; and their ſucceſſors, the Bramins, continue the ſame to this day. The conſideration Gaſſendus chiefly inſiſts on, why man ſhould not be carnivorous, is the ſtructure and conformation of our teeth; moſt of them being either inciſores or molitores; not ſuch as carnivorous animals are furniſhed with, proper to tear fleſh; except the four *canini:* as if nature had rather prepared us for cutting herbs, roots, &c. than for eating meat. To which may be added, that when we do feed on fleſh, it is not without a preparatory coction, by boiling, roaſting, &c.

To theſe arguments, Dr. Wallis joins another; which is, that all quadrupeds which feed on herbs or plants have a long colon, with a cœcum at the upper end of it, or ſomewhat equivalent, which conveys the food, by a long and large progreſs, from the ſtomach downwards, in order to its ſlower paſſage and longer ſtay in the inteſtines. In man, the cœcum is very viſible: a ſtrong preſumption that nature, which is ſtill conſiſtent with herſelf, did not intend him for a carnivorous animal.

To the arguments uſed by Dr. Wallis and others, to prove that man is not naturally carnivorous, Dr. Tyſon anſwers, that if man had been deſigned by nature not to be carnivorous, there would doubtleſs have been found ſomewhere on the globe, people who do not feed on fleſh; and as hiſtory ſeems not to furniſh any inſtance of this kind, may we not ſay, that what is done univerſally by the whole ſpecies, is natural? For what the Pythagoreans did in abſtaining from fleſh, was on the principle of a tranſmigration, a miſtake in their philoſophy, not a law of nature: and though in ſome countries men feed more ſparingly on fleſh than in others, this is owing to their own choice, or from religious prejudices. He adds, that carnivorous animals are not always without a colon and *cœcum:* nor are all animals carnivorous which have thoſe parts; but that the *Sarigue*, or *opoſſum*, for inſtance, has both a colon and a cœcum, yet feeds on poultry, and other fleſh; whereas the hedge-hog has neither colon nor cœcum, and therefore ought to be carnivorous, yet it feeds principally on vegetables: add, that hogs, which have both, will feed on fleſh greedily enough when they can get it; and that rats and mice, which have large cœca, feed on bacon, as well as bread and cheeſe.

And, from the multitude of carnivorous animals which want thoſe parts, and of non-carnivorous, which have one or both, no ſafe concluſion can be drawn; ſince we might as well argue, that becauſe the neat-kind, ſtag-kind, goat-kind, and ſheep-kind, which live on herbage, have four ſtomachs, therefore all thoſe which have not four ſtomachs were not deſigned by nature to be graminivorous; whereas the horſe-kind and hare-kind have but one ſtomach, yet feed on graſs like the former; add, that in many animals which live on the ſame ſort of food, the ſtructure of the ſtomach is found very different; and that in others which live on different foods, ex. gr. on fleſh, on fruits, on graſs, &c. the ſtomachs are found ſo like, that it is difficult to aſſign any difference between them: and if we cannot make a judgment what food is moſt natural to an animal from the ſtructure of its ſtomach, which is the part moſt concerned in digeſting it, much leſs can we judge from the colon or cœcum, which are parts remote from the ſtomach, and ſeem rather as a cloaca for the reception of a fæces, than of uſe for digeſting or diſtributing the food.

In this, however, as in moſt other controverſies, truth lies between the two extremes; there is an obvious connexion between the conformation of the teeth, ſtomach, and inteſtines, and the nature of the food upon which an animal ſubſiſts: and according to the rules laid down by comparative anatomiſts on this ſubject, man was deſigned to uſe a mixed food in common; but if circumſtances required it, his organs were adapted to digeſt either animal or vegetable ſubſtances. His teeth are neither calculated for grinding coarſe vegetable food, nor for tearing the fleſh, or breaking the bones of animals: they are only fitted for maſticating ſuch matter when divided by machinery, or prepared by the operation of heat, in the ſeveral proceſſes of cooking.

The ſtomach of man is not very capacious; he does not need a reſervoir, even when ſubſiſting excluſively upon vegetables, as his invention always furniſhes him with the means of extracting the more nutritive parts; and, on the other hand, his ſtomach is formed to retain its contents for ſome time: if it were otherwiſe conſtructed, it would only be qualified for the concoction of animal matter.

Further, his inteſtines, with reſpect to length and capacity, hold a middle place between thoſe of graminivorous and carnivorous animals, or rather more like the latter, on account of the degree of preparation to which we ſubmit vegetable ſubſtances, previous to our eating them, in order to get rid of their indigeſtible parts.

Theſe obſervations are conſiſtent with daily obſervation and experience. The lower claſſes of people in almoſt all civilized nations live chiefly upon vegetable diet, and yet no rank in ſociety poſſeſſes more bodily ſtrength; and, on the other hand, the inhabitants of thoſe countries in which no ſteps have been taken to cultivate the ſoil, ſubſiſt almoſt entirely upon the beaſts they hunt down, or the fiſh their ſeas or rivers afford.

Man, therefore, in different circumſtances, and in different ſtates of ſociety, may be either *graminivorous*, *carnivorous*, or *omnivorous*.

CARNIUS, in *Chronology*, the Syracuſian name for the Athenian month METAGITNION; which was the ſecond of their year, and anſwered to the latter part of our July and beginning of Auguſt.

CARNO, in *Geography*, a river of North Wales, which runs into the Severn, in Montgomeryſhire.

CARNOET, or Carnet, a town of France, in the department of the north coaſt, and diſtrict of Guingamp, containing about 1100 inhabitants; 6 leagues S.W. from Guingamp.

CARNONACÆ, in *Ancient Geography*, a people of the north-weſtern part of Ancient Britain, placed by Ptolemy between the Creones and the Careni, and occupying, according to Baxter, that part of Roſſe which is called Aſſenſhire.

CARNOSA *Membrana*, } in *Anatomy*; ſee Panniculus
CARNOSUS *Panniculus*, } *Carnoſus*, and Membrane.

CARNOSITY, in *Surgery*, is a term uſed by former practitioners to denote a fleſhy excreſcence or tubercle, ſuppoſed to be a frequent cauſe of obſtruction in the urinary canal; but which is now generally believed to conſiſt of a ſimple conſtriction in the urethra. See Bougies, Caruncle, and Stricture.

Admitting, however, that ſuch carnoſities or caruncles do now and then exiſt in the urethra, they will require the ſame plan of treatment as ſtrictures, properly ſo called; ſo that no conſiderable error of a practical nature is likely to enſue from retaining the old opinion. Almoſt the only remedy we poſſeſs, in either caſe, is the diligent uſe of Bougies.

CARNOSUM *folium*, in *Botany*. See Leaf.

CARNSORE Point, in *Geography*, the S.E. point of Ireland, in the county of Wexford, and on the coaſt of St. George's channel, a little to the weſtward of which point is a cluſter of ſmall iſlands called the Saltees. N. lat. 52° 11'. W. long. 6° 20'.

CARNTOGHER Mountains, a large mountainous tract in the counties of Tyrone and Londonderry, Ireland.

CARNUS, in *Ancient Geography*, a town of Arabia Felix, belonging to the Sabæans.—Alſo, a town of Pannonia, on the Danube, according to Ptolemy.

CARNUTÆ, or Carnutes, a people of Gaul, to whom Ptolemy aſſigns the cities of Autricum or Carnutes, (Chartres) and Cenabum or Genabum (Orleans.) The Carnutes were mentioned long before the time of Cæſar, as Livy reckons them among the Celtic nations which paſſed the Alps in order to eſtabliſh themſelves in Italy, in the time of the elder Tarquin. They are alſo called Carnuti or Carnuteni Fœderati, and by Plutarch Carnutini. Their territory was very conſiderable, ſince it extended from the Seine to the Loire. Among theſe people the Druids held their general aſſemblies.

CARNUTUM or Carnuntum, a town of the Upper Pannonia, ſeated on the Danube, according to Pliny and Velleius Paterculus: the Carnus of Ptolemy.

CARO, in *Anatomy*, &c. See Flesh.

Caro *muſculoſa quadrata*, in *Anatomy*, a muſcle ſo called by Fallopius and Spigelius, but more popularly PALMARIS *brevis*.

Caro, *Annibal*, in *Biography*, an Italian poet and diſtinguiſhed ſcholar, was born in 1507 at Civita Nuova, in the march of Ancona, and as his parents were poor, though reputable, he was under a neceſſity in his youth, of gaining a ſubſiſtence by being domeſtic tutor to the ſons of Luigi Gaddi at Florence, who, duly apprized of his talents, appointed him his ſecretary, and conferred on him ſome benefices. After the death of Gaddi, he was taken under the patronage of Pier-Luigi Farneſe, who employed him in various commiſſions of truſt, and particularly in a buſineſs of importance with the emperor Charles V. at Flanders in 1544. Incurring ſome danger by the tragical death of the duke Farneſe, he took refuge at Parma, where he was kindly received by the duke Ottavio Farneſe. He afterwards lived with cardinal Alexander Farneſe, in the capacity of his private ſecretary, and having been promoted by this liberal and powerful patron to ſeveral commanderies and benefices, he enjoyed his favour till his death in 1566. The life of Caro was chiefly devoted to purſuits of elegant literature. In his youth he compoſed ſome works of the light and humorous kind, and he employed himſelf in tranſlations from the Greek, and printed Italian verſions of Ariſtotle's rhetoric, two orations of Gregory Nazianzen, and one of St.

Cyprian. He alſo tranſlated the Paſtorals of Longus and Ariſtotle's Hiſtory of Animals which was left unfiniſhed. Patronized by the Farneſe family, he was enabled to collect a rich cabinet of medals, on which he wrote an extenſive treatiſe that was never printed. His familiar letters are eſteemed the moſt perfect models of eaſe and elegance in epiſtolary writing. His Italian poetry has been commended; and his canzonets and ſonnets have been particularly celebrated. One of theſe poetical pieces to the honour of the royal houſe of France, produced a literary diſpute of a very virulent and ſerious nature. By ſome ſevere critical cenſure paſſed upon it by Lodovico Caſtelvetro, a celebrated grammarian, Caro was ſo provoked, that he wrote a reply ſo infamouſly libellous as to fix an indelible ſtain on his memory, both as a man and a Chriſtian. Caſtelvetro was accuſed of procuring the aſſaſſination of a young friend of Caro, and Caro was ſuſpected of having uſed means for ſubjecting Caſtelvetro to the inquiſition which occaſioned his exile from his native country, and the hazard of his life. After the termination of this diſgraceful and dreadful quarrel, Caro retired to a ſmall villa at Freſcati, where he ſpent his latter days chiefly in a tranſlation of Virgil's Æneid into blank verſe, which has been highly applauded, and ranked among thoſe performances which do the greateſt honour to Italian literature. It was firſt publiſhed at Venice in 1581; one of the beſt editions is that of Paris, 2 vols. 8vo. 1765. The "Poems" of Caro were printed at Venice in 1584, 4to. His "Letters" were reprinted at Padua in 1749, 3 vols. 8vo. Tiraboſchi, Nouv. Dict. Hiſt.

Caro, *St., Hugo de.* See Concordance.

Caro, in *Geography*, a town of Italy in the duchy of Montferrat; 16 miles S. of Acqui.

CAROB Tree, in *Botany*. See Ceratonia *Siliqua*.

Carob is alſo a goldſmith's ſmall weight, amounting to the 24th part of a grain. It is alſo called *prime*.

CAROCEDO, in *Geography*, a town of Portugal, in the province of Tras os Montes; 6 miles S. of Outeiro.

CAROCHA, a name which the Spaniards and Portugueſe give to a kind of mitre made of paper or paſteboard, on which are painted flames of fire, and figures of demons, worn by thoſe who are condemned to death by the tribunal of the Inquisition. See Act *of faith*.

CAROENON, in *Antiquity*, καροινον, or *Carenum*, names given by the Greeks and Romans to wine boiled over a ſlow fire, till only a half, third, or fourth part remained, and then mixed with honey or ſpices. Wine thus improved acquired ſeveral other names, ſuch as *muſtum, mulſum, ſapa, defrutum*, &c. At this time the ſame operation is performed with reſpect to ſack, Spaniſh, Hungarian, and Italian wines. In Italy, new wine which has been thus boiled, is put into flaſks, and uſed for ſallad and ſauces. In Naples, it is called "muſto collo," but in Florence it ſtill retains the name of "ſapa," Plin. l. xxii. c. 2. Columella, de re ruſtica, l. xii. c. 20.

CAROLA, *Ital.* This *muſical* term in Boccaccio, is ſynonymous with *Ballata*, which the Cruſca Dictionary defines, *Canzone, che ſi canta ballando*, "a ſong which is ſung and danced at the ſame time." See Ballad. This is the ſenſe in which the word *Karole* is conſtantly uſed by Chaucer.

> Theſe folke of which I tell you ſo
> Upon a karole wentirn tho,
> A ladie karoled 'hem, that hight
> Gladneſſe the bliſsful and the light,
> Well could ſhe ſing and luſtily,
> None half ſo well and ſemely——
> And couthe enough for ſoche doing
> As longith unto karolling ——
> There mighteſt thou karollis ſene
> And folke' daunce and merry ben ——
> Ne code I nevir thennis go
> Whiles that I ſaw 'hem dauncin ſo——

CAROLATH, in *Geography*, a town and principality of Sileſia, in the circle of Glogau, on the Oder; 3 miles N.N.W. of Beuthen.

CAROLI, among ſome *Surgeons*, denote venereal puſtules on the penis; called alſo *caries pudendorum*.

CAROLINA, North, in *Geography*, one of the united ſtates of America, bounded on the N. by Virginia, on the E. by the Atlantic Ocean, on the S. by South Carolina and Georgia, and on the W. by the ſtate of Tenneſſee or Teneſſee. It lies between 33° 50′, and 36° 30′, N. lat. and between 76° 8′ and 83° 8′ W. long.; being about 450 miles in length from E. to W. and 180 in breadth; and it contains 52,500 ſquare miles, of which 3,346,000 acres are improved land. Its charter limits gave it a greater extent, as they included the ſtate of Tenneſſee as far as the river Miſſiſſippi, ſo that its length would be about 758 miles. This ſtate comprehends eight diſtricts, which are divided into three claſſes, viz. the eaſtern, containing Edenton, Newbern, and Wilmington; the middle, including Fayetteville, (which ſee), Hillſborough, and Halifax; and the weſtern, which are denominated Morgan and Saliſbury. The three eaſtern diſtricts lie on the ſea-coaſt, and extend from the Virginia line ſouthward to South Carolina. The five others cover the whole ſtate to the W. of the maritime diſtricts, and moſt of them extend quite acroſs the ſtate from N. to S. Theſe diſtricts are ſubdivided into 58 counties in the following manner:

| Diſtricts. | Counties. | Diſtricts. | Counties. |
|---|---|---|---|
| Edenton, 9 counties. | Chowan | Hillſborough, 9 counties. | Orange |
| | Churrituck | | Chatan |
| | Cambden | | Granville |
| | Paſquetank | | Johnſton |
| | Perquimins | | Caſwell |
| | Gates | | Samſon |
| | Hertford | | Wake |
| | Bertie | | Guilford |
| | Tyrrel | | Randolph |
| Wilmington, 8 counties. | New Hanover | Saliſbury, 8 counties. | Rowan |
| | Brunſwick | | Mecklenburg |
| | Cumberland | | Rockingham |
| | Robinſon | | Surry |
| | Duplin | | Montgomery |
| | Beaden | | Anſon |
| | Wayne | | Wilkes |
| | Moore | | Richmond |
| Newbern, 8 counties. | Craven | Morgan, 7 counties. | Bark |
| | Beaufort | | Green |
| | Carteret | | Rutherford |
| | Pitt | | Waſhington |
| | Dobbs | | Sullivan |
| | Hyde | | Lincoln |
| | Jones | | Hawkins |
| | Onſlow | Davidſon, 2 counties. | Davidſon |
| Halifax, 7 counties. | Halifax | | Sumner |
| | Northampton | | |
| | Martin | | |
| | Edgecombe | | |
| | Warren | | |
| | Franklin | | |
| | Naſh | | |

N. B. Theſe two are counties in the ſtate of Teneſſee.

In 1710 the number of inhabitants in this ſtate was computed at 6000; in 1787 at 270,000; in 1791 at 393,751, of whom 100,752 perſons were ſlaves; and in 1805, the number was 478,103, being about 9⅛ perſons to each ſquare mile. Of theſe 171,648 were white males, 166,116 white females, 133,296 ſlaves, 7,043 free blacks and mulattoes: and there appears to have been in 10 years an increaſe of 49,559 whites and 39,793 blacks, &c. or upon the whole of 84,352. The militia of this ſtate conſiſts of 50,000 men. The principal towns of North Carolina are Newbern, the largeſt, Edenton, Wilmington, Halifax, Hillſborough, and Fayetteville; each of which has, in its turn, been the ſeat of the general aſſembly, and the capital of the ſtate. But Raleigh, which is ſituated in Wake's county, near the centre of the country, (N. lat. 35° 56′. W. long. 79° 11′) has lately been eſtabliſhed as the metropolis. The chief rivers of this ſtate are Chowan and its branches, Roannoke, Tar Neus, and Cape Fear, or Clarendon. Moſt of theſe, as well as the ſmaller rivers, have bars at their mouths; and the coaſt affords no good harbour except cape Fear. The moſt remarkable ſwamps in this country are thoſe in Currituck county and on the line between this ſtate and Virginia. See Dismal. The moſt noted ſounds are Albemarle, Pamlico, and Core ſounds; and the capes are Look-out, Hatteras, and Fear. See their reſpective names.

North Carolina is, through its whole extent for 60 miles from the ſea, a dead level, and the greater part of this ſpace is foreſt-land, and barren. On the banks of ſome of the rivers, particularly the Roannoke, the land is fertile and productive; and in the other parts there are interſperſed glades of rich ſwamp, and ridges of oak land, of a black, fruitful ſoil. Through this whole level country marine productions are found in depths of 18 or 20 feet below the ſurface of the ground. At the diſtance of 60 or 80 miles from the ſea, the country riſes into hills and mountains, as in South Carolina and Georgia, which ſee. That part of North Carolina which lies W. of the mountains is a tract, about 500 miles long from eaſt to weſt, and upwards of 100 in breadth, of fine fertile country, watered by the Teneſſee, abounding with oaks, ſeveral kinds of locuſt trees, walnut, elm, lime, and cherry trees of large ſize, ſome of them being three feet in diameter. See Tenessee. Wheat, rye, barley, oats, and flax, thrive in the back hilly country; and Indian corn and pulſe of all kinds, in all parts. Cotton and hemp are alſo cultivated in a conſiderable degree, and might be raiſed in greater abundance; the cotton is planted annually; the ſtalk dying with the froſt. One man's labour will produce 1000 pounds in the ſeeds, or 250 fit for manufacturing. The natural growth of the plains in the low country is almoſt univerſally pitch-pine, which may be called the ſtaple commodity of North Carolina, as it affords various articles conſtituting about one-half of the exports of this ſtate. White and red oak are excellent and abundant; and the ſwamps furniſh cypreſs and bay trees in great plenty. The moſt common kinds of timber in the back country are oak, walnut, and pine; and in the moiſt gravelly ſoil is a ſpecies of oak, called "black jack." The miſletoe is alſo common; the principal wild fruits are plums, grapes, ſtrawberries, and black-berries. The country alſo abounds with medicinal plants and roots; ſuch as the ginſeng, Virginia ſnake root, Seneca ſnake root, and an herb of the emetic kind reſembling ipecacuanha. The rich bottoms are overgrown with canes. The produce of the back country, conſiſting of tobacco, wheat, Indian corn, &c. is chiefly carried to market in South Carolina and Virginia. The ſouthern interior counties carry their produce to Charleſton, and the northern to Peterſburg in Virginia. The exports from the lower parts of the ſtate are tar, pitch, turpentine, reſin, Indian corn, boards, ſcantling, ſtaves, ſhingles, furs, tobacco, pork, lead, tallow, bees-wax, myrtle-wax, &c. in which articles a trade is carried on chiefly with the Weſt Indies and the northern ſtates. From the latter they receive flour, cheeſe, cyder, apples, potatoes, iron wares, cabinet wares, hats, and dry goods of all kinds imported from great Britain, France, Holland, &c.; and from the Weſt Indies, rum, ſugar, and coffee. The exports in the year ending September the 30th 1791 amounted to 524,548 dollars; but in 1805, thoſe of the domeſtic produce amounted to 919,545, and of the foreign to 9,142, being in the whole 928,687 dollars.

In the flat country near the ſea-coaſt the inhabitants are ſubject, in ſummer and autumn, to intermitting fevers, which are often fatal; but the weſtern hilly parts of the ſtate are as healthy as any parts of the United States. The country is fertile, and full of ſprings and rivulets of pure water. The air is ſerene; and though the days are very hot, the nights are cool and refreſhing. Autumn is very pleaſant, and the winters are generally very mild; upon the whole, many of the inhabitants live to old age. Wheat harveſt commences with June, and that of Indian corn is early in September.

The weſtern parts of this ſtate, which have been ſettled within the laſt 40 years, are chiefly inhabited by Preſbyterians from Pennſylvania, the deſcendants of emigrants from the north of Ireland, and are very much attached to the doctrines, diſcipline, and uſages of the church of Scotland. They are regular and induſtrious. Some ſettlements of Germans, both Lutherans and Calviniſts, are interſperſed. The Moravians have ſeveral flouriſhing ſettlements in the upper parts of this ſtate, the principal of which are in Wachovia in the county of Surry, ſo called after an eſtate of count Zinzendorf in Auſtria; and particularly at Salem. The Quakers have a ſettlement at New Garden, in the county of Guildford, and ſeveral congregations at Perguimins and Paſquetank. The Methodiſts and Baptiſts are alſo numerous and increaſing. The inhabitants of Wilmington, Newbern, Edenton, and Halifax diſtricts, conſtituting about three-fifths of the ſtate, once profeſſed themſelves of the epiſcopal church; but many of them, during the progreſs of the late war between Britain and America, emigrated; and ſome material changes have ſince occurred. In December 1789, the general aſſembly of North Carolina paſſed a law, incorporating 40 gentlemen, viz. five from each diſtrict, as truſtees of the univerſity of this ſtate, and it has been ſince liberally endowed. There are alſo academies at Warenton, Williamſborough, and ſome others.

As to the habits and manners of the North-Carolinians we may obſerve, that they are moſtly planters, and live at a diſtance from one another of half a mile to three or four miles, on their reſpective plantations. Their country is plentiful; but they have little intercourſe with ſtrangers; however, they are fond of ſociety and hoſpitable to travellers. In the lower diſtricts of the country they have very few places for public and weekly worſhip of any kind, and for want of miniſters, theſe are neglected. The inhabitants of this ſtate appear to have as little taſte for the ſciences as for religion; and it is remarked, that leſs attention and reſpect are paid to the women here than in thoſe parts of the United States where the inhabitants have made greater progreſs in the arts of civilized life. Temperance and induſtry are not reckoned among the virtues of this ſtate; and much time is conſumed in drinking, idleneſs, and gaming at cards or dice; and alſo in cock-fighting and horſe-racing. Many of the interludes are filled up with boxing-matches, in which prevails the brutal practice of "gouging;" a ſpecies of diverſion, if it may be ſo called, which is thus performed: "when two boxers are worried with fighting and bruiſing each other, they come, as it is called, to cloſe quarters, and each endeavours to twiſt his fore-fingers in the ear-locks of his antagoniſt. When theſe are faſt clenched, the thumbs are extended each way to the noſe, and the eyes *gently* turned out of their ſockets. The victor, for his expertneſs, receives ſhouts of applauſe from the ſportive throng, while his poor *eyeleſs* antagoniſt is laughed at for his miſfortune." This barbarous practice, which we could hardly ſuppoſe to have exiſted, is ſaid to be prevalent among the lower claſs of people in both the Carolinas, and alſo in Georgia.

By the conſtitution of this ſtate, which was ratified in December, 1776, the legiſlative authority is veſted in two diſtinct branches, viz. a *ſenate* and *houſe of commons*, which, convened for buſineſs, are ſtyled the *general aſſembly*. The ſenate is compoſed of repreſentatives, one for each county, choſen annually by ballot; and the houſe of commons conſiſts of repreſentatives choſen in the ſame manner, two for each county, and one for each of ſix towns. The qualifications of a ſenator are one year's reſidence prior to his election in the county for which he is choſen, and a freehold of 300 acres: and thoſe of a member of the houſe of commons are the ſame reſidence, and a freehold of 100 acres, or ſuch a tenure for the term of his own life. A freeman of 21 years of age, who has been an inhabitant in the ſtate for 12 months immediately preceding the day of election, and who has poſſeſſed a freehold of 50 acres within the county for ſix months next before, and at the day of election, is entitled to a vote for a ſenator; and all freemen, 21 years of age, who have been inhabitants the year next before the election, and who have paid public taxes, may vote for a member of the houſe of commons. Judges of the ſuperior court; members of council; judges of admiralty; treaſurers; ſecretaries; attorney generals for the ſtate; clerks of record; clergymen; perſons denying the being of a God, the truth of the proteſtant religion, or the divine authority of the Old or New Teſtament; receivers of public monies, whoſe accounts are unſettled; and military officers in actual ſervice, are ineligible to a ſeat either in the ſenate or in the houſe of commons. The ſenate and houſe of commons, or general aſſembly, annually elect by ballot the governor, who muſt be 30 years of age, a reſident five years, and poſſeſs a freehold worth 1000l., and who is ineligible to the office for a longer time than three years in ſix ſucceſſive years. The aſſembly alſo elects ſeven perſons to be a council of ſtate for one year, with whoſe advice the governor may grant pardons, except for crimes proſecuted by the aſſembly, fill vacancies in office till the enſuing ſeſſion, and lay embargoes. The governor is liable to impeachment and proſecution in the ſupreme court for mal-adminiſtration. The ſalary of the governor is dependent on the legiſlature. The general aſſembly appoints the treaſurer, the ſecretary, judges of the ſupreme courts of law and equity, judges of admiralty, the attorney general, and all the ſuperior military officers, who hold their offices during good behaviour, and are removeable by conviction in the ſupreme court. All bills muſt alſo be prepared by the general aſſembly, and they muſt be read three times in each houſe, and be ſigned by the ſpeakers of both houſes, before they paſs into laws. Juſtices of the peace, recommended by the repreſentatives, are commiſſioned by the governor, and hold their offices during good behaviour. The conſtitution allows of no religious eſtabliſhment. The repreſentatives of this ſtate in congreſs are 12; and the ſenators are two.

The hiſtory of this ſtate in the earlieſt period of its ſettlement is confounded with that of South Carolina, from which it was not ſeparated ſo as to be erected into a diſtinct province till the year 1728; and the appropriate particulars of it cannot be accurately aſcertained. See the next article. The firſt permanent ſettlement in North Carolina ſeems to have been made about the year 1710, when a number of Palatines from Germany, who had been reduced to very indigent and diſtreſſed circumſtances by a calamitous war, were conveyed thither. The proprietors of Carolina, hoping to derive advantage from their labour in the cultivation of their lands, reſolved to afford every poſſible encouragement to ſuch emigrants. Accordingly ſhips were provided for their tranſportation; and upon their arrival governor Tynte granted them a tract of land in that province, ſince called Albermarle and Bath precincts, where they ſettled and hoped to have found an unmoleſted retreat, though in a kind of wilderneſs, from the deſolations of a war, which then raged in Europe. It was not long, however, before their calamities were renewed by a dangerous conſpiracy formed againſt them in 1712 by the Coree and Tuſcorora tribes of Indians. The attack was ſecret and unexpected; and the maſſacre of the inhabitants was as general and bloody as it was ſudden. Some few eſcaped the indiſcriminate ſlaughter and gave the alarm; and as ſoon as the news of the ſad diſaſter had reached the province of South Carolina, governor Craven diſpatched a force to their relief. The Tuſcororas were defeated; many of them were killed, and others taken priſoners. The remainder of the tribe, having loſt about a thouſand of their original number, ſoon after abandoned the country, and joined the five nations, with which they have ever ſince remained. The infant colony from this time remained in peace, and continued to flouriſh under the general government of South Carolina, till about the year 1729, when ſeven of the proprietors accepted 22,500l. from the crown, and ſurrendered its property and juriſdiction. This agreement between the proprietors and the crown was ratified by act of parliament, in 1729; a clauſe in the act reſerving to lord Granville, one of the proprietors, his eighth ſhare, which continued legally veſted in his family till the revolution in 1776. Lord Granville's ſhare formed a part of the preſent ſtate of North Carolina. About the year 1729, the extenſive territory belonging to the proprietors was divided into North and South Carolinas; and the limits of the former were aſcertained and eſtabliſhed by an order of George II. Accordingly they remained ſeparate royal governments till they became independent ſtates.

Carolina, *South*, one of the United States of America, bounded on the north by North Carolina, on the eaſt by the Atlantic Ocean, and on the ſouth and ſouth-weſt by the Savannah river, and a branch of its head water, called Tugulo river, which divides this ſtate from Georgia. The weſtern boundary has not yet been accurately aſcertained. It lies between 32° and 35° N. lat., and between 79° and 83° 30′. W. long.; extending in length about 200 miles, in breadth 125, and containing 25,000 ſquare miles, of which 2,075,000 acres are improved land. It is divided into nine diſtricts. Charleſton, Beaufort, and George-town, conſtitute what is called the "Lower Country," and contain 19 pariſhes, and 28,694 white inhabitants; ſend to the legiſlature 70 repreſentatives, and 20 ſenators, and pay taxes to the amount of 28,081l. 5s. 11d. Ninety-ſix, Waſhington, Pinckney, Camden, Orangeburg, and Cheraw diſtricts are comprehended in the "Upper Country," and contain 23 counties, and 110,902 white inhabitants;

ſend to the legiſlature 54 repreſentatives, and 17 ſenators, and pay taxes to the amount of 8,390l. 2s. 3d. See each of the above articles. The inequality of repreſentation is very obvious; and attempts have been made by the upper diſtricts to rectify it. By a late arrangement the name of county is given to the ſubdiviſion of thoſe diſtricts only, in which county courts are eſtabliſhed. In the lower diſtricts the ſubdiviſions are called pariſhes and introduced merely for the purpoſe of electing the members of the legiſlature of the ſtate. The whole number of inhabitants in 1787 amounted to 180,000; in 1791 to 240,000; in 1805 to 345,591, being about 14 perſons to each ſquare mile, and including 100,916 white males, 95,339 white females, 146,151 ſlaves, and 3,185 free blacks and mulattoes. In 10 years the increaſe of whites has been 56,077, of blacks, &c. 40,441; ſo that the whole increaſe has been 96,518. The militia has conſiſted of 35,785 perſons. The capital of South Carolina is Columbia, ſeated on the Congaree river, in N. lat. 34° 1′. W. long. 80° 57′., and containing 100 houſes and 700 inhabitants. Charleſton is alſo a town of note. The only harbours of any note are thoſe of Charleſton, Port-royal, and George-town. The iſlands that border the ſea-coaſt of this ſtate are numerous and convenient; and ſerve many uſeful purpoſes of navigation. The north part of the harbour of Charleſton is formed by Bull's, Dewee's, and Sullivan's iſlands. Oppoſite to Charleſton, on the other ſide of the harbour, is James' iſland, which is the reſidence of about 50 families. Farther ſouth-weſt is John's iſland, larger than James's; and theſe two iſlands are ſeparated by Stono river, which forms a convenient and ſafe harbour. Connected with John's iſland by a bridge is Wadmelaw, having to the eaſt the ſmall iſles of Keywaw and Simmon. Between theſe and Ediſto iſland is North Ediſto inlet, which affords a good harbour for ſmall veſſels. South of Ediſto iſland is South Ediſto inlet through which enter, from the northward, all veſſels bound to Beaufort, Aſheepoo, Combahee, and Cooſaw. On the S.W. ſide of St. Helena iſland lies a cluſter of iſlands, one of the largeſt of which is Port-royal; adjacent to which lie St. Helena, Ladies iſland, Paris iſland, and the Hunting iſlands, being five or ſix in number and deriving their name from the deer and wild game found upon them. Beyond Broad river is Hilton Head, the moſt ſouthern ſea iſland in Carolina. Weſt and ſouth-weſt of Hilton Head lie Pinckney's, Bull's, Dawfuſkies', and ſome ſmaller iſlands, between which and Hilton Head are Calibogee river and ſound, which form the outlet of May and New rivers. The ſoil on theſe iſlands is in general better adapted to the culture of indigo and cotton than the main land; but leſs adapted to rice. The natural production is the live oak, ſo excellent for ſhip-timber, beſides the palmetto or cabbage tree ſo uſeful in the conſtruction of forts. The principal rivers of this ſtate, which are navigable, are the Savannah, the Ediſto, the Santee, and the Pedee, with their branches; which ſee reſpectively. Thoſe of a ſecondary ſize, being ſuch as occur when you paſs from north to ſouth, are Wakkamaw, Black, Cooper, Aſhepoo, and Combahee rivers. To the third claſs we may refer thoſe which extend a ſhort diſtance from the ſea, and by branching off into various creeks ſerve as drains to the inland ſwamps, or are merely arms of the ſea. The tide flows in no part of the ſtate above 25 miles from the ſea. Canals are executed, projected, or begun for connecting Cooper and Santee rivers, and for uniting the Ediſto with the Aſhley; and it is alſo propoſed to make a waggon-way from the ſettlements in South Carolina over the mountains to Knoxville, in the ſtate of Tenneſſee.

This country, with the exception of the high hills of Santee, the Ridge, and ſome few other hills, is like one extenſive plain, till you reach the Tryon and Hog-back mountains, 220 miles N.W. of Charleſton. The elevation of theſe mountains above their baſe is 3840 feet, and above the ſea coaſt 4640. The mountains weſt and north-weſt of theſe riſe much higher, and form a ridge which ſeparates the waters of Tenneſſee and Santee rivers. The whole ſtate, to the diſtance of 80 or 100 miles from the ſea, is in general low and level, and abounds more or leſs, eſpecially near the rivers, with ſwamps or marſhes, which are capable of being cleared and cultivated, and which then yield in favourable ſeaſons, an annual income of from 20 to 40 dollars per acre. In the diſtance above mentioned, the land riſes by a gradual aſcent from the ſea-coaſt about 190 feet. The traveller, as he proceeds in a W.N.W. courſe from Charleſton, meets with a ſucceſſion of ſand hills, bearing little herbage and a few ſmall pines. The inhabitants are few, and find a ſcanty ſubſiſtence in their corn and potatoes. About 140 miles from Charleſton in this direction is the "Ridge" which is a fine high, healthy belt of land, well watered, and with a good ſoil, and extending from the Savannah to Broad River, in about 6° 30′ W. longitude from Philadelphia. Beyond this ridge commences a country exactly reſembling the Northern ſtates, Devonſhire in England, or Languedoc in France, where hills and dales variouſly intermixed diſplay their verdure and beauty. Wheat fields are common; and the air is found to be much more temperate and healthful than near the ſea. The hills are covered with valuable woods, the vallies are watered with beautiful rivers, and the fertility of the ſoil is equal to every vegetable production. This is called, by way of diſtinction, the "Upper Country;" and the inhabitants are actually diſtinguiſhed by their manners and modes of life, their tones of ſpeaking, and the articles which they cultivate. The land ſtill riſes as you advance; and at the diſtance of 220 miles in a north-weſt direction from Charleſton, the elevation of the land above the ſea-coaſt is found to be 800 feet. Here commences a mountainous country, which continues to the weſtern termination of the ſtate. There are four kinds of ſoil; *firſt*, the pine barren, merely valuable for its timber; with interſperſed tracts of land producing only graſs; theſe are called "Savannas" and furniſh a *ſecond* kind of ſoil, good for grazing. The *third* kind is that of the ſwamps and low grounds on the rivers, which is a mixture of black loam and fat clay, producing naturally and in abundance canes, and alſo cypreſs, bays, loblolly pines, &c. The high lands, commonly known by the name of Oak and Hickory lands, conſtitute the *fourth* kind of ſoil, which yields oak, hickory, walnut, pine, and locuſt. On theſe lands, in the low country, is cultivated principally Indian corn; and in the back country they alſo raiſe tobacco in large quantities, wheat, rye, barley, oats, hemp, flax, and cotton. It is, moreover, well aſcertained that olives, ſilk, and madder may be as abundantly produced in South Carolina (and alſo in Georgia) as in the ſouth of France. There is little fruit in this ſtate: they have indeed oranges which are ſour, plenty of figs, a few limes and lemons, pomegranates, pears, and peaches; apples are ſcarce, but melons are raiſed in perfection. The river and inland ſwamps, eſpecially thoſe within the reach of the tide, are well adapted to the culture and growth of rice; the ſwamps above the head of the tide are occaſionally planted with corn, cotton, and indigo; the ſoil is very rich, yielding from 40 to 50 buſhels of corn per acre. It is curious to obſerve, that in the iſlands near the ſea-coaſt, and for 40 or 50 miles withinland, and on the rivers much farther, the cultivators are all ſlaves. No white man cultivates a farm without negroes. The articles produced are corn, rye, oats, pulſe of every kind, potatoes, which, with the ſmall rice, are the food of the negroes; rice, indigo, hemp, and cotton, are for exportation. The plough and harrow are now introduced in the tillage of the land, together with other agricultural improvements. In the middle ſettlements, the negroes are leſs numerous; the land is not well adapted to rice; it produces tolerably good indigo weed, and tobacco for exportation; the farmer contents himſelf with raiſing corn, potatoes, oats, rye, poultry, and a little wheat. In the upper country, there are few negroes: the plough is almoſt wholly uſed; and the farmer depends for ſubſiſtence upon his own labour and that of his family. Indian corn, wheat, rye, barley, oats, potatoes, &c. are raiſed for food; and tobacco, wheat, cotton, hemp, flax, and indigo for exportation. Vines may be cultivated to great advantage; and a great variety of medicinal herbs and roots, as ſnake root, pink root, ginſeng, &c. is furniſhed in various parts of the ſtate. This country abounds with precious ores, ſuch as gold, ſilver, lead, black lead, copper, and iron. There are alſo ſeveral pellucid ſtones of different hues, rock cryſtal, pyrites, petrified ſubſtances, coarſe carnelian, beautifully variegated marble, vitreous ſtone and ſand, red and yellow ochres, potter's clay, fuller's earth, chalk, crude alum, ſulphur, nitre, and vitriol.

The iron works of this country, called the "Æra Ætna iron-work," are ſituated in York county, within two miles of the Catawba river. The Æra furnace was built in 1787, and the Ætna in 1788. Mr. W. Hill, one of the proprietors of the works, has contrived, by means of a fall of water, to blow all the fires of the forges and furnaces, ſo as to render unneceſſary the uſe of wheels, cylinders, or any other kind of bellows. The machinery for this purpoſe is ſimple and cheap.

In the middle, and eſpecially in the upper country, the people manufacture their own cotton and woollen cloths, and moſt of their tools for huſbandry; but in the lower country, they depend on being ſupplied by the merchants.

This ſtate furniſhes all materials of the beſt kind for ſhip-building. The live oak, and the pitch and yellow pines, are of a ſuperior quality. The indigo manufactured in this country will ſoon rival that of the French. For the encouragement of emigrants it has been announced that a monied capital may be profitably employed in erecting mills, for making paper, for ſawing timber, and eſpecially for manufacturing wheat-flour; in tanning and manufacturing leather, cattle being eaſily raiſed and of courſe hides being very cheap; in making bricks, and in making pot-aſh.

The ſtate of education, and, of courſe, literature, deſerves greater encouragement than they have yet found in this ſtate. However, reſpectable academies have been eſtabliſhed in Charleſton, Beaufort, Port Royal iſland, and in other parts of the country. Three colleges have been incorporated by law, one at Charleſton, one at Winnſborough, in the diſtrict of Camden, and the other at Cambridge, in the diſtrict of Ninety-ſix. Farther improvement in this reſpect may be reaſonably expected, as the legiſlature in 1795 appointed a committee to conſider the beſt means of eſtabliſhing ſchools in the different parts of the ſtate. Since the revolution, all denominations of Chriſtians have been put upon an equal footing, and there have been no diſputes between different religious ſects. The people are allowed by the conſtitution to chuſe their own miniſters, and they are required, when choſen, to ſubſcribe a general declaration expreſſing their reſolution to conform in their public inſtruction to the ſcriptures, to be diligent in the exerciſe of their miniſterial functions, and to be attentive to their own conduct. The upper parts of this ſtate are ſettled chiefly by Preſbyterians, Baptiſts, and Methodiſts. The former, including the congregational and independent churches, are the moſt numerous; the Epiſcopalians rank next, and are ſucceeded, with regard to number, by the Baptiſts, Methodiſts, &c. The Catabaws are the only nation of Indians in this ſtate; and they have but one town, called *Catabaw*: (which ſee.) The Creeks and Cherokees, in the weſt, ſtill retain their names and a portion of their ancient territories on the frontier of the ſtate. The moſt noted nations among the aborigines of South Carolina were the Stonoes and Weſtoes, the Sarannees, Apalaches, Congarees, Eſares, and Yamaſſees, in the eaſt and in the centre, who are now either extinct, or mingled with other tribes. On the ſea-coaſt the proportion of ſlaves far exceeds that of freemen; and the greater part of the white population is found in the weſtern parts of the ſtate. The Carolinians, it is ſaid, ſooner arrive at maturity than the natives of colder climates; but though they are diſtinguiſhed by quickneſs and vivacity of genius, they are generally deſtitute of that enterpriſe and perſeverance, which are requiſite for the higheſt attainments in the arts and ſciences. As they inhabit a fertile country, cultivated by ſlaves, and producing plenty, they have few motives to enterpriſe. Their wealth furniſhes them with the means of hoſpitality, in the uſe of which they are very liberal. In their manners the Carolinians are eaſy and affable, as well as polite and attentive to ſtrangers. Although the ladies want the bloom of the north, they have an engaging delicacy in their appearance and manners, and many of them poſſeſs the polite and elegant accompliſhments. The moſt faſhionable amuſement in this ſtate is hunting; gaming of all kinds is more diſcountenanced among faſhionable people in this than in any of the ſouthern ſtates. Twice a year however they have their horſe-races. In the conduct of their funerals the people of the richer claſs are leſs attentive to propriety than they are on other occaſions; as wine, punch, and all kinds of liquors, tea, coffee, cake, &c. are diſtributed in profuſion, when they are aſſembled to render their laſt tribute of reſpect to the dead. The climate varies in different parts of this ſtate. Along the ſea coaſt bilious diſeaſes and fevers of ſeveral kinds are prevalent between July and October. Theſe diſeaſes are occaſioned by a low, marſhy country, which is overflowed for the ſake of cultivating rice; but though a reſidence in or near the ſwamps is very injurious to health, it has been ſatisfactorily aſcertained, that by merely removing, 3 miles from them, into the pine land which occupies the middle ground between the rivers, the autumnal fevers may be avoided. The upper country, ſituated in the medium between extreme heat and cold, is as healthful as any part of the United States.

The little attention that is paid to manufactures in this ſtate occaſions a great conſumption of foreign imported articles; and yet the exports leave a balance in favour of the ſtate, except when there are large importations of negroes. The principal articles exported from this ſtate are rice, indigo, tobacco, ſkins of various kinds, beef, pork, cotton, pitch, tar, roſin, turpentine, myrtle-wax, lumber, naval-ſtores, cork, leather, pink-root, ſnake-root, ginſeng, &c.; and in the moſt ſucceſsful ſeaſons, 140,000 barrels of rice, and 1,300,000 pounds of indigo have been exported in a year. In the year ending Sept. 30, 1791, the amount of exports from this ſtate was 2,693,267 dollars 97 cents.; in the year ending Sept. 1795, 5,998,492 dollars 49 cents.; in 1805, the exports of domeſtic produce amounted to 5,142,100 dollars, and of foreign ditto to 2,309,516 dollars, or in the whole to 7,451,616 dollars. At this time the ſhipping of the ſtate comprehends 70,000 tons. The annual expenditure amounts to 173,000 dollars.

By the conſtitution, framed June 3, 1790, the legiſlative authority conſiſts of two branches, a "ſenate" and "houſe of repreſentatives," ſtyled "General Aſſembly;" the ſenators are elected by the people for four years, with a biennial rotation of one-half; and it is required that they be thirty years old, reſident five years, and poſſeſs a freehold worth £300, if inhabitants of the county where they are elected, or worth £1000, if they live elſewhere: the repreſentatives are choſen for two years; and they muſt be twenty-one years of age, be reſident three years, poſſeſs a freehold of five hundred acres and ten negroes, or real eſtate of £150 value, if they live in the diſtrict; but if not reſident, a freehold worth £500. The electors muſt be twenty-one years of age, be reſident two years, and poſſeſs a freehold of fifty acres, or town lot, or make a payment of a tax of three ſhillings. With the houſe of repreſentatives originate money-bills, and they have the power of impeaching officers of ſtate. It belongs to the ſenate to try impeachments; and conjointly with the other houſe to appoint commiſſioners of treaſury, ſecretary, ſurveyor, and judges. All officers in the judiciary department are appointed by the General Aſſembly during good behaviour; and receive a ſtated ſalary: the ſheriffs are appointed for four years. The executive branch conſiſts of a governor and lieutenant-governor; the former, choſen by the legiſlature for two years, but re-eligible after an interval of four years, with a certain ſalary, muſt be thirty years of age, reſident ten years, and poſſeſs an eſtate worth 1500 pounds ſterling: to him it belongs to remit fines, if not particularly reſtricted; to reprieve and pardon, except in caſes of impeachment; and he is removable, upon conviction of mal-adminiſtration, by two thirds of the ſenate. The lieutenant-governor is elected at the ſame periods, with the ſame qualifications. This ſtate has eight repreſentatives in congreſs, and two ſenators.

The firſt ſettlement in Carolina ſeems to have been made during the troubles in France, ſubſequent to the reformation; when Jaſper de Coligni, a principal commander of the proteſtant army, fitted out two ſhips, and ſent them with a colony to America, under the command of Jean Ribaud, for the purpoſe of ſecuring a retreat from perſecution. Ribaud landed at that point which is now called Albemarle river, in North Carolina. This colony endured incredible hardſhips and was extirpated by the Spaniards. Towards the latter end of the reign of Queen Elizabeth, Sir Walter Raleigh made ſome unfortunate attempts to fix colonies in Carolina; and in 1608 Carolina, which had been formerly called Carolana, and alſo Georgia, were thought very proper for propagating ſilk, wine, pot-aſhes, cochineal, &c. In 1629 king Charles I. made a grant to his attorney-general, Sir Robert Heath, and to his heirs, of the country called Carolana, including N. and S. Carolina, Georgia, &c.; and Sir Robert afterwards conveyed this province to the earl of Arundel, who was at the expence of planting ſeveral parts of it. But no permanent ſettlement ſeems to have been made in Carolina, till after the reſtoration of king Charles II., when this king granted by his firſt charter, dated March the 24th, 1662—1663, to Edward earl of Clarendon, then lord high chancellor of England, and ſeven others, all lands lying between the 31ſt and 36th degrees of North latitude, and extending weſterly as far as the South Seas; and in 1665 a ſecond charter was granted to the ſame perſons, enlarging their boundaries as far as 29° N. lat. towards the ſouth, and 36° 30′ N. lat. towards the north. Of this extenſive territory, the king conſtituted lord Clarendon and the other ſeven perſons abſolute lords-proprietors, and inveſted them with all the neceſſary powers for planting and governing it. The proprietors engaged the famous Mr. Locke to frame for them a conſtitution and body of laws, which conſiſted of 120 articles. The ſettlement, however, was not completed till the year 1669, when Colonel William Sayle, being appointed firſt governor of this country, embarked with a colony, and ſettled in the neck of land where Charleſton now ſtands. During the proprietary government, which laſted 50 years (reckoning from 1669 to 1719), the colony was haraſſed with perpetual diſſenſions, attacked by the Indians, by pirates, and by the French and Spaniſh fleets, and embroiled by internal quarrels, partly with their governors, and partly on account of religion between the epiſcopalians and diſſenters; the proprietary government was found ineffectual; and a revolution taking place about the year 1719, the government became regal. In 1728 the proprietors, with the exception of lord Granville, ſurrendered their property and juriſdiction to the crown for the ſum of £22,500 ſterling; and at this time the conſtitution was new modelled; and the territory, limited by the original charter, was divided into North and South Carolinas. From this period the colony began to flouriſh; and between the years 1763 and 1775, the number of inhabitants was more than doubled. During the conteſt for independence, this ſtate was for three years the ſeat of war, ſuffered much, and loſt many of its beſt citizens. Since the peace it has availed itſelf of its agricultural and commercial advantages, and the abilities of its moſt diſtinguiſhed characters, and promiſes in proceſs of time to become one of the richeſt in the union. A diſpute having ariſen and long continued about the boundary line, ſeparating the two ſtates of South Carolina and Georgia, commiſſioners were appointed, in April 1787, by the contending ſtates, for the purpoſe of adjuſting the controverted boundary, and it was fixed as follows: the moſt northern branch or ſtream of the river Savannah, from the ſea or mouth of ſuch ſtream, to the fork or confluence of the rivers now called Tugulo and Keowee, and from thence the moſt northern branch or ſtream of the ſaid river Tugulo till it interſects the northern boundary line of South Carolina, if the ſaid branch of Tugulo extends ſo far north, reſerving all the iſlands in the ſaid rivers Savannah and Tugulo to Georgia—but if the ſaid branch or ſtream of Tugulo does not extend to the north boundary line of South Carolina, then a weſt line to the Miſſiſippi, to be drawn from the head ſpring or ſource of the ſaid branch of Tugulo river, which extends to the higheſt northern latitude, ſhall for ever hereafter form the ſeparation limit and boundary between the ſtates of South Carolina and Georgia." Morſe's Geog. and Gazetteer. Anderſon's Commerce. Mod. Un. Hiſt. vol. xxxvi. Sketch of the Geog. and preſent State of the united territories of N. America, &c. Philad. 1805.

**Carolina, La**, a town of Spain, and the capital of new ſettlements in the Sierra Morena; founded by D. Pablo de Olavide, a native of Peru; 20 miles N.E. of Andujar. The ſoil about Carolina conſiſts chiefly of ſand; and the rock is either limeſtone or gypſum. They produce olives, oil, wine, ſilk, wheat, barley, rye, oats, peas, Indian wheat, and lentils. They have no manufactures, for the profitable employment of the people; and, conſequently, theſe new ſettlements ſwarm with half naked beggars.

**CAROLINE**, is a ſilver coin of Sweden, worth about 1s. 2d. with the legend *ſi Deus pro nobis quis contra*. See alſo Carlin.

**Caroline**, is alſo a name given to the four books compoſed by order of Charlemage, to refute the ſecond council of Nice, with regard to the worſhip of images. They contain one hundred and twenty heads of accuſation againſt that council, drawn up by the biſhops of France, and firſt publiſhed in 1549, by M. du Tillet, biſhop of Meaux, under the title of Elia Phylira.

Caroline, in *Geography*, a county of North America in Virginia, ſituate on the ſouth ſide of Rappahannock river, which ſeparates it from King George's county. It is about 40 miles ſquare, and contains 17,489 inhabitants, including 10,292 ſlaves.—Alſo a town in this county; 6 miles S. of Port-royal.

Caroline, a county on the eaſtern ſhore of Maryland, bordering on Delaware ſtate to the Eaſt and containing 9506 inhabitants, including 2057 ſlaves. Its chief town is Danton.

Caroline *Iſlands*, or, as they are ſometimes called, the *New Philippines*, form the moſt extenſive range of iſlands in the Pacific Ocean, and comprehend thoſe that lie between about 138° and 165° E. longitude; and about 10° N. lat. This chain of iſlands appears to have been diſcovered by the Spaniards in 1686, and to have derived its name from the Spaniſh monarch Charles II. They are about 30 in number, and very populous, except three, that were uninhabited. The natives reſemble thoſe of the Philippines, and chiefly live upon fiſh and cocoa-nuts; nor does their language ſeem to be very different. Each iſle, it is ſaid, has its reſpective chief to whom it is ſubject, and all of them reſpect a monarch whoſe reſidence is at Lamurue. They believe in certain celeſtial ſpirits, and think they deſcend to bathe in a ſacred lake in Fallalo; but they have neither temples nor idols, nor any appearance of worſhip. Their dead are ſometimes thrown into the ſea, and others are interred, the grave being ſurrounded with a ſtone wall. The inhabitants of Yap, it is ſaid, worſhip a kind of crocodile, and have their magicians. Polygamy is allowed, and the Tamul, or chief of the large iſle of Hogoleu had nine wives. Criminals are baniſhed from one iſle to another. Theſe iſlanders do not appear to have any inſtruments of muſic, but their dances are accompanied with ſongs. Their only weapons are lances, armed with bone. Negro ſlaves are not unknown in this remote region; and in one or two of the iſlands the breed is ſaid to be mingled: 29 Spaniards having been left on one of theſe iſlands, who are ſuppoſed to have married and ſettled. But their principal population ſeems to have been derived from the migrations of the fairer race from the Philippine iſlands, and farther eaſtward; and theſe were moſt probably occaſioned by ſtreſs of weather, which drove their canoes from iſland to iſland, and from one group to another, that had not been before peopled. The people of Ulea are reported to be more civilized than the reſt, and much to reſemble thoſe of the Pelews. The moſt conſiderable of the Carolines is Hogoleu, about 90 Britiſh miles in length and 40 in breadth. Next to this, but not above a third part of its ſize, is Yap, in the weſtern extremity of the range. Some few ſmall groups of iſlands have been diſcovered in the eaſtern extremities of this chain, which may be properly claſſed under the ſame denomination. In 1733, Cantova, a Jeſuit miſſionary, was maſſacred with eight Spaniards in the iſle of Mogmog. A particular chart of theſe iſlands has been conſtructed after that of this Jeſuit, and the relations of other miſſionaries, which have been printed as a ſupplement to the "Hiſtoire des Navigations aux Terres Auſtrales," by De Broſſes. See vol. ii. See alſo the Preliminary Diſcourſe to the Miſſionary Voyage, p. 86.

Caroline *Waters* and *Baths*. See Carlsbad.

CAROLINEA, in *Botany*, (in honour of Sophia Carolina, marchioneſs of Baden, a liberal patroneſs of botany) Linn. Jun. Supp. p. 51. Schreb. 1125. Willd. 1282. (Pachira, Aubl. 291. Juſſ. p. 279. Pachirier, Savigny in Encyc.) Claſs and order, *monadelphia polyandria*. Nat. ord. *Columniferæ*, Linn. *Malvaceæ*, Juſs.

Gen. Ch. *Cal.* ſimple, one leafed, bell-ſhaped, very ſhort, truncate, obſcurely five-furrowed, ſlightly emarginate between each furrow, ſo as to appear ſomewhat five toothed, ſurrounded by five globular bodies at its baſe. *Cor.* petals five, very long, ſword-ſhaped, nearly erect, concave, rather acute, reflexed at the tip, inſerted into the baſe of the calyx, thick, caducous. *Stam.* filaments about 300, ſhorter than the petals, united in their lower half into a tube, which incloſes the germ, divided about the middle into from 10 to 15 diſtinct bundles, which in their upper part are again divided into about as many capillary filaments; theſe filaments are ſometimes ſingle, but are moſt commonly bifid more than half way down, each diviſion bearing an anther; anthers upright, oblong, a little recurved. *Piſt.* germ ſuperior, furrowed; ſtyle filiform, the length of the ſtamens; ſtigmas five, lanceolate, acute. *Peric.* capſule very large, egg-ſhaped, coriaceous, furrowed, one-celled, opening at the ſummit with numerous valves. *Seeds* numerous, angular, thick, lying one upon another.

Obſ. The younger Linnæus attributes to his plant an inferior germ, and a two-celled pome, with twin ſeeds in each cell, whence Juſſieu and Savigny have expreſſed a doubt whether it be the ſame with that of Aubley; but as he expreſsly quotes Aubley's figure, it ſeems moſt probable that his deſcription is in theſe reſpects erroneous.

Eſſ. Ch. *Calyx* ſimple, bell-ſhaped. *Petals* five, very long. *Stamens* very numerous, monadelphous at their baſe. *Style* one. *Stigmas* five. *Capſule* egg-ſhaped, furrowed, one-celled, many-valved, many-ſeeded. Savig.

Sp. 1. C. *princeps*, Linn. Jun. Sup. p. 314. Mart. Willd. Swartz. Prod. 101. (Pachira aquatica, Aub. Guian. tab. 291, 292. Cavan. Diſſ. 3. tab. 72. fig. 1. Lam. Illuſt. Pl. 589.) "Leaves generally quinate; leaflets ovate-lanceolate." A large tree. *Trunk* much branched, from 15 to 20 feet high, 2 feet in diameter; bark aſh-coloured; wood ſoft and ſpongy; branches ſpreading widely. *Leaves* digitate; common petiole ſix or ſeven inches long, with two ſtipules at the baſe; leaflets from three to five, acute, almoſt ſeſſile, ſmooth, green, very entire, unequal in ſize, the middle one often more than ſeven inches long. *Flowers* ſuperb, more than a foot long, axillary, ſolitary; peduncles thick and very ſhort; petals yellow, caducous; filaments reddiſh; anthers purple. *Fruit* reſembling that of the cacao (theobroma), and thence called in Cayenne the wild cacao. The ſeeds are eatable, but as they are very flatulent when taken raw, they are moſt commonly roaſted. A native of marſhy ground in Guiana. 2. C. *inſignis*, Mart. Willd. Swartz. (Bombax grandiflorum, Cavan. Diſſ. 5. p. 295. tab. 154. Fromager grandiflore, Lam. Encyc. Xiloxochitl. Hernand. Mex. 63. with a figure.) See Bombax *grandiflorum*. The flowers of this ſpecies are ſo ſimilar to thoſe of the preceding, that Swartz ſeems to be juſtified in removing it from Bombax, under which it was formerly placed; but Savigny obſerves, that as he is not acquainted with the fruit, he does not abſolutely pronounce it either a Bombax or a Carolinea, though he is moſt inclined to the latter.

CAROLOSTADT, or Carlostadt, Andrew Bodenstein, in *Biography*, an eminent Lutheran divine, was a native of Carolſtadt, or Carlſtadt in Franconia, and having ſtudied in Germany and Italy, he became canon, archdeacon, and theological profeſſor at Wittemberg. When Luther took his degree of doctor in this univerſity, in 1512, Caroloſtadt was dean; and as ſoon as the former began to preach againſt popery, the latter joined him and became his colleague. His temper, however, was ardent, and not a little inclined to enthuſiaſm; and, determined to extend the reformation, he took the opportunity of Luther's abſence, in 1522, for this purpoſe, and excited a tumult at Wittemberg, by the ſuppreſſion of private maſſes, the removal of images out of the churches, and the abolition of the law which impoſed celibacy upon the clergy. In theſe meaſures, though Moſheim charges him with imprudence and precipitance, he acted in conjunction with Bugenhagius, Melancthon, Amſdorff, and others; and they were confirmed by the authority of the elector of Saxony. Luther, probably diſapproving ſome of theſe innovations, and diſpleaſed at their having been adopted without his authority, broke with Caroloſtadt on his return. Upon this the latter immediately retired to Orlamund; and attacking the opinion of Luther concerning the euchariſt, widened the breach between them. Caroloſtadt rejecting the abſurd and unintelligible conſubſtantiation of Luther, repreſented this ordinance as a commemoration of Chriſt's death, and not as a celebration of his bodily preſence; and in order to evade the difficulty attending the expreſſion, "This is my body," he alleged, that Chriſt pointed to his own body, when he made this declaration, and not to the bread. Caroloſtadt was the firſt Proteſtant divine who took a wife; and againſt this part of his conduct Luther could have had no objection, as he imitated his example. His fanaticiſm, however, was a juſt ground of complaint; for, though he did not adopt the moſt cenſurable opinions of Munzer and his anabaptiſt aſſociates, and of thoſe enthuſiaſtic teachers, who pretended to a divine inſpiration, he nevertheleſs inclined to favour them, and was actually chargeable with ſome extravagancies that were obſervable in their tenets and conduct. Accordingly he was an advocate for the abolition of the civil law, with the municipal laws and conſtitutions of the German empire, and he propoſed ſubſtituting the law of Moſes in their place. He alſo diſtinguiſhed himſelf by railing at the academies, declaiming againſt human learning, and other follies. Having thus incurred the diſpleaſure of Luther, he was commanded to leave the electorate of Saxony; and he repaired to Swiſſerland, where he ſucceſsfully propagated his doctrines, firſt at Zurich, and afterwards at Baſil; probably without that attachment to fanaticiſm, which had given offence; becauſe, after his baniſhment from Saxony, he compoſed a treatiſe againſt enthuſiaſm in general, and againſt the extravagant tenets and violent proceedings of the anabaptiſts in particular. This treatiſe was addreſſed to Luther, and produced ſuch an effect on the mind of this reformer, that he pleaded the cauſe of the exile, and obtained from the elector a permiſſion for him to return to Saxony. After this reconciliation with Luther, he compoſed a treatiſe on the euchariſt, which breathes the moſt amiable ſpirit of moderation and humility; and, having peruſed the writings of Zuingle, in which his own ſentiments on that ſubject are maintained with the greateſt perſpicuity and force of evidence, he repaired, a ſecond time to Zurich, and from thence to Baſil, where he was admitted to the offices of paſtor and profeſſor of divinity, and where, after having lived in the exemplary and conſtant practice of every Chriſtian virtue, he died with the warmeſt effuſions of piety and reſignation, on the 25th of December, 1541. Nevertheleſs, his memory has been very unwarrantably reproached, and his character calumniated, by Moreri, Boſſuet, and Roman Catholic writers. Moſh. Eccl. Hiſt. by Maclaine, vol. iv.

CAROLOSTADIANS, or Carloſtadians, in *Eccleſiaſtical Hiſtory*, an ancient ſect, or branch of Lutherans, who denied the real preſence of Chriſt in the euchariſt, ſo denominated from their leader Caroloſtadius. See the preceding article. The Caroloſtadians are the ſame with what are otherwiſe denominated Sacramentarians, and agree in moſt things with the Zuinglians.

CAROLSTADT, in *Geography*. See Carlstadt.

CAROLUS, an ancient Engliſh broad piece of gold, ſtruck under king Charles I. whoſe image and name it bears. Its value has been eſtimated at twenty-three ſhillings ſterling; though at the time when it was coined, it is ſaid to have been only rated at twenty ſhillings.

Carolus is uſed for a ſmall copper French coin, mixt with a little proportion of ſilver, firſt ſtruck by Charles VIII. of France, whence it took its name; being, at the time when it ceaſed to be current, valued at ſix *deniers*.

CAROLY, or Curute, in *Geography*, one of the Laccadive iſlands in the Indian Sea, off the coaſt of Malabar. N. lat. 10° 32′. E. long. 72° 35′.

CAROMB, a town of France, in the country of Venaiſſin; 5 miles from Carpentras.

CARO-MOELLI, in *Botany*, Rheed. Mal. See Sideroxylon.

CARON, in *Geography*, a town of Perſia, in the province of Farſiſtan; 75 miles S. of Suſa.

CARONCULE, in *Ornithology*, the French name of the wattled ſtarling, *Sturnus carunculatus*.

CARONI, in *Geography*, a river of Dutch Guiana, or Surinam, which riſes N. of the lake Parima, and flows into the Orinoco.

CARONIA, a town of Sicily, on the N. coaſt, in the valley of Demona, on a river of the ſame name; 5 miles N.E. of Miſtretta.

CAROPELLA, a river of Italy, which runs into the gulf of Manfredonia, near Rioli.

CAROPI, in *Botany*, a name given by the inhabitants of the Philippine iſlands to a plant more uſually known among authors by the name of Tugus, greatly eſteemed by the natives, and ſuppoſed by Camelli to be the true *amomum* of the Greeks, ſo much valued in thoſe ancient times.

CAROPOLIS, in *Ancient Geography*, a town of Aſia Minor, in Caria. Steph. Byz.

CARORA, in *Geography*, a town of Terra Firma, in North America, about 110 miles N.E. from Gibraltar, on Maracaybo lake.

CAROTEEL, in *Matters of Commerce*, denotes a certain weight or quantity of divers kinds of goods, ex. gr. of cloves, from four to five hundred weight; of currants, from five to nine hundred weight; of mace, about three hundred weight; and of nutmegs, from ſix to ſeven and an half hundred weight.

CAROTIC is uſed by ſome writers to denote thoſe who are ſeized with the Carus.

CAROTID, in *Anatomy*, from καροω, to lay aſleep; a name given to the large arteries which ſupply the head, from a miſtaken notion that tying theſe veſſels would induce ſleep. There are two *common carotid arteries*, a right and left; of which the former is a branch of the arteria innominata, the latter ariſes from the arch of the aorta. Each of theſe veſſels is again divided into an *external* and an *internal carotid artery*. For the deſcription of theſe veſſels, ſee Artery.

Carotid *canal*, is a winding paſſage in the petrous portion of the temporal bone, through which paſs the internal carotid artery, and the branches of the nervus motor externus, and of the vidian nerve, which join the ſuperior cervical ganglion of the great ſympathetic nerve. See Skeleton.

Carotid *foramen*, is the opening of the carotid canal on the ſurface of the baſis cranii. See Skeleton.

CAROTO, Giovanni Francesco, in *Biography*, a painter of hiſtory and portrait, was born at Verona in 1470, and having learned the principles of his art from Liberale Veroneſe, removed to Mantua and became a diſciple of Andrea Mantegna. Under his inſtruction, he acquired a readineſs in deſign and freedom of hand, which rendered him often ſuperior to his maſter; and many of his compoſitions were taken for thoſe of Andrea. In order to confute thoſe who attempted to degrade him by aſſerting that he was incapable of painting in a large ſize, becauſe he had principally delighted in ſmall figures, he finiſhed a noble deſign in the chapel of the Virgin at Verona, with figures as large as life; and thus eſtabliſhed his reputation. He died in 1546. His brother, whom he had inſtructed, deſigned all the curious remains of antiquity in and near Verona, and particularly the amphitheatre, afterwards engraved and publiſhed. He was a good architect, and is ſaid to have given leſſons to Paolo Veroneſe. Pilkington.

CAROUGE, in *Botany*, ſee Ceratomia *Siliqua*.

Carouge, in *Geography*, a town in the department of Leman, and chief place of a canton, in the diſtrict of Genève; the place contains 3250, and the canton 8,322, inhabitants: the territory includes 90 kiliometres and 10 communes.

Carouge *Point*, the northernmoſt extremity of the iſland of St. Domingo, in the Weſt Indies; 25 miles N. from the town of St. Jago.

Carouge of Buffon, in *Ornithology*, the Bonana bird of Engliſh writers, Oriolus *Bonana*.

CAROUGES, or Carrouges, in *Geography*, a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of Alençon; 4 leagues N.W. of Alençon. The place contains 1950, and the canton 15,130 inhabitants; the territory comprehends 300 kiliometres and 25 communes.

CAROVIGNO, a town of Naples, in the province of Otranto; 3 miles E. of Oſtuni.

CAROUZE, a cape on the north coaſt of the iſland of St. Domingo. N. lat. 19° 59′. W. long. 70° 53′.

CAROXYLON, in *Botany*, Thumb. Juſſieu, Lam. See Salsola *aphylla*.

CARP, in *Ichthyology*. See Cyprinus.—Common Carp. See Cyprinus *Carpis*.

Carp, *golden*. *Cyprinus Auratus*, Gold Fiſh. See Auratus Cyprinus.

Carp-*meals*, a coarſe kind of cloth, made in the northern parts of England.

Carp *ſtone*, *lapis carpionis*, a kind of gem ſaid to be found in the fauces, by others in the back-bone, of the *carp* fiſh, about the ſize of a pea, of a triangular figure, and white colour without, but yellow within. It is ſuppoſed to be of uſe againſt the ſtone, and ebullitions of the bile, being taken in powder, or held in the mouth.

CARPACK, in the *Egyptian Dreſs*, a ſort of red cap turned up with fur, which ſome make a cuſtom of wearing in common, though it is properly a part of the dreſs of the interpreters only, the ſame cap with muſlin tied round it being more properly the common dreſs.

Carpack, in *Geography*. See Carpates.

CARPÆA, from Καρπαια, a kind of dance or military exerciſe, in uſe among the Œnians and Magneſians, performed by two perſons; the one acting a labourer, the other a robber. The labourer, laying by his arms, goes to ſowing and ploughing, ſtill looking warily about him as if afraid of being ſurpriſed: the robber at length appears, and the labourer quitting his plough, betakes himſelf to his arms, and fights in defence of his oxen. The whole was performed to the ſound of flutes and in cadence. Sometimes the robber was overcome and ſometimes the labourer; the victor's reward being the oxen and plough. The deſign of this exerciſe was, to teach and accuſtom the peaſants to defend themſelves againſt the attack of ruffians.

CARPAL Ligament, or *ligamentum carpi proprium*, in *Anatomy*, is a ſtrong ligament under which the flexor tendons of the fingers, and the median nerve, enter the palm of the hand. See Ligaments.

CARPAS, in *Geography*, a town near the eaſtern point of the iſland of Cyprus, in the Mediterranean. It was anciently called *Carpaſia*, by Pliny *Carpeſium*, and by others *Carpeſſus*.

CARPASIÆ, in *Ancient Geography*, ſmall iſlands, ſituate very near to the iſle of Cyprus, and north of it, almoſt oppoſite to the town of Carpaſia.

CARPASIUM *linum*. See Linum *Carpaſium*.

CARPASUM, or Carpasium, in the *Materia Medica* of the ancients, the name of a poiſonous gum, exudating from a tree, ſo like myrrh in appearance that many periſhed by the error of uſing it inſtead of myrrh, or mixed among it. We are at this time wholly ignorant of its nature; but that it was a gum exudating from a tree, is plain from the account of Dioſcorides, who calls it *opocarpaſum*, as we do the flowing balm of Gilead, *opobalſamum*. The wood of the tree which produced it, he calls *xylocarpaſum*, in the ſame manner as the other wood is called *xylobalſamum*. This wood was little leſs poiſonous than the carpaſum, or gum itſelf. Galen tells us that the carpaſum was like myrrh of the very pureſt and fineſt kind; and that thoſe people who were moſt curious of all to have fine myrrh, often met with the carpaſum among it, and gave death, inſtead of relief, to the perſons to whom they adminiſtered it. We find, by the words of Galen, that this gum was not only like myrrh, but was alſo brought from the ſame places, and was often mixed with it. The fineſt myrrh uſually had moſt of this poiſon among it, and we may collect from the ſame account that it was a ſweet-ſcented gum, for otherwiſe no body could have miſtaken it for myrrh. Galen de Med. Simpl. lib. vii.

CARPATES, in *Ancient Geography*, the name given to a long chain of mountains, which terminated European Sarmatia on the ſouthern ſide; now called mount Carpack.

CARPATHIAN Mountains, in *Geography*, a grand and extenſive chain, which bounds Hungary on the north and eaſt, and which are called by the Germans the mountains of "Krapak," probably the original name, but ſoftened by the Roman enunciation. The Hungarians call them "Tatra." This enormous ridge extends in a ſemicircular form from the mountain of Javernick ſouth of Sileſia towards the north-weſt. But at the mountain of Trojeſká, the moſt northern ſummit, it bends to the ſouth-eaſt, to the confines of the Buckovina, where it ſends forth two branches, one to the eaſt and another to the weſt of Tranſylvania; which is alſo divided from Walachia by a branch running ſouth-weſt and north-eaſt. The whole circuit may be about 500 miles. Dr. Townſon (ſee his Travels in Hungary, 4to. 1796), viſited theſe Hungarian Alps from the vicinity of Keſmark, firſt proceeding to the "Green See," a lake amidſt the mountains, paſſing through foreſts of firs and delayed in his progreſs by the thick branches of a tree reſembling the pine, called "Krumholz," which were ſucceeded by rocks of limeſtone and granite. He computes that the Keſmark peak, which towards Hungary is a perpendicular rock, may be about 8508 feet above the level of the ſea. The Lomitz peak, to which he next proceeded, is, as he ſays, the higheſt of the whole Carpathian chain, and placed towards its centre; but he afterwards expreſſes a doubt, whether it be not rivalled, if not exceeded, by the Krivan, ſituated more towards the weſt, 20° 45′ of E. long. from London. He attained the ſummit of Lomnitz with ſome difficulty, and computed it to be 8640 feet above the level of the ſea, or not much above half the height of M. Blanc, or M. Roſa. He found it compoſed of grey granite like the rocks at the bottom; but with a ſmall mixture of a greeniſh black, earthy ſubſtance; nevertheleſs, the vegetation conſiſted of little except a few lichens. Theſe peaks are ſeldom viſited except by the hunters of the chamois, and ſome idle adventurers, who ſearch for gold and precious ſtones. The marmot alſo appeared; but our intelligent traveller denies that the ibex, or rock goat of the Swiſs Alps, is found in the Carpathian heights. The Krivan he afterwards aſcended with more eaſe, but found it inferior in height to the Lomnitz, being 8343 feet above the ſea. It is probable that ſummits of greater elevation ariſe in the eaſtern part of the chain; but there are no glaciers nor other tokens of the eternal winter of great altitude.

Dr. Townſon gives us a curious account of a Carpathian "Koſchar," and its inhabitants. This is a ſmall wooden hut in the midſt of a wood, built in the Swediſh manner; that is, with balks, whoſe ends are let into one another, ſomething in the manner of what carpenters call dove-tail work; it was only about ſix yards long, and three broad; and divided into two apartments, but by no means weather-tight. In the firſt apartment the head-ſhepherd, who is only a poor common peaſant, lives, and makes the cheeſe; the other is the magazine, where it is kept till it is ſent to Keſmark, which is every week. The buſineſs of the dairy is very ſimple: the ſheep are driven home thrice a day to be milked; and each milking is immediately made into cheeſe, for they make no butter. The rennet is poured upon the milk while it is warm, which is ſoon after beaten together, and preſently the head-ſhepherd gropes together with both his hands all the curds. This buſineſs appeared to be difficult, and laſted near half an hour: the curds then form one great maſs, and are taken out together, put into a cloth, and hung up; but no preſſure is uſed. The whey which remains is boiled, and acquires ſome conſiſtence, and this forms the food of the ſhepherds, and their only food for the whole ſeaſon; they have not even bread. After the ſhepherd and his men had eaten their ſupper, the men, of whom there are four or five, left the hut, and went to ſleep under ſheds around the fold. In the night the head-ſhepherd got up two or three times and hollowed to his men, to aſcertain whether they were upon the watch; and they always anſwered, to ſatisfy him that they were attentive to their duty. Great vigilance is requiſite againſt the wolves, and with all their precautions theſe animals had carried off their ſheep this ſummer.

The Carpathian ridge occaſionally branches towards the north and ſouth; in the former direction the moſt remarkable are the hills on the weſt of Sileſia, thoſe which adjoin to the ſalt mines of Wieliczka, a few miles ſouth-eaſt from Cracow in Poland, and thoſe which extend through part of Buckovina. Toward the ſouth a branch ſtretches from the centre of the chain towards Tokay; and there are other branches not accurately defined, which deſcend in the ſame direction from the eaſtern circuit. Pinkerton's Mod. Geog. vol. i.

Carpathian *Sea*, a part of the Mediterranean Sea, to the ſouth-weſt of the iſle of Rhodes, between this and the iſland of Candia. It derives its name from Carpathos, an iſland whoſe coaſts it bathes. This ſea has acquired celebrity from having been mentioned by Horace, Ovid, Propertius, and Juvenal.

CARPATHOS, or Carpathus, in *Ancient Geography*, now *Scarpanto*, an iſland of the Mediterranean Sea, ſituate between the iſle of Crete or Candia, to the ſouth-weſt, and the iſle of Rhodes to the north-eaſt. Strabo ſays that it contained four towns, one of which was called Niſyros; Scylax aſſigns it only three, and Ptolemy one, called Poſidium. It was long and ſtrait, and, according to Scylax, 100 ſtadia in length from nearly the ſouth to the north. Strabo ſays, that its circuit was 200 ſtadia. This iſland was anciently inhabited by ſome ſoldiers of Minos, the firſt of the Greeks who poſſeſſed the empire of the ſea. Many generations after his time, Jolcos, the ſon of Demoleon, an Argian, planted here a colony. Homer calls it Crapathos. It was alſo called Tetrapolis, from its four towns, Heptapolis, from its ſeven towns, and Pallenia, after the ſon of Titan, the firſt poſſeſſor of this iſland.

Carpathos, a town in the above iſland, which was a metropolitan ſee.

Carpathos, in *Geography*, a town of South America, in the country of Peru, and juriſdiction of Guamalies; moſt of the inhabitants are weavers, and employed in manufacturing bays, ſerges, and other ſtuffs.

CARPE de Mer, in *Ichthyology*, the name by which the common wraſſe, *labrus tinca*, is known in ſome of the maritime parts of France; called alſo *labre vielle*.

CARPELLA, in *Ancient Geography*, a promontory of Aſia, placed by Ptolemy in Carmania, very near to the promontory Armoſum, in the Perſian gulf, and S.W. of it.

CARPENTANOS Montes, in *Geography*, a chain of Spaniſh mountains, extending from near Soria on the N.E. and purſuing a S.W. direction towards Portugal. This chain is alſo called that of Urbia, or Guadarama.

CARPENTARIA, a large bay on the northern coaſt of New Holland, diſcovered in the year 1618. S. lat. 10° 20′. E. long. 130° 50′.

CARPENTER, an artificer, whoſe buſineſs is to cut, faſhion, and join timber and other wood for the purpoſes of building. The word is formed from the French *charpentier*, which ſignifies the ſame, formed of *charpente*, which denotes timber; or rather from the Latin *carpentarius*, a maker of *carpenta*, or carriages.

Carpenter, in *Ornithology*, a name given in St. Domingo to a ſpecies of wood-pecker, probably the green wood-pecker, or *picus viridis*, which it reſembles in its colour, form, note, and habits; becauſe it hollows and injures trees, particularly the plum trees, which it ſometimes bores through, and the cocoa-tree. The inhabitants of Cayenne give the name "Yellow Carpenter" to the yellow wood-pecker, the *picus exalbidus* of Gmelin, the *picus Cayanenſis albus* of Briſſon, and *picus flavicans* of Latham.

Carpenter's *Work*, in *Architecture*, includes the framing, flooring, roofing; the foundation, carcaſe, doors, windows, &c. In the menſuration of this kind of work, large and plain articles are uſually meaſured by the ſquare foot or yard, &c.; but enriched mouldings and ſome other articles are often eſtimated by running or lineal meaſure, and ſome things are rated by the piece. In meaſuring of *joiſts*, it ſhould be recollected, that only one of their dimenſions is the ſame with that of the floor; and the other will exceed the length of the room by the thickneſs of the wall, and $\frac{1}{3}$ of the ſame, becauſe each end is let into the wall about $\frac{2}{3}$ of its thickneſs. No deductions are made for hearths, on account of the additional trouble and waſte of materials. *Partitions* are meaſured from wall to wall for one dimenſion, and from floor to floor, as far as they extend, for the other; nor is any deduction made for door-ways, on account of the trouble of framing them. The *meaſure of centering for cellars* is found by means of a ſtring made to paſs over the ſurface of the arch for the breadth, and taking the length of the cellar for the length; but in groin-centering, it is uſual to allow double meaſure, on account of their extraordinary trouble. In *roofing*, the length of the houſe in the inſide, together with $\frac{2}{3}$ of the thickneſs of one gable, is to be conſidered as the length; and the breadth is equal to double the length of a ſtring which is ſtretched from the ridge down the rafter, and along the eaves board, till it meets with the top of the wall. For *ſtair-caſes*, take the breadth of all the ſteps, by making a line ply cloſe over them, from the top to the bottom, and multiply the length of this line by the length of a ſtep for the whole area. By the length of a ſtep is meant the length of the front, and the returns at the two ends; and by the breadth is to be underſtood the girt of its two upper ſurfaces, or the tread and riſer. For the *baluſtrade*, take the whole length of the upper part of the hand-rail, and girt over its end till it meet the top of the newel-poſt, for the length; and twice the length of the baluſter upon the landing, with the girt of the hand-rail, for the breadth. For *wainſcotting*, take the compaſs of the room for the length; and the height from the floor to the ceiling, making the ſtring ply cloſe into all the mouldings, for the breadth. Out of this muſt be made deductions for windows, doors, chimneys, &c.; but workmanſhip is counted for the whole, on account of the extraordinary trouble. For *doors*, it is uſual to allow for their thickneſs, by adding it to both the dimenſions of length and breadth, and then multiply them together for the area. If the door be pannelled on both ſides, take double its meaſure for the workmanſhip; but if one ſide only be pannelled, take the area and its half for the workmanſhip. For the *ſurrounding architrave*, girt it about the outermoſt part for its length; and meaſure over it, as far as it can be ſeen when the door is open, for the breadth. *Window ſhutters*, *baſes*, &c. are meaſured in the ſame manner. In the meaſuring by roofing for workmanſhip alone, all holes for chimney-ſhafts and ſky-lights are generally deducted. But in meaſuring for work and materials, they commonly meaſure in all ſky-lights, luthern-lights, and holes for the chimney-ſhafts, on account of their trouble and waſte of materials. Artificers meaſure flooring, partitioning, roofing, tiling, &c. by the ſquare of 100 feet. See MEASURE and CARPENTRY.

CARPENTERS, *Company of*. See COMPANY.

CARPENTER'S *Joint rule*. See RULE.

CARPENTER, *Ship*, a perſon employed in the docks, in the conſtruction and repairing of veſſels.

CARPENTER *of a ſhip*, is an officer at ſea, whoſe buſineſs is to have things in readineſs for keeping the veſſels in repair; and to attend the ſtopping of leaks, fiſhing of maſts or yards, alſo caulking, careening, breaming, and the like. He is to watch the timber of the veſſel that it does not rot, conſult frequently with other officers on the ſtate of the maſts, yards, &c. and in time of battle he is to have plugs, tompions, and planks ready, for repairing breaches made by the enemy's cannon.

The carpenter has a mate under him, and a crew or gang to command on neceſſary occaſions.

CARPENTORACTE MINORUM, in *Ancient Geography*, now *Carpentras*, a town of Gallia Narbonnenſis, N.E. of Avenio, ſeated upon an eminence near the river Auſonius. It was known to Pliny, who reckoned it among the Latin cities; and the Romans fixed in it a colony, probably in the time of Julius Cæſar. It belonged to the Memnicians, and had a triumphal arch, which is ſuppoſed to have been erected in commemoration of the victory obtained by Cn. Domitius Ænobarbus over the Allobroges and Auvernates, near the confluence of the Sorgue and the Rhone, about 2½ leagues from this city.

CARPENTRAS, in *Geography*, an ancient town of France, in the county of Venaiſſin, on the river *Auſon*, or chief place of a diſtrict, in the department of Vaucluſe. It was, before the revolution, the ſee of a biſhop, and ſtill exhibits many veſtiges of Roman magnificence. The north part of it contains 4,784, and the ſouth 3,705 inhabitants: the north canton has 9,300, and the ſouth 11,146 inhabitants. The extent of its territory comprehends 2 0 kilometres, and 8 communes, 5 in the northern, and 3 in the ſouthern part. It is diſtant 12 miles N.E. from Avignon. N. lat. 44° 4′. E. long. 5° 6′.

CARPENTRY, in *Civil Architecture*. The art of carpentry is, in general terms, the art of employing timber in the conſtruction of edifices. This is an art of the moſt general and important uſe, and of the higheſt antiquity; from the rude and ſolitary cabin to the rich and peopled city, in the earlieſt dawnings and the brighteſt periods of civilization, wherever nature has preſented to man her foreſts, the building art has found in them a material of univerſal application, commodious and economical. Carpentry is alſo intereſting to the fine arts, as its forms and operations have been the model of Grecian architecture, which has decorated and improved, but never renounced, its original type in wooden building. See the articles BUILDING and CIVIL *Architecture*.

With reſpect to the hiſtory of this art our information is ſhort and ſcanty. Pliny and Vitruvius, the only writers upon the building arts whoſe works have reached modern times, confine their obſervations upon carpentry chiefly to the choice and felling of timber; and it may be readily conceived that ancient buildings preſerve no ſpecimens of an art which is not calculated to reſiſt the injuries of time and the violences of rapine.

The remains of Egyptian architecture preſent, perhaps, the only example of a complete ſyſtem of building without the uſe of timber, while, at the ſame time, arches and vaults were unknown; for many Roman edifices, ſuch as the Pantheon, Temple of Peace, &c. might be quoted, which, by means of vaults, are independent of carpentry. In the Egyptian conſtruction, however, flat roofs of maſſy ſtone were uſed, which it was neceſſary to ſupport by thick-ſet avenues of columns, arranged at ſmall equal diſtances over the whole area. This form, though ſufficiently ſtriking and pictureſque, was of courſe incommodious, and only adapted to a dry climate. A pediment roof, therefore, was the firſt effort of conſtructive carpentry; this anſwered the purpoſe of an effectual ſhelter, by throwing off the humidity of the ſkies; at the ſame time, the rafters, in connexion with the tranſverſe beams of the ceiling, formed a truſs which would be gradually improved, and thus give the means of covering a wide ſpace, without any other ſupport than the external walls.

The invention of pediment roofs leads us naturally to Greece, where this member was an eſſential part of architecture. Beſides forming roofs, the Greeks appear to have uſed carpentry in the framing of floors, and for ruſtic buildings and other purpoſes. But in a warm climate, abounding with ſtone and marble, it is not probable, that wood was much uſed in the internal finiſhing of any edifices, except for thoſe objects wherein lightneſs and tenacity are eſſential qualities, as doors; though there are ſome remains of marble doors. Muſeum Worſleyanum.

This was leſs the caſe in Rome. The Romans ſeem to have uſed wood for nearly all the purpoſes of carpentry that the moderns are acquainted with. The roofs of buildings, the architraves, where they were very long, as in the Tuſcan temples and other caſes, the framing of floors, were all of this material. They alſo formed arches of ſlight timber grating for ſtuccoing; they had wooden cornices, and the ſtone ſeats of theatres were covered with boarding. Vitruvius, l. 4. l. 7. &c. We alſo read of conſiderable buildings, as amphitheatres, being erected of wood; ſuch was that built by Auguſtus to exhibit the ſhows on account of the victory of Actium, and many others, at Rome and different parts of Italy. It may be remarked that the beams of the roof were generally left uncovered by a ceiling; and ſometimes, in magnificent buildings, encruſted with bronze, and even gilded as in the baſilica of St. Peter, erected by Conſtantine.

In the colder countries of Europe, wood was more plentifully uſed, particularly in the interior works; and in the middle ages the art of carpentry partook of the bold and ſkilful conſtruction exhibited in that ſtyle of building commonly called gothic; of this the high pitched weighty roofs and lofty ſpires of the great cathedrals afford many ſtriking inſtances.

In more modern times carpentry ſtill improved. The wooden bridges of Palladio are examples of admirable conſtruction. Some French artiſts too have given eminent inſtances of ingenious carpentry, as Philibert Delorme in his method of conſtructing wooden domes; and Moulineau in his, which was executed at the Halle du Bled, at Paris, and various centres for large ſtone arches by Perronet, Hupeau, &c. In England the timber work of the dome and ſcaffolding of St. Paul's, and, in later times, many examples of centres, bridges and roofs may be cited as models of ſcientific carpentry: while in accuracy of execution, celerity and neatneſs of finiſhing, our workmen are unequalled. In the north of Europe, and particularly in Sweden and Norway, wood is almoſt the only material uſed for building; and of courſe the natives muſt have conſiderable practical ſkill in carpentry.

The art of employing timber in building is divided into two grand branches: carpentry and joinery. The firſt includes the larger and rougher kinds of work, and that part which is material to the conſtruction and ſtability of an edifice; and, generally, all the work wherein the timber is valued by the cubical foot. Joinery, which is called by the French, menuiſerie, from the menus bois, or ſmall wood employed in that art, includes all the interior finiſhing and ornamental wood-work, and is valued by the ſuperficial foot.

In this article we ſhall treat of the conſtructive part, or carpentry, ſtrictly ſpeaking, leaving what reſpects the material and belongs to architecture in general, as the choice of trees, the ſtrength of timber, &c. to the article TIMBER. We ſhall therefore ſuppoſe the material arrived in the carpenter's yard, and in the ſtate of whole or ſquared timber. The operations it undergoes from this period to its final employment in a building may be claſſed under two general heads, thoſe which relate to individual pieces, and thoſe which relate to their connexion with others. Under the firſt head are the operations of the pit ſaw, too generally known to need deſcription, by which the whole timber is divided and reduced to the required *ſcantlings;* this term, from the French, *echantillon,* means dimenſions, relative to breadth and thickneſs without reſpecting length:—Planing, which is giving a ſmooth face to wood by means of a familiar inſtrument called a plane, conſiſting of a chiſel fixed in a frame, ſerving as a handle, by which the workman moves it along over the ſurface of the timber, ſhaving off its inequalities: timber thus prepared is ſaid to be wrought:—Mouldings of various forms, and performed with particular planes or chiſels:—Rebating, which conſiſts in diminiſhing the width of a ſquare, or rectangular piece of timber, for a certain depth on one edge, thus taking off a rectangle of the whole width, and leſs than the depth of the original piece; this method is particularly uſed in door-caſes, and the frames of caſement windows, the *rebate* forming a kind of ledge for the door or caſement to ſtop againſt:—Grooving or plowing, in which a narrow channel is excavated out of the thickneſs of the timber: the groove is either ſquare, forming an equal ſection in the whole depth, or wider at bottom than at top, which is called a *dovetail* groove. Timber may alſo be *ſunk* where the piece is formed like a wedge, or rounded; or *bevilled* in various ſhapes, which means when the ſection forms a figure without right angles.

We now come to the ſecond and moſt important head of the operations by which timbers are connected together. Theſe are generally ſpeaking, by *mortiſe* and *tenon,* the firſt an excavation, and the ſecond a projection, adapted to it; or by wooden pins or nails, ſpikes, ſcrews, bolts, ſtraps, and other faſtenings of metal, or by glue, though this laſt is ſcarcely uſed except in joinery.

The following is a deſcription of the moſt general and uſeful methods of joining timbers. Firſt, by ſimple tenon and mortiſe, as when joiſts are framed into trimmers, the moſt uſual method is to make the tenons in the middle of the breadth of the trimmer with a plain ſhoulder; ſee *fig.* 1. *Plate* LXII. of *Architecture,* which repreſents a ſection of the trimmer, and a part of the joiſt, framed in a longitudinal direction. But when binding-joiſts are framed into girders, as the binding-joiſt has to ſupport the bridging-joiſts, and theſe the floor, the beſt method, in order to give ſtrength to the tenon, is to make a reſt of a ſhort length under the tenon, with a ſloping ſhoulder above, extending in a line from the extremity of the reſt to the perpendicular of the ſquare ſhoulder below at the upper edge of the binding-joiſt. See *fig.* 2. *Plate* LXII. of *Architecture.* No. 1. repreſents a ſection of the girder through the mortiſes; Nos. 2 and 3 part of the joiſts in a longitudinal direction.

When a piece of timber is to be framed between two parallel pieces which are quite immoveable, the true method, in order to make cloſe work, is to make the extremity of the tenon and the bottom of the mortiſe, at one end, in the arch of a circle, having its centre in one edge of the mortiſe, and the extremity of the tenon, and the bottom of the mortiſe at the other end, in a concentric arch from the ſame centre. As the mortiſe at this end muſt be much longer than the breadth of the tenon, there will be a large part of the mortiſe ſtill open, which may afterwards be filled up. Inſtead of the bottom of the mortiſe here being formed in the arch of a circle, it may be cut quite parallel to the edge to the deepeſt part, as it will not impede the tranſverſe piece in going to its place. This mode of framing is much uſed in ceiling, joiſting for double floors: the long mortiſes cut in this manner are called chaſe mortiſes. In forming the tenon and mortiſe, at the end where the centre is placed, it is not neceſſary that the mortiſe and tenon ſhould be ſo deep as to form an entire quadrant; in this caſe the bottom may be quite parallel, and only the further edge oppoſite the centre made circular. *Fig.* 3. *Plate* LXII. of *Architecture* repreſents a piece of framing, in the manner above deſcribed, A B, the bottom of the mortiſe, and the extremity of the tenon deſcribed from the centre C; D E the running, or chaſed mortiſe, which muſt be quite free from the circumference deſcribed by the point D, whether the extremity be in the circumference, or in a tangent, D F, parallel to G E.

The manner of repreſenting the tenon and mortiſe at the end on which the centre is placed, when the mortiſe is made of a leſs depth than the breadth of the tenon, is ſhewn at the other end.

When a tranſverſe piece is to be framed between two parallel joiſts, of which their vertical ſurfaces are oblique to each other, the upper edge of the tranſverſe piece is turned downwards upon the top of the joiſts, and marked at the interval or clear; it is then turned upwards into the poſition in which it is to be placed, the mark at one end is brought into a right line with the vertical ſurface of the joiſt, and a line is drawn by the edge of a rule or ſtraight edge placed vertically in the plane of the joiſt and the tranſverſe piece; this line marks the ſhoulder of the tenon. The other end is drawn in the ſame manner. This mode of framing a tranſverſe joiſt between two parallel joiſts is called by workmen tumbling-in-joiſts. The manner of tumbling in a joiſt is exhibited at *fig.* 4. *Plate* LXII. of *Architecture.* A and B are ſections of the parallel joiſts, C D E F the tranſverſe joiſt, or the piece tumbled in, G H the ſtraight edge placed for drawing the ſhoulder C F.

A piece of timber may be joined at right angles to another in the manner of *fig.* 3. *Plate* LXI. of *Architecture,* which is a longitudinal ſection in the direction of the fibres of both pieces. A mortiſe is cut in the one piece to the breadth of the piece which is to form the perpendicular: the edge of the tenon is cut with a dove-tail notch, ſo that the piece may be at right angles to the other, and a wedge or key is driven from the other edge of the tenon, which forces it quite cloſe. One inconvenience ariſing from the dove-tail is, that if the timber of which it is made be not quite dry, the tenon will ſhrink in proportion to its breadth, and therefore the perpendicular piece will be liable to be drawn to a certain degree. To remedy this defect, inſtead of the edge of the tenon being cut dove-tail ways, it may be notched, as is to be ſeen in *fig.* 4. No. 1. No. 2. ſhews another view of the perpendicular piece with the wedge.

Another method of fixing one piece of timber perpendicular to another, is to mortiſe the piece forming the baſe not quite through, enlarging the edges towards the bottom, and making the tenon of the perpendicular piece to fit the upper part of the mortiſe. Two wedges are then fixed to the bottom of the tenon; where the perpendicular piece is driven, the wedges will be reſiſted by the bottom, which will ſplit the ends of the tenon, and fill up the mortiſe to the breadth at the wideſt place. This mode of fixing one piece at right angles to another is called fox-tail wedging. By this method, ſo long as the wedges are kept from ſlipping, the one piece can never be drawn from the other, without breaking the tenon. In order to enlarge the tenon in breadth ſtill more towards its extremity, two other ſmaller wedges may be put in, of which their ends do not reach quite ſo far as thoſe of the other two, which, when partly driven, the ſmall wedges will then begin to widen the end of the tenon likewiſe, and make it fill the mortiſe completely at the bottom. *Fig.* 5. No. 1. ſhews the edge of the piece on which the mortiſe is cut. Fox-tail wedging is chiefly uſed where the pieces to be put together are ſmall, and then the wedges are frequently driven in with glue; when the pieces to be joined are large, the former method is generally practiſed.

The fixing beams to wall-plates is called cocking or cogging. When a beam is to connect two wall-plates, in order to bind the ſides of the building together, one method is to cut the end of the beam in the form of a dove-tail, and to make a correſponding notch in the wall-plate to receive it, as is ſhewn in *fig.* 6. No. 1. No. 2. is a tranſverſe ſection at the neck of the dove-tail. *Fig.* 7. ſhews the ſame thing, with a ſmall variation in the form of the dove-tail, fitted obliquely to the other piece. But when the timber has not been ſufficiently ſeaſoned, and when it begins to dry, the perpendicular piece may eaſily be drawn from the other, to a certain degree. Therefore, if the ſides of the building are affected by lateral preſſure, this mode of fixing the one piece to the other will not prevent the walls from coming nearer together, or expanding. The moſt effectual method of preventing this is ſhewn at *fig.* 8. No. 1. where a ſmall notch is cut out of the beam, and the contrary parts, viz. a double notch, cut in the wall-plate to receive it. No. 1. the beam ſhewn longitudinally upon a tranſverſe ſection of the wall-plate; No. 2. the upper face of the wall-plate. The beſt method of connecting any number of poſts with croſs-beams depends upon this principle. *Fig.* 9. No. 1. ſhews a tranſverſe ſection of a poſt with two beams longitudinally bolted to it, in the manner of cogging beams to wall-plates: No. 2. a part of one of the beams, ſhewing the notches. The ſtrongeſt method of fixing the purlins of a roof to the rafters alſo depends upon the ſame principle. *Fig.* 10. No. 1. is a ſection of the rafter, with the purlin longitudinally drawn; No. 2. the upper edge of the rafter; No. 3. the under ſide of the purlin, ſhewing the notch.

The method of joining timber laterally, by means of keys and dove-tails, is ingenious, and not generally known; it will be neceſſary to exhibit and deſcribe the manner of doing it *Fig.* 1. *Plate* LXI. of *Architecture,* No. 1. is a longitudinal ſection of two pieces joined in this manner, with the dove-tail pieces and the wedge or key, by means of which they are forced againſt the ends of the pieces to be fixed, and in order to make the one preſs harder to the other, the interior angle of the dove-tails is greater than the exterior one, formed upon the pieces to be joined; No. 2. is a tranſverſe view of the mortiſe, exhibiting the ends of the dove-tails and keys. *Fig.* 2. is the ſame method, applied in joining parallel pieces not touching each other together, which is plain to inſpection.

The modes in which beams are lengthened are of infinite variety; ſome of the moſt approved forms are as follow. A beam may be continued to any extenſion by building it in three thickneſſes; ſee *fig.* 1. *Plate* LX. of *Architecture.* It may alſo be done by ſplicing one to the end of another, called by carpenters ſcarfing, which is of various forms, as in *figures* 1, 2, 3, 4, 5, 6, 7, and 8. When a beam is to be lengthened, as in *fig.* 2. and 3. it is very difficult to get the joints cloſe when the pieces compoſing it are very large, and hence they are ſeldom uſed but for very ſmall pieces, which may be glued together. To remedy this inconvenience in large works, as well as to make it leſs dependent on the bolts; and to prevent every poſſibility of the one being drawn away from the other, is to indent them together, called tabling, as in *figures* 4, 5, 6, 7, 8, and 9, and to leave a ſmall ſpace at the end or meeting of each table for a wedge. In the operation of joining timbers in this manner, the pieces are laid ſo as to bring the joint as cloſe as poſſible, the wedge is then driven while another perſon ſtrikes the extremity of one of the pieces with a large hammer or mallet, which will bring the joint quite cloſe, if they have been well fitted together previouſly to the operation; of theſe two forms, *figures* 5, 6, and 7 ought to have the preference, as the faces of the tables are parallel to the fibres of the wood, which will make them reſiſt any longitudinal ſtrain with a much greater force; but as a diſadvantage ariſes from this form, that more than half the wood is cut quite through at the two ends of the joints, it has been found neceſſary to fix plates of iron acroſs them, as are ſhewn. However, there is leſs to be apprehended from the tearing of the fibres, by being drawn in a direction of their length, than from the bending of the bolts.

*Fig.* 6. is a ſcarfe with ſeveral tablings; in this it is to be obſerved, that the wedges in the two extreme mortiſes are only effective. A wedge in the middle would tend to force the joints open, and therefore the other two ſhould only be fixed. Long ſcarfings add to the ſtrength; but to increaſe the number of tables more than two, is, it is thought, rather diſadvantageous, as it ſhortens its fibres, and conſequently makes their reſiſtance leſs. *Fig.* 7. is an excellent method of ſcarfing in two pieces, each piece being tabled together, as in *fig.* 5. It has been thought by ſome that tabling ſcarfings leſſen the ſection of reſiſtance more than is neceſſary; and for this purpoſe they prefer *fig.* 8. with an oblique ſcarf, where the keys are let half into the one and half into the other: but in this mode, as a draught muſt be left for the keys, they will be apt to be turned round in the driving, and therefore will have leſs effect in keeping the pieces together. *Fig.* 9. is a mode of ſcarfing a beam by tabling the pieces together; No. 1. and 2. are the two halves; when bolted together they have the appearance of being quite ſtraight, as is ſhewn in No. 6. The tables are made in the form of obtuſe angles, with a ridge in the middle, depreſſed and raiſed alternately, in the form of re-entering and ſalient angles; No. 3. ſection acroſs the depreſſed part; No. 4. ſection acroſs the raiſed part; No. 5. ſection of the beam when bolted together. In all forms of ſcarfing whatever, every butting joint ſhould be ſtrapped acroſs with iron on both ſides; this will in a great degree prevent the bolts from being bent, and will increaſe the longitudinal reſiſtance at the weakeſt ſection. If a beam is to be ſcarfed and tabled as in this laſt mode, the utmoſt care ought to be taken in the workmanſhip, ſo that all the butting-places ought to be cloſely fitted together.

Connected with ſcarfing is the method of joining timbers, which may either be endways, ſideways, perpendicularly, or obliquely. When two pieces of timber are ſo joined that the common ſeam or joint is perpendicular to the fibres of both pieces, then the joint is ſaid to be butting, and is called by workmen a butting or heading joint. When two pieces of timber are joined together, ſo that the common ſeam is parallel to the fibres of both pieces, this then may be called lateral or longitudinal joining, and the joint may be called a longitudinal joint, as it runs in the direction of the grain; and when the fibres and ſeam of the one piece run perpendicular to the fibres of the other, this mode of joining timbers may then be called tranſverſe joining, and the joint may be called a tranſverſe or perpendicular joint. Laſtly, when the fibres of the one piece run obliquely to thoſe of the other, this is called oblique joining, and the joint is called an oblique joint.

Butting joints for many purpoſes are preferable to ſcarfings, particularly in ſmall work, ſuch as the hand-rails of ſtairs.

They are fixed together with bolts, having a ſcrewed nut at each end, the head of one of theſe nuts muſt be quite round and the other ſquare; the round one muſt be cut in its circumference full of notches. After having let in the bolt perpendicularly to the joint in both pieces, the nuts are ſunk from one ſide acroſs the grain, until the ends of the bolt may be able to paſs the interior ſcrew made on purpoſe to receive the exterior one; the ſquare nut is firſt put in and the one end of the bolt is firmly driven into the bore made on purpoſe to receive it, and ſcrewed to the nut. The other notched nut is then put in, and the bolt in its place; the one piece may be turned round upon the other until the joint is cloſe, but in order to ſecure the joint from turning round, two dowels may be inſerted on each ſide of the bolt. Drive the one piece as cloſe to the other as the nut will permit. Then by means of a narrow pointed ſcrew-driver and mallet, the nut may be turned round until the joint is quite cloſe.

*Fig.* 5. *Plate* LXII. of *Architecture* repreſents the meeting of a pair of rafters and the king-poſt, together with the manner of ſtrapping them. This mode of forming a junction by making the rafters meet each other, without the intervention of the joggle-head, which is generally made to the king-poſt, has the advantage over the common mode with a joggle-head, exhibited in *fig.* 6. *Plate* LXII. of *Architecture*, as the ſhrinking of the king-poſt at the joggle will allow the roof to deſcend, and conſequently put it out of ſhape.

One method of ſtrapping the tie-beam to the king-poſt is exhibited at *fig.* 7. *Plate* LXII. of *Architecture*. The mortiſe of the ſtrap on both ſides is made oblong, and that through the king-poſt is made ſomewhat lower, in order to give the wedges a proper draught. An idea may be formed by examining No. 1. which repreſents the bottom of the king-poſt with part of the tie-beam; No. 2. is a longitudinal ſection of the king-poſt, with a tranſverſe ſection of the beam, in the upper part of this is ſhewn the manner of fixing the wedges, with the form of the waſhers, which are neceſſary in preventing the ſtrap on each ſide from penetrating into the wood, the whole force of the friction being taken away from the ſtraps by them. Another mode of fixing the tie-beam to the king-poſt is by a bolt, as exhibited at *fig.* 8. *Plate* LXII. of *Architecture*. No. 1. ſhews the elevation of the bottom of the king poſt; No. 2. is a vertical ſection cutting the beam tranſverſely; in order to give greater ſecurity, there are two nuts, one let in from the face of the beam and the other from the edge. *Fig.* 1. *Plate* LXIII. of *Architecture* ſhews the meeting of a brace and ſtraining-piece under a truſs-beam, as the brace may be reſolved into two forces, one puſhing in a direction of the beam, that is, compreſſing the ſtraining-piece, and the other tending to break it tranſverſely, the end of the brace is cut in the form of a ſally, or bird's mouth, as it is called by workmen. Another method is ſhewn at *fig.* 2. *Plate* LXIII. of *Architecture*. This mode is uſed in the roof of Greenwich chapel. See the figures in the article Roof. It may, however, be obſerved, that this abutment is not of the beſt kind; the ſpace left for the brace to give preſſure to the ſtraining-piece is much too ſmall; the upper part ſhould not be let into the ſtraining or truſs-beam, this prevents the ſtraining piece from acting with its full force, and weakens the truſs-beam.

*Fig.* 3. *Plate* LXIII. of *Architecture* ſhews the method of ſecuring a collar-beam, at one extremity, to its adjacent rafter, in order to prevent its being pulled away at the joint, a bolt is made to paſs through the rafter at the angle of their meeting.

Beſides what has already been ſhewn of the hanging of king-poſts to their principal rafters, *fig.* 4. *Plate* LXIII. of *Architecture* is another. The rafters meet each other as in *fig.* 5. *Plate* LXII. of *Architecture*, but inſtead of the forked ſtrap, a bolt is here uſed, with a ſpreading head, ſo as to form a ſhoulder at right angles to the rafters, which are notched, in order to receive the bolt. This alſo prevents the rafters of a roof from ſinking in the middle. Inſtead of any part being of wood, the whole may be of iron, conſiſting of two parts, connected together by means of a ſcrew, which will draw the tie-beam higher and higher at pleaſure as it is turned round. No. 1. part of the king-poſt with the bolt; Nos. 2. and 3. part of the rafters; No. 4. view of the upper edge of the rafters. Various forms are ſometimes adopted for the abutments at the bottom of the king-poſt; for the braces, when the king-poſt is not ſufficiently broad at the bottom, as to allow the abutting ſhoulder to be at right angles to the length of the brace, and to its whole breadth. Two of the moſt approved forms are exhibited in *figures* 5 and 6. *Plate* LXIII. of *Architecture*. *Fig.* 5. ſhews the form of the abutment, when the part which makes the reſiſtance in the direction of the king-poſt is at right angles to it. *Fig.* 6. ſhews the form of the abutment, when the part of the ſhoulders which makes the reſiſtance is at right angles to the brace; this mode is better than the former, becauſe it is leſs liable to compreſs the king-poſt at the bottom.

*Fig.* 7. *Plate* LXIII. of *Architecture* repreſents one form of the heel of a principal rafter, with the ſocket cut in the end of the tie-beam to receive it; but as the ſmall part cut acroſs the fibres of the beam is ſo near to the extremity, and as this part ſuſtains the whole force of the rafters, in drawing the beam in a direction of its length, it will be liable to be forced away. To prevent this in ſome meaſure, a double reſiſtance is formed, as in *fig.* 8. *Plate* LXIII. of *Architecture*, equally deep into the beam; this mode gives the ſtrength of the intermediate part contained between the two abutments, in addition to the end reſiſtance, which is of itſelf equally ſtrong with that repreſented in *fig.* 7. The intermediate part in this mode being cut acroſs the fibres, it is eaſily ſplit away. A more effectual method of forming a double reſiſtance is ſhewn at *fig.* 9. *Plate* LXIII. of *Architecture*, where the heel of the rafter and the ſocket is cut parallel to the fibres of the beam; the tenon forms the ſecond abutment, being removed farther from the extremity. No. 1. the elevation of part of the rafter with part of the beam; No. 2. the upper edge of the beam, ſhewing the mortiſe. But the moſt effectual mode of forming a reſiſtance on the heel of the rafter and ſocket on the extremity of the beam is that repreſented by *fig.* 10. *Plate* LXIII. of *Architecture*, where the abutment is brought nearer to the inner part of the heel, which leaves a greater length on the end of the beam, in order that the reſiſtance may ſtill be greater than what is given by the wood. A ſtrap may be placed round the extremity of the rafter, and the two ends bolted together through the beam, as is ſhewn by this diagram at No. 1. and 2.

*Fig.* 11. *Plate* LXIII. *Architecture* repreſents two braces of a roof meeting an iron king-poſt, which is only a ſmall rod of iron ſufficiently ſtrong to hang up the middle of the beam, and to receive the force of the braces by the weight of the middle rafters. The ſtrap which prevents the braces from being puſhed downwards, has an eye through each ſide, and the bottom of the king-rod is formed with a croſs equal in length to the thickneſs of the braces; this croſs is perforated in its length to receive the bolt.

The purpoſes for which wood is employed in modern buildings, and particularly in thoſe of England, are very various. It is uſed to form the frame work of the roof, and in laths or boarding, to ſupport the covering of tiles, ſlates, &c. Long pieces, called *bond* or *chain* timber, are laid in the walls to ſtrengthen and bind them together: other flat pieces, called *plates* or *wall plates*, are placed to receive the ends of the girders, joiſts, and other timbers, which form the framing of the floors, and afford them a level bed. *Ties* are placed acroſs the building to aſſiſt in keeping the oppoſite walls in their ſituation, and counteract the lateral preſſure of the roof, and diagonal ties at the angles. *Lintels* are laid over the apertures of doors or windows to ſupport the incumbent walls. The floors are framed with various beams and joiſts. The rooms are divided with *quarter partitions*, being a frame work of ſmall poſts and horizontal and diagonal pieces placed at about a foot aſunder, and deſtined to be caſed with lath and plaſter on the outſide. Door and window-frames are alſo placed in the apertures of the walls. In bad foundations piles are ſometimes uſed; and ſometimes planking, and what are called *ſleepers*, pieces of timber, laid at ſhort intervals traſverſely, beneath the foundation wall, and extending about two feet wider: beſides all the finiſhing wood work, ſuch as doors, windows, wainſcoting, &c. which belongs to joinery. Carpentry is alſo employed to conſtruct the centres for arching and vaulting, and frequently in entire bridges. Coffer dams, caiſſons, flood-gates, and all the methods of building in water, derive large aſſiſtance from this art.

The general principles of meaſuring and valuing carpenter's work may be given very ſhortly; and to enter into minutiæ would be ſuperfluous in the preſent work. The timber uſed for building in London, and in the greateſt part of England, conſiſts entirely of oak and fir; the firſt the growth of this country, the ſecond imported chiefly from Norway. That timber which is out of ſight, as being covered with lath and plaſter or other facing at the completion of the building, which is by much the greater part, is uſed as it comes from the ſaw, without the operations of the plane. Of this, part is framed as the roof, floors, partitions. The quantity is meaſured by the cubic foot, and either valued as *fir framed*; or elſe the quantity of timber being aſcertained, is put down as fir without labour, *(fir no labour)* in the valuation of which is included the original price of the timber, with the expence of cartage, ſawing, waſte, and the profit to the carpenter; and a ſuperficial dimenſion is taken of the frame or ſpace in which the timber was employed under the denomination of *labour* and *nails*, to a floor of ſuch a kind, roof, quarter partition, &c. in which is eſtimated the value of the workmanſhip, with the maſter's profit. The choice between theſe two methods is influenced by cuſtom, and the convenience of the meaſurer. The timber uſed in the walls, as the plates, and bond timber, is meaſured ſeparately by the cubic foot, and put down under the denomination of *fir in bond*: this is valued at a medium price between fir framed, and fir without labour. As for the timber which remains apparent after the completion of the building, it is generally worked in ſome manner with the plane, and is meaſured by the cubic foot, and denominated and valued according to the workmanſhip; thus a doorcaſe is *framed*, *wrought*, *rebated*, and *beaded*. We have mentioned only fir becauſe it is infinitely more uſed than oak, however the latter is meaſured in the ſame way.

Boarding, ſuch as weather-boarding, boarding for ſlates, &c. is meaſured by the ſuperficial foot, and valued in the bill by the ſquare, or 100 ſuperficial feet. Timber uſed in very ſmall ſcantlings, as fillets, is valued, not by the cubic or ſuperficial foot, but by the foot in length, called foot run.

Having thus deſcribed what is properly included under the general head of carpentry, the reader is referred, for more particular information, to the articles Centre, Floor, and Roof; under which articles that part of conſtructive carpentry which depends on certain branches of mechanics and geometry will be fully explained.

CARPENTUM, in *Antiquity*, a denomination common to divers ſorts of vehicles, anſwering to coaches as well as waggons, or even carts among us: ſometimes on two and ſometimes on four wheels; and ſometimes covered, and at other times uncovered.

The carpentum was originally a kind of carr or vehicle wherein the Roman ladies were carried; though in after-times it was alſo uſed in war. The form of this carriage may be ſeen on antique coins, where it is repreſented as a two-wheeled carr, with an arched covering, and it was ſometimes hung with coſtly cloth. It was a later invention than the *lectica*, and the *arcera* mentioned in the 12 tables, which was a covered carriage uſed by ſick and infirm perſons.

Some derive the word carpentum a *carro;* others from *Carmenta*, mother of Evander, by a converſion of the *m* into *p*, *carpentum* for *carmentum*. Thus Ovid, Faſt. lib. i.

"Nam prius Auſonias matres Carpenta vehebant
Hæc quoque ab Evandri dicta parente reor."

CARPENZANO, in *Geography*, a town of Naples, in the province of Calabria Citra; 10 miles S. of Coſenza.

CARPERA, in *Ichthyology*, a name given by Cuba, and ſome other writers on fiſhes, to the common carp, cyprinus carpio.

CARPESIA, in the *Materia Medica of the Ancients*, a name given to a kind of ſpice, or aromatic drug, often mentioned by Ægineta and others, and made an ingredient in cordial and ſtomachic medicines. This was a vegetable ſubſtance, being the top ſhoots of young twigs of an odoriferous ſhrub, growing in Pamphylia, and ſmelling very like the fineſt cinnamon.

As the ancients uſed both this drug and cubebs, it is certain that had they both been the produce of the ſame tree, they muſt have known it; and this it is plain they did not know, for they have no where named any ſuch thing; but, on the contrary, they have expreſsly ſaid, that the *carpeſia* was the ſhoots of a tall tree, which produced no fruit. Avicenna gives alſo this account, and adds, that it grew, in his time, on mount Lebanon, and that the part gathered for this uſe was certain twigs, very long, cylindric, and but little thicker than a needle, which had a very fragrant ſmell.

CARPESIUM, in *Botany*, (Καρπησιον, Galen.) Linn. gen. 948. Schreb. 1284. Willd. 1478. Juſſ. p. 184. (Conyzoides; Tourn.) Claſs and order, *ſyngeneſia polygamia ſuperflua*. Nat. Ord. *Compoſitæ diſcoideæ*, Linn. *Corymbiferæ* Juſſ.

Gen. Char. *Cal. common*, imbricated; outer ſcales larger, ſpreading, reflexed; inner ones equal, cloſe, ſhorter. *Cor. compound*, equal; florets hermaphrodite in the diſk, funnel-ſhaped; border five-cleft, ſpreading; female in the circumference, tubular, five-cleft, converging. *Stamens* filaments five, ſhort. *Piſt.* ſimilar in both kinds of florets; germ oblong; ſtyle ſimple; ſtigma bifid. *Seeds* inverſely egg-ſhaped, naked. *Recep.* naked.

Eſſ. Char. *Receptacle* naked. *Down* none. *Calyx* imbricated; outer ſcales reflexed.

Sp. 1. C. *cernuum*, Linn. Sp. Pl. Jac. Auſt. tab. 204. Lam. Illuſt. Pl. 696. fig. 1. (After cernuus; Colum. Ecphr 1. tab. 252. Barrel. ic. 1142. Conyzoides flore flaveſcente; Tourn. Chryſanthemum conyzoides, Moriſ. hiſt. 3. tab. 5. fig. 26.) "Flowers terminal, ſolitary, nodding." Willd. *Root* perennial, Willd. Lam. biennial, Mil. *Stem* a foot and half high, branched, leafy, cylindrical, villous. *Leaves* alternate, oval-lanceolate, ſlightly ſerrated, narrowing at their baſe, cloathed with ſhort hairs. *Flowers* yellowiſh; peduncle thicker at the top, with four or five unequal, lanceolate bractes ſituated at the baſe of the calyx. A native of moiſt ground in Italy, Switzerland and Provence. 2. C. *abrotanoides*, Linn. Sp. Pl. Oſbeck it. tab. 10. Lam. Illuſt. 696. fig. 2. "Flowers axillary, generally ſolitary." *Root* perennial. *Stem* branched, rather hard. *Leaves* alternate, broad-lanceolate, ſlightly crenate, leſſening into a petiole, about the length of a finger. *Flowers* ſeſſile, or on very ſhort peduncles, about the ſize of a hazel nut, nodding; calyx umbilicated, ſurrounded by ſpreading leaflets; florets numerous; ſeeds oblong, naked, ſmooth, ſmeared with a kind of balſam. A native of China.

CARPESIUM, in *Ancient Geography*, a mountain of Aſia, in Pamphylia.

CARPESTRIERA, in *Geography*, a river of Italy, which runs into the ſea; 9 miles E. of St. Severino.

CARPET, a ſort of covering, worked either with the needle, or on a loom; to be ſpread on a table, trunk, an eſtrade, a paſſage, or a floor.

Perſian and Turkey carpets are thoſe moſt prized; eſpecially the former, for which there is a manufacture at Paris: carpets that had a hair or ſhag on one ſide only, were called by the ancients *tapetes*; ſuch as had a ſhag on both ſides, were called *amphitapetes*. Engliſh *carpets*, eſpecially thoſe of AXMINSTER, (which ſee) and thoſe, the manufacture of which was eſtabliſhed in London by the late Mr. Moore, are much valued. For a further account of this manufacture, ſee TAPESTRY.

Among *Jockeys*, to *ſhave the carpet*, is to GALLOP very cloſe, or near the ground; a fault foreigners charge on Engliſh horſes.

Figuratively, an affair, propoſal, &c. are ſaid to be brought on the *carpet*, or tapis, when they are under conſideration, &c.

CARPET-*knights*, a denomination given to gown-men, and others, of peaceable profeſſions, who, on account of their birth, office, or merits to the public, or the like, are, by the prince, raiſed to the dignity of knighthood.

They take the appellation *carpet*, becauſe they uſually receive their honours from the king's hands in the court, kneeling on a carpet. By which they are diſtinguiſhed from knights created in the camp, or field of battle, on account of their military prowefs.

Carpet-knights poſſeſs a medium between thoſe called *truck*, or *dunghill-knights*, who only purchaſe, or merit the honour by their wealth; and *knights bachelors*, who are created for their ſervices in the war.

CARPET-*way*, in *Agriculture*, a term applied to a green plat or path left unploughed up in an arable field; or, in common fields, to ſuch ſtrips as ſerve for diviſions.

CARPETANI, in *Ancient Geography*, a people of Hiſpania Citerior, ſituate on the W. towards Luſitania. Their principal towns were Complutum, Contrebia, Mantua, and Toletum. Ptolemy aſſigns to them 18 towns.

CARPETANIA, a country of Spain, in which Pliny places the towns of Contrebia and Hippona; and where this author, and alſo Ptolemy, place Oebura. The mountains of Carpetania are denominated by Pliny "Carpetana juga;" and he ſays that the chief town was Contrebia.

CARPHALEA, in *Botany*, (from Καρφαλεος, dry.) Lam. Illuſ. 155. Pl. 59. Juſſ. p. 198. Claſs and order, *tetrandria monogynia*, Linn. Nat. Ord. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* ſuperior, four-leafed; leaflets ovate, veined, ſcarious, permanent. *Cor.* funnel-ſhaped; tube long, ſlender, ſwelling near the top, hairy within; border four-cleft; lobes acute. *Stam.* Filaments four, very ſhort, inſerted within the tube; anthers linear, erect. *Piſt.* Germ. inferior; ſtyle briſtle-ſhaped, longer than the corolla; ſtigma bifid. *Peric.* Capſule crowned with the calyx, two-celled, two-valved, many-ſeeded; partition oppoſite to the valves, ſplitting into two. *Seeds* unknown. Eſſent. Ch. *Calyx* ſuperior, four-leafed, ſcarious. *Corolla* tubular. *Capſule* crowned with the calyx, two-celled, many-ſeeded.

Sp. C. *Madagaſcarienſis*. "Leaves oppoſite, linear-lanceolate; flowers in a corymbus." An arid ſhrub, with leaves like thoſe of hyſſop, and terminal flowers in a denſe corymbus or rather cyme. In La Marck's figure the younger branches are leafy, the older ones naked; and one of the younger branches there repreſented has a ſingle pair of oppoſite leaves near the top, and three ſets of ſix or ſeven in a whorl below; the other has five pair of oppoſite leaves, and appears rough near the bottom with the ſcars of the fallen whorls. Found by Comerſon in the iſland of Madagaſcar. Juſſieu obſerves that it has the habit of Seriſſa and the calyx of Petræa.

CARPI, UGO DA, in *Biography*, flouriſhed in 1500, and was leſs celebrated as a painter than in other reſpects. The Italians have aſcribed to him the honour of having been the firſt engraver on wood; but though this be not true, his claim to the invention of that ſpecies of engraving on wood, diſtinguiſhed by the name of chiaro-ſcuro, in imitation of drawing, appears to be better founded. For this purpoſe he cut the outlines on one block of wood; the dark ſhadows upon a ſecond; and the light ſhadows or half tint upon a third. The firſt being impreſſed upon the paper, the outlines only appeared: this block being removed, the ſecond was put in its place, and being alſo impreſſed upon the paper, the dark ſhadows were added to the outlines; and the third block being put in the ſame place, upon the removal of the ſecond, and alſo impreſſed upon the ſame paper, made the demi-tints; and the print was completed. In ſome few inſtances the number of blocks was increaſed, and being applied in the ſame manner, the print received an impreſſion from every block. His prints, though ſlight, are uſually very ſpirited, and wrought in a very maſterly ſtyle. Out of the great number which he engraved, we ſhall mention the following: viz. "A Sibyl reading in a book, with an infant holding a flambeau to light her;" "The burning of Troy, with Æneas ſaving his father Anchiſes;" "A deſcent from the croſs;" "David cutting off the head of Goliah;" all from Raphael; and a "Magician ſeated on the ground, with a book open before him, and in the back-ground a bird with its feathers plucked off," from Parmigiano. This ſpecies of engraving was carried to great perfection by Andrea Andriani, (ſee his article,) and alſo by Balthaſar Perezzi of Siena, and Parmigiano. Strutt. Pilkington.

Carpi, Girolano da, a painter of portrait and hiſtory, was born at Ferrara in 1501, and ſtudying under Gærofalo, had become the beſt artiſt among his diſciples. He afterwards ſtudied the works of Correggio, and for this purpoſe ſpent ſeveral years at Parma, Modena, and other cities of Italy, where the beſt of his works are preſerved. Such was his ſucceſs in the imitation of this eminent maſter's ſtyle, that many paintings, copied by Carpi from his pictures, were taken for originals, and eagerly purchaſed by connoiſſeurs. It is preſumed that at this day ſeveral of the paintings of Carpi paſs for the genuine productions of Correggio. He died in 1556. Pilkington.

Carpi, in *Ancient Geography*, a people of Valeria, according to Ammianus Marcellinus, tranſplanted by Diocleſian into Lower Pannonia, and placed in the vicinity of the Iſter. The mountains called "Carpates," were probably the firſt habitation of this people, who abandoned it under the empire of Alexander.

Carpi, a town of Proconſular Africa, according to Pliny, called Carpis by Ptolemy, and placed by him one third of a degree more northerly than Carthage; to this city pertained an epiſcopal ſee, noticed in the conference at Carthage. Dr. Shaw (Travels p. 87.) ſuppoſes the ſpot which this town occupies to be that which "Gurbos" or "Hammam-Gurbos" now ſtands upon; and that the hot-bath near it is the "Aquæ Calidæ" of Livy (l. xxx. 24.) which he places over againſt Carthage; informing us, that ſeveral veſſels belonging to the fleet of Octavius were here ſhipwrecked.

Carpi, in *Geography*, a ſtrong town of Italy, and capital of a principality in the duchy of Modena; taken by the French and abandoned in 1703, taken again by them in 1705, and retaken by prince Eugene in 1706: the ſee of a biſhop, ſuffragan of Bologna; 7 miles N. of Modena. N. lat. 44° 45′. E. long. 11° 12′.

Carpi, a town of Italy, in the Veroneſe, ſituate on the Adige, and ſubject to the Venetians; famous for a victory obtained by prince Eugene over the French in 1701. N. lat. 45° 10′. E. long. 11° 39′.

Carpi *extenſor radialis, longior et brevior*, in *Anatomy*, are two muſcles, which ariſe cloſe to each other from the lower extremity of the os humeri: the latter having its origin from the external condyle, and the former from the outer margin of the bone, immediately above the condyle. They are cloſely connected together, lie immediately on the radius, and paſs under the extenſor tendons of the thumb. Their tendons run in a groove of the inferior extremity of the radius, where they are ſurrounded by a burſa mucoſa, and then ſeparate from each other; the longer muſcle being inſerted into the metacarpal bone of the fore finger, and the ſhorter into that of the middle finger.

The action of theſe muſcles conſiſts in drawing the back of the hand towards the outſide of the fore arm, which motion is termed by anatomiſts, the extenſion of the wriſt.

When the radius is prone, or ſupine, they will bring it into the middle ſtate between theſe poſitions. The longer muſcle may aſſiſt in bending the elbow.

Winſlow, Albinus and Soemmerring call theſe muſcles "Radiales externi, longior et brevior."

Carpi *extenſor ulnaris* ariſes in common with ſome other muſcles from the external condyle of the humerus, and from the upper part of the ulna. Its tendon, which commences about the middle of the fore arm, is bound down at the back of the ulna by a tendinous burſa mucoſa, and is affixed to the metacarpal bone of the little finger. It extends the joint of the wriſt, and may aſſiſt in turning the hand ſupine. This muſcle is the ulnaris externus of ſeveral anatomiſts.

Carpi *flexor radialis* ariſes in company with the pronator teres, flexor ſublimis, flexor carpi ulnaris, &c. from the inner condyle of the humerus. It paſſes obliquely acroſs the ulna, and forms a tendon towards the wriſt, which penetrating a canal on the os naviculare is fixed to the metacarpal bone of the index. It moves the palm of the hand towards the front of the radius and ulna, or in anatomical terms bends the wriſt. It turns the radius into the prone poſition. Winſlow, Albinus, &c. call this muſcle "radialis internus."

Carpi *flexor ulnaris* ariſes by a common origin with the neighbouring muſcles from the internal condyle of the humerus, and alſo from the margin of the ulna. It paſſes over this bone, receiving fibres all the way to the wriſt. Its tendon is inſerted into the os piſiforme of the carpus. It bends the wriſt. It is called by many anatomiſts "ulnaris internus."

This muſcle concurs with the extenſor carpi ulnaris in producing a lateral motion of the wriſt, in which the ulnar ſide of the hand is moved towards the ulna. The extenſores carpi radiales and the flexor carpi radialis draw the radial ſide of the hand towards the radius. When the wriſt is bent, or extended without any inclination to either ſide of the fore arm, the effect is produced by the combined action of the radial and ulnar flexors or extenſors.

CARPIANI, in *Ancient Geography*, a people of European Sarmatia, who, according to Ptolemy, inhabited the diſtrict between the Peucini and the Baſterni.

CARPIGNANA, in *Geography*, a town of Italy, in the Novareſe; 12 miles N.W. of Novara.—Alſo, a town of Naples, in the province of Otranto; 7 miles N.W. of Otranto.

CARPINUS, in *Botany*, (a Latin radical) hornbeam, or hardbeam tree, French charme, charmille. Tourn. p. 582. Linn. Gen. 1073. Schreb. 1449. Juſſ. p. 409. Gært. 556. Claſs and order, *monæcia polyandria*. Nat. ord. *Amentaceæ*. Linn. Juſſ.

Gen. Ch. *Male flowers* in a cylindrical ament or catkin.

*Scales* looſely imbricated, ovate, concave, acute, often villous or ciliated, one-flowered. *Cor.* none. *Stam.* filaments about ten, very ſhort; anthers didymous, compreſſed, villous at the tip

*Female flowers* in a ſquarrous, looſe, pendulous ament. *Scales* oblong, entire, or divided, a little villous. *Cor.* none. *Piſt.* germ two-celled, compreſſed, with the rudiments of two ſeeds, but one generally abortive; ſtyles two, filiform. *Peric.* nut one celled.

Eſſ. Char. Male. *Scale* of the ament roundiſh. *Cor.* none. *Stamens* from eight to twenty. Female. *Scale* of the ament oblong. *Cor.* none. *Germ* two-celled. *Nut* one or two-celled.

Species, 1. C. *Betulus*, Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Ill. Pl. 780. Gært. tab. 89. fig. 2. Duham. Arb. tab. 49. (Oſtrya fructu in umbilicis foliaceis, Bauh. Pin. 427. Raii Syn. 451.) "Scales of the ſtrobiles flat." Linn. "Strobiles leafy, looſe; ſcales deeply trifid; lobes lanceolate, the middle one longeſt." Lam. A tree, ſometimes ſixty or ſeventy feet high, but ſlender in proportion to its height, never encreaſing to much more than a foot in diameter. Its moſt common height, in the woods of Picardy and Flanders, is from forty to fifty feet. *Trunk* tolerably ſtraight, but often imperfectly cylindrical; bark even, whitiſh, marked with grey ſpots; branches numerous. *Leaves* about three inches long and two broad, alternate, petioled, ovate, acuminate, doubly ſerrated, ſmooth, wrinkled above, with ſtraight and parallel veins below, remaining on the tree in a withered ſtate during the whole winter. *Male catkins*, about an inch long, lateral, ſolitary, appearing in ſpring a little before the leaves; ſcales ferruginous, concave, ciliated. *Female catkins* terminal, ſolitary, peduncled, looſe; ſcales green, ſmooth, with three lanceolate lobes, of which the middle one is largeſt; nut ſmall, ovate, lenticularly compreſſed, ſtriated, with longitudinal, filiform ribs; crowned with ſix, or, according to Scopoli, four teeth, ſeated at the bottom of the permanent enlarged ſcale. A native of woods in many parts of Europe. There is a variety with pinnatifid-angular leaves. 2. C. *orientalis*, Lam. ii. Cor. 40. (C. betulus, β. Mart. Mil.) "Strobiles leafy, ſhort; ſcales dilated, ſerrate-angular, nerved, flat, abbreviated on one ſide." A tree, from eighteen to twenty feet high. *Trunk* rather crooked and knotty, with a brown or greyiſh bark; branches finely divided, often pubeſcent towards the ſummit. *Leaves* ſmaller than thoſe of the preceding ſpecies, leſs wrinkled, on villous petioles, falling off before winter. *Male catkins* from ſix to eight lines long, ſolitary; ſcales ſmooth; anthers bearded. *Female catkins* ſhort, villous, whitiſh; ſcales not three-lobed as in the preceding ſpecies, but irregularly dilated, flat, nerved, angular, and toothed. *Nut* very ſmall, crowned with teeth. A native of the Eaſt. 3. C. *duinenſis*, Mart. 4. Scop. Carn. 1190. tab. 60. "Scales ſubcordate, doubly toothed; female ament ovate." About two fathoms high. *Trunk* ſoon dividing into branches. *Leaves* ovate-acuminate, doubly ſerrated, ſmooth, hardiſh, on ſhort petioles, with two deciduous ſtipules at the baſe. *Female aments* a little longer than the leaves; ſcales imbricated, ovate or ſemicordate, hard, inflexed on one ſide to the baſe; germ covered by the flexure of the ſcale, not ſtriated as in C. Betulus, gloſſy, crowned with five teeth. A native of Carniola. 4. C. *oſtrya*, hop hornbeam, Linn. Sp. Pl. 2. Mart. 2. Lam. 3. (Oſtrya fructu lupino ſimili, Bauh. Pin. 427. Oſtrya italica, Mich. Gen. 223. tab. 104. fig. 1, 2. Scop. Carn. 1191.) "Scales of the ſtrobiles inflated." Linn. "Strobiles reſembling thoſe of the hop, ovate; leaves ovate-acute; buds obtuſe." Lam. In general habit reſembling the common hornbeam, but ſmaller. *Leaves* leſs wrinkled, ovate, acuminate, doubly toothed, with ferruginous nerves. *Male catkins* long, pendant, faſciculated; filaments branched; anthers emarginate. *Female catkins* reſembling thoſe of the hop; ſcales inflated, cloſed on every ſide, villous at the baſe; nut two-celled, not crowned with teeth, hard, ſmooth, conical. A native of Italy and Germany. 5. C. *virginiana*, Miller, Lam. 4. Pluk. Phyt. tab. 156. fig. 1. "Strobiles reſembling thoſe of the hop, long; leaves ovate oblong, acuminate; buds acute." Lam. Perhaps only a variety of the former, as Linnæus and Duhamel conſidered it, differing chiefly in the ſize and form of the leaves, and the length of the female catkins. Its fruit is exactly ſimilar. Lam. According to Miller it is about thirty feet high, and of quicker growth than the other ſpecies, ſhedding its leaves in autumn, about the ſame time with the elm, and reſembling the long-leaved elm more than the hornbeam. A native of Virginia and Canada.

Obſ. Authors differ much from each other in deſcribing the ſtructure of the female flower. Linnæus aſcribes to it a one-leafed, ſix-cleft, calyx-ſhaped corolla, with two of the ſegments larger than the reſt. La Marck gives it a one-leafed, ſomewhat campanulate, ſix-cleft, ſuperior calyx; and Gærtner adopts the ſame idea. Juſſieu, as we apprehend, juſtly doubts whether the teeth, which crown the germ, conſtitute a proper calyx, and whether the germ ſhould not rather be conſidered as naked and ſuperior, like all the others of its natural family. As this part, or appendage, is wanting in the laſt two ſpecies, it muſt be excluded from the generic character, or, as La Marck propoſes, thoſe two ſpecies muſt form a diſtinct genus. Juſſieu alſo is inclined to ſeparate them from carpinus, not however, on account of theſe teeth, but of the inflated ſcales, which he thinks ſhould rather be called follicles of the branched filaments, of the emarginate anthers, and of the two-celled nut.

*Propagation and Culture.* The common hornbeam is valued as a timber tree in France and Germany. Its wood is hard and tough, and is an excellent material for wheel-cogs, ſcrew-preſſes, heads of beetles, handles of working tools, and other purpoſes in which ſtrength is required. Mr. Evelyn recommends it alſo for turners' uſe: but M. Feuille, a French writer, aſſerts, that it is too brittle for cabinet work. Its trunk, according to him, is ſeldom regularly grained, and ſtill more rarely well rounded. The texture of its fibres is ſingular: its annual layers are not uniformly circular as in the other trees, but aſſume an undulated or zig-zag form; and its tranſverſe fibres, which paſs from the circumference to the centre, have conſiderable intervals between them; the wood is conſequently refractory under the workman's tool, and apt to break into ſplinters. It is alſo in great requeſt abroad as a durable fuel, producing a vigorous flame, and yielding a powerful heat. In England it is ſaid, by Mr. Evelyn, to be moſt abundant in Hertfordſhire, and to be rare weſtward; but, as Mr. Miller obſerves, it is ſeldom ſuffered to grow as a timber tree, being generally reduced to a pollard by the country people. The largeſt and the loftieſt we have ever ſeen are in Bramham park, between Leeds and Tadcaſter, in Yorkſhire, where they form a part of thoſe ſtately clipt avenues which diſtinguiſh that curious ſpecimen of ancient ornamental gardening. The pleaſing verdure and luxuriance of its foliage, and its ready ſubmiſſion to the ſhears of the gardener, ſtrongly recommended it to our formal anceſtors as admirably fitted for eſpalier hedges, and cloſe plantations intended to ſhelter tender perennial exotics. The property of preſerving its withered leaves through the winter, which it poſſeſſes in common with the beech, and which honeſt Evelyn, attentive only to beautiful effect, reluctantly calls an infirmity, makes it eminently proper for the laſt mentioned purpoſe. Our venerable dendrologiſt ſpeaks with rapture of the eſpalier hedge in the Luxemburg garden at Paris, and of the cradle walk at Hampton-court; and while the paſſion for architectural gardening prevailed, the hornbeam was profuſely cultivated in our nurſeries. Brown, and his numerous followers, have now produced a more natural taſte, and the demand for it has conſequently diminiſhed. It is ſtill, however, entitled to the attention of the planter: and as, according to Evelyn, it preſerves itſelf beſt of all the foreſters from the brutting of deer, it is peculiarly proper for parks.

When intended for hedges or underwood, it is generally propagated by layers, but for timber-trees it ſhould always be raiſed from ſeeds. Theſe ſhould be ſown in the autumn, ſoon after they are ripe, and in two years time will be fit to tranſplant to the ſituation where they are to remain. If not intermixed with other trees they ſhould be planted pretty cloſe, eſpecially on the outſide of the plantations, that they may protect and draw each other up. If ſown in the ſpring the ſeeds ſhould be previouſly kept in ſand. In that caſe they will lie in the ground till the ſpring following, when, about the month of February, the ſurface ſhould be gently looſened and ſprinkled with freſh mould. After remaining three years in the native beds, the ſtraighteſt plants ſhould be tranſplanted for trees, and the reſt be removed to ten feet rows, and ſet five feet from each other, where, in four years, they will be fit to be again tranſplanted for hedges. Some prefer the ſpring for tranſplanting: others early in October. The tree plantations ſhould be thinned with caution, ſo as not to let in too much cold at once.

The hop hornbeam has in England been generally grafted upon the common hornbeam. This practice is condemned by Mr. Miller, the trees ſo raiſed being ſeldom of long duration: for, as the graft uſually grows much faſter than the ſtock, in a few years there is ſuch a diſproportion in their ſize, that, when expoſed to high winds, they are frequently broken at the point of their union.

Carpinus *viſcoſa*, Burm. Zeyl. tab. 23. See Dodonæa *viſcoſa*.

CARPIO, in *Geography*, a town of Spain, in the country of Leon; 3 leagues W.S.W. of Medina del Campo.—Alſo, a town of Spain, in the province of Cordova; 8 leagues N. of Cordova.—Alſo, a town of Spain, in the province of Eſtramadura; 2½ leagues from Badajoz.

CARPIONE, Giulio, in *Biography*, a painter of great eminence, was born at Venice, in 1611, made a very conſiderable proficiency under Aleſſandro Varotari, called Paduanino, and in a very ſhort time acquired a very great reputation for deſign, invention, and a charming tint of colouring. His pictures are generally ſmall, and the ſubjects which he commonly ſelected were bacchanals, proceſſions, and triumphs, in which he excelled; ſo that his paintings were highly valued and much ſought after: they are now very rare, and bear a high price. He alſo etched ſeveral plates, which, though ſlight, are performed in a very maſterly manner, and exhibit ſome reſemblance to thoſe of Guido. From his own compoſition, we may notice "Bacchanalian ſubjects, with Boys playing, &c.;" "Love blinding Temperance;" "Chriſt in the Garden of Olives;" "A holy Family, with Angels, and the Deity repreſented above;" and "A Repoſo; the Virgin reading, and Joſeph ſtanding by her." This artiſt died in 1674. Strutt. Pilkington.

CARPIONE, in *Ichthyology*, a name given by ſome old writers to the fiſh called in England the *charr*. See Salmo *alpinus*.

CARPIS, in *Ancient Geography*, a city of Pannonia, placed by Ptolemy near the Danube.—Alſo, a river, which ran into the Iſter, on the northern ſide. See alſo Carpi

CARPOBALSAM, or Carpobalsamum, the fruit of the tree which yields the true oriental balm, or balſam; very much reſembling, both in figure, ſize, and colour, that of turpentine. The word comes from καρπος, *fruit*; and βαλσαμος, *balſam*. The *carpobalſamum* is an oblong fruit with a ſhort foot-ſtalk, a brown wrinkled rind, marked with four ribs; of a grateful taſte and ſmell. See Balsam.

CARPOBOLUS, in *Botany*. See Lycoperdon *carpobolus*.

CARPOCRATIANS, in *Eccleſiaſtical Hiſtory*, a branch of the ancient Gnoſtics, ſo called from *Carpocrates*, who, in the ſecond century, adopted and taught philoſophical tenets, which agree, in general, with thoſe of the Egyptian Gnoſtics. He was born at Alexandria, and flouriſhed about the middle of the ſecond century. He acknowledged the exiſtence of one God, eternal and incomprehenſible, who made angels and powers of different orders, and to ſome of theſe he aſcribes the formation of this lower and viſible world. He taught that Jeſus was the ſon of Joſeph and Mary, according to the common courſe of nature; that he was endued with a moſt pure ſoul of great capacity and underſtanding, and that he retained the remembrance of the things which he had ſeen with the father, in his pre-exiſtent ſtate, which he revealed to men; that he wrought miracles, and excelled in the holineſs of his life, and in all virtue; and that he lived among the Jews, and ſuffered death; after which his ſoul aſcended to heaven and returned to God. He alſo inculcated the pre-exiſtence of human ſouls; and expected the ſalvation of the ſoul only, and not the reſurrection of the body. Some have aſſerted, that his doctrine, with regard to practice, was in the higheſt degree licentious. Accordingly, he is charged with not only allowing his diſciples to ſin, but recommending to them a vicious courſe of life, as a matter of obligation and neceſſity; and with aſſerting, that eternal ſalvation was attainable only by thoſe who had committed all ſorts of crimes, and had daringly filled up the meaſure of their iniquity. It is alſo ſaid, that, though he acknowledged the laws which Chriſt enjoined on his diſciples, he held that luſts and paſſions, being implanted in our nature by God himſelf, were not criminal and culpable; that all actions were indifferent in their own nature, and were rendered good or evil only by the opinions of men, or by the laws of the ſtate; that it was the will of God, that all things ſhould be poſſeſſed in common, the female ſex not excepted; but that human laws, by an arbitrary tyranny, branded thoſe as robbers and adulterers, who only uſed their natural rights. It has been ſaid alſo, on the authority of ſome ancient writers, that the Carpocratians marked their diſciples on the back part of one of their ears; that they had pictures and images of Chriſt and his apoſtles, and of ſome heathen philoſophers and poets; and that they honoured them with ſuperſtitious rites. They are charged alſo, not only with maintaining the community of women, but with allowing lewd and laſcivious practices at their ſuppers, or love-feaſts; and they were chargeable with unnatural uncleanneſs, as well as magic. Dr. Lardner, with his uſual impartiality and candour, examines the ground of theſe charges, and inclines to think that the immoral principles and immoral practices aſcribed to them are not proved, and that the charges are owing to miſtake or prejudice, or both. There might, he ſays, be looſe and wicked men among the Carpocratians, as there were in other ſects; but that they were countenanced either by Carpocrates, or by his ſon Epiphanes, who taught the ſame opinions with his father, and had many followers, though he died at the age of 18 years, or by the principles they taught, does not appear to him to be probable. Epiphanius ſays, that they rejected the Old Teſtament; but Dr. Lardner conjectures that poſſibly the fact only was this, that they did not reſpect the inſtructions of Moſes and the prophets equally with thoſe of Chriſt and his apoſtles. He apprehends alſo, that they received all the books of the New Teſtament, as they were received by other Chriſtians in their time. Moſheim, Eccl. Hiſt. vol. i. p. 227, &c. Larduer's Works, vol. ix. B. ii. ch. 3. p. 308—319.

CARPODETUS, in *Botany*, (from καρπος, *fruit*, and δεω, *to bind*, the fruit being ſurrounded or bound by a ring or fillet) Schreb. gen. 360. Mart. Willd. 410. Juſſ. 382. Forſt. gen. 17. Claſs and order, *pentandria monogynia.* Nat. Ord. *Rhamni*. Juſſ.

Gen. Ch. *Cal.* Perianth top-ſhaped, adhering to the germ, five-toothed: teeth awl-ſhaped, deciduous. *Cor.* Petals five, ovate, ſmall, inſerted into the margin of the calyx: anthers roundiſh. *Piſt.* Germ inferior (ſemiinferum: Juſſ.) ſtyle filiform, longer than the ſtamens: ſtigma capitate, depreſſed. *Peric.* Berry dry, globular, ſurrounded as with a ring by the adhering margin of the calyx, (ſemiinfera, Juſſ.) five-celled. *Seeds* ſeveral, ſomewhat angular.

Eſſ. Ch. Corolla pentapetalous, inſerted into the margin of the calyx. Berry inferior, dry, five-celled, annulated.

Sp. Carpodetus *ſerratus*. Forſt. Prod. iii. gen. p. 33. tab. 17. A native of New Zealand. According to Boſc. (nouv. dict.), it is one and the ſame plant with Ceanothus aſiaticus of Linnæus.

CARPOLOGY is that part of *Botany* which treats of the fruit of plants in the moſt extenſive ſenſe of the word, deſcribes its various appearances, divides it into diſtinct kinds, analyſes it into its ſeveral parts, and forms the whole into a regular ſyſtem. See FRUIT.

CARPUDEMUM, in *Ancient Geography*, a town placed by Ptolemy in the interior of Thrace.

CARPUS, in *Anatomy*, is the term applied to the wriſt. See SKELETON.

CARPUTH, in *Geography*, a town and fortreſs of Aſiatic Turkey, in the province of Aladulia; 12 miles from Arzengun.

CARPZOVIANUS, in *Biblical Hiſtory*, is the denomination of a MS. of the four goſpels, marked 78 in the firſt part of Wetſtein's New Teſtament, which Küſter, judging from the letters, ſuppoſed to be 600 years old. Gottlob Carpzow of Leipſick had it in his poſſeſſion, and Küſter procured from Dr. Boerner thoſe extracts, which he inſerted in Mill's edition of the Greek Teſtament.

CARPZOVIUS, BENEDICT, in *Biography*, was born in 1595, and ſucceeded his father, who was an eminent lawyer, as counſellor to the elector of Saxony, and aſſeſſor of the judges of appeals. His acquaintance with the juriſprudence and legal practice of Germany was very extenſive; and by availing himſelf of an induſtrious reſearch into the conſtitutions and determinations preſerved in the various archives of the country, he was the beſt writer on theſe ſubjects. Of his numerous works the principal are as follow, *viz.* "Practica rerum criminalium," fol. publiſhed in 1635, and ſeveral times reprinted and abridged; "Definitiones forenſes, vel juriſprudentia forenſis Romano-Saxonica ad conſtitutiones electoris Auguſti," 1638, fol.; A commentary "Ad legem regiam Germanorum," 1640; "Reſponſa juris electoralia;" fol. 1642; "Definitionum eccleſiaſticarum ſeu conſiſtoralium," &c. 1649; "Deciſiones Saxonicæ," 3 vols. 1646—52—54; and "Proceſſus Juris Saxonicæ," fol. 1657. The cloſe of his life at Leipſic was devoted altogether to the ſtudy of the ſcriptures, which he had read over, as it is ſaid, 53 times, beſides commentaries. He died in 1666. Several others of the ſame family and name diſtinguiſhed themſelves as theologians and philologiſts.

CARR, in *Agriculture*, is a ſort of cart made uſe of in ſome diſtricts for conveying light weights. There is an improved kind of carr, which is much employed in Leiceſterſhire, for conveying dung and other ſimilar matters upon land in an eaſy and expeditious manner, as a good horſe is capable of drawing near a ton weight in it. It is conſtructed in the following manner. The diameter of the wheels is four feet; the length of the body the ſame; the width of the body three feet ten inches; the extent of the ſhafts ten feet. Rails are capable of being occaſionally put on for the purpoſe of carrying turnips, or other roots of a ſimilar kind. It is made by Mr. Handford, of Hathern; and coſts when complete, 5*l.* 15*s.* 6*d.* and, with an iron axle-tree, 6*l.* 16*s.* 6*d.* This ſort of carriage was found very uſeful for various purpoſes on Mr. Bakewell's farm. And the *improved* Iriſh Carr is another uſeful ſort of carriage of this kind, which was much reccommended by the ſame intelligent farmer. It is obſerved, in the ſecond volume of communications to the Board of Agriculture, that "its principal advantages conſiſt in the facility with which it is loaded, from its lowneſs; and where gateways and roads are narrow, much room being gained by having the wheels under the body of the cart. In ſuch ſituations, this cart ſeems well calculated for carrying manure, eſpecially on meadow or ploughed land; and for that purpoſe its wheels ought to have a flat bearing, and be at leaſt ſix inches in breadth. Another advantage of this carr is, that from its conſtruction the wheels are neceſſarily cylindrical, at leaſt they are not neceſſarily conical; and the facility of draught ariſing from this unobſerved circumſtance has probably been imputed to ſome other part of the conſtruction, as we find by experiment, that the reſiſtance to the cylindrical wheel is not increaſed, but diminiſhed by increaſing the breadth, and the flat bearing of its rim. The knowledge of this fact is of very great importance to the farmer, as well as to the waggoner, ſince by this means, he may be enabled, in almoſt all ſeaſons, to drive his broad-wheeled carts, &c. on his meadow or plough grounds when no narrow wheel can be uſed; the advantages of which are too well known to be here inſiſted on: but when the width of gate-ways, and the breadth of roads, will admit of the wheels being placed at the ſides of the cart, without confining the width of its body, it will probably be more advantageous to have them ſideways than under the cart." A carr of this nature is repreſented at *fig.* 2. *Plate* III. of *Agriculture*.

CARR, *carrum*, in the *Middle Age*, denoted any ſort of vehicle, or carriage, either by land or ſea.

CARR, *Carrus*, a kind of rolling throne, uſed in *Triumphs*, and at the ſplendid entries of princes.

The word is from the ancient Gauliſh, or Celtic, *carr*; mentioned by Cæſar, in his Commentaries, under the name *carrus*. Plutarch relates, that Camillus having entered Rome in triumph mounted on a carr drawn by four white horſes, it was looked on as too haughty an innovation.

CARR is alſo uſed for a kind of light or open chariot. Pontanus obſerves, that Erichthonius was the firſt that harneſſed horſes, and joined them in a carr or chariot. The carr, on medals, drawn either by horſes, lions, or elephants, uſually ſignifies, either a triumph, or an apotheoſis: ſometimes a proceſſion of the images of the gods, at a ſolemn ſupplication; and ſometimes of thoſe of ſome illuſtrious families at a funeral.—The carr covered, and drawn by mules, only ſignifies a conſecration, and the honour done any one of having his image carried at the games of the circus. See Consecration.

The carr uſed by the ladies was called *pilentum*, *carpentum*, and *baſterna*. See Coach.

Carr, in *Geography*, a ſmall plantation in the county of Lincoln and diſtrict of Maine, North America.

CARRA, a river of the county of Kerry, Ireland, which riſes in Magillicuddy's reeks, W. of the lake of Killarney, and after a rocky courſe of a few miles flows into a lake of the ſame name, from which its waters are emptied into the bay of Caſtlemain. On, or very near the banks of this river was the village of *Blackſtones*, a romantic ſpot where Sir W. Petty erected iron works, which continued as long as the timber on the neighbouring mountains ſupplied wood for charcoal; but when this was exhauſted, from neglect of copſeing, the works ceaſed, and the village has gone to decay. Smith's Kerry.

CARRAC, or Carraca, a name given by the Portugueſe to the veſſels they ſend to Braſil and the Eaſt Indies; being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have ſometimes ſeven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little uſed. Formerly they were alſo in uſe among the knights of Rhodes, as well as among the Genoeſe, and other Italians.

It is a cuſtom among the Portugueſe, when the carracs return from India, not to bring any boat or ſloop for the ſervice of the ſhip, beyond the iſland of St. Helena; at which place they ſink them on purpoſe, in order to take from the crew all hopes or poſſibility of ſaving themſelves, in caſe of ſhipwreck.

In the year 1592, a Portugueſe carrack was captured by Sir John Barrough which is thus deſcribed. "This carrack was in burthen no leſs than 1600 tons, whereof 900 were merchandiſe: ſhe carried 32 pieces of braſs ordnance, and between ſix and ſeven hundred paſſengers: was built with decks, ſeven ſtory, one main aſlope, three cloſe decks, one fore-caſtle, and a ſpare deck, of two floors apiece. According to the obſervations of Mr. Robert Adams, an excellent geometrician, ſhe was in length from the beak-head to the ſtern 165 feet; in breadth near 47 feet; the length of her keel 100 feet: of the main-maſt 121 feet; its circuit at the partners near 11 feet; and her main-yard 106 feet."

CARRACA, in *Ancient Geography*, a town of Italy, in the country of the Bechuni according to Ptolemy; ſuppoſed to be *Caravaggio*.

CARRACCI. See Caracci.

CARRÆ, in *Ancient Geography*, a town of Aſia, in Syria, ſituate to the eaſt of a chain of mountains, on the banks of a ſmall river, S. W. of Goaria, and at ſome diſtance to the eaſt of Heliopolis.

CARRAGH *Lough*, a very pretty lake of the county of Mayo, Ireland, 5 miles long and 2½ broad, with wooded peninſulas and iſlands. In the ſurrounding barony which is called from it, and includes the town of Caſtlebar, the linen manufacture is carried on in a manner ſuperior in neatneſs to moſt parts of the county.

CARRAGHROE *Mountains*, mountains in the weſtern extremity of the county of Tyrone adjoining the county of Donnegal, and North of Lough Derg. Beaufort.

CARRAGO, in *Antiquity*, a kind of fortification, or defence about a camp, compoſed of carts, waggons, and the like vehicles, chained or faſtened together; chiefly uſed by the barbarous nations.

CARRANTAGEA *Lagoon*, in *Geography*, a large gulf on the ſouth ſide of the bay of Honduras, about 70 miles N. W. of Cape Gracios a Dios, and nearly as far S. E. from Brewer's Lagoon.

CARRANZA, Bartholomew, in *Biography*, an eminent catholic prelate, was born in 1503 at Miranda in Navarre, entered among the Dominicans in Caſtile, taught theology with high reputation at Salamanca, and diſtinguiſhed himſelf in the council of Trent by his zeal in maintaining the duty of clerical reſidence. In 1554 he was taken to England by his pupil Philip of Auſtria, afterwards king of Spain, when he went to marry queen Mary, with a view of ſucceſsfully combating proteſtantiſm, for which he was not deficient in his ardent efforts. He was appointed confeſſor to the queen, and in recompence of his ſervices to Philip, was promoted by him, in 1557, to the rich archbiſhopric of Toledo. He had the honour of attending the emperor Charles V. at his death, and of adminiſtering to him the laſt ſacraments. However he was ſoon after ſuſpected of hereſy, and in 1559 committed to the priſon of the inquiſition. In his way thither he ſaid to his companions; "I go between my beſt friend and my worſt enemy; my friend is my innocence; my enemy is my archbiſhopric of Toledo." After a confinement of 8 years in Spain, he appealed to Rome, and removing thither, it was not till after the expiration of 9 years more, viz. in 1576, that ſentence was pronounced againſt him. The ſentence of this deteſtable court was founded on mere ſuſpicion; and on the ground of the ſtrong preſumptions that were alleged againſt him, he was condemned to make a ſolemn abjuration of his ſuppoſed errors. In conſequence of this ſentence to which he ſubmitted with reſignation, he retired to the convent of Minerva, which belonged to his order. Here he ſoon after died in his 72d year, proteſting his innocence as to any mental offence reſpecting the faith, but at the ſame time acknowledging the juſtice of the proceedings againſt him. Such was his reputation for ſanctity, and ſo impreſſed were the minds of the people with reſpect to his innocence, that on the day of his funeral, the ſhops were ſhut; and his remains were venerated like that of a ſaint. Gregory XIII. placed on his tomb an epitaph, which did juſtice to his memory, and which repreſents him as illuſtrious both for his learning and his morals, modeſt in proſperity and patient in adverſity. His principal works are "Summa Conciliorum," 1681, 4to; a Collection of Councils held under the popes from St. Peter to Julius III.: a Latin treatiſe "On Reſidence," 1547; and a "Spaniſh Catechiſm," which was put into the prohibited index by the inquiſition. Gen. Dict. Nouv. Dict. Hiſt.

CARRAPATEIRA, in *Geography*, a town of Portugal, in the province of Algarve; 10 miles N. of Sagres.

CARRARA, a town of Italy, in the principality of Maſſa; 3 miles N. of Maſſa, celebrated for its marble.

Carrara *marble*, among our *Artificers*, the name of a ſpecies of white marble, which is called *marmor* lunense, and *liguſtrium* by the ancients: it is diſtinguiſhed from the Parian, now called the ſtatuary marble, by being harder and leſs bright.

CARRAT, Carat, or Caract. See Caract.

CARRE', Louis, an eminent mathematician, was born in 1663 in the province of Brie in France. His father intended him for the church, and he was engaged for three years in the ſtudy of theology; but refuſing to take orders, his means of ſubſiſtence at Paris were diſcontinued; and in this diſtreſſed ſituation he found an aſylum under the patronage of Father Mallebranche, who employed him as an amanuenſis. Here he acquired the mathematics and the moſt ſublime metaphyſics. Having continued ſeven years in this excellent ſchool, he undertook to teach the mathematics and philoſophy, and ſucceeded to ſuch a degree as to attach a great number of ſcholars, many of whom were females; of whoſe underſtandings in general, he formed a higher opinion than he did of thoſe of men. In this ſituation his time was ſo much employed, that he had not leiſure to purſue thoſe reſearches in the ſublime geometry to which his taſte inclined him. However, in 1697, he was admitted as an eleve into the Academy of Sciences by the favour of M. Varignon; and in 1700 he publiſhed the firſt entire work which had appeared on the integral calculus, under the title of "A Method of meaſuring ſurfaces and ſolids, and finding their centres of gravitation, percuſſion, and oſcillation." This work was afterwards corrected and improved in a ſecond edition. Under the patronage of Varignon, Carré ſoon became aſſociate, and afterwards penſioner: and he was thus enabled to devote his whole time to ſtudy. As he occupied the office of mechanic, he directed his principal views to that ſubject, and contrived every thing that relates to muſic, the theory of ſounds, the deſcription of different inſtruments, &c. But his labours were interrupted by ill health, and at length he cloſed his life with fortitude and calmneſs on the 11th of April, 1711, in the 48th year of his age. Many of his mathematical and philoſophical treatiſes were left to the Royal Academy, and remain unpubliſhed. His memoirs in the volumes of the Academy are the following: viz. "The Rectification of Curve Lines by Tangents," 1701; "Solution of a Problem propoſed to Geometricians, &c." 1701; "Reflections on the Table of Equations," 1701; "On the Cauſe of the Refraction of Light," 1702; "Why the Tides are always augmenting from Breſt to St. Malo, and diminiſhing along the Coaſts of Normandy," 1702; "The Number and the Names of Muſical Inſtruments," 1702; "On the Rectification, &c. of the Cauſtics by Reflection," 1703; "Method for the Rectification of Curves," 1704; "Obſervations on the Production of Sound," 1704; "On a Curve formed from a Circle," 1705; "On the Refraction of Muſket-balls in Water, and on the Reſiſtance of that Fluid," 1705; "Experiments on Capillary Tubes," 1705; "On the Proportion of Pipes to have a determined Quantity of Water," 1705; "On the Laws of Motion," 1706; "On the Properties of Pendulums, with ſome new Properties of the Parabola," 1707; "On the Proportion of Cylinders, that their Sounds may form the Muſical Chords," 1709; "On the Elaſticity of the Air," 1710; "On Catoptrics," 1710; "On the Monochord," &c. &c. Eloge par Fontenelle, 1711. Rozier's Index.

Carré, Henry, a painter of reputation, was born, as Weyerman and Deſcamps ſay, at Amſterdam, in 1656, but according to Houbraken in 1658, and became a diſciple, firſt of Jurian Jacobsz of Hamburgh, and afterwards of Jacques Jordaens. As ſtate painter at the court of Frizeland, he adorned the palace with ſeveral fine paintings, particularly landſcapes, in which he introduced huntings of the wild boar and of other animals, in all which ſubjects his manner reſembled that of Sayders. However, he ſpent the greateſt part of his life at Amſterdam and the Hague, where his works were in high eſteem. His uſual ſubjects were landſcapes, with peaſants attending flocks of ſheep, or herds of cattle; huntings; and ſometimes converſations. His ſtyle was pleaſing, and his manner of colouring good; his figures were well deſigned, and touched with ſpirit; though many of his pictures ſhew too great a degree of darkneſs. He died in 1721.

Carré, Michael, the younger brother of the former, was born at Amſterdam in 1666, and having commenced the ſtudy of his art under his brother, accompliſhed himſelf in his profeſſion as the diſciple of Nicholas Berchem; he afterwards preferred the ſtyle of Vander Leew to that of Berchem. He reſided ſeveral years in London, without obtaining much employment or reputation. After his return to his native city, he was invited to the Pruſſian court and liberally recompenſed for his works as an artiſt. His taſte led him to embelliſh grand ſaloons, halls, and large apartments; and in works of this kind he was fond of introducing ſubjects that excited terror; ſuch as ſtorms with lightning, the deſtruction of caſtles and towers, and the tearing up of trees by the roots. In his eaſel pictures he had a ready hand, and a neat manner of pencilling. Pilkington.

CARREA *Pollentia*, in *Ancient Geography*, a town of Italy, in Liguria, N. of *Auguſta Vagiennorum*, celebrated for its black wool.

CARREI, a people who, according to Pliny, inhabited the interior of Arabia Felix, and to whom he aſſigns the town of Carriatha, called by Ptolemy Chariatha.

CARREL, in *Antiquity*, a cloſet or apartment for privacy and retirement. This term, which has been long diſuſed, was principally applied during what are called the middle ages to the cloſets for ſtudy which were uſually given to each monk in the cloiſter of his monaſtery. In the viſitations of the old religious houſes the prior or ſuperior is frequently enjoined to viſit theſe *Carolæ*, or cells, once or twice a year. (See Cowel's Law Interpreter, *v.* Carola.)

CARRHÆ, in *Ancient Geography*, a very ancient city of Aſia in Meſopotamia, near the Euphrates, at the diſtance of eighty miles from Hierapolis. It was famous for the defeat of the Romans by the Parthians, and the death of Craſſus, the Roman general, and alſo for a temple of the moon. M. D'Anville places it to the weſt of a ſmall chain of mountains, which ſeparated it from Chaboras. See Haran.

CARRI, in *Geography*, a town of Italy, in the province of Piedmont; eight miles N.N.W. of Ceva.

CARRIAGE, a vehicle for the conveyance of perſons, goods, &c. from place to place.

Carriage *Artillery*, in French *affuts des canons*, are wooden frames or machines, on which cannons are mounted and tranſported from one place to another. They are of various kinds.

*Garriſon-gun-carriages* are thoſe, on which garriſon-guns are commonly mounted. Such a carriage with its gun on it moves on four caſt-iron trucks or ſmall low wheels ſeldom exceeding twenty-four inches in diameter.

A *Ship-gun-carriage* differs from a garriſon-gun-carriage only in having its trucks of wood, and breach-rings, which the other has not.

There are copper clouts underneath the axle-trees of garriſon-carriages to diminiſh the friction of the iron on the wood.

*Travelling-carriages* and field carriages are ſuch as guns are mounted and tranſported on when employed at ſieges or on ſervice in the field. They are much longer than garriſon or ſhip gun-carriages and are differently conſtructed. Every ſuch carriage has two wheels and a long trail. And the limber for moving it with by means of the pintle-pin or iron bolt has two wheels alſo.

*Limbers*, are two-wheel-carriages, made commonly each with two ſhafts, but ſometimes with a beam or pole, for drawing double with. They ſupport the trails of travelling or field carriages, by means of the pintle-pins or iron bolts, when the guns are to be tranſported, or removed from one place to another. The pieces are generally fired with the trails of their carriages taken off from the limbers—but they may be fired with them on the ſame, and ſometimes are on a march when attacked, or preſſed on by an enemy.

*Galloper-carriages*, are for one and a half pounders. Such a carriage has ſhafts to be drawn without a limber, and is regarded by many artilleriſts, as more convenient than other field-carriages, and preferable to them. It is a carriage, that anſwers very well alſo for a light three, or ſix pounder.

*Howitzer-carriages*, are for ſupporting, and tranſporting howitzers. Thoſe for the 6 and $\frac{5}{8}$ inch howitzers are made with ſcrews, for elevating them in the ſame manner as the light ſix-pounder-carriages are. They are therefore made without a bed, and the centre-tranſom is nine inches broad for fixing the elevating ſcrew in, inſtead of four, as in thoſe that are made without ſuch a ſcrew. In the centre, between the trail and centre-tranſom, there is a tranſom-bolt, which is not in others, becauſe the centre-tranſom muſt be made to be taken out; and when it is, the howitzer may be elevated to any degree under ninety.

*Tumbrel*, or *Tumbrel-carriages*, are carriages with two wheels, commonly made uſe of for carrying the pioneers', miners', and artificers' tools. They are alſo ſometimes employed for carrying the money of the army.

*Block-carriage*, is one that is made out of a ſolid block, or piece of timber, ſo hollowed or cut into, as to receive the gun or howitzer into the cap-ſquares: the flat, or lower part of the cap-ſquare is let into the ſolid wood, and the gun or howitzer is elevated or depreſſed by means of a ſcrew, as on another carriage. The limber of this carriage carries two large cheſts for ammunition, and takes four men. The pintle-pin, or iron bolt of the limber, is ſo conſtructed as to take the gudgeon of the carriage, by which means a greater relief is obtained when the carriage paſſes over rough or uneven ground. Block-carriages are chiefly made for the purpoſe of conveying mortars and their beds from one place to another.

Block-carriages are alſo uſed by the horſe-artillery, as curricles. They are very uſeful on ſervice. The original inventor of theſe is the ingenious General Congreve, to whom the Board of Ordnance is indebted for many improvements, and the nation for important ſervices; which merit attention and recompence.

*Truck-carriages*, are for carrying timber and other heavy articles from one place to another, at no great diſtance from it. They are alſo employed for moving guns and mortars, where their own carriages cannot go, and are drawn by men as well as horſes and other beaſts of burthen.

*A Ponton-carriage* is ſolely for tranſporting the pontons. Formerly it had only two wheels, but now it has generally four.

Beſides theſe, there are other artillery carriages, as land and ſea mortar-beds, which have no wheels, as mortars are not tranſported on their carriages; powder carts; ammunition waggons; ſling waggons; travelling forges; and pontons.

*Figure* 1. (See *Artillery-carriages* in the plates) is the outſide elevation or profile of a garriſon or ſhip carriage; and *fig.* 2. is the inſide elevation of one of the cheeks or ſide pieces, ſhewing ſome of the irons in it, that would not otherwiſe be ſeen; the manner in which theſe pieces ſhould be let into the axletrees, and the poſition of the tranſom.

The height of each ſide-piece before, is equal to 4¾ diameters of the ſhot, and its height behind is only half as much. The length of the ſide-piece is ſuppoſed to be biſected or divided into two equal parts, and of theſe two, the hind part is ſuppoſed to be divided into four equal parts, as a ſcale for making the ſteps by. Each of theſe ſide-pieces is hollowed or cut out beneath, in the form of a circular arc, of which the radius is about half the length of the piece. This makes it ſomewhat lighter without diminiſhing its ſtrength. Both the axletrees are ſunk into the ſide-pieces in the manner repreſented in *fig.* 2. The tranſom is placed directly over the fore-axletrees, in the middle of the height of the ſide-pieces, and is one diameter of the ſhot broad, and two deep.

The following are the names of the different pieces of iron-work in a ſhip and garriſon-carriage, with the number of each. See *Artillery-carriages*, *fig.* 1. and .

*N. B.* The garriſon-carriage has all theſe irons as well as the ſhip-carriage, except the two breeching-bolts with rings.

The conſtruction of theſe carriages is as follows. See *fig.* 3. Let A B be any indefinite right line. In it take any two points, C, D, ſo that the diſtance between them ſhall be equal to three ſeventh parts of the gun's length, or to the diſtance from the centre of the trunnions to the extremity of the breech. Through theſe points draw two right lines at right angles to A B. On the firſt of theſe, take C E, C F, in oppoſite directions and each of them equal to half the diameter of the ſecond reinforce-ring of the gun. On the ſecond take alſo D G, D H, in oppoſite directions, and each of them equal to half the diameter of the baſe-ring. Then right lines drawn through the points E, G, and F, H, will determine the inſide width of the carriage.

If parallel to theſe two laſt mentioned right lines, there be drawn two others at the diſtance of one caliber of the gun from them reſpectively, theſe again will determine the breadth of each of the ſide-pieces and the outſide width of the carriage. And if, from D towards B, there be ſet off D I, equal to the length of the caſcables, and from C towards A, there be ſet off C K, equal to half the diameter of one of the trunnions, with half the diameter of one of the fore-trucks, I K will be the length of the carriage.

The right line E F, paſſes through the centre of the trunnion-holes, the diameter of each of which is equal to a caliber of the gun. The centre of each of theſe holes is about a quarter of an inch below the upper ſurface of the ſide-piece. Six inches are ſet on each ſide of G H, for the axletree, which is always twelve inches broad.

The dimenſions of ſuch a carriage are ſpecified in the following Table.

| Natures of the guns. | | 42 Pounder | 32 Pounder | 24 Pounder | 18 Pounder | 12 Pounder | 9 Pounder | 6 Pounder | 3 Pounder |

Mr. Muller, in his "Treatiſe on Artillery," gives another conſtruction for gun-carriages to ſuit his conſtruction of guns. In conſtructing both he ſuppoſed the diameter of the ſhot to be divided into 24 equal parts; and on this ſuppoſition, in conſtructing the gun-carriage, he takes CD, (ſee *fig.* 3.) equal to ſix diameters of the ſhot, and ten parts; CE, CF, each equal to 34 parts; DG, DH, each equal to 39.5 parts; the breadth of each of the ſide-pieces equal to one diameter, or 24 parts; DI equal to one diameter and 12 parts; and CK equal to two diameters and a half. He makes the breadth of the fore axle-tree equal to 30 ſuch parts; its length equal to ſix diameters and a third; the length of each of the arms equal to 44 ſuch parts, and the diameter of each of them equal to 24 ſuch parts. In the elevation he makes the height of each of the ſide-pieces before, equal to four diameters and three quarters, and equal to half that height behind. The height or depth of the fore axle-tree he makes equal to 42 ſuch parts; and that of the hind axle-tree equal to 30 ſuch parts. The bed-bolt paſſes under the middle of the fourth ſtep and is even with the laſt, or hind ſtep.

He makes the breadth, or thickneſs of each of the wooden trucks equal to that of each of the ſide-pieces, which by his conſtruction is equal to one diameter of the ſhot, or to 24 ſuch parts; the diameter of each of the fore-trucks equal to four diameters of the ſhot, and that of each of the hind-trucks equal to three diameters and a half. Theſe diameters, however, muſt of courſe be increaſed or diminiſhed to ſuit the height of the port-holes in ſhips.

*Of travelling, or field carriages.* The long ſide-pieces, PQ, RS, (ſee *fig.* 12.) are called the cheeks; the fore part, QR, of the carriage, is called the breaſt, and the hind part, PS, the trail. T denotes the trail-tranſom; X the bed-tranſom; V the centre-tranſom; and Y the breaſt tranſom; GH the body of the axle-tree; W the pintle-hole; and m,n denote the trunnion-holes.

The following are the dimenſions of the cheeks.

| Natures of the guns. | | 24 Pounder | 18 Pounder | 12 Pounder | 6 Pounder | 3 Pounder |
|---|---|---|---|---|---|---|
| | | Inches and decimals. | Inches and decimals. | Inches and decimals. | Inches and decimals. | Inches and decimals. |
| Lengths of the cheeks | | 156.0 | 150.0 | 144.0 | 132.0 | 120.0 |
| Thickneſs of ditto | | 5.8 | 5.2 | 4.6 | 3.6 | 3.0 |
| Height of the plank | | 22 0 | 21.6 | 19.0 | 16.0 | 13.0 |
| Height of the cheek | Before | 20.0 | 19.6 | 17.0 | 14.0 | 11.5 |
| | Centre | 17.0 | 16.6 | 15.0 | 12.0 | 9.5 |

The following are the names and numbers of the different irons, or pieces of iron-work in a travelling carriage.

| | | |
|---|---|---|
| Tranſom bolts with burs | Breaſt | 1 |
| | Centre | 2 |
| | Trail | 2 |
| Tranſom-bolts with hooks | Breaſt | 2 |
| | Centre | 2 |
| | Trail | 2 |
| Trunnion-plates | | 2 |
| Cap-ſquares with joint-bolts | | 2 |

| | | |
|---|---|---|
| Spring keys with chains and ſtaples | | 4 |
| Eye-bolts | Fore | 2 |
| | Hind | 2 |
| Single fore-lock keys | | 8 |
| Breaſt-plates | | 2 |
| Bed piece chain and ſtaple | | 1 |
| Plates with roſes | Garniſh | 2 |
| | Trail | 2 |
| Garniſh | Bolts | 2 |
| | Nails | 6 |
| Axle-tree bands | | 2 |
| Side-ſtraps | | 4 |
| Locker | Hinges | 2 |
| | Haſp with ſtaple | 1 |
| Draught-rings with bolts and burs | | 2 |
| Locking plates | | 2 |
| Laſhing-rings with loops | | 8 |
| Nails | Roſe-buds | 4 |
| | Diamond-headed | 8 |
| | Counter-ſunk | 0 |
| | Trail | 26 |
| Pintle-plates | | 2 |

The names and numbers of the parts and irons of a travelling carriage-wheel are the following.

| | |
|---|---|
| Nave | 1 |
| Spokes | 12 |
| Felloes, or fellies | 6 |
| Dowel-pins | 6 |
| Streaks | 6 |
| Streak-nails | 48 |
| Nave-boxes | 2 |
| Nave-hoops | 3 |
| Dowledges | 6 |
| Rivets for ditto | 24 |
| Nave hoop-ſtubs | 9 |
| Box-pins | 6 |

The dowel-pins are wooden pegs about three inches long each, and three quarters of an inch in diameter. They ſerve for joining or faſtening the felloes together.

The dowledges are iron plates, which are ſunk into the felloes on the outſide, and are each of them faſtened to the ſame with four pins, or rivets. They ſerve to faſten the felloes ſtrongly together, and to ſtrengthen the joints.

The nave is almoſt always made of elm, cut ſix months before it is uſed, and left all that time in the bark. Larch, however, would probably be found on trial to anſwer full as well, if not much better. The ſpokes are made of elm, or young oak, as dry and well ſeaſoned as poſſible. The felloes are for the moſt part alſo of elm, but are ſometimes made of ſplit beech, which makes to the full as good, if not better ones. And the axle-tree is generally made out of dry elm, young oak, or young beech. Swamp-maple is, however, much preferable for this purpoſe to either elm or beech.

The cheeks and tranſoms are always made of dry elm. But either young oak, or ſwamp-maple, are preferable to it for both.

The names and the numbers of irons, or pieces of iron-work in the axle-tree of a travelling-carriage, are the following.

| | | |
|---|---|---|
| Axle-tree bar | | 1 |
| Clouts | Body | 2 |
| | Linch | 2 |
| Axle-tree hoops | Linch | 2 |
| | Arms | 2 |
| | Body | 2 |
| Hurlers with ſtraps | | 2 |
| Waſhers | | 2 |
| Linch-pins | | 2 |
| Axle-tree bolt | | 1 |
| Single fore-locks | | 2 |
| Clout-nails | | 12 |
| Dog-nails | | 8 |
| Axle-tree hoops | | 2 |

The uſual conſtruction of travelling-carriages is the following. See *fig.* 11.

Let A b c d be the plank, out of which one of the cheeks is to be made, and let A B be the height of the ſaid cheek before. Set off from B to C the ſum of the ſaid height, or of the head, A B, and the diſtance from the hind part of the trunnions to the extremity of the caſcable. Then, from the point, A, as a centre with the radius, A C, deſcribe an arc, in which, as a chord, apply a right line, C D, equal to the height of the cheek at the centre, and draw the right lines, A D, B C. On B C, take B E, equal to the head, A B, or height of the cheek before, and from the point, E, ſet off towards B the right lines, E r, r S, equal each to half the diameter of one of the trunnions. Then, E S being equal to the diameter of the trunnion, cut the trunnion-hole out of the cheek, ſo that its centre may be about a quarter of an inch below the line, B C, or E S. From the point, r, draw the right line, r F, perpendicular to A D, or parallel to A B, and in A D, take F H, equal to the breadth of the axle-tree, which is ſunk or let in about an inch into the cheeks. On the right line, F H, conſtitute a ſquare, and from I, the point of interſection of its diagonals, as a centre with a radius of 29 inches, which is equal to the radius of the wheel, deſcribe an arc. This arc will repreſent a part of the wheel; and if a ruler touching the ſaid arc be ſo laid acroſs the plank, that the diſtance, M L, between the points, M, L, where their edges meet, be equal to the length of the trail, and from the points, M, L, perpendiculars, M N, L O, to M L, be alſo erected, equal each to the height of the trail, the right lines, C N, N O, and D M, being drawn, will, with the right lines, A B, B C, and A D, give the figure, A B C N O P M D A, of the cheek required.

The lower part, M P, of the trail is rounded in order that the carriage may ſlide with more eaſe on the ground, or on a platform, which rounding is formed by firſt dividing L O into four equal parts, and taking L P equal to one of them; ſecondly, by erecting right lines at the points, M, P, perpendicular reſpectively to D M, M P, and meeting in the point Q; and laſtly, by biſecting M Q in the point, R, and from R, as a centre with the radius, R M, deſcribing the arc, M P.

The mortiſe, V, of the centre-tranſom is aſcertained or determined by drawing a right line through the point, C, perpendicular to the horizon, K M, in which C p is taken equal to a fourth part of the ſhot's diameter, and p q equal to twice that diameter for its height. Its breadth, p x, taken in a right line, p z, parallel to K M, is equal to one diameter of the ſhot. The diſtance between the centre-tranſom, V, and the bed-tranſom, X, is equal to two diameters of the ſhot; and the height and breadth of this laſt are each equal to one diameter. The breaſt-tranſom, Y, is one diameter of the ſhot broad and two high. The ſides of it are parallel to the head, A B, and terminate above, or at top in a right line parallel to B E, and equally diſtant from it with the bottom of the trunnion-hole. And the inſide one of them, if produced, would paſs through the point at the ſide of the ſaid hole, that is next to the head, A B. The mortiſe of the trail-tranſom is equal in length to the trail itſelf; its height is equal to one diameter of the ſhot, and it is parallel to the upper ſide, N O, of the trail. Its lower ſide, if produced, would paſs through the point, P.

All theſe mortiſes, viz. of the breaſt-tranſom, the bed-tranſom, the centre-tranſom, and the trail-tranſom, are divided by horizontal right lines into four equal parts, the upper one of which is ſunk or let in half an inch into each of the cheeks, the two middle ones to the depth of two-thirds of the thickneſs of one of the cheeks, and the lower one not at all.

And the following is the conſtruction of the plan of a travelling gun-carriage. See *fig.* 12.

Draw any indefinite right line, A B. In it take the right line, C D, equal to the diſtance from the centre of the trunnions to the extremity of the baſe-ring of the gun. Through the points C, D, draw right lines perpendicular to A B, and let them be produced indefinitely. On that drawn through the point C, take C E, C F, contrary ways and equal each to the radius of the ſecond reinforce-ring. And on that drawn through the point D, take D K, D L, alſo contrary ways, and equal each to the radius of the baſe-ring. Then right lines drawn through the points F, L, and E, K, will determine or aſcertain the width of the carriage within; and if two right lines be drawn parallel to theſe, and at a diſtance from them reſpectively equal to the length of either of the trunnions they will give the equal thickneſſes of the cheeks Q P, R S.

The poſitions of the trunnion-holes m, n, are aſcertained by ſetting off a diſtance both from the point E, and the point F, equal to half the diameter of either of the trunnions. The breaſt-tranſom, Y, muſt be drawn with a breadth equal to one diameter of the ſhot, and with its inſide in a line with the fore parts of the trunnion-holes. Take C A equal to r B in the laſt figure. Then a right line, R A Q, perpendicular to A B, will determine the breaſt of the carriage; and its total length is aſcertained by the immediately preceding figure.

If two diameters be ſet off from the right line K L, we ſhall get the hind part of the centre-tranſom, V, the width or breadth of which as well as that of the bed-tranſom is equal to one diameter of the ſhot. The diſtance between theſe is equal to two diameters, and the poſition and breadth of the trail-tranſom are determined as in the immediately preceding figure. In the middle of this tranſom is the pintle-hole, of an oval form, wider above than below, in order that the pintle may have room to play in it when the carriage is moving on or going over uneven ground. The bed, w, is a piece of an inch and half-board one foot broad and is ſunk or let down into the bed and centre-tranſoms. The plane of the fore-part of the axle-tree would, if produced, paſs through the centres of the trunnion-holes. There is a board fixed with one end on the axle-tree and the other on the bed-tranſom, for laying hay, ſtraw, &c. upon for wadding. From about one diameter and a half from the centre-tranſom, to about a diameter from the trail, the breadth or thickneſs of each of the cheeks is diminiſhed by a ſixth part of the ſame.

This is the conſtruction that has been commonly obſerved and made uſe of for travelling carriages. But Mr. Muller has given a general conſtruction for them to ſuit his conſtruction of guns, the lengths of which he ſuppoſes to be reſpectively equal to 20 or 21 diameters of their ſhot.

The general dimenſions of travelling gun carriages, according to this conſtruction, are the following. See *fig.* 11. The length, A d, of the plank is equal to ſeven feet and a half together with twelve diameters of the gun's ſhot. The height, A B, of each of the cheeks is equal to three diameters and a quarter. B b is equal to half a diameter, and the height, D C, at the centre is equal to 70 ſuch equal parts as thoſe, of which the ſaid diameter contains 24. The length of the trail is equal to three diameters, and its height, M N, to two. The breadth, F H, of the axle-tree is equal to two diameters, and the reſt of the dimenſions are regulated by the ſize of the gun.

The following is his conſtruction of travelling carriages for ſuch guns. See *fig.* 11.

Make the length, A d, of the plank for either cheek of the carriage equal to ſeven feet and a half together with 10 diameters of the ſhot of the gun; its height, A b, equal to three diameters and three quarters of a diameter; and the height, A B, of the cheek itſelf equal to three diameters and a quarter. Take B C equal to eight diameters, together with 20 ſuch parts as thoſe, of which one diameter of the ſhot contains 24; from the point, A, as centre with the radius, A C, deſcribe an arc, in which apply as a chord C D, equal to 70 ſuch parts, and draw the right lines A D, B C. On B C ſet off B E equal to the head A B, or the height of the cheek, and from the point, E, ſet off towards the point, B, the right lines, E r, r S, equal each to nine ſuch parts, making E S equal to 18 ſuch parts or the width of the trunnion-hole, of which the centre is about a quarter of an inch below B C or the upper ſurface of the cheek. From the point r, draw the right line r F, perpendicular to A D, and on A D take F H equal to 30 ſuch parts for the breadth of the axle-tree, which is let in or ſunk into the cheek about an inch. On F H conſtitute a ſquare, and from the interſection, I, of its diagonals as centre with a radius of 29 inches deſcribe an arc, which will repreſent a part of one of the wheels. Apply a ſtraight ruler touching this arc ſo to the ſaid plank that the diſtance M L, between the points, M, L, where its edge coincides with the edges of the plank, may be equal to three diameters, and from theſe points draw M N, L O, perpendicular to K M, and equal each of them to two diameters. Then if the right lines C N, N O, and D M, be drawn and the under part of the trail be deſcribed as above pointed out from R, the biſecting point of the right line, M Q, as a centre, we ſhall have A B C N O P M D A for the outline of the cheek.

And the conſtruction of the plan of ſuch a carriage is as follows. See *fig.* 12.

Draw any indefinite right line, A B. In it take C D equal to ſeven diameters and 17 ſuch parts. Through the points, C, D, draw right lines, E F, K L, at right angles to A B, making C E, C F, equal each of them to 27.5 ſuch parts, and D K, D L, equal each of them to 32.5 ſuch parts. Then right lines drawn through the points F, L, and E, K, will determine or aſcertain the width of the carriage on the inſide. And if parallel to theſe lines two other right lines be drawn at the diſtance from them reſpectively of 18 ſuch parts, we ſhall have the thickneſſes of the cheeks and the outſide width of the carriage.

The poſitions, m, n, of the trunnion-holes are determined by ſetting off on both ſides of the points, E, F, nine ſuch parts for the radius of each of the trunnions. And if C a be taken equal to r B in the laſt *fig.* or *fig.* 11. the line, R Q, drawn at right angles to A B, will determine the breaſt of the carriage; and its total length, a I, is aſcertained from the ſaid figure. The other parts of the conſtruction are the ſame as thoſe above.

Figure 13. is the elevation of a ſix-pounder travelling carriage with the irons marked on it, and *figure* 14. is the plan of the ſame.

*Field-carriages* are ſhorter and much lighter than thoſe above mentioned, and deſcribed, being in theſe reſpects proportioned to the weights and lengths of the pieces mounted on them. They are nearly in the ſame form, however, but have their wheels eight inches lower, which reduction of height makes them perhaps lower than they ought to be.

Their dimenſions are the following:

| Calibers or natures of the guns | | 24 Pounder | 12 Pounder | 6 Pounder |
|---|---|---|---|---|
| | | Inches and Decimals. | Inches and Decimal. | Inches and Decimals. |
| Plank | Length | 108.0 | 106.0 | 94.0 |
| | Height | 15.6 | 14.0 | 12.4 |
| | Thickneſs | 14.5 | 3.7 | 3.0 |
| Cheeks | Height before | 14.5 | 12.7 | 11.0 |
| | Ditto at the centre | 12.0 | 10.9 | 9.8 |
| | Ditto at the trail | 10.0 | 9.2 | 8.4 |
| Length of the trail | | 11.0 | 10.5 | 10.0 |
| Length from head to centre | | 50.0 | 45.0 | 40.0 |
| Width within | Before | 11.5 | 10.7 | 10.0 |
| | Behind | 17.0 | 15.0 | 13.0 |
| Lockers | Length | | | 23.0 |
| | Breadth | | | 13.3 |

| Length of each nave | | 15.0 | 13.0 | 12.7 |
| Diameter of ditto | Body | 13.0 | 11.0 | 10.6 |
| | Middle | 14.0 | 12.0 | 11.6 |
| | Linch | 12.0 | 11.0 | 10.0 |
| Felloes | Height | 4.7 | 4.0 | 3.6 |
| | Breadth | 3.3 | 2.8 | 2.4 |
| Spokes | Breadth | 2.0 | 1.8 | 1.7 |
| | Thickneſs | 3.5 | 3.2 | 2.9 |
| Length of axle-tree | | 75.0 | 72.0 | 73.4 |
| Body | Length | 39.0 | 40.0 | 42.0 |
| | Breadth | 6.0 | 5.5 | 5.0 |
| | Height | 8.0 | 7.0 | 6.0 |
| Length of each arm | | 18.0 | 16.0 | 15.7 |
| Diameters | Body | 6.0 | 5.5 | 5.0 |
| | Linch | 4.0 | 3.0 | 3.5 |

The length of the plank for either cheek in one of theſe carriages is equal to four feet, together with thirteen diameters of the ſhot. And the width within varies with the thickneſs of the metal in the piece.

The conſtruction for travelling carriages anſwers likewiſe for field carriages, if theſe dimenſions be made uſe of inſtead of thoſe delivered above. See *figs.* 15 and 16. The latter, however, differ from the former in the following particulars.

They have no bed-tranſoms, as ſcrews, inſtead of wedges, are made uſe of for elevating or depreſſing them; for which reaſon the centre tranſom in each of them is two diameters broad, and but one thick, and is ſo placed in the middle of the height of the cheeks, that the neck of the caſcable anſwers to the middle of the breadth of the tranſom, where the ſcrew is fixed.

On each ſide of one of theſe carriages there is a box or locker, about twenty-three inches, or two feet long, with its upper ſurface even with, or rather about an inch above the upper part of the axle-tree, and extending from thence towards the trail. Theſe boxes, or lockers, ſerve for carrying ſhot on a march, and are covered each of them by another box holding cartridges, which ſlides on and is faſtened with a bolt.

The iron-work in one of theſe carriages is nearly the ſame as that in a travelling carriage, but not quite ſo ſtrong. It has only one garniſh-bolt, and no garniſh-nails. The eye-bolt next to the joint-bolt paſſes through the axle-tree band behind and not before as in other carriages, and the fore part of this band is only faſtened by the fore eye-bolt. The draught-hooks are fixed ſometimes to the breaſt-tranſom plates, and ſometimes to the axle-tree. But the nearer they are fixed on a level with the breaſts of the horſes the better. There are ſometimes hooks to the trail tranſom-plates, and ſometimes nails about four inches long. The waſhers have alſo hooks, to which are faſtened the ropes, by which the gunners or their aſſiſtants drag the gun along.

*A galloper-carriage* is for a pound and a half gun. *Fig.* 19 is an elevation of one, and *fig.* 20 a plan of one. The following are its dimenſions.

| | Feet | Inches |
|---|---|---|
| Total length of each ſhaft | 11 | 0.27 |
| From the fore end to the fore croſs-bar | 6 | 4.16 |
| From the hind end to the round part | 5 | 0.11 |
| Height at the hind end | 0 | 6.0 |
| Height at the fore end | 0 | 3.0 |
| Breadth behind and before | 0 | 3.5 |
| Breadth in the middle | 0 | 4.5 |
| Inſide width behind | 2 | 6.5 |
| Do. at the fore croſs-bar | 2 | 4.0 |
| Do. at the fore end | 2 | 1.0 |
| From the hind end to the axle-tree | 0 | 11.0 |
| Croſs bar from the hind end | 0 | 3.12 |
| Length of each cheek | 4 | 2.11 |
| Breadth of do. | 0 | 2.5 |
| Height of do. | 0 | 6.5 |
| Inſide width before | 0 | 8.0 |
| Do. behind | 0 | 11.5 |
| Total length of the axle-tree | 6 | 4.18 |
| Length of the body of do. | 3 | 6.5 |
| Length of each arm | 1 | 4.84 |
| Breadth of the body | 0 | 5.0 |
| Height of do. | 0 | 6.0 |
| Greateſt diameter of each arm | 0 | 5.0 |
| Leaſt diameter of do. | 0 | 3.3 |
| Diameter of each wheel | 4 | 3.13 |
| Length of the nave | 1 | 1.0 |
| Diameter of the body of do. | 0 | 11.0 |
| Diameter of the middle of do. | 1 | 0.0 |
| Do. of the linch of do. | 0 | 10.0 |
| Breadth of each ſpoke | 0 | 1.5 |
| Thickneſs of do. | 0 | 3.0 |
| Breadth of each felloe | 0 | 3.0 |
| Thickneſs of do. | 0 | 4.5 |

The reſt of the dimenſions not inſerted here may be taken from the draughts, *fig.* 19 and 20. A galloper-carriage is made with ſhafts to be drawn, as we have already obſerved, without a limber.

The dimenſions of limbers both for travelling and field-carriages are the ſame, and are the following.

| Nature of the guns. | 24 Pounder. | 12 Pounder | 6 Pounder. | 3 Pounder. |
|---|---|---|---|---|
| | Inc. | Inc. | Inc. | Inc. |
| Diameter of each wheel - - | 48 | 48 | 48 | 48 |
| Length of the nave - - | 16 | 15 | 14 | 10 |
| Diameter of the body of do. - | 13.5 | 13.5 | 12 | 12 |
| Do. of the middle of do. - | 14.0 | 14.0 | 13.0 | 12.5 |
| Do. of the linch of do. - - | 12.0 | 12.0 | 11.0 | 10.0 |
| Breadth of each felloe - - | 4.5 | 4.0 | 3.5 | 3.0 |
| Height of do. - - | 5.0 | 4.5 | 4.0 | 3.5 |
| Breadth of each ſpoke - - | 1.8 | 1.6 | 1.4 | 1.2 |
| Thickneſs of do. - - | 4.0 | 3.5 | 3.0 | 2.5 |
| The length of the axle-tree - | 78 | 76 | 74 | 69 |
| Length of the body of do. - | 40 | 40 | 40 | 43 |
| Height of the body of do. - | 7.6 | 7.0 | 6.0 | 5.5 |
| Breadth of the body of do. - | 6.0 | 5.5 | 5.0 | 5.0 |
| Length of each arm of do. - | 19 | 18 | 17 | 13 |
| Diameter of the body of do. - | 5 | 4 | 4 | 4 |
| Do. of the linch of do. - - | 4 | 3 | 3 | 3 |
| The length of each ſhaft - - | 94 | 94 | 94 | 94 |
| Breadth of hind end of do. - | 6 | 5.5 | 5 | 4 |
| Do. of fore end of do. - - | 3 | 3 | 2.5 | 2.5 |
| Height of hind end of do. - | 3.3 | 3 | 3 | 3 |
| Do. of fore end of do. - - | 3 | 3 | 2.5 | 2.5 |
| Length of the beams - - | 110 | 110 | 110 | 110 |
| Breadth of do. at hind end - | 4.5 | 4.0 | 3.5 | 3.0 |
| Do. of do. at fore end - - | 4.0 | 3.5 | 3.0 | 2.5 |
| The height of the bolſter - | 12.5 | 10.0 | 8.0 | 7.0 |
| The length of do. - - | 40 | 40 | 40 | 43 |
| The breadth of do. - - | 6 | 5.5 | 5.0 | 5.0 |
| Breadth of the fore croſs-bar - | 4.5 | 4.0 | 3.5 | 3.0 |
| The height of do. - - | 1.5 | 1.5 | 1.5 | 1.5 |
| Breadth of hind croſs-bar - | 3.5 | 3.5 | 3.5 | 3.0 |
| The height of do. - - | 1.5 | 1.5 | 1.5 | 1.5 |
| Diſtance of axle-tree from the fore croſs-bar - - - | 11.5 | 11.5 | 11.5 | 11.5 |

The ſhafts of limbers are about two feet open before, two feet ten inches in the middle, and a little leſs near the axle-tree according as the wood, out of which they are made, happens to be more or leſs crooked. For it ought never to be cut acroſs the grain for fear of weakening it too much. The height of the bolſter diminiſhes towards both ends, as in *fig.* 22. That given in the immediately preceding table is for the middle of it.

The following are the names of the irons, or pieces of iron-work in the ſhafts and beams of limbers with the number of each. See *fig.* 21, 22, and 23.

| | | |
|---|---|---|
| *a.* | Limber-bolt - - - - | 1 |
| *b.* | Shaft-rings - - - - | 2 |
| *c.* | Shaft-pins with chains - - - - | 2 |
| *d.* | Breech-hooks - - - - | 2 |
| *e.* | Ridge-chain with hook and loop - - - | 1 |
| *f.* | Limber-chain with hook and rings - - | 1 |
| *g.* | Single fore lock keys - - - | 4 |
| *h.* | Diamond-headed nails - - - | 8 |
| *k.* | Dog-nails - - - - - | 6 |
| *l.* | Bolſter-hoops - - - - - - | 2 |
| *m.* | The pintle - - - - - | 1 |
| *n.* | The pintle-waſhers - - - - | 2 |
| | Stubs for bolſter-hoops - - - - | 8 |

The irons, or pieces of iron-work in the wheels and axle-tree are the ſame in form and number as thoſe mentioned above, but ſomewhat lighter and ſmaller, and need not therefore be ſpecified.

*Howitzer-carriages* are for mounting and tranſporting howitzers on. Thoſe for the 6 and 5.8 inch howitzers are made with ſcrews for elevating or depreſſing them in the ſame manner as the light ſix pounders are elevated or depreſſed. For this reaſon they are made without a bed, and the centre-tranſom in each of theſe is nine inches broad, for fixing the ſcrew on inſtead of four, the breadth of it in thoſe that are without ſcrews. In them that is alſo between the trail and centre-tranſom, a tranſom-bolt, which is not in others, becauſe the centre-tranſom muſt be ſo made as to be taken out in order that the howitzer may be elevated to any angle under 90 degrees.

The iron-work of a howitzer-carriage is the ſame as that of a field-carriage, with this exception, that in it there are only four garniſh nails, viz. two of a ſide, becauſe it is ſo ſhort as not to admit of more. The wheels and axle-tree are the ſame as thoſe of an 18 and 12 pounder-carriage.

The following are the dimenſions of an eight-inch howitzer-carriage.

| | | Feet | In |
|---|---|---|---|
| The length of each check - - | | 8 | 5 |
| The thickneſs of do. - - - | | 0 | 4.5 |
| The height of do. before - - | | 1 | 6 |
| Do. of do. at the centre - - | | 1 | 4 |
| Do. of do. at the trail - - | | 1 | 2 |
| Length of the trail - - | | 1 | 3 |
| Height of the plank - - | | 1 | 6 |
| Diſtance from the head to the centre - | | 3 | 7 |
| Do. of trunnions from the head - - | | 0 | 9 |
| Breaſt-tranſom | Length - - - | 1 | 2.5 |
| | Height - - | 0 | 2 |
| | Thickneſs - - | 0 | 4.5 |
| Centre-tranſom | Length - - | 1 | 4.5 |
| | Height - - | 0 | 2.5 |
| | Thickneſs - - | 0 | 4.5 |
| Trail-tranſom | Length - - | 1 | 7 |
| | Breadth - - | 1 | 3 |
| | Thickneſs - - | 0 | 4.5 |

*Of mortar-beds.*

A mortar-bed anſwers for mounting a mortar on as a gun carriage does for mounting a cannon on. Land mortar-beds are commonly made ſolid, each of them conſiſting of four pieces of timber well ſecured and ſtrongly faſtened together with iron-work, except thoſe for royals and coehorns, each of which is made out of a ſingle block.

| Bores of the mortars and natures of the beds - - | | 13 Inch | 10 Inch | 8 Inch | 5.8 Inch | 4.6 Inch |
|---|---|---|---|---|---|---|
| | | Inc. | Inc. | Inc. | Inc. | Inc. |
| Lower bed | Length - | 84 | 66 | 50 | 0 | 0 |
| | Breadth - | 33 | 26 | 20 | 0 | 0 |
| | Height - | 13 | 10 | 9 | 0 | 0 |
| Upper bed | Length - | 83 | 65 | 49 | 31.5 | 28.5 |
| | Breadth - | 32 | 25 | 19 | 16 | 14 |
| | Height - | 13 | 12 | 11 | 10 | 9 |
| Breadth of quarter round - | | 3 | 2.5 | 2.5 | 0 | 0 |
| Do. of the ogee and fillet - | | 4 | 3.5 | 3 | 0 | 0 |
| The length of the cavity - | | 20 | 16 | 12 | 8 | 5.7 |
| Diſtance of the trunnion-holes from the fore end - | | 31 | 20 | 15.5 | 13.3 | 11.7 |
| The diameter of the trunnion-holes - - - | | 7.2 | 6.4 | 5.4 | 3.4 | 2.4 |
| The depth of the trunnion-holes - - | | 7 | 6 | 5 | 3.2 | 2.2 |

The diſtance of the trunnion-holes is meaſured from the quarter round, and not from the very end of the bed. The joint of the two pieces of the upper bed of a 13, 10 and 8 inch mortar-bed is ſo contrived as not to be directly over the joint of the two pieces in the lower bed.

The following are the names and numbers of the irons in a 13, 10, or 8 inch mortar bed. See *fig.* 24, 25, 26, and 27.

| | |
|---|---|
| *a.* Cap-ſquares - - - - | 2 |
| *b.* Eye-bolts - - - - | 2 |
| *c.* Joint-bolts - - - - | 2 |
| *d.* Under and upper bed-bolts - - - | 9 |
| *e.* Dowel-bars - - - | 4 |
| *g.* Rings with bolts - - - | 4 |
| *h.* Reſerve-bars - - - - | 2 |
| *k.* End rivetting plates - - - | 2 |
| *l.* Middle plate - - - - | 1 |
| *m.* Rivetting bolts - - - - | 6 |
| *n.* Square rivetting bolts - - - | 12 |
| *p.* Traverſing bolts - - - | 6 |
| *q.* Keys, chains, and ſtaples - - - | 2 |

Names and numbers of irons in a royal or coehorn bed.

| | |
|---|---|
| *a.* Cap-ſquares - - - - | 2 |
| *b.* Eye-bolts - - - - | 2 |
| *c.* Joint-bolts - - - - | 2 |
| *d.* Rivetting bolt with ring - - - | 1 |
| *f.* Handles with ſtarts - - - | 2 |
| *g.* Square rivetting plates - - - | 5 |
| *h.* Keys, chains, and ſtaples - - - | 2 |

Mr. Muller gives the following dimenſions for mortar beds to ſuit his general conſtruction of three kinds of mortars, ſuppoſing, as in his conſtruction of them, the diameter of the bore to be always divided into thirty equal parts, as a ſcale to go by.

| Diameter of the bore in each kind divided into | 30 equal parts. | | 30 equal parts. | | 30 equal parts. | |
|---|---|---|---|---|---|---|
| | Diameter of the bore. | Parts of the diameter. | Diameter of the bore. | Parts of the diameter. | Diameter of the bore. | Parts ot the diameter. |
| Lower bed: Length | 6 | 0 | 5 | 10 | 4 | 25 |
| Lower bed: Breadth | 2 | 10 | 2 | 2 | 1 | 26 |
| Lower bed: Thickneſs | 0 | 28 | 0 | 25 | 0 | 22.5 |
| Upper bed: Length | 5 | 28 | 5 | 8 | 4 | 23 |
| Upper bed: Breadth | 2 | 8 | 2 | 0 | 1 | 24 |
| Upper bed: Thickneſs | 0 | 28 | 0 | 25 | 0 | 22.5 |
| The breadth of the ogee | 0 | 6 | 0 | 5 | 0 | 4.5 |
| The breadth of the quarter round the fillet | 0 | 6 | 0 | 5 | 0 | 4.5 |
| The diameter of each of the trunnion holes | 0 | 14 | 0 | 13 | 0 | 12 |
| The depth of each of the trunnion holes - | 0 | 10 | 0 | 9.5 | 0 | 9 |
| The interval between them | 1 | 5 | 1 | 5 | 1 | 4 |
| The length of each of them | 0 | 15 | 0 | 14 | 0 | 13 |

The dimenſions of the firſt of theſe kinds of mortar beds correſpond nearly to thoſe of the mortar beds that have been generally in uſe.

The general dimenſions of the iron work for ſuch beds are the following:

| | Diameters of the bore. | Parts of the diameter divided into 30. | Diameters of the bore. | Parts of the diameter divided into 30. | Diameters of the bore. | Parts of the diameter divided into 30. |
|---|---|---|---|---|---|---|
| Of each cap ſquare - Length - | 1 | 18 | 1 | 14 | 1 | 9 |
| Of each cap ſquare - Breadth - | 0 | 12 | 0 | 10 | 0 | 8 |
| Of each cap ſquare - Thickneſs - | 0 | 3 | 0 | 2.5 | 0 | 2 |
| Fore end from the trunnion-hole - - | 0 | 16 | 0 | 14 | 0 | 13 |
| Of each eye-bolt-head Height - - | 0 | 8 | 0 | 7 | 0 | 6 |
| Of each eye-bolt-head Breadth - | 0 | 7 | 0 | 6 | 0 | 5 |
| Of each eye-bolt-head Thickneſs - | 0 | 3.5 | 0 | 3.5 | 0 | 3 |
| The diameter of each joint bolt head - | 0 | 11 | 0 | 8.5 | 0 | 7.5 |
| The thickneſs of ditto - - - | 0 | 3.5 | 0 | 3.5 | 0 | 3 |
| Diſtance from the trunnion-hole - - | 0 | 10.5 | 0 | 9.5 | 0 | 7.5 |
| The length of each traverſing-bolt - - | 0 | 23 | 0 | 20 | 0 | 16 |
| The diameter of the head of ditto - - | 0 | 4.5 | 0 | 3.5 | 0 | 3 |
| The diameter of the bolt itſelf - - | 0 | 3 | 0 | 2 | 0 | 2 |
| The diſtance from the end - - | 1 | 2 | 0 | 29 | 0 | 24 |
| Its diſtance from below - - - | 0 | 12 | 0 | 11 | 0 | 10 |
| Of the middle plate - Length - - | 2 | 8 | 2 | 0 | 1 | 24 |
| Of the middle plate - Breadth - | 0 | 9 | 0 | 7 | 0 | 6 |
| Of the middle plate - Thickneſs - | 0 | 1.6 | 0 | 1.5 | 0 | 1.5 |
| The length of the bed-bolt - - | 2 | 10 | 2 | 2 | 1 | 26 |
| The diameter of ditto - - - | 0 | 3 | 0 | 2.5 | 0 | 2 |
| The diameter of the ring - - - | 0 | 14 | 0 | 12 | 0 | 10 |
| The thickneſs of the ring - - | 0 | 3 | 0 | 2.5 | 0 | 2 |

| | Diameters of the bore. | Parts of the diameter divided into 30. | Diameters of the bore. | Parts of the diameter divided into 30. | Diameters of the bore. | Parts of the diameter divided into 30. |
|---|---|---|---|---|---|---|
| The diameter of each rivetting bolt | 0 | 3 | 0 | 2.5 | 0 | 2 |
| The diameter of the ring of ditto | 0 | 3 | 0 | 2.5 | 0 | 2 |
| Diſtance from the ends of the plates | 0 | 6 | 0 | 5 | 0 | 4 |
| Diameter of the bed bolts burs | 0 | 6 | 0 | 5 | 0 | 4 |
| Rivetting plates — Length | 1 | 27 | 1 | 19 | 1 | 14 |
| Rivetting plates — Breadth | 0 | 8 | 0 | 6 | 0 | 5 |
| Rivetting plates — Thickneſs | 0 | 1 | 0 | 1 | 0 | 1 |
| From the quarter-round | 0 | 8 | 0 | 6 | 0 | 5 |
| Diameter of the traverſing bolt-plates | 0 | 11 | 0 | 10 | 0 | 10 |

He ſuppoſes theſe mortars, contrary to what has been the common practice, to be ſo placed in their beds as to be moveable, and capable of being raiſed from an angle of 10 degrees to any under 90, and alſo the cavity in each bed to be ſo made as to receive the wedges for raiſing the mortar with.

*Sea-Mortar-beds* are likewiſe made ſolid with very ſtrong timbers but differ from the land-mortar-beds in point of form or figure, and have each of them a hole in the middle, or centre, for receiving the pintle-pin, or ſtrong iron bolt, round which the bed may turn. They are placed on ſtrong wooden frames fixed into the bomb ketches, to which the pintles are faſtened. The fore-part of a ſea-mortar-bed is an arc of a circle deſcribed from the centre of the pintle-hole.

The following are their dimenſions in inches. See *fig.* 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38 and 39.

| Diameters of the bores | 13 inch<br>inches. | 10 inch<br>inches. |
|---|---|---|
| The lengths of the beds | 94 | 84 |
| The breadths of the beds | 54 | 47 |
| The heights of the beds | 27 | 23 |
| Diſtances of the pintle-holes from the fore-ends | 39 | 32 |
| Diameters of the pintle-holes | 6.5 | 6.5 |
| Diſtances of the trunnions from the fore-ends | 46 | 42.5 |
| Diameters of the trunnion-holes | 10 | 8 |
| Depths of the trunnion-holes | 8 | 5 |
| Diameters of the circular beds | 59 | 59 |
| Heights of the circular beds | 8 | 6 |
| Diſtances to the bed bolſters | 16 | 15 |
| Depths of the cavities | 15 | 12 |
| Their openings above | 30 | 21 |
| The lengths of the bed-bolſters | 53 | 44 |
| Their lengths below | 29 | 22.1 |
| Their breadths | 14 | 12 |

And the names and numbers of the irons in both the 13-inch mortar-bed and 10-inch mortar-bed are the following.

| | |
|---|---|
| *a.* Cap-ſquares | 2 |
| *b.* Eye-bolts | 6 |
| *c.* Loop-bolts | 4 |
| *d.* Traverſing-bolts | 4 |
| *e.* Middle-plate | 1 |
| *f.* Rivetting-plate | 1 |
| *g.* Rivetting bolts | 6 |
| *h.* Croſs-bed bolts | 7 |
| *l.* Square rivetting plates for ditto | 7 |
| *k.* Down bed-bolts | 15 |
| *m.* Bed-bolſter plates | 2 |
| Keys, chains and ſtaples | 6 |
| Nails to the bed-bolſter bed | 4 |
| Bed-bolſter rings with loops | 2 |

*Tumbrels*, as we have already obſerved, are carriages with two wheels, only are commonly made uſe of for carrying tools for miners, artificers, and pioneers, and ſometimes the money of the army. The dimenſions of one are the following. See *fig.* 40 and 41.

| | inches. |
|---|---|
| The diameter of each wheel | 60 |
| The length of the nave | 15 |
| The diameter of the body of ditto | 12 |
| Ditto of middle of ditto | 13 |
| Ditto of linch of ditto | 10 |
| The breadth of each ſpoke | 2.2 |
| The thickneſs of ditto | 3.3 |
| The breadth of each of the felloes | 4.5 |
| The thickneſs of ditto | 3.5 |
| The length of the axle-tree | 76 |
| The length of the body of ditto | 42 |
| The breadth of ditto of ditto | 5 |
| The height of ditto of ditto | 6.7 |
| The length of each arm | 17 |
| The diameter of the body of ditto | 4.5 |
| Ditto of the linch of ditto | 3 |
| The total length of each ſhaft | 147 |
| The diſtance from the hind end of each to the croſs-bar | 7 |
| Ditto from the hind croſs-bar to the fore end | 62 |
| Diſtance from the fore-cut to the fore-end | 78 |
| The breadth of ditto behind | 4 |
| Ditto of ditto at the fore-cut | 4.5 |
| Ditto of ditto in the middle | 3.5 |
| Ditto of ditto at the fore-end | 2.3 |
| Height of ditto from the hind end to the fore-cut | 3.5 |
| Ditto of ditto at the fore-end | 2.3 |
| Inſide width behind and at the fore-cut | 34 |
| Ditto in the middle | 35 |
| Ditto at the fore end | 25 |
| Croſs-bars — Breadth | 3.5 |
| Croſs-bars — Thickneſs | 2 |
| Croſs-bars — Length | 31 |

| | | Inches. |
|---|---|---|
| Fore-cut | Length | 51 |
| | Breadth | 4 |
| | Thickneſs | 2 |
| Raves | Length | 62 |
| | Breadth | 2 |
| | Thickneſs | 3 |
| Standards | Length | 24 |
| | Breadth | 2.8 |
| | Thickneſs | 1.3 |
| Head-bars | Length | 36 |
| | Breadth | 1.2 |
| | Thickneſs | 1.8 |
| Uprights | Length | 22 |
| | Breadth | 1.3 |
| | Thickneſs | 3 |

And the following are the irons in one of them.

| The irons of a pair of wheels and axle-tree complete. | N° |
|---|---|
| Axle tree pins with rings and keys | 2 |
| Fore-cut pins | 2 |
| Breech-hooks | 2 |
| Shaft-rings | 2 |
| Shaft-pins with chains and ſtaples | 2 |
| Ridge chain with hook and loop | 1 |
| Bail ſtaples | 6 |

*Block-carriages*, as we have obſerved above, are chiefly for conveying mortars and their beds from one place to another.

The dimenſions of one of them are the following. See *fig.* 42, 43, and 44.

| | inches. |
|---|---|
| The height of each fore-wheel | 48 |
| The length of the nave | 15 |
| The diameter of the body of ditto | 14 |
| Ditto of the middle of ditto | 15 |
| Ditto of the linch of ditto | 13 |
| The height of each felloe | 5.5 |
| The breadth of ditto | 3.5 |
| The breadth of each ſpoke | 2 |
| The thickneſs of ditto | 3 |
| The height of each hind-wheel | 60 |
| The length of its nave | 17 |
| The diameter of the body of ditto | 14 |
| The diameter of the middle of ditto | 15 |
| The diameter of the linch of ditto | 13 |
| The height of each of its felloes | 6.5 |
| The breadth of each felloe | 4 |
| The breadth of each of its ſpokes | 4 |
| The thickneſs of each of its ſpokes | 2.3 |
| The total length of the fore axle-tree | 77 |
| The length of its body | 39 |
| The breadth of its body | 6.5 |
| The height of its body | 8 |
| The length of each of its arms | 19 |
| The diameter of the body of each of ditto | 6 |
| The diameter of the linch of each | 4 |
| The length of the bolſter | 49 |
| The breadth of the bolſter | 6.5 |
| The height of ditto | 7 |
| The total length of the hind axle-tree | 77 |
| The length of the body of ditto | 37 |
| The breadth of the body of ditto | 7 |
| The height of the body of ditto | 8.7 |
| The length of each arm of ditto | 20 |
| The diameter of the body of each of ditto | 6 |
| The diameter of the linch of ditto | 4.8 |
| The length of the bolſter | 47 |
| The breadth of the bolſter | 7 |
| The height of ditto | 8 |
| The length of each ſide-piece | 132 |
| The breadth of ditto | 6.5 |
| The height of ditto | 6.5 |
| The diſtance between the axle-trees | 72 |
| The ſide pieces project equally by | 24 |
| The length of each ſhaft | 96 |
| The breadth of each behind | 5.3 |
| The breadth of each in the middle | 6 |
| The breadth of each before | 3 |
| The length of the ſtraight bar | 19 |
| The opening behind | 28.5 |
| Ditto in the middle | 32.5 |
| Ditto before | 24 |
| The height of each ſhaft | 3 |
| The length of the rider | 46 |
| The breadth of the rider | 6.5 |
| The height of ditto | 8 |
| The interval between the ſide pieces | 12 |
| The ſide pieces are let into the rider and hind bolſter | 2 |

And the irons in ſuch a carriage are the following.

| Irons complete for wheels, axle-tree, and ſhafts. | N° |
|---|---|
| Iron bar for faſtening the hind axle-tree to the fore one | 1 |
| Bolts for fixing this bar to the axle-trees | 2 |
| Bolſter-bolts | 4 |
| Hooks faſtened to the ſide-pieces with two bolts and bars | 4 |
| Bar for faſtening the ſide pieces to the middle | 1 |
| Staples for the ſhafts and iron bands with loops | 2 |
| Loops, one faſtened to the rider, and another to the hind bolſter | 2 |

The principal uſe of a *truck carriage*, as we have already obſerved, is to carry timber and other heavy articles from one place to another, and ſometimes guns and mortars, where their own carriages cannot go.

The following are the dimenſions of one. See *fig.* 45, 46, 47, and 48.

| | Inches. |
|---|---|
| The length of the body of the fore axle-tree | 32 |
| The breadth of the body of do. | 5 |
| The height of the body of do. | 11.5 |
| The length of each arm of do. | 6.5 |
| The diameter of each arm of do. | 3 |
| The length of the body of the hind axle-tree | 32 |
| The breadth of the body of do. | 6 |
| The height of the body of do. | 7.8 |
| The length of each arm of do. | 6.5 |
| The diameter of each arm of do. | 3 |
| The length of each ſide-piece | 100 |
| The breadth of each ſide-piece | 10 |
| The height of each ſide-piece | 2.5 |
| The interval between them | 10 |
| Interval between the ſide-pieces and fore axle-tree | 15 |
| Ditto between the ſide-pieces and hind axle-tree | 15 |
| The length of the fore bolſter | 32 |
| The breadth of do. | 5 |
| The height of do. | 6 |
| The length of each ſhaft | 96 |
| The height of each ſhaft | 3.3 |
| The opening of do. near the bolt | 23 |
| Ditto in the middle | 35 |
| Ditto before | 24 |
| The breadth of each ſhaft before | 3 |
| The breadth of each in the middle | 4 |
| The breadth of each at the bolt | 3.5 |

Diſtance

| | | Inches. |
|---|---|---|
| Diſtance from the end to the ſtraight croſs-box | | 12 |
| Fore-guide | Length | 30 |
| | Breadth | 21 |
| | Height | 4 |
| | Interval | 10 |
| The diameter of each truck | | 25 |
| The thickneſs of each truck | | 4 |
| The breadth of the croſs-piece fixed to the fore end of the ſide-pieces | | 5 |
| The height of do. before | | 3 |
| The height of do. behind | | 1.5 |
| The breadth of the croſs-piece under the ſide-pieces behind the fore-boltter | | 10 |
| The thickneſs of do. | | 1.5 |

The plan and elevation of the carriage ſhew the iron-work ſufficiently.

The following are the dimenſions of a *ponton*, or *ponton carriage*.

| | | |
|---|---|---|
| The diameter of each wheel both behind and before | | 63 |
| The length of each nave | | 15 |
| The diameter of the body of do. | | 14 |
| The diameter of the middle of do. | | 15 |
| The diameter of the linch of do. | | 12 |
| The breadth of each felloe | | 4 |
| The height of do. | | 4.5 |
| The breadth of each ſpoke | | 2 |
| The thickneſs of do. | | 3.5 |
| The length of each axle-tree | | 86 |
| The length of the body of do. | | 46 |
| The breadth of the body of do. | | 6 |
| The height of the body of do. | | 8.5 |
| The length of each arm of do. | | 18 |
| The diameter of the body of each arm | | 6 |
| The diameter of the linch of do. | | 3.8 |
| The length of each of the under ſide-pieces | | 210 |
| The breadth of do. | | 7 |
| The height of do. | | 6 |
| The length of each of the upper ſide-pieces | | 206 |
| The breath of do. | | 5 |
| The height of do. | | 2.6 |
| Of the fore and hind croſs-bars | Breadth | 6.5 |
| | Height | 3.5 |
| | Length | 52 |
| The diſtance of the centre of the fore axle-tree from the fore end | | 10 |
| The diſtance of the centre of the hind axle-tree from the hind-end | | 9.3 |
| Opening between the upper ſide-pieces | | 51 |
| Ditto between the under ſide-pieces | | 18 |
| The diſtance of the fore-ſupporter from the fore-end | | 45 |
| The diſtance of the hind-ſupporter from the hind-end | | 32 |
| The height of each ſupporter | | 12 |

The *artillery-carriage*, commonly called a travelling forge, is the carriage of a ſort of portable ſmith's ſhop, at which all kind of ſmith's work is done in camp, and even on a march. Formerly it uſed to have but two wheels, and had wooden ſupporters to prop up the forge for working at when in the park of artillery. But now it has uſually four wheels, and is much more convenient.

The dimenſions of ſuch a carriage are the following.

| | Inches. |
|---|---|
| The height of each fore-wheel | 104 |
| The length of its nave | 14 |
| The diameter of the body of do. | 12 |
| The diameter of the middle of do. | 13 |
| The diameter of the linch of do. | 9 |
| The breadth of each felloe | 3 |
| The height of do. | 4 |
| The breadth of each ſpoke | 1.7 |
| The thickneſs of do. | 3 |
| The height of each hind-wheel | 64 |
| The length of its nave | 14 |
| The diameter of the body of do. | 12 |
| The diameter of the middle of do. | 13 |
| The diameter of the linch of do. | 9 |
| The breadth of each felloe | 4 |
| The height of do. | 3 |
| The breadth of each ſpoke | 1.7 |
| The thickneſs of do. | 3 |
| The total length of the fore axle-tree | 76 |
| The total length of the hind axle-tree | 76 |
| The length of the body of each | 42 |
| The breadth of the body of each | 6 |
| The height of the body of each | 7 |
| The length of each arm of each | 17 |
| The diameter of the body of do. | 5 |
| The diameter of the linch of do. | 3 |
| The total length of each ſhaft with the ſide | 203 |
| The breadth of do. behind | 4 |
| The breadth of do. in the middle | 4.5 |
| The breadth of do. before | 2.8 |
| The height of do. behind | 3 |
| The height of do. in the middle | 2.8 |
| The height of do. before | 2 |
| The opening between them before | 25 |
| Ditto in the middle | 35 |
| Ditto behind | 30 |
| The length of each rave | 124 |
| The breadth of do. | 3 |
| The height of do. | 6 |
| The length of each upright | 27 |
| The breadth of do. | 3 |
| The thickneſs of do. | 2.2 |
| The breadth of the fore croſs-bar | 3 |
| The thickneſs of do. | 2.2 |
| The breadth of the hind croſs-bar | 2 |
| The thickneſs of do. | 2.2 |
| Diſtance from the fore end to the fore axle-tree | 23 |
| Diſtance from the hind end to the hind axle tree | 14 |
| Diſtance between | 74 |

An *ammunition-waggon* is an artillery carriage for carrying all ſorts of military ſtores. It has four wheels, has its ſides railed in with ſtaves and raves, and is lined on the inſide with baſket or wicker-work. It carries 12 cwt. and is ſometimes employed for carrying bread. Its dimenſions are the following. See *fig.* 49, 50, 51, and 52.

| | |
|---|---|
| The height of each of the fore wheels | 48 |
| The length of its nave | 13 |
| The diameter of the body of do. | 12 |
| The diameter of the middle of do. | 14 |
| The diameter of the linch of do. | 10 |
| The height of each felloe | 4 |
| The breadth of do. | 3 |
| The breadth of each ſpoke | 1.5 |
| The thickneſs of do. | 3 |
| The height of each of the hind wheels | 60 |
| The length of its nave | 13 |
| The diameter of the body of do. | 12 |
| The diameter of the middle of do. | 14 |
| The diameter of the linch of do. | 10 |
| The breadth of each of its felloes | 3 |
| The height of each of do. | 4 |
| The breadth of each ſpoke | 1.8 |
| The thickneſs of do. | 3.5 |

The

| | | Inches. |
|---|---|---|
| The total length of the fore axle-tree | | 72 |
| The length of its body | | 40 |
| The breadth of its body | | 5 |
| The height or depth of its body | | 6 |
| The length of each of its arms | | 16 |
| The diameter of the body of do. | | 5 |
| The diameter of the linch of do. | | 3 |
| The total length of the hind axle-tree | | 70 |
| The length of its body | | 38 |
| The breadth of its body | | 6.5 |
| The height or depth of its body | | 6 |
| The length of each of its arms | | 16 |
| The diameter of the body of do. | | 5 |
| The diameter of the linch of do. | | 3 |
| The length of the fore-bolſter | | 49 |
| The breadth of do. | | 5 |
| The height or depth of do. | | 6 |
| The length of the hind-bolſter | | 46 |
| The breadth of do. | | 5 |
| The height or depth of do. | | 6 |
| The length of the rider | | 49 |
| The breadth of do. | | 5 |
| The height of do. | | 4.7 |
| Sommers and ſides | Length | 144 |
| | Breadth | 3 |
| | Height | 3 |
| The length of the pole | | 120 |
| Its ſquare before | | 4 |
| Its ſquare behind | | 3 |
| The length of the middle bar | | 40 |
| The breadth of do. | | 3.5 |

| Hind-guide | Length to the axle-tree | 28 |
| | Breadth at the head | 5 |
| | Square at the axle-tree | 3 |
| | Opening at the axle-tree | 24 |
| Fore-guide | Length to the axle-tree | 32.5 |
| | Breadth before | 5 |
| | Breadth behind | 4 |
| | Thickneſs | 3 |
| The length of the ſtraight part | | 20 |
| The length from the axle-tree to the hind end | | 28 |
| Opening | to receive the tongue | 4 |
| | near the axle-tree | 19 |
| | behind | 40 |
| The length of the ſweep-bar | | 50 |
| The breadth of do. | | 3.5 |
| The height or depth of do. | | 2.5 |
| The length of each rave | | 144 |
| The breadth of do. | | 2.2 |
| The height of do. | | 2.2 |
| The length of each ſlate ſtave | | 15.5 |
| The breadth of do. | | 2.5 |
| The thickneſs of do. | | 1 |
| The length of each ſhaft | | 67 |
| The length of the ſtraight part | | 10 |
| The breadth | behind | 3.2 |
| | at the fore ſhaft bar | 5 |
| | before | 3 |
| The thickneſs before | | 3.2 |
| Opening | at the ſhaft bolt | 15 |
| | at the fore ſhaft-bar | 21 |
| | in the middle | 30.5 |
| | before | 24 |
| The breadth of each ſhaft-bar | | 3 |
| The thickneſs of do. | | 2 |
| The length of the tongue | | 17 |
| The breadth of do. | | 3.6 |
| The thickneſs of do. | | 3 |
| The length of the guide-bar | | 50 |
| The breadth of do. in the middle | | 3 |
| The breadth of do. at the end | | 1.5 |
| The thickneſs | | 1.5 |
| The diſtance from the centre of one axle-tree to that of the other | | 89 |
| The ſommers reach | beyond the fore axle-tree | 10 |
| | beyond the hind | 38 |

The iron-work of ſuch a waggon.

| | No. |
|---|---|
| Pintle | 1 |
| Pole-pin | 1 |
| Bolſter-pins with keys | 4 |
| Locking-plates | 2 |
| Bail ſtaples | 16 |
| Sweep-bar pins | 2 |
| Shaft-bolt with key | 1 |
| Swing-tree pins | 2 |
| Hooks for do. | 2 |
| Bars for fixing the ſwing-tree to the axle-tree | 2 |
| Plate for the croſs-bar of the fore-guide | 1 |
| Waſhing-plates for the ſhafts | 2 |
| Bolſter bands | 4 |
| Pole plate | 1 |

With irons complete for the ſhafts, axle-trees, and the wheels, the dowledges excepted.

*Powder carts*, or *carriages*, are for carrying powder along with the army. Each of them is divided into four parts, by boards of an inch thick, which enter about an inch into the ſhafts. Only four barrels of powder are ſtowed in one of theſe carts. The roof of ſuch a cart is covered with oil-cloth, to prevent dampneſs from getting to the powder, and its dimenſions are the following: ſee *figs.* 53 and 54.

| | | Inches. |
|---|---|---|
| The diameter of each wheel | | 65 |
| The total length of each ſide with its ſhaft | | 180 |
| Diſtance from the hind end to the croſs-bar | | 5.5 |
| Diſtance from the hind croſs-bar to the fore croſs-bar | | 88.5 |
| Diſtance from the fore croſs-bar to the fore-end | | 77.5 |
| Breadth | behind | 3.3 |
| | at the fore croſs-bar | 4.4 |
| | in the middle | 3.7 |
| | before | 2.8 |
| Height | behind | 3 |
| | at the fore croſs-bar | 4 |
| | before | 2.8 |
| The opening behind and at the fore croſs-bar | | 34 |
| The opening at the middle | | 35 |
| The opening before | | 25 |
| Two ſhaft croſs-bars | Length of each | 34 |
| | Breadth | 2 |
| | Height | 3 |
| Under croſs-bars | Length of each | 40 |
| | Breadth | 3 |
| | Height | 2 |
| The length of each ſide piece | | 100 |
| The breadth of do. | | 13 |
| The height of do. | | 3 |
| Diſtance from the bottom, where the axle-tree paſſes through the ſide-pieces | | 3 |
| Diſtance from the ſhafts to the beginning of the roof | | 6 |
| The height of the roof | | 12 |
| The length of the lids or ſides | | 88 |
| The breadth of do. | | 10 |

| | Inches. |
|---|---|
| The thickneſs of do. | 1 |
| The length of the roof-ſides or lids | 88 |
| The breadth of do. | 11 |
| The thickneſs of do. | 1 |

| And the iron work is the following: | No. |
|---|---|
| *a*. Side bolts with ſcrews | 8 |
| *b*. Croſs bolts with ſingle keys | 2 |
| *c*. Double hinges for the ſhort lids | 6 |
| *d*. Staples and keys with chains | 4 |
| *e*. Hinges for roof-lids | 2 |
| *f*. Haſps, ſtaples, and keys for do. | 3 |
| *g*. Axle-tree pins with keys | 2 |

With irons complete for ſhafts, wheels and axle-tree.

A *ſling waggon* is an artillery carriage for moving mortars and heavy guns, from one place to another, at no great diſtance.

The following are the dimenſions of one: ſee *fig*. 55, 56, 57, and 58.

| | | Inches. |
|---|---|---|
| Side-pieces | Length | 152 |
| | Breadth | 6 |
| | Height | 7.8 |
| | Opening | 32 |
| | Exceed axle-tree | 10 |
| Interval between the centres of the axle-trees | | 123 |
| The height of each fore-wheel | | 48 |
| The length of its nave | | 14 |
| The diameter of the body of do. | | 13 |
| Do. of the middle of do. | | 14 |
| Do of the linch of do. | | 11 |
| The breadth of each of its felloes | | 3.8 |
| The height of do. | | 5.5 |
| The breadth of each of its ſpokes | | 2.2 |
| The thickneſs of do. | | 3.5 |
| The height of the hind-wheel | | 68 |
| The length of its nave | | 17 |
| The diameter of the body of do. | | 16 |
| Do. of the middle of do. | | 17 |
| Do. of the linch of do. | | 13 |
| The breadth of each of its felloes | | 4.4 |
| The height of do. | | 6 |
| The breadth of each of its ſpokes | | 2.3 |
| The thickneſs of do. | | 4 |
| The length of the fore axle-tree | | 75.5 |
| The length of the body of do. | | 41.5 |
| The breadth of the body of do. | | 5 |
| The height of the body of do. | | 8 |
| The length of each arm of do. | | 17 |
| The diameter of the body of each arm | | 5 |
| Do. of the linch of do. | | 3 |
| The length of the hind axle-tree | | 81 |
| The length of the body of do. | | 41 |
| The breadth of do. of do. | | 5 |
| The height of do. of do. | | 7 |
| The length of each of its arms | | 20 |
| The diameter of the body of each | | 5 |
| The diameter of the linch of each | | 4 |
| The length of the fore bolſter | | 41.5 |
| The breadth of do. | | 5 |
| The height of do. | | 12 |
| The length of the hind bolſter | | 51 |
| The breadth of do. | | 5 |
| The height of do. | | 11 |
| The length of the rider | | 54 |
| The breadth of do. | | 5 |
| The height of do. | | 7.2 |
| Of checks to ſupport the rack-work | the length below | 60 |
| | the length above | 22 |
| | the height | 20 |
| | the breadth | 6 |
| The length of each ſhaft | | 94 |
| Breadth | behind | 5.5 |
| | in the middle | 4 |
| | before | 3 |
| Opening | behind | 23 |
| | middle | 34 |
| | before | 25 |
| Thickneſs of the ſhafts | | 3 |

| And the iron-work of it is as follows: | No. |
|---|---|
| Cap-ſquares | 2 |
| Eye-bolts | 4 |
| Trunnion plates | 2 |
| Beam hooks | 2 |
| Iron to faſten the tooth-wheel | 1 |
| Rack-work with pland and handle | |
| Iron bar to ſtop the jack | 1 |
| Bolts with ſcrews to faſten the checks to the ſide-pieces | 8 |
| Hind axle-tree ſtays with bolts | 2 |
| Croſs-bar to faſten the ſide-pieces together | 1 |
| Hooks faſtened to the ſide-pieces with bolts and bars | 4 |
| Bolſter bolts with rings and keys | 4 |
| Pintle with band and waſher | 1 |
| Bolſter-hoops | 4 |
| Iron-work complete for ſhafts and wheels | |

And the following are the dimenſions of a *ſling cart*: ſee *figs*. 59 and 60.

| | | Inches. |
|---|---|---|
| The height of each wheel | | 60 |
| The length of its nave | | 15.5 |
| The diameter of the body of do. | | 14 |
| The diameter of the middle of do. | | 16 |
| The diameter of the linch of do. | | 12 |
| The breadth of each of its felloes | | 3.4 |
| The height of each of do | | 5.5 |
| The breadth of each of its ſpokes | | 2 |
| The thickneſs of each of do. | | 3 |
| The length of the axle-tree | | 77.5 |
| The length of its body | | 40.5 |
| The breadth of do. | | 5 |
| The height of do. | | 5.5 |
| The length of each of its arms | | 18.5 |
| The diameter of the body of each | | 5 |
| Do. of the linch of each | | 4 |
| The total length of each ſhaft | | 168 |
| From the centre of the axle-tree to the fore end | | 144 |
| Breadth of each from the hind end to the croſs-bar | | 7 |
| Do. of do. in the middle | | 5.5 |
| Do. of do. at the fore end | | 3.4 |
| The height of each ſhaft | | 3.6 |
| The breadth of each croſs-bar | | 4 |
| The thickneſs of do. | | 2 |
| Checks to ſupport the roller | length below | 28 |
| | above | 7 |
| | height | 9 |
| | thickneſs | 4 |
| | interval | 32 |
| Diameter of the roller | | 7 |
| From the centre of the axle-tree to the hind end | | 24 |

| And its iron-work is the following: | No. |
|---|---|
| Croſs bars | 2 |

| | |
|---|---|
| Round-headed nails to faſten the croſs bars - | 4 |
| Bolts with ſcrews to faſten the cheeks - | 7 |
| Iron-work complete for ſhafts and wheels. | |

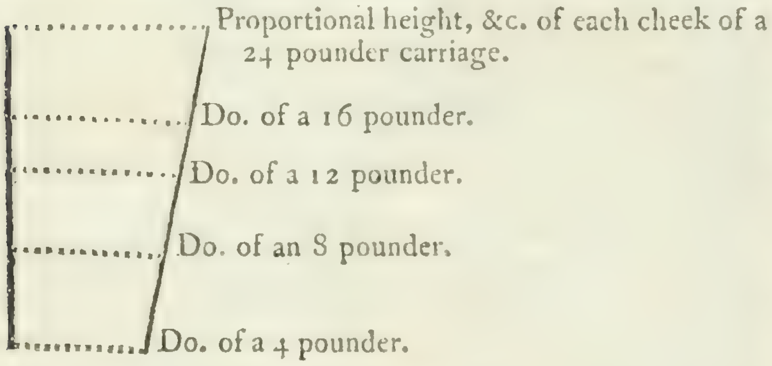
The French have been in the practice of uſing gun carriages on board their ſhips, or of having their *affuts de marins* with only two fore trucks, or roulettes pleines, to each, inſtead of ordinary wheels. Theſe carriages do not recoil ſo much as thoſe with four trucks, and are rather more eaſily pointed.

Their garriſon carriages uſed to be conſtructed a good deal in the ſame manner. But the trucks were made conſiderably larger than thoſe of their ſhip carriages, and conſiſted each of ſeveral pieces. They had alſo trails like travelling carriages, but much ſhorter.

Beſides theſe, they have travelling carriages, or *affuts a rouage*. Each of theſe conſiſts of two long cheeks of elm, rounded and ſhaped nearly as thoſe of one of our own travelling carriages, and like them are faſtened or joined together by means of four oak tranſoms, called by the French entretoiſes; the firſt of them, or breaſt tranſom, they call *entretoiſe de volée*; the ſecond, *entretoiſe de touche*; the third, *entretoiſe de mire*; and the fourth, which runs the whole length of the trail, or of thoſe parts of the cheeks that touch or reſt on the ground, *entretoiſe de lunette*. When ſuch a carriage with its gun is to be moved, a limber, or *avant train*, is faſtened to the trail of it.

*Fig.* 61. is an elevation in profile of one cheek of the travelling carriage called l'affut du capitaine Eſpagnol, repreſenting the relative dimenſions of the different parts.

The figure that follows repreſents the relative or proportional heights or depths of the heads of the cheeks of carriages for the five calibers of 24, 16, 12, 8, and 4 pounders, according to the French ordinance or regulation of 1732.



Carriage, in *Rural Economy*, in the practice of irrigation, a ſort of conduit made of timber or brick; if of the latter, an arch is turned over the ſtream that runs under it, and the ſides are bricked up; if of the former, which is commonly the caſe, it is conſtructed with a bottom and two ſides, as wide and as high as the *main* it lies in. It muſt be made very ſtrong, cloſe, and well jointed. Its uſe is to convey the water in one *main* over another, which runs at right angles with it; its depth and breadth are of the ſame dimenſions with the main it belongs to; its length in proportion to the breadth of the *main* it croſſes. Wherever it is neceſſary, it is the moſt expenſive conveyance belonging to the watering of land. See Irrigation, *and* Watering of Land.

Carriage *Drain*, a term applied to a furrow or trench, for the conveying of water to overflow and improve meadow land. Drains of this kind are diſtinguiſhed into two ſorts: the *main carriage*, which ſhould be made with a convenient deſcent; and the *leſſer carriage*, which ſhould be ſhallow, and as many in number as poſſible. Much in the watering of land depends upon their being properly laid out and formed.

Carriage alſo ſignifies the removal of goods, or other things from one place to another, eſpecially with a carr or cart.

Carriage alſo denotes the money or hire paid to a carrier, or other bearer of goods. See Carrier.

The carriage of letters is called *poſtage*. See Post.

Carriage *by ſea*, is denominated freight.

Carriage, *bill of*, *lettre du voiture*, among the French, denotes a paper given to a carrier, expreſſing the quantity and quality of the goods and parcels committed to him, partly to entitle him to receive his hire from the perſon to whom they are directed, and partly that this letter may ſhew whether all be brought, and whether in due time, and in the condition required.

Carriage is alſo uſed, in *Geography*, to denote the ſpace of ground, over which the inhabitants of New France, and other colonies of North America, who trade with the ſavages, uſually, by means of canoes, are obliged to carry their boats and proviſions, &c. on their ſhoulders. This they are forced to when they come to places in lakes or rivers, covered with willows, or otherwiſe rendered impracticable to paſs by water, till they meet with ſome new place, convenient for re-embarking.

CARRICK, or Carrig, the name of ſome towns, pariſhes, and headlands in Ireland, and the prefix to many more: it is ſuppoſed to ſignify a rock or ſtony place; and we accordingly find Carrick-fergus called alſo Knock-fergus and Cragfergus, all ſignifying the *rock of Fergus*.

Carrick, the name of a ſtrong fort on a rock near the town of Wexford, built by Fitzſtephens ſoon after his landing in Ireland, and afterwards enlarged and improved. Some time after, according to a note of Hooker's on Giraldus Cambrenſis, it was pulled down and deſtroyed, becauſe "it was not altogether ſufficient for a prince, and yet it was thought too good for a ſubject." The name is ſtill retained in the pariſh, and in a village called *Ferry Carrig*, where a wooden bridge was erected over the Slaney, by Samuel Cox, in 1795. It is two miles weſt from Wexford. Hollingſhed.

Carrick-*on-Shannon*, a poſt town of the county of Leitrim, Ireland, ſituated on the Shannon, and ſo called to diſtinguiſh it from the town mentioned in the following article. It was originally called *Carrick drum-ruſk*, but being planted by an Engliſh colony, and made a borough town, it acquired its preſent appellation. It is a ſmall place, not remarkable for any trade or manufacture; it is, however, the ſhire town of the county, and before the Union ſent two Members to Parliament. Its diſtance from Dublin is 77 miles N.W. N. lat. 53° 55'. W. long. 8° 1'.

Carrick-*on-Suire*, a market and poſt town of the county of Tipperary, Ireland, ſituated on the river Suire, between Clonmell and Waterford. The country in the neighbourhood is very beautiful, and the river being navigable for large ſloops gives it the benefit of a communication with Waterford by water. Formerly this was a walled town, and had a caſtle belonging to the Butler family, a branch of which takes the title of Earl from it. Before the bridge of Waterford was built, which is a late ſtructure, the bridge of Carrick was the neareſt paſſage to that city from Dublin, by land, which in times of diſturbance made it a very important paſs. For many years, however, it has been more remarkable for its woollen manufactures, eſpecially that of *ratteens*, which is carried on very extenſively. The town is irregularly built, but large and very populous; and the inhabitants are induſtrious. On the Waterford ſide of the river is the ſuburb of *Carrick-*

*Carrick-beg*, or *little* Carrick, which has ſome ruins, eſpecially of an old abbey. A ſteeple erected on one of the ſide walls of the church, is accounted a great curioſity, projecting about two feet over the wall, from which it takes its riſe in a point at twenty feet from the ground.

This town is mentioned by the abridger of Camden, in 1701, and called Carrick-mac-Griffin, but it is only of late years it has attained its preſent conſequence. Its diſtance from Dublin is 75 Iriſh miles S. by W. N. lat. 52° 20′. W. long. 7° 26′. Beaufort. Smith, &c.

CARRICKAMACHIN *Iſles*, a cluſter of ſmall iſlands and rocks off the coaſt of the county of Galway, Ireland, a few miles north of the Iſles of Arran. N. lat. 53° 13′. W. long. 9° 48′. M'Kenzie. Beaufort.

CARRICKAREDE. See Ballintoy.

CARRICKFERGUS, Cragfergus, or Knockfergus, *i.e.* the *rock of Fergus*, a market and poſt town of the county of Antrim, Ireland, on the northern ſhore of Carrickfergus Bay, or, as it is now uſually called, Belfaſt Lough. It was an early ſettlement of the Engliſh, and was deemed a place of great importance. In 1232, Hugh de Lacy, Earl of Ulſter, founded a monaſtery there, in the precincts of which he was buried a few years after. In the 14th century, when Edward Bruce invaded Ireland, his brother King Robert landed near Carrickfergus, and beſieged the caſtle; which held out ſo long that the garriſon were reduced to the neceſſity of eating leather, and ſurrendered only through want of food. In the reign of Henry the Seventh, this caſtle was one of thoſe which an act of Parliament declared ought to be only entruſted to Engliſhmen. It was not, however, 'till the government of ſir H. Sydney, in the reign of queen Elizabeth, that the adjoining town, the trade of which had become conſiderable, was ſurrounded with walls, and it was then made a corporation and endowed with many privileges. On the diviſion into counties, a large diſtrict was allotted to it, and it ſtill has a ſeparate juriſdiction. The mayor was alſo made admiral of the coaſt of Antrim and Down, and certain duties were paid to the corporation of Carrickfergus by veſſels going to any of the little neighbouring ports, excepting Bangor and Belfaſt. This privilege was purchaſed in the adminiſtration of lord Strafford, and the cuſtom-houſe transferred to Belfaſt. See Belfast. Lord Chicheſter, anceſtor of the preſent marquis of Donegal, having purchaſed the grant of the monaſteries at Carrickfergus about the year 1610, built a caſtle which was eſteemed ſplendid in thoſe days; but his attention ſeems to have been chiefly directed to the improvement of Belfaſt. Carrickfergus, however, continued a place of ſtrength, and as ſuch was taken poſſeſſion of by general Monk, on behalf of the Parliament of England. In the year 1690, it was the landing place of king William; but though it continues to have a governor regularly appointed, its fortifications have been ſuffered to decay. In 1759, Thurot, an adventurer, who commanded a ſmall French ſquadron, ventured to land here, and took hoſtages for the ranſom of the town, but he was ſoon obliged to retire, and his ſhips were taken or deſtroyed by the Engliſh. Carrickfergus is the aſſize town of the county of Antrim, and ſends one repreſentative to the Imperial Parliament. It is diſtant 88 Iriſh miles N. from Dublin, and 8 N. E. from Belfaſt. N. lat. 54° 43′. W. long. 5° 42′.

CARRICKHOULT, a bay or anchorage on the county of Clare ſide of the river Shannon, Ireland, near its mouth. This bay has clear ground, and good anchorage between Carrickhoult caſtle and Kilcadraan points. N. lat. 52° 33′. W. long. 9° 36′. Mackenzie.

CARRICKMACROSS, a market and poſt town of the county of Monaghan, Ireland, near the boundary of the county of Louth. From its being mentioned by Stanihurſt, it muſt be a place of antiquity, but does not appear to have been of much conſequence. It is now an improving town and a vein of good coal diſcovered near it will probably contribute to the eſtabliſhment of ſome manufacture, eſpecially as there is plenty of water, and a poſſibility of obtaining water carriage to Dundalk at no great expence. It is 44 Iriſh miles N. by W. from Dublin. N. lat. 53° 57′. W. long. 6° 43′.

CARRIER, a perſon who undertakes to convey perſons, goods, papers, money, or the like, from place to place, on condition of a certain price, either fixed by authority or cuſtom, or left to private agreement. See Carriage.

In Holland *carriers* are called *routiers*, becauſe they always keep the ſame road, or route; ſetting out, and arriving at fixed hours.

All perſons carrying goods for hire, as maſters and owners of ſhips, lightermen, ſtage-coachmen, (but not hackney-coachmen in London) and ſuch like, are legally comprehended under the denomination of common carriers, and are chargeable on the general cuſtom of the realm for their faults or miſcarriages. See Bailment. In an action on the caſe againſt the maſter of a ſtage-coach, it was adjudged that he was not chargeable (e. g. for a trunk loſt) unleſs the maſter takes a price for the carriage of the goods as well as for the carriage of the perſon, in which caſe he is within the cuſtom as a carrier; but by the cuſtom and uſage of ſtages, every paſſenger pays for the carriage of goods above a certain weight; and then the coachman ſhall be charged for the loſs of goods beyond ſuch weight. If a common carrier loſes goods which he is entruſted to carry, a ſpecial action in the caſe lies againſt him, on the cuſtom of the realm; and ſo of a common carrier by boat. 1 Rol. Abr. 6. An action will lie againſt a porter, carrier, or bargeman, upon his bare receipt of the goods, if they are loſt by negligence. 1 Sid. 36. Alſo, if a lighterman ſpoils goods which he is to carry, by letting water come to them, an action on the caſe lies againſt him on the common cuſtom. Palm. 528. If a carrier entruſted with goods opens the pack, and takes away any part of its contents, he is guilty of felony. H. P. c. 61. And it is the ſame alſo if a carrier receives goods to carry them to a certain place, and carries them to ſome other place, with intent to defraud the owner. 3 Inſt. 607. If a common carrier, having convenience and being offered his hire, refuſes to carry goods, he is liable to an action. 2 Show. Rep. 327. But he may refuſe to admit goods into his warehouſe at an unſeaſonable time, or before he is ready to take his journey. Lord Raym. 652. A common carrier may have action of trover or treſpaſs for goods taken out of his poſſeſſion by a ſtranger; and where goods are ſtolen from a carrier, he may bring an indictment againſt the felon as for his own goods; and the owner may likewiſe prefer an indictment againſt the felon. Kel. 39. By ſtat. 3 Car. 1. c. 1. carriers are not to travel on the Lord's day on pain of 20s. By 3 W. and M. c. 12. the juſtices are annually to aſſeſs the price of land carriage of goods that are to be brought into any place within their juriſdiction by any common carrier, who is not to take more, under the penalty of 5l. And by 21 Geo. II. c. 28. §. 3. a carrier is not to take more for carrying goods from any place to London than the juſtices have ſettled for the carrying of goods from London to ſuch a place, under the ſame penalty. This act of 21 Geo. II. c. 28. ſtands repealed by 7 Geo. III. c. 40. ſo much of it excepted as relates to the price or rate for carriage of goods; and the 7 Geo. III. c. 40. (except ſo much as repeals the ſeveral acts within-mentioned) was repealed by 13 Geo. III. c. 78. §. 83. By 24th Geo. II. c. 8. §. 9. commiſſioners for regulating the navigation of the river Thames are to rate the price of water-carriage; and by 30 Geo. II. c. 22. §. 3. juſtices of the city of London are to aſſeſs the rates of carrying goods between London and Weſtminſter. By 13 Geo. III. c. 78. carriers and waggoners are to write or paint on their waggons or carts their names and places of abode; and the owner of every common ſtage, waggon, or cart, travelling from town to town, ſhall paint "common ſtage waggon or cart," as the caſe may be, under the pain of forfeiting not more than 5l. nor leſs than 20s.

At common law a carrier is liable by the cuſtom of the realm to make good all loſſes of goods entruſted to him to carry; except ſuch loſſes as ariſe from the act of God, or inevitable accident; from the act of the king's enemies; and from the default of the party ſending them. 1 Inſt. 89. 2 Lord Raym. 909. Eſp. N. P 619. But, in order to charge the carrier, the following circumſtances are to be obſerved, 1. The goods muſt be loſt while in the poſſeſſion of the carrier himſelf, or in his ſole care. 2. The carrier is liable only ſo far as he is paid, for he is chargeable by reaſon of his reward. 3. Under a ſpecial or qualified acceptance the carrier is bound no further than he undertakes; and, therefore, it ſeems ſafeſt, that in all inſtances of ſending things of value by a carrier, the carrier ſhould have notice and be paid accordingly. 4. A delivery to the carrier's ſervant is a delivery to himſelf, and ſhall charge him; but they muſt be goods, ſuch as it is his cuſtom to carry, not out of his line of buſineſs, Salk. 282. 5. Where goods are loſt, which have been ſent on board a ſhip, the action may be brought either againſt the maſter or againſt the owner. 2 Salk. 440. 6. It is not neceſſary in order to charge the carrier that the goods are loſt in *tranſitu*, while immediately under his care; for he is *bound to deliver them* to the conſignee, or ſend notice to him according to the direction; and though they are carried ſafely to the inn, yet if left there till they are ſpoiled, and no notice given to the conſignee, the carrier is liable. *3* Wilſ. 429. 2 Bl. Rep. 916. Jacob's Dict. by Tomlins.

Carrier *pigeon*, a ſort of pigeon uſed, when properly trained up, to be ſent with letters from one place to another. This is the Columba *Tabellaria* of the Linnean ſyſtem.

It is larger in ſize than moſt of the other kinds. Its length from the tip of the beak to the end of the tail being often fifteen inches; but its greateſt weight not twenty ounces. Its fleſh is firm and its feathers cloſe; it is long-necked, and of a better ſhape than moſt other pigeons. The upper chap of the bill is half covered from the head with a white or blackiſh tuberous furfuraceous fleſh, which projects or hangs over both its ſides, on the upper part neareſt the head, and ends in a point about the middle of the bill. This is called the *wattle*. The eyes are ſurrounded with the ſame ſort of corrugated fleſh for the breadth of a ſhilling, and their iris is red. Their beak is long, ſtraight, and thick; their wattle generally broad acroſs the beak, ſhort from the head toward the point, and tilting forward from the head; and the head narrow, long, and flat; the neck very long and thin, and the breaſt broad; the feather is chiefly black or dun, though there are blues, whites, and pyed.

It has its name from its remarkable ſagacity in returning to the place where it was bred, though carried to great diſtances; from which property it was made uſe of to carry letters to diſtant places, as a ſpeedy and ſafe method of conveyance.

They were trained to this method in Turkey and Perſia, and were carried firſt, while young, ſhort ſlights of half a mile, and afterwards more, till at length they would return from the fartheſt part of the kingdom. Every baſhaw had a baſket of theſe pigeons, bred at the ſeraglio, which, upon any emergent occaſions, as an inſurrection, or the like, he diſpatched with letters, braced under their wings, to the ſeraglio, only ſending out more than one, for fear of accidents. Lightow aſſures us, that one of theſe birds would carry a letter from Babylon to Aleppo, which is thirty days journey, in forty-eight hours. This pigeon was employed, in former times, by the Engliſh factory, to convey intelligence from Scanderoon, of the arrival of the Company's ſhips in that port, the name of the ſhip, the hour of her arrival, and whatever elſe could be comprifed in a ſmall compaſs, being written on a ſlip of paper, which was ſecured in ſuch a manner under the pigeon's wing as not to impede its flight; and her feet were bathed in vinegar, with a view to keep them cool, and prevent her being tempted by the ſight of water to alight, by which the journey might have been prolonged, or the billet loſt. The pigeons performed this journey in 2½ hours. The meſſenger had a young brood at Aleppo, and was ſent down in an uncovered cage to Scanderoon, from whence, as ſoon as ſet at liberty, ſhe returned with all poſſible expedition to her neſt. At the ſeaſon of the arrival of the annual ſhips, it was uſual to ſend pigeons to be ready at the port. Some have aſſerted that the pigeon was at once ſent down to Scanderoon in a cage; but others with greater probability affirm, that ſhe was taught by degrees to fly from ſhorter diſtances on the Scanderoon road. It is alſo ſaid, that the pigeons, when let fly from Scanderoon, inſtead of bending their courſe towards the high mountains ſurrounding the plain, mounted at once directly up, ſoaring ſtill almoſt perpendicularly till out of ſight, as if to ſurmount at once the obſtacles intercepting their view of the place of their deſtination.

The cuſtom of carrying on a correſpondence between Aleppo and Scanderoon by means of pigeons was common in M. D'Arvieux's time. Mem. T. v. p. 496. Maillet, in his "Deſcription de l'Egypt," vol. ii. p. 271, has given a very circumſtantial account of this mode of conveying intelligence; and he alſo relates a ſtory of a pigeon diſpatched from Aleppo to Scanderoon, which, miſtaking its way, was abſent for three days, and in that time had made an excurſion to the iſland of Ceylon; a circumſtance then deduced from finding green cloves in the bird's ſtomach, and credited at Aleppo. Baumgarten mentions the flying of pigeons in his time (1504) in Egypt. Sir John Mandeville alſo mentions it in his Travels. In the time of the holy war, certain Saracen ambaſſadors who came to Godfrey of Antioch from a neighbouring prince, ſent intelligence to their maſter of the ſucceſs of their embaſſy, by means of pigeons, fixing the billet to the bird's tail. Bochart has collected numerous authorities for the antiquity of this cuſtom both in Syria and Greece, (vol. ii. p. 15,) and more reſpecting its antiquity may be found in Pennant's Britiſh Zoology. Hirtius and Brutus, at the ſiege of Modena, held a correſpondence with one another by means of pigeons. And Ovid tells us, that Tauroſthenes, by a pigeon ſtained with purple, gave notice to his father of his victory at the Olympic games, ſending it to him at Ægina. Ælian. Var. Hiſt. lib. ix. cap. 2. Pliny, lib. x. cap. 24. Anacreon tells us, that he conveyed a billet-doux to his beautiful Bathyllis, by a dove. Ode 9. The uſe of pigeons, as couriers between Aleppo and Scanderoon, and alſo Bagdad, has been diſcontinued for the laſt 40 or 50 years, becauſe the Curd robbers killed the pigeons. See Dragoon and Horseman.

CARRIERA, Rosalba, in *Biography*, an eminent female painter, was a native of Chiozza, in the Adriatic, where ſhe was born, in 1675; and being deſtitute of perſonal charms, ſhe gave ſcope to her mental abilities. Having manifeſted an early taſte for painting, her father procured for her the inſtruction of an artiſt, from whom ſhe learned to paint full ſize in oil; but afterwards ſucceeding in miniatures, ſhe confined herſelf to this branch of the art, and carried crayon painting to a high degree of perfection. Her portraits, ſpread all over Europe, are as elegant and graceful in conception and attitude, as they are freſh, neat, and alluring in colour. Her Madonna, and other religious ſubjects, blend dignity, and even majeſty, with grace. Her reputation was very widely extended; and whilſt ſhe exhibited ſpecimens of her ſingular ſkill in Italy, at Paris, and Vienna, ſhe received diſtinguiſhed marks of reſpect and eſteem. She lived with diſtinction in her native country, and her works were eagerly ſought by the curious in diſtant nations. Inceſſant application deprived her of ſight during the laſt ten years of her life. She combined muſic with painting; and at the advanced age of 82 years, cloſed her life, in 1757, after having amaſſed conſiderable property of her own acquiſition. D'Argenville. Pilkington, by Fuſeli.

CARRIERE. See Career.

CARRION, in *Geography*, a river of Spain, which joins the Piſuenga, near Duennas.

Carrion *di los Condes*, a town of Spain, ſeated on the river Carrion, in the province of Leon, on the frontiers of Old Caſtile; containing 10 pariſh churches, 10 convents, and 2 hoſpitals; 14 leagues W. of Burgos.

CARROBALISTA, in the *Ancient Military Art*, denotes a ſpecies of *baliſta*, mounted on wheels, and drawn by horſes; by which it differed from the *manubaliſta*, which, being leſſer and lighter, was thrown by the hand.

CARROCIUM, or Carrocerum, in *Middle Age Writers*, denotes the banner, or chief flag of an army, which was mounted on a kind of chariot, and drawn by oxen.

CARROCK, in *Geography*, a mountain of England, in the county of Cumberland, 2265 feet above the level of the ſea.

CARRODUNUM, in *Ancient Geography*, a town of Germany, according to Ptolemy, ſuppoſed to be the preſent Radom, in the palatinate of Sendamir.—Alſo, a town of Vindelicia, ſuppoſed to be the preſent Crainburg, on the Inn.—Alſo, a town of Upper Pannonia, which the interpreters of Ptolemy ſuppoſe to be the preſent Carnburg, on the banks of the Rab.—Alſo, a town of European Sarmatia, ſeated on the river Tyras. Ptolemy.

CARROG, a river of Wales, which runs into the ſea, about 4 miles S.W. from Caernarvon.

CARRON, a river of Scotland, which runs into the ſea, near Stonehaven, in the county of Kincardine.—Alſo, a ſmall river of Scotland, which riſes about the middle of the iſthmus between the friths of the Forth and Clyde, and, after a courſe of about 14 miles, dividing the county of Stirling into two nearly equal parts, falls into the Forth, three miles E. from the Carron works, in the county of Stirling. This river ſeems to have been the boundary of the Roman province in North Britain; Antoninus's wall being in the vicinity of this river, and running parallel to it for ſeveral miles. This opinion is rendered probable by the ſituation of "Arthur's Oven," as it is called, which is ſuppoſed to have been a temple dedicated to Terminus, and erected near the Roman frontier. It ſtood on the weſt ſide of the river Carron, or between that river and Kinnaird. The moſs of Kinnaird, which was without doubt formerly united to that of Froſk, is diſtant only one mile and a half from the river, and the moſs of Kincardine is only twelve miles diſtant from the ſtation at Camelon. Foreſts, therefore, in either of theſe places, would have afforded very convenient refuge to the Caledonians, whether they were making incurſions into the Roman province, or haraſſing the Roman armies in their expeditions towards the north. Beſides, that a people more civilized than the ancient Caledonians muſt have been in this country before the moſs of Kincardine exiſted, is completely eſtabliſhed by the diſcovery of a road on the ſurface of the clay at the bottom of that moſs, after the peat, to the depth of eight feet, had been removed. The direction of this road is from the Forth acroſs the moſs towards a road, ſuppoſed to be Roman, which paſſes between the moſs and the river Teith. Theſe roads probably communicated, and were parts of the military works of the Romans, and deſigned for the uſe of the troops employed to repel the incurſions made by the Caledonians from the mountains into the Roman province. A paſſage in Herodian favours the opinion here advanced. That hiſtorian (lib. iii. cap. 48.) mentions the army of Severus paſſing τα προβεβλημενα ῥευματα τε και χωματα της Ρωμαιων αρχης. He adds, that on this frontier the Barbarians uſually made their eſcape, "and concealed themſelves in the thickets and marſhes." Edinb. Tranſ. vol. iii. p. 276. Near the middle of the courſe of this river, in a pleaſant valley, ſtand two beautiful mounts, called the "hills of Dunipace," which are now planted with firs, and between which is ſeated the church of Dunipace. Tradition reports, that theſe mounts were raiſed as monuments of a peace concluded in that place between the Romans and Caledonians, and that their name is compounded of the language of both people; *dun*, ſignifying a hill in the old language of this iſland, and *pax*, peace, in the language of Rome: ſo that Dunipace denotes "the hills of peace." Others, however, have ſuppoſed that they are ſepulchral monuments, which is an opinion, not improbable. See Barrow. As this river runs ſo near the boundary of the Roman province, if it be not itſelf the preciſe boundary, the adjacent country muſt unavoidably be the ſcene of many rencounters and battles. Accordingly, hiſtorians mention a bloody battle fought near this river between the Romans and the confederate army of the Scots and Picts in the beginning of the 5th century; and the tranſlator, or the author, of Oſſian's poems lays the ſcenes of ſome of them upon the banks of this river. About the diſtance of half a mile from the river, and near the town of Falkirk, lies the field of that battle which was fought by William Wallace and the Engliſh, in the beginning of the 14th century. It bears the name of "Graham's Muir," from the valiant John Graham, who fell there, and whoſe grave-ſtone is ſtill to be ſeen in the church-yard of Falkirk.

Carron, a village of Scotland, in the county of Stirling, ſeated on a river of the ſame name; celebrated for its extenſive iron forges; two miles N. of Falkirk, and three miles above the entrance of the Carron into the frith of Forth. The river is navigable for ſome miles from its mouth, and a conſiderable trade is carried on upon it by ſmall craft; for the convenience of which its channel has of late years been ſtraightened and much ſhortened, and the great canal is connected with it by a cut and lock. See *Forth and Clyde* Canal. The Carron ore is deſcribed by Mr. Kirwan, (Miner. vol. ii. p. 174.) as being an argillaceous ſtone, of a bluiſh grey, internally of a dark ochre yellow. It is found in ſlaty maſſes, and in nodules, in an adjacent coal-mine, of which it ſometimes forms the roof. At the Carron-works, this ore is often ſmelted with the red greaſy iron ore from Ulverſton, in Lancaſhire, which imparts eaſier fuſion, and ſuperior value. Theſe works, which have attained ſuch diſtinguiſhed celebrity, were firſt eſtabliſhed principally under the direction of Dr. Roebuck, an ingenious chemiſt and phyſician of Birmingham, and by means of a capital furniſhed by his relations and friends, as well as thoſe of his aſſociate Mr. Garbet, in addition to their own. After a careful and minute compariſon of the advantages and diſadvantages of different ſituations in Scotland, he made choice of a ſpot, on the banks of the river Carron, as the moſt advantageous ſituation for the eſtabliſhment of the propoſed iron manufacture. There he found they could eaſily command abundance of water for the neceſſary machinery; and in the neighbourhood of it, as well as every where along both the north and ſouth coaſts of the Frith, were to be found inexhauſtible quarries of iron ſtone, lime-ſtone, and coal. From Carron alſo, they could eaſily tranſport their manufactures to different countries by ſea. The communication with Glaſgow, at that time, by land-carriage, which opened to them a ready way to the American market, was ſhort and eaſy. To aid him in the execution of his undertaking, he engaged the co-operation of Mr. Smeaton, then the firſt engineer in England, and alſo of Mr. James Watt, then of Glaſgow, but ſince better known for his inventive genius in the mechanic arts, both in Scotland and England. The neceſſary preparations for the eſtabliſhment of the iron-works at Carron were finiſhed towards the cloſe of the year 1759; and on the firſt of January, 1760, the firſt furnace was blown; and in a ſhort time afterwards a ſecond was erected. See the article Roebuck. For the extenſion and improvement of this foundery, about 100 acres of land have been converted into reſervoirs and pools, for water diverted from the river Carron, by magnificent dams built about two miles above the works, which, after turning 18 large wheels for the ſeveral purpoſes of the manufacture, falls into a tide-navigation that conveys its produce to the ſea. For a further account of the machinery of theſe works, the number of its furnaces, the annual amount of iron ſmelted, &c. &c. ſee Blast *Furnace*. See alſo Cannon. The preſent proprietors of this foundery are a chartered company, with a capital of 150,000l. ſterling, a common hall, &c.; but their ſtock is confined to a few individuals.

CARRONADE, in the *Military Art*. See Cannon.

CARROOR, in *Geography*, a town and fort of Hindooſtan, in the country of Myſore, and province of Coimbetore, ſeated on the Ambravetty; evacuated by the troops of Tippoo Sultan, on the 15th of June, 1790, when general Meadows, commander of the Britiſh forces, took poſſeſſion of it, and made it a depôt for proviſions; 38 miles W. of Trichinopoly. N. lat. 10° 57′. E. long. 78° 12′.

CARROT, in *Botany*. See Daucus *carota*.

Carrot, in *Gardening*. See Daucus.

Carrot, in *Huſbandry*, is a large well-known tap-rooted plant, which, at preſent, is much employed in the feeding of different ſorts of live ſtock; in which view it is a root of conſiderable utility and importance to the farmer. It is, however, only within theſe few late years that its application in this intention has been carried to any extent in this country. It was probably firſt introduced into field culture in the ſouthern parts of the iſland from the Low Countries. There are ſeveral varieties of this valuable plant, but that which is the moſt proper for being cultivated in the field for the above uſe is that which is uſually termed the *orange carrot*, in which the colour of the root is of a much more dark orange appearance than in any of the others; and, beſides, it riſes to a much larger ſize, and is more ſaccharine and juicy. See Daucus.

This ſort of crop is capable of being cultivated probably to the greateſt advantage on the warm, light, loamy, or ſandy ſoils; but it ſucceeds well on other kinds, as on gravelly lands. Mr. Young properly remarks, that the proper ſort of ſoil "ſhould not be miſtaken through common notions, or confined to a compaſs much within the reality. It is, ſays he, a general idea, that nothing but ſands will do for carrots, but this is a miſtake, the beſt ſoil for them is a ſandy loam, rather light, but moiſt, of a great depth; in which there is little difficulty in ploughing to the very beam of the plough, all the ſoil brought up being of the ſame kind, and as fit for vegetation as the ſurface." But, though he conſiders this ſort of ſoil as the moſt perfectly adapted to this kind of crop, "it will, he conceives, thrive to great profit on the heavier loams, but not on wet ones, or clays. On good wheat loams of the gravelly kinds that plough eaſily they do well. At firſt ſight, he ſuppoſes, they might, perhaps, be thought too ſtiff; but they will yield large carrots, though the expences of cultivation will run higher in cleaning the ground, &c."

In the preparation of the land for this ſort of crop much tillage is by ſome conſidered unneceſſary: "the beſt culture of carrots is," ſays the above author, "to let the barley or wheat ſtubble lie till you plough and ſow, putting them in on one earth." But others are inclined to more tillage, and think that on whatever ſort of ſoil this root may be grown, or after whatever kind of crop, the ground ſhould conſtantly be ploughed as deep as poſſible in October, a ſecond time in dry weather in February, and a third in March, for the reception of the ſeeds. By ploughing the land deep in October, two beneficial purpoſes are, they ſuppoſe, anſwered; the new ſoil is expoſed to the influence of the winter's froſts, by which it is mellowed and rendered more fit for nouriſhing the plants; and the roots of the carrots are enabled, with more freedom, to puſh downwards, a circumſtance of conſiderable importance in this kind of huſbandry; for, if the roots meet with any obſtruction in getting down, they are apt to grow forked, and throw out lateral roots, by which the crop is injured in a very material degree. Mr. Young, however, only conceives the ſecond ploughing in February neceſſary, in caſes when the ſurface mould is not expected to be in a ſtate of ſufficient fineneſs at the period of ſowing. When the laſt ploughing or ſeed-furrow in March has been given, the land ſhould be harrowed, and the ſurface made as fine as poſſible for the ſeed to be put in upon.

Though it is not abſolutely neceſſary to make uſe of manure for this ſort of crop, as good carrots may be grown without it, it is plain, from the numerous trials which have been made and recorded in different works, that it is only by the liberal application of it, that the largeſt quantity of produce can be afforded. Where it is applied it ſhould be turned into the ground in a well-rotted ſtate during the laſt ploughing in March.

At this period the ſeed ſhould be ſown in an even manner over the ſurface, in the proportion of five pounds to an acre, and harrowed in immediately in a light way. Mr. Young, however, adviſes, that where the land is ſufficiently fine and mellow at the time of ploughing, in February, and proper for being harrowed upon, not to omit ſowing upon that ploughing, "for, although March is the common ſeaſon, the uncertainties of the weather are ſuch, that the ſtate of the land, in moſt caſes, requires a greater attention than the name of the month; and carrot ſeed, let the weather be ever ſo ſevere, will take no harm. It may, ſays he, be ſown without danger in November. In caſe March turns out very wet, and the ſowing is driven into April, it is twenty to one that the crop will ſuffer." About the 25th of March is, however, the time moſt generally obſerved in the Suffolk practice.

In regard to the ſeed, it has been recommended by the author of "Practical Agriculture," for cultivators to be careful in ſaving it, by ſelecting ſome of the beſt and moſt perfectly formed roots annually of the preceding year's growth, and ſetting them out ſeparately in the beginning or middle of March, in an open piece of ground for the purpoſe. The ſeed in this way will be ready in Auguſt; by which means the farmer will always be in poſſeſſion of ſuch good freſh ſeed as may be fully depended upon; which can ſeldom or ever be the caſe where it is purchaſed. As this ſort of ſeeds is liable to adhere or cling cloſe together, it is almoſt impoſſible to ſow them with any degree of regularity or exactneſs, without adopting ſome method of ſeparating them, before they are made uſe of in the way of ſeed. With this intention the beſt mode is probably that of mixing them with ſome ſort of material that may render them more capable of being diſperſed over the land, ſuch as ſaw-duſt, bran, or a light kind of dry ſand, uniting the whole well by rubbing them together. By this means the ſeeds may be ſo diſengaged and ſeparated from each other, as to enable the ſeedſman to ſcatter them with much more evenneſs over the ſurface of the ground. There is alſo another improvement in the culture of this crop, with reſpect to the ſeed, which is that of ſteeping it from one to two days in water, by which, it is ſaid, the vegetation of it is greatly forwarded, which is a circumſtance of much conſequence to the crop.

Though we have ſeen that five pounds of ſeed are made uſe of to the acre in the broad-caſt method; where the drill plan is followed, two or three pounds may be fully ſufficient. The firſt of the above modes of ſowing is, however, the moſt commonly practiſed, the ſeed being afterwards lightly harrowed in by a ſmall harrow; and, as it is not much ſuited for being diſperſed or delivered with exactneſs by the drill-machine, and the young plants eaſily ſet out to proper diſtances by the hoe, it is probably the moſt ſuitable method of putting in the crop.

The drill plan has, notwithſtanding, been attempted in order to leſſen the expence of hand labour in hoeing the crops by ſome farmers. In theſe caſes, the ſeed is put in in equidiſtant rows, at twelve, fifteen, or eighteen inches diſtance from each other, according to the land and the mode of hoeing that is employed. In ſome inſtances drill-machines are not made uſe of, but the land is ſtricken into ſmall drills or furrows by hoes or other implements for the purpoſe, and then the ſeed caſt over the ground by the hand, and harrowed in lightly, or covered, by hoeing in the tops of the ridgelets, in a light even manner. When a drill machine is employed for this purpoſe, it is recommended by Mr. Amos to put the ſeed in to the depth of one inch in the rows, leaving the ſpace of fourteen inches between them as an interval. The ſeed is prepared by previous ſteeping and mixing in the manner mentioned above, and the land afterwards harrowed over once in a place, in a light manner.

It is of great conſequence that this ſort of crop ſhould be properly thinned out while the plants are in their early growth, and kept perfectly free from all ſorts of weeds by repeated hoeings. In the firſt of theſe, which ſhould be given as ſoon as the plants can be fully diſtinguiſhed from the weeds that are about them, the work ſhould be performed with three inch hoes, having handles not more than two feet in length, and be executed with great care and attention, as it is often extremely difficult to diſtinguiſh the young carrot plants from the weeds. The ſecond hoeing ſhould be given in a few weeks afterwards, according to the ſtate of the crop, which may be performed with common hoes, and the plants be ſet out to proper diſtances. From eight to fifteen or eighteen inches each way are the moſt uſual diſtances at which they are ſuffered to ſtand; and it has been found, from the experience of many years, in diſtricts where they are the moſt cultivated, that carrots, which grow at ſuch diſtances, conſtantly prove a more abundant crop than when the plants are permitted to ſtand cloſer together. The third hoeing is moſtly given about the middle or towards the end of June, and in this, beſides deſtroying the weeds, another material circumſtance to be attended to is, to ſet out the carrots at proper diſtances, and alſo whenever any have been left double at the former hoeings, to take the worſt of the two plants away, ſo as to leave the reſt perfectly clear and free from interruption. When the crop has been put in earlier than the uſual period, the firſt hoeing ſhould, Mr. Young ſays, be performed in the latter end of April, and when the weather is fine, as much injury may be done in executing it when there is much wet. And where the firſt hoeing has been given at the above time, the crops ſhould, in the beginning of May, be well harrowed, and have a ſecond hoeing towards the end of it. The harrowing will not, he aſſerts, "damage the young carrots, nor pull up one in twenty; but it will diſplace the weeds ſet again by rain, and check the growth of thoſe that are got up ſince." The crops ſhould likewiſe be looked over towards the latter end of Auguſt, and ſuch ſtraggling weeds as may be met with removed. This is more neceſſary than farmers in general ſuppoſe.

The expence of theſe different hoeings differs conſiderably in different ſituations, but is generally from 10s. to 18s. the acre, and in ſome places rather more.

There are differences in the carrot huſbandry in different diſtricts. In Suffolk, the farmers ſow them after turnips, ſummer-land-barley, and peaſe ſet upon a rye graſs lay; the crops upon the firſt are generally moſt productive; next to that they prefer the latter. In the firſt caſe they feed off the turnips by the beginning of February, and then lay the land up in ſmall balks or furrows, in which ſtate it remains till the ſecond week in March, when it is harrowed down, and double-furrowed to the depth of about twelve inches, and the ſeed ſown thereon, at the rate of four pounds and a half to the acre. As ſoon as the plants appear diſtinctly, they are ſet out with a ſmall hoe at the diſtance of ſix inches from each other, they are afterwards hoed twice more at different times, according as the crop ſeems to require it; and it is not unuſual to harrow them between the hoeings, which does no injury to the root, and frequently ſaves the expence of the third hoeing. When carrots are intended to be ſown after peaſe, they uſually plough the ſtubble as ſoon as the harveſt is over, in order that the land may clear itſelf of weeds; in December, it is laid up in ſmall balks to receive the benefit of the froſts; in February, it is harrowed down and manured at the rate of fifteen loads per acre; the manure is ploughed in to the depth of about four inches, and in the month of March the land is double-furrowed and the ſeed ſown. By purſuing this method they ſay the manure lies in the centre of the ſoil, and not only affords nouriſhment and ſupport to the carrot in its perpendicular progreſs, but renders it eaſy to be turned up by a ſingle ploughing, and greatly promotes the growth of the ſucceeding crop of barley. But in Norfolk, where it is the practice alſo to ſow carrots after a crop of turnips, the manure, after being put on the land in the beginning of March, is firſt ploughed in with a common plough, and afterwards the land is trench-ploughed about fourteen or fifteen inches deep, it is then harrowed very fine, and the ſeed ſown about the middle of March, though the latter end of that month is probably better, as then plants come up early as ſoon as the early ſown, and are attended with fewer weeds. The carrots are in this way generally ready to hoe in the beginning of May, and when tolerably free from weeds, may be hoed with large hoes. Carrots are alſo frequently grown with the ſame preparations on the ſame land where potatoes have grown. The manner in which Mr. Billing cultivated his land for theſe plants, is the following: The wheat and clover ſtubbles were ſplit down by him with the plough the preceding November, and he is ſatisfied, that whether the wheat ſtubble, be, as it is called in Norfolk, flat work, or in ridges, or the carrots are to be ſown after clover or rye graſs, the land cannot be ploughed too early, ſo that the froſt and ſnow may have their full effect in mellowing the ground for the reception of ſo ſmall a ſeed; and this is the more neceſſary to be attended to, the ſtiffer and tougher the ſoil is. He ploughs the wheat and clover ſtubble three times, but the land on which the turnips have been, but twice; the firſt time ſhallow, but the laſt as deep as the ſtaple of the ground will permit, and on this ploughing the carrots are ſown. Sometimes the land is immediately dunged for the carrots, but at other times only for the previous crop: the former is probably the better method. Mr. Billing thinks four pounds of ſeed an acre is fully ſufficient. It is generally three weeks after ſowing, and ſometimes longer before the carrots appear, and they are frequently ſeven or eight weeks before they are fit for the hoe, which affords the weeds an opportunity to get ſtrength in this ſeaſon, as they grow faſt. Mr. Billing is therefore of opinion, that it is better to ſow them as late as you can with ſafety to the crop, as he found thoſe ſown in April on clover-ſtubble, came much the ſooneſt to the hoe, though later ſown. In this mode where the crop of carrots is very clean, one hoeing may, he thinks, be ſufficient; but, where the weeds are ſtrong, it is neceſſary to hoe them a ſecond time; but about ten days or a fortnight after the firſt hoeing, they ſhould be harrowed: this will diſplace the weeds, and prevent their growing again, which many of them will probably otherwiſe do, eſpecially if it be ſhowery weather. The harrowing does not hurt the carrot plants, as has been obſerved above, but, on the contrary, does them ſervice, by bringing freſh earth to them, as well as by deſtroying the weeds. In about three weeks after harrowing where the ground is not cleared, or in caſe new weeds ſpring up, Mr. Billing hoes the carrots a ſecond time; and after this, if there ſtill remain any weeds, which will be the caſe if much rain falls during the time of the ſecond hoeing, a third harrowing is beſtowed. But where the weather has been favourable, and thoſe employed in hoeing have done their duty, the carrots once hoed and harrowed have been, he ſays, as clean as thoſe on which two hoeings and as many harrowings have been practiſed.

It is the remark of an Eſſex farmer, that carrots will amply repay every expence of the fineſt culture, and ſhould from their extenſive utility, on ſound, deep, and friable land, be every where attempted. He ſows in March or April; hoes three times, and harrows after each hoeing.

The expence of cultivating this crop on poor ſandy land of five ſhillings an acre in the Suffolk method, is thus ſtated.

| *Expences.* | *£.* | *s.* | *d.* |
|---|---|---|---|
| One deep ploughing, | 0 | 7 | 0 |
| Seed and ſowing, | 0 | 4 | 6 |
| Hoeing, | 1 | 1 | 0 |
| Taking up 1s. a load of forty buſhels topped, that is on two hundred, | 0 | 5 | 0 |
| Carting home, | 0 | 5 | 0 |
| Rent, tythes, and rates, | 0 | 7 | 0 |
|  | £2 | 9 | 6 |

The charges at preſent ſtand conſiderably higher, even on ſoils of this ſort, as well as thoſe of the better kind.

In an experiment of the Rev. Mr. Young's, detailed in a late volume of the Annals of Agriculture, made on a good ſandy friable loam, ſufficiently dry for turnips being eaten off, on it; having a ſub-ſoil of the gravelly loam kind, the expences and produce were as below, on eight acres. The land was ploughed nine inches deep in the early part of March; and in the laſt week of it three pounds of ſeed per acre were harrowed in; but the work does not ſeem to have been performed with ſufficient accuracy.

| Profit, | £54 | 4 | 10 |

This is 6l. 15s. 7d. per acre profit, beſides the land being left in moſt excellent order for barley, which fully ſhews the vaſt advantage of cultivating this kind of crop wherever the farmer has land capable of admitting it.

Of the advantage of the drill culture there are different opinions, but further trials are neceſſary. Mr. Amos's method is "two pounds of ſeed per acre." He ſteeps the ſeed in rain water twenty-four hours, and lays it upon a floor, until ſpeared. Mixes it thoroughly, with three pecks of dry ſaw-duſt, and three pecks of fine dry mould. Drills one inch deep and fourteen inches between the rows, with the ſame cups uſed for wheat or barley. Harrows once in a place. The plants appear in eight or ten days. On expreſſing his ſurprize at ſeeing good long carrots grown on very ſhallow ſands, to a perſon who had been many years baliff to ſeveral eſtates, he told him that he had been accuſtomed to obtain carrots of full length and ſize, in ſuch land, by dibbling the ſeed to a great depth, with an iron dibbler; and when it was objected, that the plants, from the ſeed being ſo deeply buried, would never get above the ſurface; he aſſured him, in his numerous trials, he never obſerved any ſuch conſequence.

It is ſtated by a writer in the twenty-fourth volume of the Annals of Agriculture, that he ſowed broad-caſt two acres of carrots, following a potatoe crop, on a light ſandy loam of twenty ſhillings an acre. They were twice hoed, at thirteen ſhillings the two, in the manner of hoeing turnips; and in the courſe of the Summer he mowed one third of the tops twice; another third of the tops once: and the remaining third of the crop the ſcythe did not paſs over. The tops were greedily devoured by his horſes, cattle, and pigs, in the fold-yard, and were equal in quantity and value to a conſiderable crop of clover, cut and made uſe of in the ſame mode. At the end of October he took up the carrot roots and preſerved them in a trench in the manner of potatoes. The crop was full ſix hundred buſhels per acre; and it was not found that the roots of thoſe carrots whoſe tops had been twice cut were at all inferior in ſize or quality to thoſe whoſe tops had been left untouched. A paſſage was left for a ſmall cart to carry off the tops, and another he made by drawing the young carrots wanted for family uſe. He has reaſon to conſider this mode of cultivating carrots equal to the beſt fallow crop, provided the carrots are twice well hoed, and the tops are cut off, as the ſcythe prevents any weeds ſeeding in the autumn. His horſes, oxen, milch cows, and pigs, were fed with the carrot roots; his turkeys and other poultry had them in a boiled ſtate, and were fatted well upon them: even his pigeons were fed upon carrots, as they conſtantly attended in the fold-yard to pick up every particle that dropped from the mouths of the cattle; which ſupply was ſufficient to keep them at home, and to ſave an expence in feeding them in the ſevere weather. The market price of carrots near his houſe, twelve miles eaſt of York, was from ten-pence to one ſhilling a buſhel; at which price it muſt be allowed, he ſays, that the crop was a profitable one. He further remarks, that the demand for carrots in his neighbourhood for ſtallions is not inconſiderable, for it is found that this food is more invigorating and fattening than any other that can be given them.

Though it is a common practice with farmers in Suffolk to allow crops of carrots to remain in the ground all winter, it ought by no means to be generally recommended; as beſides the injury the crop may frequently ſuſtain by ſevere froſts, the farmer muſt often experience great difficulty in getting up a ſufficient quantity of roots for the ſupply of his live ſtock, eſpecially when the earth is bound up by froſt or covered with ſnow. On theſe grounds it is evident that the beſt way of preſerving carrots during winter and ſpring is to dig them up in the end of October, or beginning of November, when their green leaves are decayed, which is a common practice in Leiceſterſhire. In doing this, the beſt method is to make uſe of three-pronged forks, though ſpades are frequently uſed. By looſening the ſoil with either of theſe inſtruments, and drawing up the carrots at the ſame time by the tops, the work is performed in a very expeditious manner. The carrots ſhould be allowed to dry a day or two on the field before they are taken home; on being dug up, when they are dry, the tops may be taken off and given to the ſwine or cattle; and the roots be piled up in heaps in ſome cloſe dry houſe, well covered up, either with ſtraw or dry ſand, ſo as to defend them from froſt and dampneſs. Where the buſineſs of taking up the roots is delayed till November, Mr. Young well obſerves, that in caſe of wet weather they are liable to be much injured. It is obſerved by an Eſſex farmer that it is his practice to take them up on a dry day, put them directly into ſmall upright cocks of ten buſhels each, entirely covered with the tops cut off; they thus appear to dry better than in any other mode; and with very little loſs, to bear the weather. If after being thus dried, they are carried into any barn, or ſhed, it will be better, if in large quantities, on account of the hazard of heating, not to pack them cloſe, but rather throw them promiſcuouſly into heaps with a little ſtraw over them. Some however pile them up in a conical manner with a few of the tops hanging down on the outſide, and others place them in a ridge of earth in the manner of potatoes.

According to the account of Mr. Arthur Young, in Suffolk, a medium crop may be reckoned at three hundred and fifty buſhels the acre, which at ſix-pence the buſhel, the price at which they are ſold to be ſent to the London markets, amounts to 8l. 15s. 0d. the acre. Hence, though the hoeing and digging up of a crop of carrots may be attended with conſiderable expence, the above groſs produce will amply repay, and leave a very handſome profit.

The uſes to which this root are applied are various. Large quantities are ſent to the London markets, and alſo given as food to different kinds of live ſtock. Horſes are remarkably fond of carrots; and it is even ſaid, that when oats and carrots are given together, the horſes leave the oats and eat the carrots. The ordinary allowance is about 40 or 50 lb. a day to each horſe. Carrots, when mixed with chaff, that is, cut ſtraw, and a little hay, without corn, keep horſes in excellent condition for performing all kinds of ordinary labour. The farmers begin to feed their horſes with carrots in December, and continue to give them chiefly that kind of provender till the beginning or middle of May, to which period, with proper care, carrots may be preſerved. As many farmers are of opinion that carrots are not ſo good for horſes in winter, as in ſpring, they give only half the above allowance of carrots, at firſt, and add a little corn for a few weeks after they begin to uſe carrots.

The reſult of the inquiries made by the above author in Suffolk, as ſtated in the ſurvey of that diſtrict, is, that they give "at Sutton ſix horſes two loads a week; no corn, and eat little hay. At Shottiſham, ſix horſes one load a week, with corn; in the ſpring two loads, without corn; eat little hay. At Ramſholt, ſix horſes 72 buſhels a week; no oats, and half the hay ſaved. At Alderton, ſix horſes 42 buſhels a week; oats given, and the ſaving of hay not conſiderable. At Alderton oats given, becauſe not carrots enough. At Holleſley, ſix horſes two loads a week; no corn, ſave more than half the hay." And upon reviewing theſe circumſtances, ſays the ſame writer, "it appears that two loads a week are a very large allowance, probably more than are neceſſary; ſeeing that with 72 buſhels at one place, which is one and three quarters, and one load at another, all the corn is ſaved: let us therefore decide, that when ſix horſes eat 80 buſhels of carrots a week, which is 13 buſhels a week for one horſe, they want no corn whatever, and will eat only half the hay of corn-fed ones. This will enable us to aſcertain the value tolerably, though not exactly, becauſe we do not, ſays he, know what would be the fair allowance of oats to balance ſuch feeding with carrots." The whole turn of the intelligence he received ran, he ſays, upon the vaſt ſuperiority of condition in which horſes are kept by carrots to that which is the reſult of corn-feeding; for this evident reaſon, carrots are given nearly, if not quite, in as large quantities as the horſes will eat them; but the oats are never given in ſuch a manner, they are always portioned out in an allowance far ſhort of ſuch plenty. A quarter and a half of oats would, he is perſuaded, from the general turn of every man's converſation, be inferior to two loads of carrots; this at 20s. is 1l. 10s. and there is to be added the ſaving of half the hay, which may be called 10 pounds per horſe a day, or 70 pounds per week, which, at 50s. a ton, is 1l. 4s. per horſe, and 8s. for ſix; which added to 1l. 10s. for corn, makes in all 1l.

18s. againſt 80 buſhels, or 19s. a load: and that this is a moderate calculation, appears, he thinks, from the decided preference given by ſeveral farmers in favour of carrots at 15s. a load, againſt oats at 20s. a quarter, not reckoning the carrots by any arbitrary eſtimation, but ſuppoſing themſelves forced to buy the one or the other. The prime coſt is calculated at 7s. a load; and that this is fair, will, he thinks, appear by the following ſtatement of the articles:

| | £. | s. | d. |
|---|---|---|---|
| Rent, tythes, and poor-rates | 0 | 15 | 0 |
| Ploughing | 0 | 7 | 0 |
| Harrowing, &c. | 0 | 1 | 0 |
| Seed and ſowing | 0 | 6 | 0 |
| Hoeing | 0 | 18 | 0 |
| Taking up ten loads, at 1s. 2d. per load | 0 | 11 | 8 |
| | 2 | 18 | 8 |

The tenth of which is, he ſays, 5s. 10d. or per buſhel one penny three-farthings; call it, however, two pence per buſhel, or 6s. 8d. per load, and if to ſquare with one article of intelligence it is made 7s. it will not amount to two pence farthing the buſhel: here, therefore, ſays he, another view opens upon us, which is the farmer's profit; the carrots are worth, in feeding his team, 15s. but they coſt him only 7s.; he has therefore the advantage of 8s. a load as the grower, on all his horſes conſume, and on an average 4l. an acre.

Another way by which a friend of his, he ſays, made his calculation, was this: "at one load and a half of carrots, nine loads a moderate acre, laſt ſix horſes ſix weeks." He was inclined to think, from the intelligence, that one load and a half ought to be eſteemed the proper quantity, and ſave ſix

| | £ | s. | d. |
|---|---|---|---|
| quarters of oats, which at 20s. is | £6 | 0 | 0 |

| | 8 | 12 | 6 |
| The carrots may coſt | 3 | 3 | 0 |
| Farmers profit per acre by feeding horſes | 5 | 9 | 6 |

It admits of various calculations, ſays the writer; but view it in any light you pleaſe, the reſult is nearly, though not exactly, the ſame. Two facts reſult, he thinks, moſt clearly from the intelligence; viz. that horſes will do upon them as well as upon oats, and that this application will not only pay the charges of culture, but leave a profit nearly as great as the groſs produce of a common crop of wheat. He wonders, therefore, the farmers cultivate them for their own uſe alone, without any view to a ſale. It ſhould farther be remarked, he ſays, that this reſult takes place, not in a diſtrict where the horſes are poor mean animals that betray a want of good food, but, on the contrary, amongſt the moſt uſeful teams that are to be found in England; and that theſe teams are the fatteſt, and in the higheſt condition, when they are ſupported by carrots. No greater proof of the excellency of the food can, he thinks, be wiſhed for, than the horſes going through the barley-ſowing upon it, and the root doing better at that ſeaſon of hard labour than earlier in the winter; this ſeems to ſpeak, he ſays, the heartineſs as well as wholeſomeneſs of the food. One concluſion very naturally ariſes from this part of the intelligence, that the crop, or a conſiderable part of it, ought to be taken up in autumn, and packed in a barn, in which they would much ſooner loſe their juicineſs, and acquire a more withered ſtate, in which they are found to yield the beſt nouriſhment for animals."

But the author of the New Farmers' Calendar, who ſays he has given carrots to horſes of every deſcription, and that the practice is perfectly familiar to him, obſerves "that neither cart nor ſaddle-horſes, although they will perform very well whilſt fed with carrots, are able to go through ſo much labour, or to do it with ſo much eaſe or ſafety to themſelves, as when they are allowed corn; and the only proper application of carrots to horſes is to ſuch as either do not work at all, or very moderately; but ſhould the carrots be ſubſtituted for hay inſtead of corn, it makes a very material difference in the queſtion, and in many caſes ſuch a diſpenſation might be advantageous in all points. If a man can maintain his cart-horſes in good working order and good health, as many really do, upon theſe roots, inſtead of oats, he has nothing farther to ſay, except in praiſe of his economy; he only inſiſts, that the very ſevere labour which he has been accuſtomed to ſee horſes go through, could not be endured without corn; and that he has known horſes abſolutely ruined by working them upon carrots, when the labour was by no means hard enough to have injured them had they been properly fed with corn. He has little to ſay on this ſubject, ſince he has himſelf ſufficiently often ridden and driven horſes carrot-fed, watching their daily condition, and marking even the dew upon their coats, the heaving of their flanks, and the comparative tone of their muſcular exertions." This writer's opinion, however, ſeems chiefly to reſt upon their being a laxative, and conſequently a debilitating food, which is probably not the caſe when they are taken up and kept in a dry place for a proper length of time, ſo that a portion of the juicy material may be diſſipated.

In March this ſort of food is in the greateſt perfection, as much of the ſucculence of the roots is diſſipated, and from their being in ſome degree withered, they bend in the hand. Every part of them is then highly nutrient, being full as hearty a food as oats. It is, of courſe, an object of vaſt importance to the farmer to be well provided with this root for uſe in February, March, and the following months.

Carrots have likewiſe been made uſe of for fattening cattle with great ſucceſs; ſome, indeed, think that this is the moſt advantageous way of applying them; and there cannot be any doubt but that they muſt be highly uſeful in this way; from the great quantity of ſaccharine matter they contain. They have alſo been long proved to be excellent food for milch cows in the ſpring; as they certainly give no bad taſte to the milk or butter, while the quantity of both is greatly increaſed by their uſe. For this laſt uſe they ſhould probably be employed without being much kept, as in that way there will be the largeſt proportion of the juicy liquor in them, which is of advantage in this intention.

Sheep have alſo been frequently fattened on this root in Suffolk; and from Mr. Young's account, who ſeems to have fully conſidered the carrot-huſbandry, a good crop will weigh 11 tons, which quantity, he ſuppoſes, will feed 20 wethers for 100 days, in which ſpace they will be completely fattened. In Norfolk it is reckoned a good crop of turnips that will fatten eight wethers; ſo that it would ſeem that one acre of carrots will go as far in fattening ſheep as two acres and a half of turnips, which is a circumſtance that deſerves the farmer's attention in many ſituations. The ſame writer alſo further ſtates, that the expence of cultivating carrots exceeds that of turnips by 1l. the acre. To counterbalance which, he ſays, the carrots are much more impenetrable to froſt, if left in the ground to be taken up as wanted; that they are not ſubject to any diſtemper ſimilar to that of the fly in turnips; and that they are ſown at a ſeaſon when they cannot ſuffer by drought; while, of late years, turnips have ſuffered ſo much in various ways, as to have ſubjected the farmers, particularly thoſe of Norfolk and Suffolk, to very heavy loſſes. Beſides, as carrots can be preſerved with certainty to an advanced period of the ſpring, as April or May, when the fattening of cattle is more expenſive than at any other ſeaſon, the ſuperiority of carrots over turnips muſt, he thinks, appear evident to every practical farmer. He further adds, that with all theſe advantages, it might naturally be expected that carrots ſhould be more univerſally cultivated, and that the only reaſon why they are not, is becauſe their value is not aſcertained, or made generally known. Some ſuch reaſon as this would appear alſo to be the cauſe why the cultivation of ſo valuable a crop ſhould be confined to one particular diſtrict of the kingdom; which, without doubt, if it were commonly cultivated, would be the means of ſaving an immenſe conſumption of oats, beans, and peas, which are at preſent given to horſes and other animals. This ſort of crop is likewiſe of great utility in the keeping of ſtore-pigs; but they will not probably fatten them without the aſſiſtance of corn or milk. In the experiments of the reverend Mr. Young, this ſeems to have been exactly the caſe, as the hogs, in many inſtances, gained weight, though they did not become fat under this management. See Swine.

The able writer of the Suffolk report has further remarked, that the next circumſtance to be attended to is the advantage of the plant as a preparation for corn; all the minutes agree, ſays he, that the barley after them is good and clean; ſeveral perſons were inclined to think it equal to that after turnips fed on the ground; but the fair reſult is evidently, that if carrots were ſo fed, the barley would be much ſuperior; of this the intelligence he received will not, he ſays, permit us to doubt. It is, however, fair to obſerve, that they one and all declare for putting them in upon clean land, and in this courſe: 1, turnips; 2, barley; 3, carrots; 4, barley, &c.; from which it appears, that on theſe ſandy ſoils they are not to be depended upon for cleaning them when foul with couch.

The utility and advantage of the carrot root have been already ſhewn in many inſtances; it is, however, obvious, that the value of crops of this deſcription muſt vary in a conſiderable degree, according to the manner in which they are employed in their conſumption. The differences have been found to be from two pence halfpenny to two ſhillings the buſhel; in general it may, however, be from about ſixpence to eight-pence, and perhaps in ſome inſtances tenpence or a ſhilling. In the trials of different experimenters, as ſtated in the 25th volume of the Annals of Agriculture, under different modes of application, the reſults were theſe:

| *Application of crop.* | *Value per Buſhel.* | | |
|---|---|---|---|
| In feeding all ſorts of cattle | 0 | 0 | 2½ |
| Average in different ways | 0 | 1 | 0 |
| In fattening oxen | 0 | 0 | 6 |
| In fattening hogs, boiled | 0 | 2 | 0 |
| When uſed inſtead of oats for horſes | 0 | 0 | 6 |
| In fattening hogs, raw | 0 | 0 | 8 |
| In fattening ſheep | 0 | 0 | 4 |

It has been remarked by a late practical writer, that from the great facility of cultivating this ſort of crops, the little riſk that attends them, their very general application in the feeding and fattening of different ſorts of domeſtic animals, the large proportion of manure that they afford, and their great utility in the preparation of the land for grain crops; they may in moſt caſes be conſidered not only preferable to turnips, but much more advantageous and better ſuited to all ſoils of the pure ſandy or light ſandy loam kinds.

It has been ſuggeſted by Mr. Baker, that the large tops of this root might be rendered more extenſively beneficial by having them converted into a ſort of coarſe hay, by mowing them over while in their young, green, juicy ſtate of growth, without injuring the heads or crowns of the plants, ſomewhat in the manner noticed above; and then letting them become perfectly dry on the ground; as in this way, he aſſerts, that two tons of fodder may be produced from an acre of land. It is plain, however, that in this practice injury muſt be done to the growth of the roots, beſides its being uneconomical, on account of the great loſs that muſt take place in the drying of ſuch ſucculent materials, which can be wholly conſumed without it. It is unqueſtionably a much leſs waſteful method of management to have them conſumed in the yards by ſome ſort of ſtock, as they are taken up; becauſe in this way not a particle is loſt, from the great avidity with which almoſt all ſorts of animals devour them.

When it is thought neceſſary to have the roots cleaned before they are given to animals, it may be readily performed in the ſame manner as for potatoes.

The author of the Agricultural Survey of the County of Suffolk concludes this intereſting ſubject with "earneſtly calling on all perſons who have ſand, or light ſandy loams, to determine to emancipate themſelves from the chains in which prejudice or indolence has bound them; to cultivate this admirable root largely and vigorouſly; to give it the beſt ſoil they have; to plough very deep; to hoe with great ſpirit; and to baniſh corn from their ſtables, as a mere luxury and barren expence, that ought to be extirpated: an effect that flows very fairly from the preference which the inſtinct of the four-footed inhabitants generally gives to carrots." They ſhould not, he thinks, be confined to ſmall cloſes of an acre or two, but be introduced regularly in the courſes of the crops of the farm in the ſame manner as wheat, barley, turnips, or any other plant. None, in his opinion, pay better, and very few ſo well; and beſides they are capable of a very general application, no root being fit for ſerving more uſeful purpoſes.

The penalty for ſtealing carrots is the ſame with that for ſtealing turnips, potatoes, cabbages, parſnips, and peas; for which ſee Turnips.

Carrot, *wild*, in *Agriculture*, a weed of the biennial kind frequently met with in paſture lands, where the ſoil is inclined to be dry. Wherever it is found it ſhould be extirpated as ſoon as poſſible before it flowers and ſheds its ſeeds, as if this is not attended to, it will increaſe with rapidity, and become very troubleſome as well as difficult to remove. It has ſometimes the name of *birds' neſt*, from the head, after flowering, contracting ſomewhat into that form. See Daucus.

Carrot, *Candy*, in *Botany*. See Athamanta *creten*ſ*is*.

Carrot, *Deadly*, or *Scorching*. See Thapsia.

Carrot, *Mountain*, a ſpecies of fennel. See Fennel.

CARROUGE, Bertrand-Augustin, in *Biography*, an ingenious aſtronomer of France, was born at Dol, on the 8th of October, 1741, and on account of his merit and indigence, he was appointed "Adminiſtrateur General des Poſtes," by Reveilliere-Lepaux, the director. Notwithſtanding his advancement to this office, which rendered him, in ſome degree, independent, he applied with diligence to aſtronomy. He calculated 1000 ſtars for the celeſtial globe publiſhed by C. Lamarche, ſucceſſor to Fortin, and made many calculations for the "Connoiſſances des Temps," and the ſecond edition of Lalande's aſtronomy. He alſo publiſhed ſeveral memoirs in the "Connoiſſances des Temps," and, a few days before his death, which happened on the 29th of March, 1798, he delivered to Lalande tables for calculating the phaſes of the moon, better, as this hiſtorian of aſtronomy ſays, than thoſe which are in Bouguer's and La Caille's "Elements of Navigation." They are contained in the "Connoiſſances des Temps" for 1801. Lalande's Hiſt. of Aſtronomy for the year 1798.

Carrouge, in *Geography*. See Carouge.

CARROUSAL, or Carrowsal, properly a courſe, or conteſt of chariots and horſes: or a magnificent entertainment, on occaſion of ſome public rejoicing; conſiſting in a cavalcade of ſeveral perſons, richly dreſſed, and equipped after the manner of the ancient cavaliers, divided into ſquadrons, meeting in ſome public place, and practiſing juſts, tournaments, and other noble exerciſes. The term is ſince become of more general uſe, and is given to any merry meetings. The word comes from the Italian *caroſello*, a diminutive of *carro, chariot*. Tertullian aſcribes the invention of carrouſals to Circe; and will have them inſtituted in honour of the Sun, her father: whence ſome derive the word from *carrus*, or *currus ſolis*. The Moors introduced cyphers, liveries, and other ornaments of their arms, with trappings, &c. for their horſes. The Goths added creſts, plumes, &c.

CARR-TAKERS, are officers of the king's houſehold, who, when the court travels, have charge to provide waggons, carts, &c. to tranſport the king's furniture and baggage.

CARRUCA, in *Antiquity*, a ſplendid kind of carr, or chariot, firſt mentioned by Pliny, mounted either on one wheel, like our wheel-barrows, or, as is more probable, on four wheels, richly decorated with gold, ſilver, ivory, &c. in which the emperors, ſenators, and people of condition, were carried. The carrucæ, or coaches of the Romans, were often of ſolid ſilver, curiouſly carved and engraved; and the trappings of the mules, or horſes, were emboſſed with gold. This magnificence continued from the reign of Nero to that of Honorius; and the Appian way was covered with the ſplendid equipages of the nobles, who came out to meet St. Melania, when ſhe returned to Rome, ſix years before the Gothic ſiege. Seneca Epiſt. 87. Pliny H. N. xxxiii. 49. The Romans conſidered it as an honour to ride in thoſe that were remarkably high. In the Theodoſian code the uſe of them is not only allowed to civil and military officers, but enjoined as a mark of their dignity.

The word comes from the Latin *carrus*, or Britiſh *carr*, which is ſtill the Iriſh name for any wheel-carriage.

Carruca was alſo ſometimes uſed for *carrucata*. See Carrucate.

Carruca, in *Rural Economy*, a term employed by ſome old writers to ſignify a plough. It is ſometimes written *Carraca*.

CARRUCAGE, in *Huſbandry*, a term which denotes the ploughing of ground, either ordinary, as for grain, hemp, flax; or extraordinary, as for woad, dyer's weed, rape-ſeed, &c.

Carrucage, *carucagium*, a kind of tax anciently impoſed on every plough, for the public ſervice. See Carrucate and Hidage.

CARRUCATE, or Carucata, in our *Ancient Laws* and *Hiſtory*, denotes a plough land, or as much arable as could be tilled and managed by one plough and the beaſts belonging thereto in a year; having meadow, paſture, and houſes for the houſeholders and cattle belonging to it.

In the Domeſday Survey, the hide and carucate appear to be the ſame; the hide being the meaſure in the Confeſſor's reign; and the carucate that to which it was reduced by the Conqueror's new ſtandard. Thus, different places are ſaid to have paid gold for ſo many hides, T. R. E. in the time of the Confeſſor. And then follows the *exiſting* meaſure of ſo many carucates, "Eſt ix. Carucatarum." Mr. H. P. Wyndham, however, in his "Wiltſhire, extracted from Domeſday Book," 1788, diſtinguiſhes between "hida" and "carucata," though they have hitherto been conſidered as ſynonymous terms. Accordingly, he conjectures, that the firſt was intended to ſignify "the valuation of the eſtate," and the latter "the meaſurement of the land."

In ſome of the counties, as thoſe of Nottingham, Derby, and Lincoln, only carucates are mentioned. But in others, as we have already mentioned, both occur.

The contents, however, of the carucate are very variouſly ſtated; and, in fact, we have no criterion in any one county for judging of its real extent. The Liber Niger, as well as ſeveral of our ancient chartularies, eſteem it to contain a hundred acres; while it is carried by other authorities to a hundred and twenty: and the Liber Elienſis aſſerts, that ſome conſiſted even of two hundred and forty acres. In the early part of the reign of Richard I. it is ſtated to have been eſtimated at ſixty acres; and ſo to have continued till his ninth year, when in the five ſhilling aid, it was fixed at a hundred. In the time of Edward I. it appears to have been more than once eſtimated at a hundred and eighty acres: and in the 23d of Edw. III. a carucate of land in Burceſter contained a hundred and twelve acres, and in Middleton a hundred and fifty. Nor was the calculation of its extent under other circumſtances leſs liable to variation. The Monaſticon Anglicanum (tom. i. p. 75.) ſays, that fourteen carucates made a knight's fee. A manuſcript regiſter of Fountain's abbey, ſixteen. Another mentions twelve. And one of Dodſworth's manuſcripts in the Bodleian goes to forty-eight. A charter of the 5th of Edward III. records, that each of three carucates of land which the abbot of Netley held in the New Foreſt conſiſted of a hundred acres: and a ſimilar meaſure is repeated in a patent of Henry IV.

The meaſurement of the carucate then appears to have been arbitrary, and differs conſiderably not only in different counties, but even in different diſtricts of the ſame county. It appears, likewiſe, to have been various at various times. And for different purpoſes a larger or a leſs number of acres appears to have been required. It ſeems clear, ſays the hiſtorian of Leiceſterſhire, that the commiſſioners, in the ſurvey of that county, at leaſt, from the conviction that hides and carucates were of no certain meaſure, and that they differed ſtill more in quality than they did in meaſure, adopted the very rational mode of determining the value of the land by the number of ploughs that were actually employed, or in their judgment might be employed on it. "We ſometimes find that the number of ploughs is conſiderably leſs than the number of plough-lands; and ſometimes the commiſſioners tell us the land would have admitted of more ploughs than were then in actual uſe. And it is but reaſonable to conclude, that certain lands had been in a better ſtate in the time of king Edward, than they were in the reign of William I. from their having more ploughs at work on them; and, on the contrary, that other lands were much improved at the time of the ſurvey, as they had more ploughs at work than had been employed in the days of the Confeſſor. There are few paſſages in ſome of the counties that can be made intelligible in any other way of interpretation. Nichols's Diſſ. on Domeſd. Pref. to the Hiſt. of Leic. Antiq. Diſc. i. 46, 47. Hutchins's Diſſ. Kelham's Domeſ. Book. Illuſtr. p. 168. Selden. Tit. of Hon. 622. By a ſtatute under William III. for charging perſons to the repair of the highways, a plough-land is rated at fifty pounds per annum, and may contain houſes, mills, wood, paſture, &c. Stat. 7 and 8 Will. III.

CARRUCCI, Jacopo, called *Pontormo*, from the place of his nativity, in *Biography*, was born in 1493, poſſeſſed great natural ingenuity, and in his earlieſt works was admired by Raphael and Michael Angelo. His inſtruction, derived in regular ſucceſſion from Leonardo da Vinci, Albertinelli, and Pier di Coſimo, was completed in the ſchool of Andrea del Sarto, who, by jealouſy and ungenerous treatment, converted the ſcholar into a rival. Notwithſtanding his talents, he frequently changed his ſtyle and became the victim of inconſtancy. The "Certoſa" of Florence exhibits ſpecimens of the three different manners commonly aſcribed to him. The firſt, being correct in deſign and vigorous in colour, approaches the ſtyle of Andrea del Sarto: the ſecond, combining with good drawing a languid tone, became the model of Bronzino and the ſubſequent epoch. The third is a direct imitation of Albert Durer. To theſe might be added a fourth manner, if the freſcoes of the general deluge and univerſal judgment, on which he ſpent eleven years, and his laſt work, had not been white-waſhed, with the tacit acquieſcence of all contemporary artiſts. In this labour he ſtrove to imitate Michael Angelo, and to exemplify, like him, anatomic ſkill, which was then becoming the favourite purſuit of Florentine art. This artiſt died in 1558, aged 65. Pilkington, by Fuſeli.

CARRYING, in *Falconry*, ſignifies a hawk's flying away with the quarry.

Carrying is one of the ill qualities of a hawk, which ſhe acquires either by a diſlike of the falconer, or not being ſufficiently broke to the lure.

Carrying, among *Huntſmen*. When a hare runs on rotten ground (or even ſometimes in a froſt), and it ſticks to her feet, they ſay ſhe *carries*.

Carrying, among *Riding-Maſters*. A horſe is ſaid to *carry* low, when, having naturally an ill-ſhaped neck, he lowers his head too much. All horſes that arm themſelves *carry* low; but a horſe may *carry* low without arming. A French branch, or gigot, is preſcribed as a remedy againſt *carrying* low.

A horſe is ſaid to *carry* well, when his neck is raiſed, or arched, and he holds his head high and firm, without conſtraint.

Carrying *wind*, a term uſed by our dealers in horſes to expreſs ſuch a one as frequently toſſes his noſe as high as his ears, and does not carry handſomely. This is called *carrying wind;* and the difference between *carrying* in the wind, and beating upon the hand, is this: that the horſe who beats upon the hand, ſhakes the bridle and reſiſts it while he ſhakes his head; but the horſe that carries in the wind puts up his head without ſhaking, and ſometimes beats upon the hand. The oppoſite to *carrying* in the wind, is arming and *carrying* low; and even between theſe two there is a difference in wind.

CARS, Laurence, in *Biography*, a French engraver of great merit, flouriſhed about the year 1760, and reſided at Paris. His prints were numerous; and the following are from Le Moine, viz. a portrait of "Louis XIV. ſurrounded with emblematical figures;" "Hercules and Omphale;" Perſeus and Andromeda;" "Time and Truth," and "Nymphs Bathing." Strutt.

Cars, in *Geography*, ſuppoſed by ſome to be the *Chorſa* of Ptolemy ſeated on the banks of the Euphrates, a city of Armenia, the laſt town of Turkey towards the frontiers of Perſia. It is built on a riſing ground, expoſed to the ſouth-ſouth-eaſt. It is defended by a caſtle, built on a ſteep rock, and has behind it a deep valley, watered by a river, which, not far from thence, diſembogues itſelf into the Arpagi, without ever coming near the city of Erzeron, contrary to the deſcription given of it by Sanſon. Theſe two rivers joined together are known by the name of Arpagi, and ſerve as a frontier to the two empires. N. lat. 41° 30′. E. long. 43° 50′.

Carse, or *Carſe of Gowry*, a diſtrict of Perthſhire, in Scotland, lying on the N. ſide of the Tay, extending 14 miles in length from Dundee to Perth, and being from two to four in breadth. It is a rich plain country, cultivated like a garden, and producing as good harveſts of wheat as any in Great Britain. Its ſituation, however, is damp and low, ſo that the inhabitants are ſubject to agues, and the common people are in great want of fuel for firing.

CARSEOLI, in *Ancient Geography*, a town of Italy, belonging to the Sabines at the 22d mile on the Valerian way. Livy calls it in one place a town of the Marſi, and in another a town of the Æqui; and it might probably have been occupied by one and the other of thoſe people alternately. Livy ſays that it was a Roman colony, eſtabliſhed in the year of Rome 454; and in the map of M. D'Anville it is marked in the country of the Sabines. The preciſe ſituation of this place was not known till it was diſcovered, in 1645, by Holſtenius, near the mountains called "Rio-Fieddo," and it has been again aſcertained, in 1766, by the abbé Chauppy. From an ancient inſcription found in this place it appears, that this city was a colony, and that it had a college of prieſts called "Dendrophori," conſecrated probably to ſome rural deity.

CARSIDAVA, a town of Dacia, according to Ptolemy, ſuppoſed to be the preſent Kuryma.

CARSOLI, in *Geography*, a ſmall ill-built town of Naples, ſeated on the ſide of a ſteep hill, which ſhuts up a defile of the mountains. It is juſt within the limits of the Neapolitan ſtate, for in the plain below is the point of diviſion at an inn called "Il Cavaliere," where ſome cuſtom-houſe officers are ſtationed. This town bears the name of the ancient city of Carſeoli, though its ruins lie near a mile off in the plain. Carſoli is a portion of the immenſe demeſne poſſeſſed by the conſtable Colonna, who has 37 manors in this neighbourhood.

CARSTARES, William, in *Biography*, an eminent Scots clergyman, was the deſcendant of an ancient family, and born in 1649 at Cathcart, near Glaſgow. Having received the rudiments of his education in the academy of a Preſbyterian clergyman, where he formed many important connections, and where he acquired a fluency of expreſſion in the Latin language, as no other was allowed to be ſpoken in his family; he purſued his theological and philoſophical ſtudies in the univerſity of Edinburgh, and afterwards at Utrecht, whither his father ſent him for the purpoſe of avoiding thoſe political conteſts which agitated the reign of king Charles II., and to which his active and enterpriſing ſpirit ſeemed to incline him. Here, however, he was involved in thoſe political intrigues which were occaſioned by the alarm excited in England about the Popiſh ſucceſſion. By means of a letter of recommendation, obtained from a phyſician in London, who carried on a correſpondence with perſons belonging to the court of the prince of Orange, he was introduced to the penſionary Fagel, and afterwards to the prince himſelf; and by him he was entruſted, on account of his ſagacity and information with regard to the ſtate of political parties at home, and his ardent attachment to the intereſts of civil and religious liberty, with his deſigns relating to Britiſh affairs. During his reſidence in Holland, his principles, both in religion and politics, were ſtrongly confirmed; and upon his return to his native country, he entered with zeal into the counſels and ſchemes of thoſe noblemen and gentlemen who oppoſed the tyrannical meaſures of government. His political engagements, however, did not divert him from purſuing the profeſſion of divinity; and when he had paſſed through his previous examinations, he obtained a licence to preach. But as he had no proſpect of uſefulneſs in his clerical character, and as his mind ſeemed to have acquired a decided bias towards politics, he determined to reviſit Holland. On his way thither he paſſed through London, and was employed by Argyle, and the other Scots patriots, in treating with the Engliſh excluſioniſts. Towards the cloſe of the year 1682, he held various conferences with the heads of that party, which terminated in his being privy to what has been called the "Rye houſe plot." Accordingly, he was committed to cloſe cuſtody in the Gate-houſe, Weſtminſter. After ſeveral examinations before the privy council, he was ſent for trial to Scotland; and as he refuſed to give any information reſpecting the authors of the excluſion ſcheme, he was put to the torture, in order to extort from him a confeſſion. This cruel treatment he endured with invincible firmneſs; but when milder methods of a more inſidious nature were adopted, and a pardon was propoſed, with an aſſurance that no advantage ſhould be taken of his anſwers as evidence againſt any perſon, his reſolution failed, and he conſented to anſwer their interrogatories. The privy council immediately cauſed to be printed a paper, entitled, "Mr. Carſtares's Confeſſion," which contained, as he ſaid, a falſe and mutilated account of the whole tranſaction; and in direct violation of their promiſe, they produced his evidence, as they termed it, to be produced in open court againſt one of his moſt intimate friends. This treachery and its conſequences very deeply affected him; but as ſoon as he was cleared, he obtained permiſſion to retire to Holland, towards the cloſe of the year 1684, or the beginning of 1685, where he was kindly received by the prince of Orange, who appointed him one of his chaplains, and cauſed him to be elected miniſter of the Engliſh Proteſtant congregation at Leyden. In this ſituation he was ſingularly uſeful to the prince and his party in concerting thoſe meaſures that terminated in the revolution. When the prince determined to tranſport an army to England, Carſtares accompanied him as his chaplain, and continued about his perſon till the ſettlement of the crown. During the whole of this reign he was the chief agent between the church of Scotland and the court, and he contributed by his influence with the king to the eſtabliſhment of preſbytery in Scotland, to which his majeſty was diſinclined, and to that coaleſcence or accommodation on the part of the Preſbyterian clergy with the Epiſcopalians, which the bigotry of the former made it difficult for him to effect. When an act was paſſed, in 1693, by the Scots parliament, obliging all officers, civil and eccleſiaſtical, to take an oath of allegiance, and alſo to ſign an *aſſurance*, (as it was called), declaring William to be king *de jure*, as well as *de facto*, the miniſters refuſed to ſign the declaration, and appealed to the privy council, who recommended to the king to enforce the obligation. Accordingly, meaſures were adopted for this purpoſe; and the body of the clergy applied to Carſtares, requeſting his interference in their favour. The king perſiſted in his reſolution; orders were renewed in peremptory terms, and diſpatches were actually delivered to the meſſenger to be forwarded next morning. In theſe critical circumſtances Carſtares interpoſed; he haſtened to the meſſenger at night, demanded the diſpatches, which had been delivered to him in the king's name, and inſtantly repaired to Kenſington, where he found his majeſty gone to bed. Having obtained admiſſion into his chamber, he gently waked him, fell on his knees, and aſked pardon for the intruſion, and the daring act of diſobedience of which he had been guilty. The king at firſt expreſſed his diſpleaſure; but when Carſtares further ſtated the caſe, his majeſty cauſed the diſpatches to be thrown into the fire, and directed him to ſend ſuch inſtructions to the royal commiſſioners of the general aſſembly as he thought moſt conducive to the public good. In conſequence of this ſeaſonable interpoſition, the oath and aſſurance were diſpenſed with on the part of the clergy. By this timely ſervice Carſtares acquired the confidence of the Preſbyterian party to ſuch a degree, and he ſo ſucceſsfully cultivated the friendſhip of the earl of Portland, and other men of influence about the court, that he was regarded in the management of Scots affairs, as a kind of viceroy for Scotland, though he poſſeſſed no public character. Although he acted with conſummate prudence and delicacy, he could not eſcape envy: but he retained the eſteem of thoſe whom he moſt valued; and the king once ſaid of him, in the preſence of ſeveral of his courtiers, "that he had long known Mr. Carſtares; that he knew him well, and knew him to be an *honeſt man*."

Although, after the death of king William, Carſtares was not much employed in public affairs, queen Anne continued him in the office of royal chaplain for Scotland, and obtained for him the offer of an appointment to the vacant place of principal of the univerſity of Edinburgh; which he accepted in 1704, with the firſt profeſſorſhip of divinity. After this appointment, whilſt he refuſed any addition to his own ſalary, he uſed his influence at court for augmenting the very ſmall ſalaries pertaining to the regents in the ſeveral univerſities of Scotland; and in the execution of his office, as principal, he ſecured the affection and reſpect of thoſe that were ſubject to his authority, by the dignified affability and gentleneſs of his deportment. In the year of his appointment to the principalſhip of the univerſity, he was unanimouſly invited to the paſtoral office in one of the pariſhes of Edinburgh, which he performed with exemplary diligence; and as moderator of the general aſſembly, which poſt he occupied four times in eleven years, he maintained great weight in its debates. When the union of the two kingdoms was agitated, it engaged his cordial concurrence, and he was the principal inſtrument of preventing any public oppoſition from the preſbyterian clergy. His efforts to control the bigotry of this body rendered him unpopular; and with a view of gaining their good opinion, he accepted the office of one of the agents, ſent to London to oppoſe the bills for the reſtoration of patronage in Scotland, and for the toleration of the epiſcopal clergy; though in the latter inſtance, at leaſt, his oppoſition muſt have counteracted his principles. His excuſe ſeems to have been an apprehenſion that the Scots epiſcopalians wiſhed the exiled family to be reſtored. His efforts, however, whether they were ſincere or not, proved unſucceſsful. To the ſucceſſion of the houſe of Hanover he gave his active ſupport; and he obtained from the general aſſembly an addreſs of congratulation to George I. on his acceſſion to the throne; and in return for this ſervice his office of royal chaplain was continued. His death happened ſoon after this event, in December, 1715. "His private character was highly reſpectable. His religion was free from enthuſiaſm and ſuperſtition, and his charity and bounty comprehended all ſects and parties. His memory is revered by his countrymen as that of a true and enlightened patriot, and few have held an active courſe amidſt violent public contentions with leſs reproach." See State papers and letters, addreſſed to William Carſtares, confidential ſecretary to king William, during the whole of his reign, afterwards principal of the univerſity of Edinburgh, relating to public affairs in Great Britain, but more particularly in Scotland, during the reign of king William and queen Anne; to which is prefixed the life of Mr. Carſtares; publiſhed from the originals, by Joſeph M'Cormick, D.D. miniſter at Preſton-pans. 1774. 4to. Biog. Brit.

CARSULÆ, in *Ancient Geography*, a town of Italy, in Umbria, ſituate between Narnia and Mavania, on the Flaminian way. According to Strabo it was a place of conſiderable note, and from Tacitus we learn, that it was about 10 miles diſtant from Narnia. Livy aſſigns it to a people called Carſuli.

CARSUM, a town of Lower Moeſia, according to Ptolemy. It is placed in the Itinerary of Antonine between Capidava and Cion.

CARSUMBLIA, in *Geography*, a town of European Turkey, in the province of Servia; 12 miles W. of Precop.

CARSUS, in *Ancient Geography*, a river of Aſia, in Cilicia; which ſprung in mount Amanus, near the town of Erana, ran to the ſouth-weſt between the branches of this mountain, watered the town of Epiphania, and diſcharged itſelf into the Mediterranean, at the bottom of the gulf "Iſſicus."

CART, a vehicle mounted on two wheels, drawn by horſes, uſed for the carriage of heavy goods. The word ſeems formed from the French *charette*, which ſignifies the ſame; or rather the Latin *caretta*, a diminutive of *carrus*. See CARR.

Mr. Sharp's *rolling cart* is fixed upon two rollers, running a-breaſt, or parallel with each other, and both placed under the body of the cart, working upon pivots like the wheel of a wheel-barrow. The rollers are both cylinders of caſt iron, two feet diameter, and ſixteen inches broad. An iron ſpindle paſſes through the centre of each roller, upon the ends of which reſt the four planks that ſupport the body of the cart. Criminals are drawn to execution on a cart. Bawds, and other malefactors, are whipped at the cart's tail.

Scripture makes mention of a ſort of carts or drags, uſed by the Jews to do the office of threſhing. They were ſupported on low thick wheels, bound with iron, which were rolled up and down on the ſheaves to break them, and force out the corn. Norden and Niebuhr, in their "Travels," inform us, that this method of threſhing is ſtill practiſed in Egypt and Arabia. The former ſays that in Egypt they threſh, or rather tread, rice by means of a ſledge drawn by two oxen, and that the man who drives them is upon his knees, whilſt another has the care of drawing back the ſtraw, and of ſeparating it from the grain that remains underneath. In order to tread the rice they lay it on the ground in a ring, ſo as to leave a void circle in the middle. The Arabians, ſays the latter writer, in threſhing their corn, lay the ſheaves down in a certain order, and then lead over them two oxen, dragging a large ſtone. They uſe oxen in Egypt, he adds, as the ancients did, to beat out their corn by trampling upon the ſheaves, and dragging after them a clumſy machine. This machine is not, as in Arabia, a ſtone cylinder; nor a plank with ſharp ſtones, as in Syria; but a ſort of ſledge, conſiſting of three rollers, fitted with irons which turn upon axles. A farmer chooſes out a level ſpot in his fields, and has his corn carried thither in ſheaves upon aſſes or dromedaries: two oxen are then yoked in a ſledge; a driver gets upon it, and drives them backwards and forwards, or rather in a circle upon the ſheaves, and freſh oxen ſucceed in the yoke from time to time. By this operation, the chaff is very much cut down; the whole is then winnowed, and the pure grain thus ſeparated. Something of the like kind alſo obtained among the Romans, under the denomination of *plauſtra*, of which Virgil makes mention. Georg. I.

*Tardaque Eluſinæ matris volventia plauſtra,*
*Tribulaque, traheaque*——

On which Servius obſerves, that *trahea* denotes a cart without wheels, and *tribula* a ſort of cart armed on all ſides with teeth, uſed chiefly in Africa, for threſhing corn. The Septuagint and St. Jerom repreſent theſe carts as furniſhed with ſaws, inſomuch that their ſurface was beſet with teeth. David having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be cruſhed to pieces under ſuch carts, moving on wheels ſet with iron teeth; and the king of Damaſcus is ſaid to have treated Iſraelites in the land of Gilead in the ſame manner. 2 Sam. xii. 31. Amos. i. 3. Calm. Dict. Bibl. tom. 1. p. 366.

CART, in *Agriculture*, is a carriage or vehicle conſtructed with two or more wheels, and drawn by one or more horſes. It is employed for the purpoſe of conveying manure, hay, grain, and various other articles which are connected with the farm. Carts are made of different forms and dimenſions, in ſome diſtricts according to the nature of the materials they are intended to carry, and the uſes to which they are applied; but by ſuitable contrivances they may be eaſily conſtructed, ſo as for the ſame cart to ſerve different uſes. In the more ſouthern parts of the kingdom this is moſtly the caſe, by which there is not only a conſiderable ſaving, in fewer carts being wanted, but likewiſe in leſs room being taken up by them in the ſheds or houſes where they are kept. In theſe ſituations they are moſtly formed in a cloſe manner, having ladders or other ſimilar contrivances applied when they are wanted to convey any of the more bulky ſorts of materials, ſuch as hay, ſtraw, &c.

It is obvious that the chief object in the conſtruction of carts ſhould be to adapt the wheels and axle in ſuch a manner, that the power may be applied in the moſt favourable direction for draught, and that the carriage may move with the leaſt poſſible force. In this view the height of the wheels ſhould likewiſe be well adapted to that of the animals which are employed in drawing them; but the exact heights which are the moſt favourable under different circumſtances have not yet been fully ſhewn by any trials that can be fully depended upon. There is likewiſe another point which ought to be particularly conſidered in the making of farm-carts, which is, that they are not more heavy than is neceſſary; which is too often the caſe in the ſouthern parts of the iſland. It has been remarked that the large heavy carts and waggons, which are ſo common in the ſouthern diſtricts, are not only reprobated, but almoſt wholly in diſuſe in thoſe of the north, where ſmall carts are in general uſe. Though there cannot be any doubt but that carts muſt vary in their forms, ſizes, and modes of conſtruction, according to the nature and ſituation of the roads, and many other local circumſtances; yet for the purpoſes of farming, eſpecially in field work, probably thoſe of the light, ſingle, and two horſe kind may in general be the moſt advantageous, convenient, and uſeful.

It has been obſerved, in the twenty-ſeventh volume of the Annals of Agriculture, by lord Robert Seymour, that "the advantages of ſingle-horſe carts are, he believes, univerſally admitted, wherever they have been attentively compared with carriages of any other deſcription. By his own obſervation he is led to think that a horſe, when he acts ſingly, will do half as much more work as when he acts in conjunction with another; that is to ſay, that two horſes will, ſeparately, do as much work as three conjunctively: this ariſes, he believes, in the firſt place, from the ſingle horſe being ſo near the load he draws; and, in the next place, from the point or line of draught being ſo much below his breaſt, it being uſual to make the wheels of ſingle horſe carts very low. A horſe harneſſed ſingly has nothing but his load to contend with, whereas when he draws in conjunction with another, he is generally embarraſſed by ſome difference of rate, the horſe behind or before him being quicker or ſlower than himſelf; he is likewiſe frequently inconvenienced by the greater or leſſer height of his neighbour: theſe conſiderations give, he conceives, a decided advantage to the ſort of cart he is recommending." If any other is wanted, that "of the very great eaſe with which a low cart is filled may, he ſays, be added: as a man may load it, with the help of a long-handled ſhovel or fork, by means of his hands only; whereas, in order to fill a higher cart, not only the man's back, but his arms and whole perſon muſt be exerted." To the uſe of ſingle horſes in draught he has heard no objection, unleſs it be the ſuppoſed neceſſity of additional drivers created by it: the fact however is, that it has no ſuch effect; for, horſes once in the habit of going ſingly, will follow each other as uniformly and as ſteadily as they do when harneſſed together; and accordingly we ſee, ſays he, "on the moſt frequented roads in Ireland, men conducting three, four, or five, ſingle horſe cars each, without any inconvenience to the paſſenger: ſuch likewiſe, is the caſe in this country, in which lime and coal are generally carried upon pack-horſes, where one man manages two or three, and ſometimes more." And in a preceding volume of the ſame work, Mr. Young is decidedly of the ſame opinion, which he clearly ſhews to be founded in truth, by entering into a variety of diſcuſſion in reſpect to the points in which they are preferable to tumbrils or waggons. In the northern diſtricts they uſually draw in theſe carts from twelve to twenty-four hundred weight, and where the roads are good, occaſionally thirty, with much eaſe and facility.

And Mr. Donaldſon, in his view of the "Preſent State of Huſbandry in Great Britain," ſeems to think that, "for carrying on the ordinary operations of huſbandry, carts drawn by two horſes are greatly ſuperior to large, cumberſome, unwieldy waggons, that require four, five, or ſix horſes to move them along. It has of late," ſays he, "been a ſubject pretty much agitated, whether ſingle-horſe carts are not to as great a degree ſuperior to thoſe drawn by two horſes, as theſe have been repreſented to be to waggons. Single-horſe carts are certainly loaded and unloaded with much leſs trouble, and are in every way more eaſily managed, eſpecially when carrying out dung, or when uſed for doing any odd jobs on a farm." It has alſo been found, from long experience and the moſt attentive obſervation, that "one horſe will draw, on any road, two-thirds of the load that two horſes, drawing in a line, and of equal power, are capable of doing. The carters of the town of Falkirk, in Stirlingſhire, for example, have long been famous for the great weights drawn by their carts. Before the navigable canal between the Forth and Clyde was made, the whole goods tranſported to and from Glaſgow, and the ports upon the Forth, were," ſays he, "drawn upon one and two-horſe carts belonging to theſe carters; the moſt expert of whom have long given the preference to carts drawn by one horſe, as they experience no difficulty in carrying upon a cart, drawn by a ſingle horſe, from Borrowſtounneſs to Glaſgow, a diſtance of upwards of thirty miles, and of indifferent road, from twenty to thirty-five hundred weight." It is, he obſerves, further worthy of remark, that "at the great iron-work at Carron, the company engaged in it formerly made uſe of waggons and waggon-ways, to wheel their coals and other heavy articles upon: but have entirely laid aſide the uſe of them, and on principles of economy, employed carters with ſingle-horſe carts to tranſport the heavy articles which they require."

In the agricultural report of Northumberland it is likewiſe remarked, that "ſingle-horſe carts are becoming more prevalent in ſeveral parts of that county; and that Mr. James Johnſon, a common carrier at Hexham, has a horſe, ſixteen hands high, that commonly carries from Hexham to Newcaſtle 24 cwt., and 20 cwt. back again; and there are inſtances of his having carried 26 cwt. from Newcaſtle to Hexham, which is a very banky, heavy-pulling road." It is alſo further noticed that "the neateſt, moſt uſeful, and beſt contrived carts we know, are thoſe made in many parts of the North-Riding of Yorkſhire. The ſingle-horſe carts of this conſtruction, uſed for carrying coals from the county of Durham into Yorkſhire, are 60 inches long, 36 inches wide, and 18 deep, hold 24 buſhels of coals, when ſet round the ſides with large ones and upheaped. A man, or boy, drives three of theſe, two of which are equal to the greateſt quantity ever carried by three horſes." Mr. Charge of Newton, ſends three of theſe carts for coals every day, which bring 72 buſhels, the diſtance of 26 miles, there and back, which is performed in 12 hours by one man. The ſame gentleman's two-horſe carts bring 36 buſhels of the ſame coals.

And in the agricultural ſurvey of Cumberland, the writers ſay, "the advantages of ſingle-horſe carts are ſo well underſtood in this county, that we did not ſee any other uſed. Three ſingle-horſe carts are driven without any difficulty, by a man, or boy, or even women and girls."

The author of the Agricultural Report of Mid Lothian, ſtates, that "the wheel-carriages employed in huſbandry are only the cloſe-cart and the corn-cart, both of a light conſtruction, drawn by two horſes, and of late by one. The large wains, or heavy four-horſe waggons, employed in Engliſh huſbandry, are diſcarded there. Two horſes in a cart are commonly loaded with 18 or 20 cwt. One horſe draws ſtill more eaſily 12 cwt.; even 24 cwt. is frequently put on a ſingle horſe; and 30 cwt. on good roads is not uncommon." And that "the firſt ſort of cart has lately been much improved: when placed on its axle, the bottom at each ſide projects over the inner head of the naves as far as nearly to touch the ſpokes of the wheels; from which acquired breadth the capacity is enlarged; while the ſide-ſtandards, being brought nearer to a perpendicular, are able to ſuſtain more weight." The dimenſions are, the length five feet three inches; the breadth below, four feet; the breadth above, four feet three inches; the depth, one foot three inches; containing about a cubic yard. The price of a cart, painted, 1l. 15s. not including wheels, axle, or mounting, which may amount in all to ſeven or eight pounds more. The wheels are generally 52 inches high, the axle commonly of iron, from an idea, that, in the end, it is more economical to have them ſo: for it is not found in practice that iron axles are either more or leſs difficult to draw, although not half the thickneſs, of thoſe of wood."

It has been ſuggeſted on the ground of much experience, that, in conſtructing carts of this ſort, the capacity of waggons is by no means an accurate rule to proceed by; as on finding that they contained in the bed, or *buck*, ninety-ſix cubical feet, being twelve feet long, four feet wide, and two feet in depth; it was ſuppoſed that to give one horſe the fourth part of the load of four, it would only be neceſſary to let the cart have the ſpace of twenty-four cubical feet, or to make it four feet by three, with the depth of two; but from the vaſt ſuperiority of horſes working ſingly, over thoſe in teams, it was ſoon diſcovered, that they required to be very conſiderably enlarged, admitting of having the dimenſions of five feet one inch in length of bed or *buck*, three feet ſeven inches in breadth, with two feet in depth; ſo as to contain thirty-five cubical feet and a fraction. This, therefore, affords a further ſtriking proof of the great ſuperiority theſe ſmall carts have over thoſe of the large kind, in the quantity of work which they are capable of performing.

In ſpeaking of the advantage of having low caſt-iron wheels, it is remarked by lord Seymour, in the paper juſt mentioned, that "the price of iron, caſt into wheels, is 16s. per cwt., and the weight of each wheel about three quarters of a cwt. Two inconveniences only, he believes, have been found from the uſe of low caſt-iron wheels: the firſt is, that caſt-iron is very liable to breakage, upon concuſſion; the next is, that the courſe of ſo ſmall a diameter creates a very quick conſumption of greaſe. The firſt of theſe objections is in a degree removed by the eaſe with which the rim of the wheel is repaired by the application of worked iron, which being joined to it by a rivet, the wheel acquires ſome little elaſticity, and thereby becomes perhaps ſtronger than when it was new. In order that the ſupply of greaſe may keep pace with the conſumption, he has introduced four grooves, or cavities, in the boxes, increaſing a little towards their centres; and in order to defend the axle-tree, which conſiſts of worked iron, againſt the harder body of the box, he has ſteeled the extremity of it."

Theſe ſmall carts are conſidered by many, from actual experience, to be better adapted to the carrying of all ſorts of materials except thoſe of the very bulky kinds, and ſuch as trees, blocks of ſtones, &c. the weights of which might injure them, and which cannot from their nature admit of diviſion. In all hilly diſtricts where the roads are of an inferior kind, and the inhabitants poor, theſe are the carts that are in moſt general uſe, and which are found the moſt advantageous. The ſuperior goodneſs of the roads in ſome of the northern parts of the kingdom have likewiſe been aſcribed to the uſe of theſe kinds of carts, as large carriages of all ſorts that require the wheels to be locked in deſcending hills, are the deſtruction of roads.

By the author of the New Farmer's Calendar it is ſtated that "of the great ſaving to be made by one-horſe carts there can be no doubt, ſince it has been experimentally proved, and was moreover, eaſily to be diſcovered from juſt theory. More weight may be drawn by ſix horſes in ſo many carts, than by eight in a large waggon; and one man may manage two carts in the country." There are, however, he thinks, "ſome peculiar inconveniences attendant upon this plan, which are ſufficiently obvious; and, ſays he, notwithſtanding it has been, for years paſt, ſo warmly recommended by very powerful pens, it never has, nor probably ever will be, reliſhed by the generality of farmers."

After this view of the nature of carts in general, and of the particular advantages of ſingle-horſe carts; it may be uſeful to deſcribe the different ſorts of carts that are employed in the buſineſs of huſbandry.

*Cloſe cart*, a name given to all ſuch carts as have no ladders, rails, or wings, attached to them. They are made cloſe by boards, and moſtly employed in conveying dung, gravel, earth, or ſuch other materials as have conſiderable weight, in a ſmall compaſs. By the application of wings or ladders to them, they are however, frequently made to ſerve the double purpoſe of conveying heavy cloſe matters as well as thoſe of a light bulky nature. This ſort of cart is repreſented at *fig.* 3. *Plate* III. of *Agriculture.*

*Corn cart*, is that ſort of cart which is only placed occaſionally on wheels, for carrying hay, corn in the ſtraw, or other light bulky articles; carts of this kind are generally compoſed of ſtandard rods, and ſpars, without deals, but broader and much longer than the cloſe cart, that they may hold a more bulky load. They coſt from 20s. to 30s. in Scotland, but in England they are conſiderably higher. They are commonly employed in the northern parts of the kingdom for carrying hay, grain in the ſtraw, and other ſimilar bulky materials. A cart of this ſort is ſhewn at *fig.* 4. *Plate* III.

*Coup cart*, a cart of the cloſe kind, ſo denominated from the body-part reſting on a ſort of frame, to which it is kept by means of ſtaples, or other contrivances, through which a caſt-bar, or wooden pin, is put, by which it is confined, and which can be readily removed when the load is to be either partially or wholly diſcharged. Carts of this ſort are generally uſed in putting dung upon land, and are convenient for many other purpoſes in huſbandry. See *fig.* 3. *Plate* III.

*Drag cart*, a ſort of cart invented by lord Sommerville, which is conſtructed with a drag, or ſome other contrivance, for checking, or regulating the rapidity of the motion in going down hills, or other declivities. A full account of this cart has been given in the ſecond volume of "Communications to the Board of Agriculture." At *fig.* 5. in *Plate* III. is a perſpective view of a cart of this ſort to be drawn by two ſtrong oxen, by a pole, yoke, and bows, made to carry 45 cwt. In the front of this *figure* is repreſented the method which his lordſhip has contrived for adjuſting the poſition of the centre of gravity of the load, to prevent its preſſing too much on the cattle in going down hill, the front of the cart being elevated by means of a toothed rack ſcrewed to the front of the cart, and worked by a pinion, and the handle, *a*, immediately connected with the pole, *e*. By means of this pinion and rack, the front of the carriage is elevated more or leſs, in proportion to the declivity of the hill, by which means the weight of the load is made to bear more on the axis, and leſs on the necks of the oxen.—On the ſide view of this cart is repreſented the manner of applying the friction-drag, which is made to preſs more or leſs on the ſide of the wheel, according to the ſteepneſs of the deſcent:—*bb* is the friction-bar, or drag, the one end of which is connected with the tail of the cart by a ſmall chain, and the other end to the front, by means of a toothed rack, *bd*, which catches on a ſtaple in the front of the cart, by which the friction-bar may be made to preſs on the ſide of the wheel, more or leſs, at the diſcretion of the driver: the notches or teeth in this rack, it is obſerved, ſhould be as cloſe to each other as circumſtances will permit. And in this repreſentation, the friction-bar is, he remarks, applied lower upon the wheel than was at firſt propoſed, in order to divide the preſſure and friction more equally on the oppoſite ſides of the wheel, ſo that the preſſure on each is diminiſhed, the riſk of over-heating and deſtroying the friction-bars is alſo rendered leſs, than if the whole preſſure was applied in one point on the top of the wheel. The weight of the iron-work of this cart is 2 cwt. 20 lb. This is unqueſtionably an uſeful contrivance for hilly diſtricts. At *fig.* 5. in the ſame *Plate*, is a ſide view of a cart of this kind of a ſmaller ſize, to carry 25 cwt. and to be drawn by ſteers, or ſmall oxen, with the friction-drag, *bb*, out of uſe; and repreſenting another and more ſimple method of adjuſting the centre of gravity of the load to the declivity of the deſcent: *ab* is part of the arch of a circle, whoſe radius is nearly equal to its diſtance from the axis of the cart, and having ſeveral holes in it, through which a ſtrong iron pin is put, to keep the body of the cart at any deſired inclination with the pole:—*c*, a ſmall chain to prevent the body of the cart being thrown too far back, through the careleſſneſs of the driver in adjuſting it:—*dd*, the upper ſtage of the cart, for carrying bulky loads.—The weight of iron in this cart is 1 cwt. 30 lb. This is a very uſeful, neat, light ſort of cart for many purpoſes.

The advantages of the friction-drag, and other contrivances in this cart, according to the ingenious account of Mr. Cumming, contained in the ſame volume, are,

"1. The method, which is equally ſimple and expeditious, of adjuſting the centre of gravity of the load, ſo as to have a proper bearing on the horſes or cattle in going down hill, the advantage of which muſt be obvious to every man of ſcience, more eſpecially with bulky loads, in which the centre of gravity lies high.

2. The method of applying friction to the ſide of the wheel to regulate the motion of the carriage in going down hill (inſtead of locking the wheels), the advantages of which method appear to be as follow: namely, 1ſt. The preſſure and degree of friction may with great expedition be adjuſted to the ſteepneſs of the declivity, ſo that the carriage will neither preſs forward, nor require much exertion to make it follow the cattle. 2dly. The friction is ſo applied to the wheel, that a given preſſure will have twice the effect in retarding the progreſs, that it would have if immediately applied to the body of the carriage, or to the axis: and by applying the friction on both ſides of the wheel, the riſk of heating and deſtroying the friction-bar is much leſs than if the ſame degree of friction was applied in one place. 3dly. This apparatus is ſo conveniently placed, that it can be inſtantly applied or adjuſted, without ſtopping the carriage, or expoſing the driver to the ſame danger as in locking a wheel. And, 4thly. This uſeful contrivance, in which he ſays ſimplicity and ingenuity are ſo happily blended, will aſſume yet greater importance when applied to both the hind wheels of waggons, by which means the reſiſtance may always be proportioned to the ſteepneſs of the deſcent, the tearing up of the road prevented, the unneceſſary exertion of the cattle in drawing the locked carriage down hill avoided, the danger to which the driver is ſometimes expoſed in locking the waggon wheel totally avoided, and the time now loſt in locking and unlocking the wheel ſaved to the proprietor." Theſe are certainly advantages of much importance in many diſtricts where the roads are hilly.

At *figs.* 7 and 8 in the ſame *Plate* are views of carts to be drawn by a ſingle horſe, by ſhafts. By an attentive compariſon of thoſe drawn by ſhafts, with thoſe that are drawn by the yoke and bows, the ſuperiority of the pole to the ſhafts, and the advantage of making the cattle to draw by the yoke in preference to drawing by the forehead, become evident. When cattle draw by the ſhafts, ſays his lordſhip, the one before the other, it is impoſſible for the driver to know that each exerts an equal force, ſo as to contribute equally to the draught; but when they draw by the pole and yoke, the point of draught being in the middle of the yoke, when the beaſts draw equally, the yoke will ſtand ſquare with the pole, and the poſition of the yoke will always enable the driver to diſcover the defaulter, and to bring him to a proper exertion: it is, he ſays, this harmony of draught, and equality of exertion, that gives ſo great advantage to drawing by the yoke, that it is ſcarcely poſſible to ſay what weight of load two good large oxen can draw on a level road." The powers of cattle drawing by the forehead, on lord Shannon's eſtate, are recorded by Mr. Young and Mr. Billingſley:—an ox of the late Mr. Tatterſall, near Ely, drew four tons of wood on a level ſurface without apparent difficulty. What then, ſays he, "might not be expected from the equal exertion of two ſuch powerful animals, acting at the equal ends of the ſame yoke?" Notwithſtanding theſe judicious obſervations, further trials are wanting with reſpect to the beſt modes of draught.

*Hay Cart*, a cart made uſe of for conveying hay from the field; it is conſtructed in the ſame way as that made uſe of for corn. See *Corn Cart.*

*Quarry Cart*, is a ſtiff, ſtrong ſort of cart, employed in quarries. Carts for this purpoſe are variouſly conſtructed, according to the nature of the materials to be conveyed by them. When flat ſtones of great length and breadth are to be carted, they ſhould be low, for the convenience of loading and unloading, and at the ſame time very firmly put together.

It is ſtated in the Agricultural Survey of the County of Perth, that "Mr. Mylne, of Mylnfield, employs a cart of a particular conſtruction in his quarry of Kingoodie, which merits the attention of thoſe who have works of a ſimilar nature. This cart has a bend in the axle, which brings it within fourteen inches of the ground, although moving on wheels more than five feet high. The eaſe with which it is drawn, loaded, and unloaded, is ſuperior to the common cart, in the proportion of 7 to 3." It is ſeen at *fig.* 9. in *Plate* III. He alſo uſes in this quarry "a cart for carrying very large ſtones, ſuch as mill-ſtones, &c. which is drawn as eaſily upon wheels of two feet two inches in height as upon wheels of a greater diameter. In this cart the axle is only about five feet long, ſo that the wheels run under the body of the frame, which is flat, and may be made of any breadth or length required."

*Single horſe Cart*, that light ſort of cart in which only one horſe is employed. The term is made uſe of to diſtinguiſh them from thoſe of the large kind, in which three, four, or even a greater number of horſes are made uſe of. Carts of this ſmall conſtruction are extremely uſeful for all the various little purpoſes of cartage about the farm, as has been fully ſhewn above. See *figs.* 3. 7. and 8. in *Plate* III.

*Three wheel Cart*, a kind of cart that is conſtructed with three wheels, one being commonly placed in the middle, before, and generally of a ſmaller ſize. Carts of this ſort are moſtly cloſe, and uſed when great quantities of earth or other materials are to be conveyed at once to ſome diſtance.

CARTS, *laws relating to.* By 13 Geo. III. c. 78. no cart, having the ſole or bottom of the fellies of the wheels of the breadth of nine inches, ſhall be drawn with more than five horſes; and no cart, having the ſaid ſole the breadth of ſix inches, ſhall be drawn with more than four horſes; and thoſe of leſs breadth than ſix inches ſhall not be drawn with more than three horſes, under a penalty on the owner of 5l., and on the driver (not being the owner) of 10s. for every horſe above the ſtipulated number: the information to be laid within three days and the action commenced within one calendar month after the offence committed. Exceptions are admitted in favour of carriages, moving upon wheels or rollers of the breadth of 16 inches on each ſide, with flat ſurfaces, and ſuch as juſtices allow by licence to be drawn up ſteep hills, or on roads that are not turnpikes, or in deep ſnow or ice, or carrying any one ſtone, block of marble, cable rope, piece of metal, or ammunition and artillery for his majeſty's ſervice. Two oxen or horned cattle are conſidered in the contemplation of this act, as one horſe. Moreover it is enacted by 6 Geo. I. c. 6. that no perſon in London and Weſtminſter, or within

10 miles, ſhall carry at one load in carts or waggons having their wheels ſhod with iron, more than 12 ſacks of meal of five buſhels each, nor more than 12 quarters of malt, nor more than 750 bricks, nor more than one chaldron of coals, on pain of forfeiting any one of the horſes, with geers, bridles, &c. And by 18 Geo. II. c. 33. wheels of every cart, car, or dray, within the bills of mortality, ſhall be ſix inches broad in the felly, and not wrought about with iron, nor be drawn with more than three horſes, after they are up the hills from the waterſide, under a penalty of 40s.; but this act does not extend to any country cart or waggon, that ſhall bring any goods, or ſhall carry any goods half a mile beyond the paved ſtreets of the ſaid cities and places. Any perſon, within the ſaid limits, uſing any cart, car, or dray, having the wheels full ſix inches broad, when worn, may have the ſame bound round with tire of iron, provided it be ſix inches broad, and made flat, and not ſet on with roſe-headed nails. No perſon ſhall drive any cart, within the ſaid limits, unleſs the name of the owner, and number of ſuch cart, &c. be placed in ſome conſpicuous place of the cart, &c.; and his name be entered with the commiſſioners of hackney-coaches, under the penalty of 40s. and every perſon may ſeize and detain ſuch cart till the penalty be paid. On changing property, the names of the new owners are to be affixed, and to be entered with the commiſſioners of hackney-coaches, 30 Geo. II. c. 22. And ſtat. 24 Geo. III. ſt. 2. c. 27. compels the entry of all carts driven within five miles of Temple-bar. By 13 Geo. III. c. 78. §. 11. a perſon, who leaves any cart or other carriage, &c. in any high-way, beyond the reaſonable time allowed for loading or unloading, ſo as to obſtruct the paſſage of any other carriage, &c. ſhall forfeit 10s. By 1 Geo. ſtat. 2. c. 57, by 24 Geo. II. c. 43, and, more generally, by 13 Geo. III. c. 78, it is enacted, that if the driver of any cart, car, dray, or waggon, ſhall ride upon any ſuch carriage in any ſtreet or highway, not having ſome other perſon on foot or on horſeback to guide the ſame (ſuch carriages as are conducted by ſome perſon holding the reins of the horſe or horſes drawing the ſame excepted);—or if the driver of any carriage whatſoever, on any part of any ſtreet or highway, ſhall by negligence or wilful miſbehaviour cauſe any hurt or damage to any perſon or carriage paſſing or being upon ſuch ſtreet or highway;—or ſhall quit the highway and go on the other ſide of the hedge or fence incloſing the ſame; or wilfully be at ſuch diſtance from ſuch carriage, whilſt it ſhall be paſſing upon the highway, that he cannot have the direction and government of the horſes or cattle drawing the ſame: or ſhall, by negligence or wilful miſbehaviour, prevent, hinder, or interrupt the free paſſage of any other carriage, or of his majeſty's ſubjects, on the ſaid highways; or if the driver of any empty or unloaded waggon, cart, or other carriage ſhall refuſe or neglect to turn aſide and make way for any coach, chariot, chaiſe, loaded waggon, cart, or other loaded carriage; or if any perſon ſhall drive, or act as the driver, of any ſuch coach, poſt chaiſe, or other carriage let for hire, or waggon, wain, or cart not having the owner's name (as by this act is directed) painted thereon, or ſhall refuſe to diſcover the true chriſtian and ſurname of the owner of ſuch reſpective carriage; he ſhall on conviction by confeſſion, view of the juſtice, or oath of one witneſs, before one juſtice, forfeit any ſum not exceeding 10s., in caſe ſuch driver be not the owner of ſuch carriage; and if he be the owner, then any ſum not exceeding 20s.; and in default of payment be committed to the houſe of correction for any time not exceeding one month, unleſs the ſame be ſooner paid. And every ſuch driver offending in either of the ſaid caſes, may by authority of this act, with or without any warrant, be apprehended by any perſon who ſhall ſee ſuch offence committed, and ſhall be immediately conveyed or delivered to a conſtable or other peace officer, to be conveyed before a juſtice, to be dealt with according to law. And if any driver, in any of the caſes aforeſaid, ſhall refuſe to diſcover his name, the juſtice may commit him to the houſe of correction for any time not exceeding three months, or may proceed againſt him for the penalty by a deſcription of his perſon and the offence, and expreſſing in the proceedings that he refuſed to diſcover his name.

And for the better diſcovering of offenders, the owner of every waggon, wain, or cart, and alſo of every coach, poſt chaiſe, or other carriage, let to hire, ſhall cauſe to be painted, upon ſome conſpicuous part of his waggon, wain, or cart, and upon the pannels of the doors of all ſuch coaches, poſt chaiſes, or other carriages, before the ſame ſhall be uſed in any public highway, his chriſtian and ſurname and place of abode, in large legible letters; and continue the ſame thereupon ſo long as ſuch carriage ſhall be uſed upon any highway: and the owner of every common ſtage waggon or cart ſhall, over and above his chriſtian and ſurname, cauſe to be painted on the part and in the manner aforeſaid, the following words, *common ſtage waggon or cart*, as the caſe may be. And every perſon uſing any ſuch carriage as aforeſaid upon any highway, without the ſaid names and deſcriptions reſpectively, or cauſing to be painted thereon any fictitious name or place of abode, ſhall forfeit not exceeding 5l. nor leſs than 20s.

"Taxed carts," conſtructed, kept, and uſed under the regulations of the ſtat. 43 Geo. III. c. 99, are exempted from the annual duty of 5l. 5s. charged for carriages with leſs than four wheels and drawn by one horſe. Such carriages are thus deſcribed: they ſhall be built wholly of wood or iron, without any covering other than a tilted covering, and without any lining or ſprings, made of iron, wood, leather, or other materials, and with a fixed ſeat, without ſlings or braces, and without any ornament whatever, other than paint of a dark colour, for the preſervation of the wood or iron only, and which ſhall have the words "a taxed cart," and the owner's chriſtian and ſurname and place of abode, marked or painted on a black ground in white letters, or on a white ground in black letters, on the outſide of the back pannel or back part of ſuch carriage, in words at full length, and of a breadth in proportion, and the price of which (repairs excepted) ſhall not have exceeded, or the value thereof ſhall not at any time exceed the ſum of 12l. ſterling. For ſuch a carriage kept by any perſon for his own uſe, and not for hire, the annual duty to be paid is 1l. 4s. The exemption from all duties ſpecified in the foreſaid act extends to any cart kept to be uſed wholly in huſbandry, or in the carriage of goods in the courſe of trade, and whereon the name and reſidence of the owner, and the words "common ſtage cart" ſhall be legibly painted; although the owner, or his or her ſervant, ſhall occaſionally ride therein or thereon when laden, or when returning from any place to which, or when going to any place from which any load ſhall have been or ſhall be to be carried in ſuch carriage, or for conveying the owners thereof or their families to or from any place of divine worſhip on Sunday, or on Chriſtmas-day, or on Good Friday, or on any day, appointed for a public faſt or thankſgiving, or for carrying perſons going to or returning from the election of members to ſerve in parliament.

Cart, in *Artillery*. See Carriage.

Cart-*bote*, in our *Ancient Cuſtoms*, denotes wood to be employed in making or repairing inſtruments of huſbandry.

CART-*ladder*, a kind of rail or rack, placed occaſionally at the head, ſides, and tail of a cart to make it hold a larger quantity of hay, ſtraw, or other ſimilar bulky material. Rails of this ſort are framed and made very ſtrong.

CART-*lodge*, a ſmall out-houſe for ſheltering carts from the weather. Farmers ſhould be very careful to place their carts, &c. under proper ſhelter, when out of uſe, as they will laſt much longer by this means than if left expoſed in the yard to the effects of the weather; for, as they are thus ſometimes wet, and ſometimes dry, they ſoon rot, and become unfit for uſe. The duſt and naſtineſs ſhould alſo be conſtantly waſhed off before they are laid up in theſe places. Theſe ſheds ſhould always be as cloſe to the farm yards as poſſible, for the ſake of convenience.

CART-*rake*, a provincial term applied to the cart-track, or furrow made by the wheels of the cart.

CART-*rut*, the track made by the wheels: it is the ſame with cart-rake.

CART-*wright*, a name applied to a perſon whoſe buſineſs it is to make carts, waggons, &c. generally called a wheelwright.

CART-*water*, in *Geography*, a river of Scotland, which runs into the Clyde, 3 miles N. of Paiſley.

CARTA, *Ital.* literally means paper; but it is uſed in *Muſic* for a folio, a leaf, or page of muſical characters.

CARTA, in *Ancient Geography*, a town of Aſia, in Hircania, according to Strabo.

CARTAGO. See CARTHAGE.

CARTAGO *Nova*. See CARTHAGENA.

CARTAGO, in *Geography*. See CARTHAGO.

CARTAL, a town of European Turkey, in Beſſarabia, ſituate on the Danube; 28 miles W. of Iſmael.

CARTAMA, a town of Spain, in the province of Grenada, ſeated on an eminence; 4 leagues N.W. of Malaga.—Alſo, a town of Spain, in the province of Grenada, 6 leagues S.W. of Alhama.

CARTE, THOMAS, in *Biography*, a learned and laborious Engliſh hiſtorian, was the ſon of the Rev. Samuel Carte, vicar of Clifton upon Dunſmoor, in Warwickſhire, and born there, or at leaſt baptized there by immerſion, on the 23d of April, 1686. In 1698, ſoon after he had entered the 13th year of his age, he was matriculated in the univerſity of Oxford, and he was afterwards incorporated at Cambridge, where he took his degree of maſter of arts in 1706. Having entered into holy orders, he became reader of the abbey-church at Bath; and in conſequence of a ſermon, preached on the 30th of January 1713-14, and vindicating the character of king Charles I. from the aſperſions caſt on his memory with regard to the Iriſh rebellion, he was engaged in a controverſy with Mr. Chandler, a diſſenting miniſter at Bath and father of the celebrated Dr. Samuel Chandler. This controverſy occaſioned his firſt publication, entitled "The Iriſh Maſſacre, ſet in a clear Light, &c.;" which was afterwards inſerted in "Somers's Tracts." On the acceſſion of George I. he ſcrupled taking the oaths to the new government, and aſſumed a lay habit. In 1715 he was ſuſpected of being concerned in the rebellion, and in order to elude orders that were iſſued for apprehending him, he was for ſome time concealed in the houſe of a clergyman at Coleſhill. Whilſt he afterwards acted as ſecretary to biſhop Atterbury, he incurred ſuſpicion of being a party in the conſpiracy attributed to that prelate, and being charged with high-treaſon in 1722, a reward of 1000l. was offered for ſeizing his perſon. He fortunately eſcaped to France, and reſided in that country ſeveral years under the name of Philips. At this time he had acceſs to many perſons of learning and rank, and to ſeveral libraries, and thus had an opportunity of collecting materials for an intended Engliſh edition of the hiſtory of Thuanus. His collections were purchaſed by Dr. Mead, and employed in Buckley's ſplendid edition of that work, which appeared in 1733. By the intereſt of queen Caroline he obtained permiſſion to return to his own country, and ſoon after engaged in his important work, "The Hiſtory of the life of James duke of Ormonde" compriſed in 3 vols. fol. and publiſhed in 1735-36. This work contained uſeful materials with reſpect to the hiſtory of thoſe times, and particularly relating to the affairs of Ireland, of which Dr. Leland and other writers have availed themſelves; but as it diſplayed the author's attachment to arbitrary principles of government, it raiſed his reputation with the tory party. As he and thoſe with whom he was more immediately connected diſapproved the principles of Rapin's Hiſtory of England, and thought it chargeable with many errors, he announced his intention of writing a new hiſtory; and having, in 1738, printed an account of the materials as well as the encouragement that were neceſſary for the completion of his plan, he obtained ſubſcriptions, or reaſon to expect them, to the amount of 600l. per annum. Accordingly he commenced his reſearches in the libraries of Cambridge, reſided for ſome time in the houſe of Sir John Hinde Cotton, and employed himſelf in arranging his large collection of pamphlets and journals. In 1744, when the Habeas Corpus act was ſuſpended on account of apprehenſions from the Pretender, Carte was again ſuſpected, and being taken into cuſtody underwent an examination; but as no evidence appeared againſt him, he was ſoon diſcharged. Deriving from this circumſtance additional encouragement to proſecute his hiſtory, and a handſome ſubſcription from the city of London, voted by the common council, as well as from ſome of the London companies, he was enabled to complete the firſt volume in folio, terminating with the death of king John, towards the cloſe of the year 1747; but the introduction of an abſurd ſtory concerning a man who went from Somerſetſhire in 1716 to Avignon to be touched by the Pretender for the king's evil, and who was ſaid to have been cured, evinced his credulity and want of judgment to ſuch a degree, that his hiſtory ſunk into diſrepute, and the author was diſappointed with regard to ſeveral ſubſcriptions which he had reaſon to expect. However, he perſevered, and publiſhed two additional volumes in 1750 and 1752; and the fourth, which was poſthumous, appeared in 1755, and he continued the hiſtory to 1654. In this hiſtory, which in point of ſtyle is indifferently written, much uſeful information, procured by indefatigable reſearches, is blended with inveterate prejudice. Mr. Carte was the author of various other works, which are chiefly compilations, collections, and tranſlations. The moſt conſiderable is "A catalogue of Gaſcon, Norman, and French Rolls preſerved in the Tower of London," printed in French at Paris, in two vols. fol. 1743. He died at Caldecot houſe, near Abingdon in Berkſhire, on the 2d of April, 1754. His papers are depoſited in the Bodleian library; and they have been peruſed by the earl of Hardwicke, and alſo by Mr. Macpherſon, who availed himſelf of them in the compilation of his Hiſtory and State papers. Mr. Carte was a man of ſtrong conſtitution, indefatigable in his application to ſtudy, negligent with regard to his outward appearance, but when the labours of the day were cloſed, fond of ſociety, and in converſation chearful and entertaining. He left a widow, but no children. Nichols's Anecdotes of Bowyer. Biog. Brit.

CARTE, in *Fencing*, denotes a thruſt with a ſword at the inſide of the upper part of the body, with the nails of the ſword hand upwards. *Low carte* is a thruſt at the inſide of the lower half of the body; the poſition of the hand being the ſame as in the former.

Carte *Blanche*, a French term, ſeldom uſed but in this phraſe, To give, or ſend any one the *carte blanche*; i. e. to ſend him a blank paper, ſigned, for him to fill up with what conditions he pleaſes. Much like this is the French *blanc ſigne*, a paper without writing, except a ſignature at the bottom, given by contending parties to arbitrators, or common friends, to fill up with the conditions they judge reaſonable, in order to end the quarrel.

Carte *Blanche*, in *Military Language*, is an abſolute power or authority given by a ſovereign to a general of his army to do whatever may appear to him moſt proper or adviſable without waiting for order from his court; or it is permiſſion granted to a general to act in conformity to his own will, his knowledge, intelligence, and information, and according to circumſtances, without ſpecific orders from his chief. A general in conſequence of ſuch a power conferred on, and confidence repoſed in him, may attack his enemy in point both of time and manner as he thinks fit, without having either received a particular freſh order, or waiting for any.

In ancient times the general of an army had commonly the power of executing, with the troops under his command, his own plans and deſigns. The Grecian, Roman, and Carthaginian generals had almoſt always a carte blanche. But they were anſwerable to their reſpective governments for their want of ſucceſs, and they rarely eſcaped puniſhment as criminals when they were unſucceſsful. And even the excuſing of them from baniſhment was a favour, or indulgence, which was regarded as a mark of diſgrace or diſhonour. In modern times the republics of Venice and Geneva have particularly afforded examples of this ſeverity even towards generals who had gained many victories, and had rendered eſſential ſervice to thoſe ſtates; from which it may fairly be inferred, that the general who accepts a perfect carte blanche, is at leaſt imprudent, if he is not ambitious.

The Ottoman hiſtory alſo furniſhes ſeveral inſtances of generals ſtrangled on their return from campaigns for having been unſucceſsful, or defeated.

Seignior de Gordes, governor of Picardy, having engaged at Guinegale, without the orders of the court, the archduke Maximilian of Auſtria, Louis XI. was ſo vexed on being informed, that though his troops had at firſt the advantage in the action, they at laſt loſt it by betaking themſelves to pillage, that he determined his generals ſhould afterwards undertake nothing of conſequence without expreſs orders. Since the time of that prince, the kings of France, who have indeed been generally themſelves at the head of their armies, have not granted a carte blanche but very rarely, and only to generals whoſe valour and abilities have been frequently tried and acknowledged.

As moſt of our expeditions are carried on at a great diſtance from this country, it is perhaps more neceſſary for thoſe generals who command them to have a diſcretionary power of acting, than it is for thoſe of any other nation. But none ſhould be inveſted with ſuch authority, or entruſted with the command and management of ſuch diſtant expeditions but men of approved knowledge, diſcretion, and capacity. Had a general of talents been employed with a ſort of carte blanche at the beginning of the American war, commonly called the American rebellion, he would probably have ſettled it completely in the courſe of a few months.

The king being generaliſſimo of all his forces may grant a carte blanche to ſuch of his generals as he either knows, or ſuppoſes to poſſeſs great prudence and ſuperior talents. In like manner the general of an army may give a carte blanche to a general officer commanding a diviſion of the ſame. When a general poſſeſſes all the talents and qualifications neceſſary for his ſituation or employment, his ſovereign ought to confer on him this power or authority in order to prevent the want of it from retarding, embarraſſing, or crippling his operations. It is neceſſary indeed that every general ſhould have a diſcretionary power of acting to a certain degree. One of the great advantages, which a king capable of commanding his own armies enjoys, is that of doing what he chooſes, and when he chooſes, without loſing occaſions and opportunities of acting by waiting for orders. It is for the ſame reaſon uſeful and advantageous for a ſovereign to be preſent with his army, if he even have not the talents neceſſary for commanding it. For then orders are obtained promptly and expeditiouſly. Intrigue and jealouſy have not time to operate and produce their baneful effects: and the general has it more in his power to guard himſelf againſt them.

In engagements, the commander of an army ought to give only conciſe and general orders, leaving a ſort of carte blanche, or diſcretionary power of acting with all his generals as to matters of detail. For in every action there is almoſt an infinite number of circumſtances, which neither the commander himſelf nor the generals under him can foreſee, that require ſudden changes of diſpoſition and prompt movements, which every general ſhould have it in his power to direct, and cauſe to be made without waiting for orders.

Carte *geographique* of Argenville, in *Conchology*, the map cowry, Cypræa *mappa*.

Carte *geographique*, *Fauve*, in *Entomology*, the trivial French name of the European kind of butterfly, called by Linn. and Fabr. papilio prorſa.

CARTEIA, in *Ancient Geography*, *Rocadillo*, a town in the ſouthern part of Bœtica. Some difference of opinion has ſubſiſted about its preciſe ſituation; but the reſearches of ingenious geographers lead us to conclude, that it was ſeated at the bottom of the bay of Gibraltar, and that it was called "Tarteſſos" by the Greeks, though the Latins transferred this name to Gades. Some authors have confounded it with "Calpe," which was at the extremity of the mountain. Strabo ſays that it had been founded by Hercules, and that it had formerly been called "Heraclea." This city ſuffered much when Cæſar purſued the army of the ſon of Pompey, defeated at Munda. Carteia, it is ſaid, ſubſiſted till the arrival of the Moors; and the town, now called Caſtillon, is ſaid to be the remains of Carteia.

Carteia, a town of Spain, in Celtiberia, called by Polybius Althæa.

CARTEL, in *Military Language*, is a particular agreement, or convention between two belligerent powers, and has commonly for its objects the exchange or ranſom of priſoners, and the mutual delivering up of each others' deſerters at certain times, and under certain conditions.

There are alſo cartels agreed on or ſettled between princes in time of war, for carrying on commerce without interruption, notwithſtanding hoſtilities.

*Cartel* originally ſignified a *placard*, or manifeſto in writing, poſted in public places, for the purpoſe of notifying, or announcing its contents.

It comes from the Italian word *cartello*, or the Latin word *cartellus*, both of which have the ſame ſignification, being diminutives of *charta*, ſignifying *paper*.

The term *cartel* has alſo been made uſe of to denote the agreement or convention which contained the rules or regulations, that were to be obſerved by the knights, or chevaliers who jouſted and combated at a tournament, or carrouſal.

This name is likewiſe given to the billet, or note of challenge which the perſon offended or inſulted ſends to the aggreſſor, deſiring him to meet him at the place and time appointed to give him ſatisfaction, and ſettle their quarrel by ſingle combat.

This term has alſo been often employed to ſignify a letter of defiance, or challenge to ſingle combat. Such letters were in frequent uſe, when under the feudal ſyſtem combats of this nature were not only practiſed, but were ſanctioned and enjoined by princes, and even by biſhops and the dignified clergy as the beſt method of ſettling difficult points of law and controverſies that could not eaſily be otherwiſe determined. Such challenges, or letters of defiance, were not always confined to ſingle combats. They ſometimes extended to ſmall bodies of men of an equal number on each ſide, and ſometimes even to armies. Rymer gives the cartel which Edward III. ſent to Philip de Valois challenging him to fight him within ten days before the gates of Tournay, either body to body, or one hundred men to a hundred men, or army to army.

Challenges of this nature, however, took place long before the exiſtence of the feudal ſyſtem, and as far back indeed as either hiſtory or poetry carries us. For inſtances of them are to be found in Homer, Virgil, and other Greek and Latin poets, as well as in their hiſtorians.

*Cartel* is alſo a term uſed to denote a ſhip commiſſioned in time of war for exchanging the priſoners of any two belligerent powers, or for carrying a requeſt or propoſal from one to the other. The officer who commands her is permitted to carry a ſingle gun only for the purpoſe of firing ſignals.

*Cartel* likewiſe denotes a meaſure of capacity for corn in divers parts of France, varying in different places.

CARTENAGA, in *Ancient Geography*, a town of India, placed by Ptolemy on this ſide of the Ganges.

CARTENNA, or Cartennæ, a very conſiderable city of Africa, in Mauritania Cæſarienſis, or the weſtern province of the kingdom of Algiers, called Tlemſan, or Tremecen, ſituated near the mouth of the river Cartennus, to the north-eaſt, and S.S.W. of that of the river Chinalaph, or Shelliff. Pliny and Ptolemy mention it. It was a Roman colony, and Auguſtus ſettled in this place the ſoldiers of the ſecond legion. Its ſituation correſponds to that of Muſty-gannim, or Moſtagan, and alſo of Maſagran. The ſtrength and beauty, ſays Dr. Shaw, (Travels, p. 16.) of the walls of Muſty-gannim to the N.W. may well allow us to ſuppoſe them to have been formerly a portion of ſome Roman fabrick. For both Muſty-gannim and Maſagran are ſo copiouſly ſupplied with water; they are ſo commodiouſly ſituated with regard to the fertile and extenſive lawns that are ſpread far and near behind them; they enjoy, beſides, ſuch a delightful proſpect of the ſea, and of the rich maritime country that lies in view, to a great diſtance, on each ſide, that, without doubt, they were ſtations too valuable to have been neglected by the Romans. Pliny and Ptolemy place their Cartenna in this direction; and in the Itinerary we have the ſame diſtance betwixt Arſenaria and Cartenna that is found betwixt Arzew and theſe places. One or other of them, or both, might have formerly made up this colony: for, conſidering that their ſituations are nearly contiguous, and that the interjacent plantations belong indifferently, as perpaps they always did, to both of them, there is ſome probability at leaſt that they had likewiſe the ſame intereſt, and were accordingly one and the ſame community, under the name Cartennæ, as it is written in the plural by Ptolemy. See Mostagan.

CARTENNUS, a river of Africa, which diſcharges itſelf into a gulf of the Mediterranean Sea, N.E. of the port of Arſinaria. It is now, as Dr. Shaw ſuggeſts, the *Halrah*, which ſee.

CARTER, in *Geography*, a new county in the ſtate of Tenneſſee, in North America, formed of a part of the county of Waſhington.

CARTERET, John, earl Granville, in *Biography*, an eminent ſtateſman, was born in 1690, and educated at Weſtminſter ſchool and Chriſtchurch college, Oxford, from which ſeats of learning he derived a great degree of claſſical knowledge, and alſo high principles of government, and a fondneſs for convivial pleaſures, which marked the progreſs of his life. Upon being introduced into the Houſe of Peers, in 1711, he diſtinguiſhed himſelf as a zealous advocate for the Hanover ſucceſſion, and was ſucceſſively advanced by king George I. to ſeveral poſts of honour. As a forcible and eloquent ſpeaker, he ſtrenuouſly ſupported the meaſures of adminiſtration during that reign. In 1719 he was deputed as ambaſſador extraordinary and plenipotentiary to the queen of Sweden, and negociated the peace between that crown and Denmark, which terminated the troubles of the north of Europe; and in 1721 he was appointed ſecretary of ſtate, which gave him an opportunity of vigorouſly defending the boldeſt meaſures of the exiſting adminiſtration. Having accompanied the king to Hanover in 1723, he was, on his return, in the following year, appointed lord lieutenant of Ireland, and exerted himſelf in compoſing the diſturbances in that country, which had been fomented by Swift's famous Drapier's letters. When Swift expoſtulated with him for his proſecution of the printer of thoſe letters, he replied in a line of Virgil, no leſs appropriate as an apology for many meaſures of that reign, "Regni novitas me talia cogit moliri," i. e. The unconfirmed ſtate of the throne compels me to make uſe of theſe means. After his return to England, in 1726, he continued his firm ſupport to the government. After the acceſſion of George II., in 1727, he again occupied the vice-royalty of Ireland, and conducted the affairs of government till the year 1730, in a manner that conciliated contending parties. On this occaſion, Swift wrote an humorous vindication of his lordſhip from the charge of favouring none but tories, high church-men, and jacobites. After his return to England, he joined the oppoſition to ſir Robert Walpole, and in the parliamentary conteſt with his miniſtry, adopted maxims and language very different from thoſe which he had avowed and uſed, whilſt he himſelf was a member of adminiſtration. Having at length ſucceeded, in connection with his coadjutors, in procuring the diſmiſſion of Walpole in 1742, he became ſecretary of ſtate, and ſupported meaſures ſimilar to thoſe which he had been lately cenſuring. In 1744, upon the death of his mother, he ſucceeded to the titles of viſcount Carteret and earl Granville. After a courſe of various political changes, he cloſed his life the 2d of January, 1763, in the 73d year of his age. Although he poſſeſſed diſtinguiſhed talents and acquirements, his temper was ſo ardent and overbearing, that he was fitter for being the miniſter of an abſolute monarch than of a limited ſovereign. Ambitious, and fond of ſway, he was neither mercenary nor vindictive; and the elevation and fertility of his genius were equalled by his confidence and preſumption; ſo that he is ſaid never to have doubted. Learned himſelf and an encourager of literature, he particularly patronized Dr. Taylor, the celebrated Grecian, and Dr. Bentley. In ſocial life he was pleaſant, good-humoured, frank, and bacchanalian. Biog. Brit.

Carteret, in *Geography*, an iſland in the Southern Pacific Ocean, diſcovered by captain Carteret in Auguſt 1767. S. lat. 8° 26′. E. long. 154° 14′.

Carteret, a maritime county of Newbern diſtrict, in the ſtate of North Carolina, in North America, on Core and Pamlico ſounds. It contains 3732 inhabitants, including 713 ſlaves. Its chief town is Beaufort.

Carteret *Harbour*, a bay on the ſouth-eaſt coaſt of New Ireland. S. lat. 4° 48′ 40″. E. long. 152° 45′ 40″. This harbour forms a ſort of baſin, where the clouds, loaded with water, after paſſing over the high mountains of New Ireland, experience a calm, which prevents the air from ſupporting them. To this circumſtance are owing thoſe exceſſive rains, which render the anchoring-place far from deſirable to navigators. Nevertheleſs, this harbour furniſhes plenty of good water, which may be procured with great facility: but the wood obtained in this place introduces into the ſhips a prodigious number of ſcorpions and ſcolopendræ, of the ſpecies called "ſcolopendra morſitans," which are very troubleſome. This harbour affords no refreſhments. The tides take place once a day, and riſe only about ſix feet. The thermometer, obſerved at noon in the middle of July, varied from 19° to 21°; and the barometer from 28 inches $1\frac{7}{10}$th line to 28 inches $1\frac{2}{10}$th line. Voyage in ſearch of La Perouſe, vol. i.

Carteret *Point*, the N.W. extremity of the iſland of Egmont, in New Guernſey. S. lat. 10° 42′. E. long. 163° 50′.

CARTERIA, in *Ancient Geography*, an iſland of Aſia Minor, near Smyrna, according to Pliny.

CARTEROMACO, or Carteromachus, Scipio, in *Biography*, a learned Italian, whoſe proper name was *Fortiguerra*, was born at Piſtoia in 1467; and having ſtudied in his native city at a college founded by his family, at Rome, and at Florence, where he learned Greek under Angelo Poliziano, and having paſſed ſome years at Padua, he was appointed by the republic of Venice, in 1500, with a liberal ſalary, to teach the Greek language to the Venetian youth. Upon an invitation to Rome by pope Julius II. he was placed by this pontiff with his nephew, cardinal Galeotti de la Rovere; and upon the death of this cardinal, he attached himſelf to cardinal Francis Alidoſio, who was killed at Ravenna in 1511. His next patron was cardinal John de Medici, afterwards pope Leo X.; but his riſing expectations were ſuddenly fruſtrated by death, at the age of 46, in 1513. Scipio was equally diſtinguiſhed for modeſty and learning; and both theſe qualities are aſcribed to him in a very eminent degree by Eraſmus (Epiſt. 471.), who conſulted him and Marcus Muſurus upon ſuch difficulties as occurred to him in the explication of Greek proverbs. His principal works are, "A Latin Oration in praiſe of Greek learning," Venice, 1504; "A Latin Tranſlation of the Greek Oration of Ariſtides in praiſe of the City of Rome," Venice, 1518; "An Edition of Ptolemy's Geography," Rome, 1507; and various prefaces, epigrams, and letters in Greek and Latin, inſerted in other publications. Gen. Dict. Tiraboſchi.

CARTERON, or Carterum, in *Ancient Geography*, a town of Aſiatic Sarmatia, ſituated on the coaſt of the Euxine ſea, according to Ptolemy.

CARTES, Renè Des, in *Biography*, an eminent philoſopher, and founder of a numerous ſect, called *Carteſians*, was a native of France, the deſcendant of an ancient and noble family, and born at La Haye in Touraine, on the 31ſt of March in 1596. As he diſcovered in his infancy an eager curioſity to inquire into the nature and cauſes of things, his father called him "the Philoſopher," and placed him, at the early age of 8 years, under the tuition of a relation in the Jeſuits' college at La Fleche, where he made an uncommon proficiency in the learned languages and polite literature, and formed an intimate acquaintance with ſeveral perſons, who afterwards became eminent in the republic of letters, particularly with Merſenne. After ſpending 5 years in the diligent ſtudy of languages, and in reading the ancient poets, orators, and hiſtorians, he directed his attention to mathematics, logic, and morals; but diſapproving the mode in which theſe ſciences, and more eſpecially the two latter, had been uſually taught, he formed a plan of ſtudy for himſelf, and ſketched out a conciſe ſyſtem of rules or canons of reaſoning, in which he followed the ſtrict method of the geometricians. Diſſatisfied, however, with the courſe of ſtudy which he was purſuing, he left the college at the cloſe of 8 years, and returned to his parent, lamenting that he had derived no other benefit from his paſt application than a fuller conviction that he had hitherto known nothing with perfect clearneſs and certainty. He therefore determined to throw aſide his books, and to ſeek knowledge in the ſtudy of himſelf and of the great volume of nature. Having ſpent ſome time in the city of Rennes, where he employed himſelf in learning to ride and fence, and other exerciſes preparatory to a military life, he propoſed to devote himſelf to the profeſſion of a ſoldier; but his conſtitution being feeble and unfit for the fatigues of this kind of life, his father ſent him to Paris in 1613, and confiding in his diſcretion, left him to his own uncontrolled direction. Here the love of pleaſure and a propenſity to gaming would probably have wholly diverted his attention from the purſuits of literature, if he had not fortunately renewed his acquaintance with Merſenne, and other learned perſons, who reclaimed him from the frivolity and folly to which his time was devoted, and engaged him to renew his application to the ſtudy of mathematics, which he proſecuted in retirement for the ſpace of about 2 years. But ſtill unſteady in his purpoſe, and diſſatisfied with the reſult of his ſpeculations, he again laid aſide his books, and determined to embark in the military profeſſion, under a notion that he ſhould thus enjoy favourable opportunities for gaining a knowledge of the world. Accordingly he departed for Holland in 1616, and entered himſelf as a volunteer in the Dutch army. Whilſt he regularly performed his military duty, he ſpent his intervals of leiſure in ſtudy; and during the encampment of the army at Breda, he ſolved a problem in mathematics to the ſatisfaction of Beekman, an eminent mathematician, principal of the college of Dort, and he alſo wrote a treatiſe on muſic, which was printed at Utrecht in 1650, 4to., and at Amſterdam in 1656, 4to., under the title of "Compendium Muſicæ," of which an Engliſh tranſlation was publiſhed at London in 1653. During his ſtay at Breda, he alſo laid the foundation of ſeveral of his works, and is ſaid to have compoſed a philoſophical diſſertation, in which he attempted to prove that brutes are automata, or mere machines. See Brutes. In 1619 he quitted the Dutch ſervice, and entered as a volunteer in the army of the duke of Bavaria. Whilſt he remained in winter-quarters, he had many intervals of ſolitary leiſure, which he employed in a courſe of meditation upon important ſubjects; and as he was ſtill perplexed with doubts and difficulties, he had recourſe for ſatisfaction to the Roſicrucians, who boaſted of divine inſpiration; but failing to find any one who could unfold to him the myſteries of this ſect, he returned from his ſhort excurſion into the regions of enthuſiaſm to the humble path of rational inquiry, and preferring the ſociety of learned men to that of his military comrades, he appeared more like a philoſopher than a ſoldier. Having been preſent at ſeveral ſieges, and having, in 1621, made the campaign in Hungary, under the count de Bucquoy, who was killed that year, he abandoned the military profeſſion ; and after a tour through the northern parts of Germany, he returned, in 1622, to his own country, with no other profit from his travels, as he himſelf confeſſes, than that they had freed him from many prejudices, and rendered his mind more fit for the reception of truth. Some time after he fixed his reſidence at Paris, where he cleared himſelf from the imputation of being a Roſicrucian, and applied to the ſtudy of mathematics, with a view of diſcovering general principles of relation, meaſure, and proportion, applicable to all ſubjects, by means of which truth might be inveſtigated with certainty, and the boundaries of knowledge enlarged. But not ſucceeding to his wiſhes, he turned his attention to ethical inquiries, and attempted to raiſe a ſuperſtructure of morals on the foundation of natural ſcience ; being of opinion, that the beſt means of diſcovering the true principles and rules of action, is the contemplation of our own nature, and the nature of the world around us. This inveſtigation in courſe of time produced his treatiſe " On the Paſſions," or " Traité des Paſſions de l'Ame," written in 1646 for the uſe of the princeſs Elizabeth of Bohemia, and printed ſeveral times in 12mo. viz. in 1650 at Amſterdam, in 1651 at Rouen, and in 1664 and 1679 at Paris. A Latin tranſlation of it was publiſhed at Amſterdam in 1656 and 1664 in 4to. From the phyſical nature of the paſſions he deduces his principles of morals ; and his doctrine on this ſubject is as follows : " Whatever happens, is called paſſion, with reſpect to the ſubject to which it happens ; and action, with reſpect to that which cauſes it to happen. Nothing acts upon the mind more immediately, than the body to which it is joined ; whence what is paſſion in the mind, is action in the body. Heat, and the motion of the limbs, proceed from the body, and thoughts from the mind ; but the mind cannot give motion and heat to the body. The more vivid and ſubtle parts of the blood, which heat rarifies in the heart, are inceſſantly entering into the cavities of the brain, and form animal ſpirits, which are in the brain ſeparated from other leſs ſubtle parts of the blood. Theſe animal ſpirits, which are corporeal, excited as by the ſoul itſelf, ſo alſo by the action of external objects upon the ſenſes, are the immediate cauſe of all the original motions of the body. Whence all the limbs may be moved by means of the objects of ſenſe, and the animal ſpirits, without any action of the ſoul. Nothing is to be attributed to the ſoul but thoughts : and theſe are of two kinds ; active, or volition, including deſire and averſion ; and paſſive, including intelligence, perception, and feeling, or paſſion.

" The ſoul is united to all the parts of the body, but its chief functions are exerciſed in the pineal gland of the brain, where it receives notice of the impreſſions made upon the ſenſes, and whence it ſends forth animal ſpirits through the nerves, which put the muſcles into motion. The paſſions are feelings of the ſoul, produced and continued by the action of the animal ſpirits ; the chief effect of the paſſions is, to excite the ſoul to volition. All volition is in its nature free, and conſiſts in cauſing the gland, with which it is intimately connected, to move in that manner which is moſt ſuitable to produce an effect correſponding to the volition. Judgment comprehends not only the perception of the underſtanding, but the aſſent of the will, and it is from the abuſe of its natural liberty of aſſenting or not aſſenting to a propoſition that error ſprings. The ſoul, in the act of recollection, exerciſes a volition by means of which the pineal gland inclines itſelf ſucceſſively this way and that way, and impels the animal ſpirits to different parts of the brain, till that part is found upon which the object which we wiſh to recollect has left traces.

" The ſoul of man, which is one, is both ſenſitive and rational ; and the conflict between its inferior and ſuperior parts is nothing elſe but a ſtruggle between the motions which the body, by means of its animal ſpirits, and the ſoul, by its own volition, are at the ſame time endeavouring to excite in the pineal gland. By the reſult of this conteſt, every one may judge of the ſtrength or weakneſs of his ſoul. The ſoul acquires the dominion over the body by means of firm and clear deciſions concerning good and evil, produced by the contemplation of truth, which it determines to follow without ſuffering itſelf to be ſeduced by preſent paſſion. The paſſions belong to the body, and are to be imputed to the ſoul only as it is united to the body. Their uſe is, to excite the mind to exert thoſe volitions which are neceſſary to the preſervation or perfection of the body, and the attainment of that which is in its nature good. All the paſſions are uſeful, and only become injurious by exceſs. The general remedy againſt the exceſs of the paſſions is, to conſider all the appearances which they preſent to the imagination as deceitful, and to poſtpone volition and action till the commotion which they have excited in the blood is appeaſed, or where immediate action is neceſſary, to follow reaſon in oppoſition to paſſion. Since nothing beyond our own thoughts is abſolutely in our own power, it is wiſer to endeavour to ſubdue ourſelves than fortune, and to change our own deſires than the order of the world."

But to return from this digreſſion. Des Cartes having been employed for ſome time in the ſtudies above recited, he left Paris, and took a journey to Italy, where he ſpent about 2 years, converſing with eminent mathematicians and philoſophers, and informing himſelf concerning various objects in natural hiſtory. After his return to Paris, he found his ſtudies ſo much interrupted, and his mind remained in ſo ſceptical a ſtate, that he was unable to purſue any regular plan of life ; and, therefore, in 1629, he determined to withdraw to ſome more retired ſituation, where, without the intruſion of viſitors, he might have leiſure to complete his grand deſign of forming a new ſyſtem of philoſophy. In order to prevent any interference on the part of his friends from diverting him from the execution of his purpoſe, he left Paris without communicating his intention to any ; and none, except his friend Merſenne, knew for ſome time the place of his retirement. Having tranſiently viſited ſeveral towns of Holland, he at laſt fixed upon Egmond, a pleaſant village near Franeker in Frieſland, as the place of his ſtated reſidence. Here he proſecuted his philoſophical labours, and enjoyed the ſatisfaction of obſerving how much they engaged the attention of the learned world. In this ſtate of retirement, he employed himſelf in inveſtigating a proof from reaſon, independent of revelation, of the fundamental points of religion, viz. the exiſtence of God, and the immortality of the ſoul, and alſo in other important metaphyſical ſpeculations. The reſult of theſe ſpeculations afterwards appeared in his treatiſe entitled " Meditationes de primâ Philoſophiâ, &c." and printed at Paris in 1641, 8vo. ; a ſecond edition was printed at Amſterdam, in 1642, 12mo. Another edition was publiſhed at Amſterdam, in 1719, 8vo. A French tranſlation was printed at Paris, in 1647, 4to. ; a ſecond edition appeared at Paris in 1661, 4to. ; but the beſt is the third edition, divided into articles, with ſummaries, by R. F. i. e. René Fedé, doctor of phyſic of the faculty of Angers, and printed at Paris in 1673, 4to. Whilſt Des Cartes remained in Frieſland, he purſued the phyſical inquiries which he had begun in France ; and theſe reſearches gave occaſion to his " Diſcourſe on Meteors," which he publiſhed ſome years after. After his removal to Amſterdam, he directed his ſedulous attention to medicine, anatomy, and chemiſtry ;

and he ſpent a whole winter in diſſecting animal bodies, and in chemical operations. About the year 1630 or 1631, he made a ſhort tour to England; and in the neighbourhood of London he employed himſelf in obſervations on the variation of the compaſs. In the ſpring of the year 1633 he removed to Deventer, where he completed ſeveral works which were left unfiniſhed, and reſuming his ſtudies in aſtronomy, in the ſummer following he finiſhed his "Treatiſe of the World," which contained an abridgment of his natural philoſophy; but when he heard in what manner Galileo had been treated by the court of inquiſition, he was deterred from publiſhing it, and concealed his opinion concerning the true ſyſtem of the world. An abridgment of this treatiſe was publiſhed at Paris in 1664, 8vo. under the title of "Le Monde des Cartes, &c." and a correct edition of it in 1677, 4to. at the end of Des Cartes's "Traité de l'Homme." It is printed in Latin in his "Opera Poſthuma." The tenets of Des Cartes made their firſt appearance in the ſchools at Deventer in 1633, where they were introduced by the profeſſor of philoſophy, Henry Rener, a learned man, and an intimate friend of Gaſſendi. In the following year he returned to Amſterdam, and ſoon after took a journey into Denmark, and the lower parts of Germany. In 1635 he went to Leewarden in Frieſland, where he remained till the year 1637, and wrote his "Treatiſe of Mechanics," publiſhed in Latin in his "Opera Poſthuma." In the ſame year he publiſhed his four treatiſes concerning "Method," "Dioptrics," "Meteors," and "Geometry." Theſe were printed in French at Leyden in 4to. and publiſhed at firſt without his name. The three firſt were tranſlated ſome years after into Latin by Curcellæus, which tranſlation was reviſed by Des Cartes; and they were publiſhed under this title, "Renati Des Cartes Specimina Philoſophiæ, &c." Amſt. 1644, 4to. and 1656, 4to. Van Schooten, profeſſor of mathematics at Leyden, afterwards tranſlated his "Geometry" into Latin, adding his own commentaries and the notes of Monſ. de Beaune. This tranſlation, entitled "Renati Des Cartes Geometria, &c." was publiſhed at Leyden in 1649, 4to. and with the "Compendium Muſicæ" at Frankfort on the Mayne in 1695, 4to.

In his treatiſe of "Method," Des Cartes lays down the following rules for the diſcovery of truth, which are derived from the practice of geometricians. Nothing is ever to be admitted as true, which is not certainly and evidently known to be ſo; that is, in judging of truth all prejudice and precipitancy are carefully to be avoided, and nothing more is to be admitted in the concluſion, than what appears to the underſtanding ſo diſtinctly and clearly, that it cannot poſſibly be doubted. Difficulties muſt be accurately examined, and divided into ſo many parts, as may be moſt convenient for their eaſy ſolution. In proving any truth, the ideas are always to be brought forward in a certain order, beginning from things the moſt ſimple and moſt eaſily known, and advancing, by regular ſteps, to thoſe which are more complex and difficult. All the parts of a demonſtration ſhould be ſo diſtinctly numbered, that the relation of each to the whole may be clearly ſeen, and that it may be certainly known that nothing is omitted.

When the ſpecimen of his philoſophy in the above-mentioned four treatiſes appeared, the number of his followers and admirers increaſed; and his new doctrine had alſo many opponents. At Utrecht, Leyden, and Amſterdam, and in other Dutch ſchools, the Carteſian doctrines were zealouſly eſpouſed by many learned men; while ſeveral theologians, alarmed at the idea of innovation, ſtrenuouſly oppoſed them, and even attempted to ſubject their author to the cenſure of the civil magiſtrate. In Great Britain, the Carteſian doctrine gained ſuch a degree of credit, that ſir Charles Cavendiſh, brother to the earl of Newcaſtle, invited Des Cartes to ſettle in England; nor did he appear diſinclined to accept the invitation, when he was aſſured that the king was a Catholic in his heart. Charles I. indeed gave him reaſon to expect a liberal appointment; but the civil war fruſtrated this deſign, and Des Cartes remained in Holland. In his native country his doctrine was at firſt well received; but a ſtrong party among the Jeſuits combined againſt it; and a violent conteſt was long kept up between the Jeſuits and the Carteſians. In the courſe of theſe diſputes, Des Cartes himſelf appeared earneſtly deſirous of becoming the father of a ſect, and diſcovered more jealouſy and ambition than became a philoſopher.

In 1641, Des Cartes was invited to France by Lewis XIII. upon very honourable conditions; but no propoſal could induce him to quit his retirement. It appears, however, that, during his reſidence in Holland, he made three viſits to his native country, viz. in 1643, 1647, and 1648, and that he was amuſed with the promiſe of an annual penſion of 3000 livres, which he never received. Having, in 1641, publiſhed his "Meditations," which occaſioned a controverſy with Voet, rector of the univerſity of Utrecht, he afterwards viſited France, where he found the edition of his "Principles," and the Latin tranſlation of his eſſays finiſhed, and the copies ſent from Holland. His "Principles" were dedicated to his illuſtrious diſciple, Elizabeth, princeſs palatine daughter of prince Frederic V. elector palatine, and king of Bohemia. The edition of his "Principles" was printed at Amſterdam, by Elzevir, in 1644, 4to. under the title of "Principia Philoſophiæ;" and a French tranſlation, by the abbé Picot, reviſed by himſelf, was publiſhed at Paris in 1647, 1651, 1658, 4to. An Engliſh tranſlation, with remarks, was printed at London in 1653, 4to. This work is divided into four parts; the *firſt* contains the principles of human knowledge; the *ſecond* treats of the laws of nature, the principles of natural things, the properties of bodies, ſpace, motion, &c.; the *third* contains a particular explication of the ſyſtem of the world, and more eſpecially of the heavens and celeſtial bodies; and the *fourth* treats of the earth. In 1645, Des Cartes applied again to anatomy, though he was ſomewhat diverted from this ſtudy by the problem concerning the quadrature of the circle, which was then agitated, and which he declared impoſſible to be ſolved. During the winter of this year he compoſed a ſmall tract againſt Gaſſendi's "Inſtitutes," and another "On the Nature of the Paſſions." About the ſame time he had a diſpute with Roberval concerning vibrations, and he carried on a correſpondence with the princeſs Elizabeth upon moral philoſophy. In the year 1647, he was appealed to as an umpire in a diſpute between Chriſtina, queen of Sweden, and M. Chanut, the French reſident in that kingdom. The queſtion in debate was this: "When a man carries love or hatred to exceſs, which of theſe two irregularities is the worſt?" On this occaſion he drew up the Diſſertation upon Love, that is publiſhed in the firſt volume of his letters, which proved highly ſatisfactory to the queen; though ſhe objected to one paſſage, which ſeemed to intimate that the world was not finite. This learned princeſs, having, by M. Chanut, deſired his opinion of the ſovereign good, was ſo much pleaſed with his anſwer and with his treatiſe on the paſſions, which he ſent her, that ſhe expreſſed a wiſh to be inſtructed by him in the principles of his philoſophy, and invited him to Sweden. Des Cartes, notwithſtanding the apprehended injury that might attend the ſeverity of the climate, accepted the invitation, and arrived at Stockholm in October, 1648. The queen received him with reſpect, engaged him to give her inſtruction every morning at 5 o'clock, and deſired him to reviſe and digeſt all his unpubliſhed writings, and to draw up from them a complete body of philoſophy. The moſt conſiderable of them were publiſhed after his death. The French edition of his works, publiſhed at Paris, comprehends 15 volumes in 12mo. and their contents are as follow; viz. "Lettres de M. Des Cartes, ou l'on a joint le Latin de pluſieurs lettres, qui n'avoient été imprimeés qu'en François, avec une traduction François de celles, qui n'avoient juſqu'a preſent paru qu'en Latin," 1724, 6 volumes. "Les Meditations metaphyſiques touchant la premiere philoſophie," 1724, 2 vols. "Diſcours de la Methôde, pour bien conduire ſa raiſon, et chercher la verité dans les ſciences. Plus la dioptrique, les meteores, la mechanique, et la muſique," 1724, 2 vols. "Les Principes de la Philoſophie," 1724, 1 volume. "Les Paſſions de l'Ame. Le Monde, ou traité de la lumiere. Edition augmentée d'un diſcours ſur le mouvement local et ſur la fievre, ſur les principes du même auteur," 1728, 1 volume. "L'Homme de René Des Cartes, et la formation du fœtus; avec les remarques de Louïs de la Forge," 1722, 1 volume.

Queen Chriſtina earneſtly ſolicited this eminent philoſopher to remain in her kingdom, and to aſſiſt her in eſtabliſhing an academy of ſciences; and with this view propoſed to allow him a revenue of 3000 crowns a year, with an eſtate which ſhould deſcend to his heirs and aſſigns for ever. But Des Cartes had not been more than four months in Sweden, when a cold, which he caught in his early viſits to the queen, brought on an inflammation of the lungs, which ſoon terminated his life, on the 11th of February, 1650, in the 54th year of his age. The queen is ſaid to have lamented his death with tears. His remains were interred, at the requeſt of the French ambaſſador, in the cemetery for foreigners, and a long hiſtorical eulogium inſcribed on his tomb. Seventeen years afterwards his bones were carried from Sweden to France, and interred with great pomp in the church of St. Genevieve du Mont, where a magnificent monument, with his buſt in baſſo-relievo, and an appropriate inſcription, is erected to his memory.

Des Cartes, as his various writings amply teſtify, poſſeſſed an accurate and penetrating judgment, a fertile invention, and a mind ſuperior to prejudice; qualities which, united with an early acquaintance with ancient learning, and indefatigable induſtry in the inveſtigation of truth, might ſeem to promiſe no inconſiderable ſhare of ſucceſs in the great deſign of reforming and improving philoſophy. He would have been more ſucceſsful if he had been leſs deſirous of applying mathematical principles and reaſonings to ſubjects which do not admit of them; if he had ſet leſs value upon mere conjectures; and if he had been leſs ambitious of the honour of founding a new ſect in philoſophy. See the next article. We ſhall here ſubjoin ſome additional teſtimonies to his character. M. Baillet, in his account of his life, &c. highly commends him for his contempt of wealth and fame, his love of truth, his modeſty, diſintereſtedneſs, moderation, piety, and ſubmiſſion to the authority of the church. Dr. Barrow, in his "Opuſcula," tells us, that he was undoubtedly a very good and ingenious man, and a real philoſopher, and one who ſeems to have brought thoſe aſſiſtances to that part of philoſophy which relates to matter and motion, which, perhaps, no other had done; that is, a great ſkill in mathematics, a mind habituated both by nature and cuſtom to profound meditation, a judgment exempt from all prejudices and popular errors, and furniſhed with a conſiderable number of certain and ſelect experiments, a great deal of leiſure, entirely diſengaged by his own choice from the reading of uſeleſs books, and the avocations of life, with an incomparable acuteneſs of wit, and an excellent talent of thinking clearly and diſtinctly, and expreſſing his thoughts with the utmoſt perſpicuity. Dr. Halley (ſee Wotton's Reflections upon Ancient and Modern Learning), ſays, "as to Dioptrics, though ſome of the ancients mention refraction, as a natural effect of tranſparent media; yet Des Cartes was the firſt who, in this age, has diſcovered the laws of refraction, and brought dioptrics into a ſcience." Wotton (ubi ſupra), though he degrades him in compariſon with lord Bacon, whom he ſoon ſucceeded, and cenſures him for too precipitately drawing concluſions without a ſufficient number of previous experiments, obſerves nevertheleſs, that "to a vaſt genius he joined an exquiſite ſkill in geometry, ſo that he wrought upon intelligible principles in an intelligible manner, though he very often failed in one part of his end, namely, a right explication of the phenomena of nature; yet, by marrying geometry and phyſics together, he put the world in hopes of a maſculine offspring in proceſs of time, though the firſt productions ſhould prove abortive." Dr. Keil, in the introduction to his "Examination of Burnet's Theory of the Earth," animadverting on Wotton's reflections, &c. tells us, that Des Cartes was ſo far from applying geometry and obſervations to natural philoſophy, that his whole ſyſtem is but one continued blunder on account of his negligence in that point; which he could eaſily prove by ſhewing, that his theory of the vortices, upon which the whole ſyſtem is grounded, is abſolutely falſe; and that ſir Iſaac Newton has ſhewn, that the periodical times of all bodies, which ſwim in a vortex, muſt be directly as the ſquares of their diſtances from the centre of the vortex. But it is evident, from obſervations, that the planets, in turning round the ſun, obſerve quite another law; for the ſquares of their periodical times are always as the cubes of their diſtances; and, therefore, ſince they do not obſerve that law, which they neceſſarily muſt, if they ſwim in a vortex, it is a demonſtration that there are no vortices, in which the planets are carried round the ſun:—with more to the ſame purpoſe. Mr. Baker, conſidering the natural philoſophy of Des Cartes, obſerves, that, "though it would be very unjuſt to charge Des Cartes with the denial of a God, who is ſuppoſed by him to have created matter, and to have impreſſed the firſt motion upon it, yet he is blameable, that after the firſt motion is impreſſed, and the wheels ſet a going, he leaves his vaſt machine to the laws of mechaniſm, and ſuppoſes that all things may be thereby produced without any further extraordinary aſſiſtance from the firſt impreſſor. The ſuppoſition is impious, and, as he ſtates it, deſtructive of itſelf; for, not to deny him his laws of motion, moſt of which have been evidently ſhewn to be falſe, and conſequently ſo muſt all be that is built upon them, his notion of matter is inconſiſtent with any motion at all; for, as ſpace and matter are with him the ſame, upon this ſuppoſition there can be no motion in a *plenum*." Dr. Keil condemns Des Cartes for encouraging the preſumptuous pride of the modern philoſophers; who think they underſtand all the works of nature, and are able to give a good account of them. Mr. Leibnitz, whilſt he acknowledges that Des Cartes was a very learned man, and had read more than his followers imagine, and that he was one of thoſe, who has added moſt to the diſcoveries of their predeceſſors, obſerves, that thoſe who reſt entirely in him, are much miſtaken in their conduct; and this, he ſays, is true, even with regard to geometry itſelf. He alſo remarks, that Des Cartes endeavoured to correct ſome errors with regard to natural philoſophy, but that his preſumption and contemptuous manner of writing, together with the obſcurity of his ſtyle, and his confuſion, and ſevere treatment of others, are very diſagreeable. Voltaire, in his "Letters concerning the Engliſh Nation," (Lett. 14.) obſerves, that nature had favoured Des Cartes with a ſtrong and clear imagination, whence he became a very ſingular perſon both in private life, and in his manner of reaſoning. This imagination could not conceal itſelf even in his philoſophical writings, which are every where adorned with very brilliant and ingenious metaphors. Nature, ſays he, had almoſt made him a poet; and, indeed, he wrote a piece of poetry for the amuſement of Chriſtina, queen of Sweden, which, however, was ſuppreſſed in honour of his memory. He extended, continues he, the limits of geometry as far beyond the place where he found them, as ſir Iſaac Newton did after him; and firſt taught the method of expreſſing curves by equations. He alſo applied this geometrical and inventive genius to dioptrics, which, when treated by him, became a new art; and if he was miſtaken in ſome things, it was becauſe a man, who diſcovers a new tract of land, cannot at once know all the properties of the ſoil. Thoſe who come after him and make theſe lands fruitful, are at leaſt obliged to him for the diſcovery. Voltaire, however, acknowledges, that there are innumerable errors in the reſt of Des Cartes's works; and then adds, that geometry was a guide which he himſelf had in ſome meaſure formed, and which would have ſafely conducted him through the ſeveral paths of philoſophy; but that at laſt he abandoned this guide, and gave entirely into the humour of framing hypotheſes; and then philoſophy was no more than an ingenious romance, fit only to amuſe the ignorant. After other appropriate remarks, he concludes with theſe obſervations: "He deſtroyed all the abſurd chimæras with which youth had been infatuated for 2000 years. He taught his cotemporaries how to reaſon, and enabled them to employ his own weapons againſt himſelf. If Des Cartes did not pay in good money, he however did great ſervice in crying down that of a baſe alloy." Father Rapin, in his "Reflexions de Phyſique," after obſerving that Des Cartes's principles of motion, figure, and extenſion, are almoſt the very ſame with thoſe of Democritus and Epicurus, tells us, that father Merſenne mentioned in an aſſembly of learned men, that Des Cartes, who had gained great reputation by his geometry, was preparing a ſyſtem of natural philoſophy, in which he admitted a vacuum; but the notion was ridiculed by Roberval and ſome others; upon which Merſenne wrote to him, that a vacuum was not then in faſhion at Paris, which induced Des Cartes to change his ſcheme, in complaiſance to the natural philoſophers, whom he ſtudied to pleaſe, and admit the plenum of Leucippus; "ſo that," ſays father Rapin, "the excluſion of a vacuum became one of his principles, merely from political conſiderations." Rapin produces no authority for this ſtory; and it ſhould be recollected, that he was a very zealous Ariſtotelian, extremely prejudiced againſt any new ſyſtems of philoſophy.

Des Cartes, it is ſaid, imagined it poſſible to prolong life very conſiderably beyond the common period, and thought he had diſcovered the method of doing it. In converſation with ſir Kenelm Digby, Des Cartes aſſured him that, having already conſidered that matter, he would not venture to promiſe to render a man immortal; but that he was very ſure it was poſſible to lengthen out his life to the period of the patriarchs. It ſeems evident to me, ſays he, in a letter written to M. de Zuylichem from Egmond, in 1638, when he had attained the age of 42 years, that if we only guarded againſt certain errors, which we are accuſtomed to commit in the courſe of our diet, we might, without any other invention, attain to an old age, much longer and more happy than now we do. However, twelve years after this declaration was made, our philoſopher died. Des Cartes was never married, but had one natural daughter, named Francina, who died at five years of age. Of his works there have been ſeveral editions, ſeveral of which have been already mentioned.

For an account of the improvements made by Des Cartes in algebra and geometry, ſee the article ALGEBRA, and Montucla's Hiſt. Mathem. ubi infra. In reference to the diſpute between his friends and thoſe of Harriot, as to the priority of their diſcoveries, we ſhall here add, to what occurs under the article juſt cited, an anecdote told by Dr. Pell, and recorded by Dr. Wallis in his "Algebra." Sir Charles Cavendiſh, then reſident at Paris, had a converſation with M. Roberval concerning Des Cartes's geometry, then lately publiſhed, to this purport: "I admire," ſays Roberval, "that method of Des Cartes, of placing all the terms of the equation on one ſide, making the whole equal to nothing, and how it occurred to him: the reaſon why you admire it, ſaid ſir Charles, is, becauſe you are a Frenchman; for if you were an Engliſhman, you would not admire it. Why ſo? aſked Roberval. Becauſe, replied ſir Charles, we in England know whence he had it; namely, from Harriot's Algebra. What book is that? ſays Roberval; I never ſaw it. Next time you come to my chamber, ſaid ſir Charles, I will ſhew it to you; which, ſome time after, he did; and, upon peruſal of it, Roberval exclaimed with admiration, *Il l'a vu! Il l'a vu!* He had ſeen it! He had ſeen it! finding all that in Harriot which he had before admired in Des Cartes, and not doubting that Des Cartes had it from thence. Beſides, as Harriot's "Artis Analyticæ Praxis" was publiſhed in 1631, and Des Cartes was in England about this time, and as he follows the manner of Harriot, except in the method of noting the powers, it is highly probable that he was more indebted to the Engliſh algebraiſt than his partial advocates are willing to allow. For an account of Des Cartes's philoſophy; ſee the next article. Gen. Dict. Brucker's Hiſt. of Phil. by Enfield, vol. ii. c. 2. § 6. Montucla, Hiſt. Math. t. ii. p. 112, &c.

CARTESIAN *Philoſophy*, or CARTESIANISM, the ſyſtem of philoſophy advanced by Des Cartes, and maintained by his followers, the *Carteſians*.

The Carteſian philoſophy is founded on two great principles, the one metaphyſical, the other phyſical. The metaphyſical principle is this, *I think, therefore I am.* This principle has been attacked and defended, with great ſpirit, zeal, and partiality on both ſides; for though it be true that we are as ſure by an inward perception or conſciouſneſs, that we exiſt, as that we think; yet it is true, too, that the concluſion of this reaſoning, *I am*, is drawn from the antecedent *I think*; ſince *to think* ſuppoſes *to be*, or *exiſt*; and the mind ſees clearly the neceſſary connection between thinking and being.

In order to acquire this fundamental principle, this firſt and moſt certain truth in philoſophy, Des Cartes recommends to diveſt the mind of every kind of prejudice, and for this purpoſe to begin with doubting of every thing. Since the ſenſes err, and dreams deceive, it is firſt to be doubted, whether ſenſible objects have a real exiſtence; and we ought alſo to doubt concerning even mathematical axioms, becauſe we are not ſure that we may not have been ſo formed as to lie under a perpetual deception. But whatever elſe we doubt of, it is impoſſible we ſhould doubt, whether we ourſelves, who are conſcious of exerciſing the power of thinking, exiſt. Of ſuch importance, in the eſtimation of Des Cartes, is this kind of ſcepticiſm, that he adviſes his readers to conſider his reaſons for doubting of all things, not once only, but to employ weeks, or even months, on theſe alone, before they proceed any farther. Having eſtabliſhed the certainty of our own exiſtence, we are next to inquire what ſort of beings we are, before we admit the exiſtence of any thing external; and in the proſecution of this inquiry, we perceive belonging to our nature "thought," which has neither extenſion, figure, local motion, nor any other property which we commonly aſcribe to bodies, and of the exiſtence of which we have a prior or more certain knowledge, than of that of any thing corporeal. The mind having thus gained a knowledge of itſelf, but ſtill doubting the exiſtence of external objects, proceeds in the enlargement of its knowledge, and firſt finds within itſelf "ideas," concerning the exiſtence of which, as long as it reſtricts its contemplation merely to theſe, without offering or denying any thing like them to exiſt externally, it cannot be deceived. It alſo finds within itſelf certain "common notions," and from theſe frames various demonſtrations, of the truth of which, as long as its attention is directed to them, it is thoroughly perſuaded. But becauſe it does not yet know, whether it may not be ſo formed, as to be deceived in thoſe things which appear moſt evident, it perceives it to be impoſſible to admit any certain ſcience, till it has diſcovered the author of its being. Revolving within itſelf its various ideas, it finds one of a being ſupremely intelligent, powerful, and perfect, in which it diſcovers an exiſtence, not poſſible and contingent only, as in its ideas of all other things, but neceſſary and eternal. Since it finds within itſelf this idea of a ſupreme being, which could not be a fiction of its own, it concludes with certainty that it muſt have proceeded from a really exiſting deity, and conſequently that it repreſents a true and immutable nature, which cannot poſſibly not exiſt, that is God. According to this innate idea of Deity, we find him to be eternal, omniſcient, omnipotent, the fountain of all goodneſs and truth, the creator of all things; and as nothing can be an attribute of the divine nature, which implies limit or imperfection, he is, therefore, incorporeal, indiviſible, and void of paſſion, and exerciſes his underſtanding and volition, not by continued operations, but by the moſt ſimple action. Upon the will of this being, infinitely perfect, and neceſſarily exiſting, Des Cartes makes the certainty of ſelf-evident propoſitions or axioms, as well as of all other neceſſary truths, to depend. From the knowledge of the cauſe thus eſtabliſhed, he proceeds to deduce a complete knowledge of his effects by neceſſary ſteps; and he rejects all final cauſes from philoſophy; the moſt perfect kind of ſcience being, in his judgment, that of effects from their cauſes. From the veracity of the Deity, he infers the reality of material objects, which are repreſented by our ſenſes as exiſting without us. The idea of extended matter is preſented to the mind; if, therefore, matter did not really exiſt, God, who preſents this idea before the mind, would be a deceiver.

The phyſical principle of Carteſianiſm is this, that *nothing exiſts but ſubſtances*; and theſe are of two kinds, viz. one which thinks, or mind, and another which is extended, or body. The eſſence of the former is thought, and that of the latter extenſion; ſo that the thinking ſubſtance cannot be without ſome actual thought; nor can any part be retrenched from the extenſion of a thing, without taking away ſo much of its ſubſtance. Other attributes aſcribed to each of theſe ſubſtances are modes or qualities. The firſt article is oppoſed by Mr. Locke, who endeavours to ſhew, that thinking is not eſſential to the ſoul, or that its eſſence does not conſiſt in thought; but that there are various occaſions wherein it does not think at all. See DREAM. The latter is ſtrongly oppoſed by the Jeſuits, &c. as inconſiſtent with the doctrine of TRANSUBSTANTIATION; but is much better confuted by the modern writers, from the principles of the Newtonian philoſophy.

The ſole eſſential property of body being extenſion, and quantity differing from extended ſubſtance, only in our conceptions, ſpace, and the corporeal ſubſtance contained in it, are in reality the ſame; for extenſion in length, breadth, and depth, which conſtitutes ſpace, alſo conſtitutes body. Since extenſion is univerſal, Des Cartes naturally concludes there is no vacuum, nor any poſſibility thereof in nature; but that the world is abſolutely full: for mere ſpace is precluded by this principle; becauſe extenſion being implied in the idea of ſpace, matter is ſo too. If there were any ſuch thing as a vacuum, ſays he, it might be meaſured: the vacuum, therefore, is extended, and of conſequence is matter; every thing extended being matter. See VACUUM.

He adds, however, after denying a vacuum, or extenſion without matter, or properties of matter, that its parts are ſeparable and moveable; though theſe ſeem to imply more than mere extenſion. He defines motion to be the tranſlation of a body from the neighbourhood of bodies that are in contact with it, and conſidered as quieſcent, to the neighbourhood of other bodies; and thus deſtroys the diſtinction between abſolute or real, and relative or apparent motion; though both equally agree to this definition. He maintains that the ſame quantity of motion is always preſerved in the univerſe; becauſe God, he ſays, muſt be ſuppoſed to act in the moſt conſtant and immutable manner. And hence he likewiſe deduces his three laws of motion: according to which God, the firſt univerſal cauſe of all motion, in the beginning communicated motion to matter; viz. that a body muſt continue in its ſtate, as to reſt, motion, figure, &c. till ſome external influence produce a change, which is his firſt law of nature;—that the direction of motion is naturally rectilinear, or that a body never changes its direction of itſelf; which is his ſecond law:—and that a body in motion, when it meets with another moving with a greater force, is reflected without loſing any part of its firſt motion; but when it meets with a body moving with leſs force, it then carries this body along, and loſes as much motion as is tranſferred to it; and this is his third law of nature. He accounts for the hardneſs of bodies from their parts being quieſcent with reſpect to each other; and for fluidity from their being perpetually moved in all directions. Theſe principles, ſays Des Cartes, are ſufficient for explaining all the phenomena of nature; and no others ought to be admitted or even wiſhed for: and yet there is not hardly any one of them, that is not liable to inſuperable difficulties. Des Cartes concluded, from the immutability of the deity, that the ſame quantity of motion is always preſerved in the univerſe; whereas this quantity is continually varying: it is diminiſhed in the compoſition of motion, and in many caſes, in the colliſion of bodies that have an imperfect elaſticity; and it is increaſed in the reſolution of motion, and in ſome caſes, in the colliſions of elaſtic bodies. Moreover, it requires an active principle to account for the hardneſs of bodies, nor is it ſufficient for this purpoſe that the particles be at reſt; for this would not hinder their being ſeparated from each other by the leaſt force.

Theſe principles of phyſics once ſuppoſed, Des Cartes explains mechanically, and according to the laws of motion, how the univerſe might have aſſumed its preſent form, and may be for ever preſerved; and whence the preſent appearances of nature do ariſe. He ſuppoſes, that God created matter of an indefinite extenſion; that he divided this matter into little cubic portions, or maſſes full of angles; ſo as to repleniſh ſpace without leaving any interſtices between them; and that theſe particles, deriving from the motion impreſſed upon them an inceſſant agitation, which broke off their angular parts, became round, and formed what this ingenious and fanciful philoſopher calls the matter of the ſecond element. The angular parts themſelves, being ground into the moſt ſubtile particles of all, became the matter of his firſt element, and ſerved to fill all the pores of the other. But there being more of this firſt element than was neceſſary for that purpoſe, it became accumulated in the centres of the vortices, of which he imagined the univerſe to conſiſt, and formed there the bodies of the ſun and ſtars. For, according to this philoſopher, the ſolar ſyſtems were infinite in number, each fixed ſtar being the centre of one; and he, indeed, is among the firſt of the moderns, who thus removed the boundaries of the univerſe; even Copernicus and Kepler themſelves, having confined it within, what they ſuppoſed, the vault of the firmament. The centre of each vortex being thus occupied by the moſt active and moveable parts of matter, there muſt neceſſarily among them be a more violent agitation than in any other part of the vortex, and this violent agitation of the centre cheriſhed and ſupported the movement of the whole. The heavens were filled with the matter of the ſecond element, the medium of light. But the planets and comets conſiſted of a third element groſſer than the other two, the generation of which our philoſopher traces through all its ſteps. According to him, the matter of the firſt element muſt have conſtantly flowed out through the interſtices between the ſpherical particles of the ſecond element, where the circular motion is greateſt, and muſt have returned continually at the poles of this motion towards the centre of the vortex; where, being apt to cohere together, they at length produced the groſſer particles of the third element; and when theſe came to adhere in a conſiderable quantity, they gave riſe to the ſpots on the ſurfaces of the ſun or ſtars. Some being cruſted over with ſuch ſpots became planets or comets; and the force of their rotation becoming languid, their vortices were abſorbed by ſome more powerful neighbouring vortex. In this manner the ſolar ſyſtem was formed, the vortices of the ſecondary planets having been abſorbed by the vortex of the primary, and all of them by that of the ſun. Des Cartes alſo maintains, that the parts of the ſolar vortex increaſe in denſity, but decreaſe in celerity, to a certain diſtance; beyond which he ſuppoſes all the particles to be equal in magnitude, but to increaſe in celerity as they are farther from the ſun. In thoſe upper regions of the vortex he places the comets; in the lower parts he ranges the planets; ſuppoſing thoſe that are more rare to be nearer the ſun, that they may correſpond to the denſity of the vortex, where they are carried round. He accounts for the gravity of terreſtrial bodies from the centrifugal force of the ether revolving round the earth; which, he imagined, muſt impel bodies downwards that have not ſo great a centrifugal force, much in the ſame manner as a fluid impels a body upwards that is immerged in it, and has a leſs ſpecific gravity than the fluid. From the ſame principles he profeſſes to explain the phenomena of the magnet, and to account for every phenomenon in nature.

The ſyſtem of Des Cartes, notwithſtanding its defects and errors, and though in ſome reſpects it has more the appearance of a romance than of a juſt philoſophy, was diſtinguiſhed in an eminent degree by its ſubtlety, ingenuity, and originality; ſo that it not only engaged the attention of the learned, but long continued, in the midſt of all the oppoſition with which it had to encounter from the profeſſed enemies of innovation, to be zealouſly defended by many able writers, and to be publicly taught in the ſchools throughout all Europe. If we trace Carteſianiſm to its origin, we ſhall find that ſome parts of it appear to have been derived from the Grecian philoſophy: particularly the notion of innate ideas, and of the action of the ſoul upon the body, from Plato; the doctrine of a plenum from Ariſtotle; and the elements of the doctrine of vortices from the atomic ſchool of Democritus and Epicurus; but Des Cartes contrived, by the vigorous powers of his genius and the fertility of his imagination, to form of theſe and ſimilar materials a new ſyſtem of philoſophy, which profeſſed to reſolve all difficulties, and to comprehend a ſatisfactory explanation of all the phenomena of nature. His labours, however, would have been more valuable, if he had not ſuffered himſelf to be led aſtray into the romantic regions of hypotheſis by the falſe notion, that the nature of things may be better underſtood by endeavouring to account for appearances from hypothetical principles, than by inferring general principles from an attentive obſervation of appearances. Accordingly, his fondneſs for hypotheſis led him to confound the ideas of attribute and ſubſtance, as in his definitions of matter and ſpace; and thoſe of poſſibility and probability, as in his doctrine of vortices. Even his celebrated argument for the exiſtence of God, which, indeed, had long before his time been advanced by St. Anſelm, archbiſhop of Canterbury, in his book "Contra Inſipientem," and by St. Thomas Aquinas, and other ſcholaſtic writers, confounds the idea of an infinite being with the actual exiſtence of that being, and ſubſtitutes a mere conception of the meaning of a term in the place of the idea of a being really and ſubſtantially exiſting. Not to add, what is much to be regretted, that, though his whole ſyſtem is built upon the knowledge of God, and ſuppoſes his agency, in eſtabliſhing the doctrine of a deity, he forſook the clear and ſatisfactory ground of final cauſes, and had recourſe to a ſubtle argument, which few can comprehend, and with which fewer ſtill will be fully ſatisfied.

In the revolution which the ſyſtem of Des Cartes produced among metaphyſicians and philoſophers, the ſuperiority of his genius was aided by the peculiar circumſtances of the times; and it required the efforts of ſuch a genius to demoliſh the ſtructure of Ariſtotelian philoſophy. Ariſtotle had been, for more than a thouſand years, regarded as an oracle; and his authority was the teſt of truth. The Peripatetic doctrines were ſo incorporated with the whole ſyſtem of ſcholaſtic theology, that to diſſent from Ariſtotle was to alarm the church. However, the prevailing ſyſtem was beginning to loſe its authority; Des Cartes perceived its defects; and he ſeized the favourable moment to introduce and eſtabliſh a new ſyſtem. Having applied much to the mathematical ſciences, and having made conſiderable improvement in them, (ſee the preceding article), he wiſhed to introduce that perſpicuity and evidence into other branches of philoſophy which he found in them. To him we muſt allow the honour of having been the firſt who drew a diſtinct line between the material and intellectual world; which, in all the old ſyſtems, were ſo blended together, that it was impoſſible to ſay where the one ends and the other begins. In that part of philoſophy which relates to the mind, Des Cartes laid the foundation, and put us into that track, which all wiſe men now acknowledge to be the only one in which we can expect ſucceſs. With regard alſo to phyſics, or the philoſophy of body, if he had not the merit of leading men into the right track, we muſt allow him that of bringing them out of a wrong one. By the diffuſion of the Carteſian ſyſtem, *materia prima*, ſubſtantial forms, and occult qualities, with all the jargon of the Ariſtotelian phyſics, fell into utter diſgrace, and were never mentioned by the followers of the new ſyſtem, but as a ſubject of ridicule. Ariſtotle, after a reign of more than 1000 years, was now expoſed as an object of deriſion even to the vulgar, arrayed in the mock majeſty of his ſubſtantial forms and occult qualities. Queens and princeſſes, the moſt diſtinguiſhed perſonages of the age, courted the converſation of Des Cartes, and became adepts in his philoſophy. In this number we may reckon Chriſtina, queen of Sweden, and Elizabeth, daughter of Frederic, king of Bohemia, the mother of our royal family. The laſt, though very young when Des Cartes wrote his "Principia," he declares to be the only perſon whom he knew, who perfectly underſtood not only all his philoſophical writings, but the moſt abſtruſe of his mathematical works. The triumph of the Carteſian ſyſtem over that of Ariſtotle is one of the moſt remarkable revolutions in the hiſtory of philoſophy. When his authority ceaſed, that reverence for hard words and dark notions, by which men's underſtandings had been ſtrangled in early years, was turned into contempt, and every thing ſuſpected which was not clearly and diſtinctly underſtood. This is the ſpirit of the Carteſian philoſophy; and it is a more important acquiſition to mankind than any of its particular tenets; and although after the ſober method of philoſophiſing, introduced by lord Bacon, began to be generally adopted, and the fabrications of romantic theories gave way to the experimental ſtudy of nature, the ſyſtem of Des Cartes, like "the baſeleſs fabric of an air-viſion," has diſappeared, and has ſcarcely "left a wreck behind;" yet for exciting this ſpirit ſo zealouſly, and ſpreading it ſo ſucceſsfully, Des Cartes deſerves immortal honour. Beſides, by introducing geometry into phyſics, and accounting for natural phenomena from the laws of mechanics, he did infinite ſervice to philoſophy; and contributed both by his practice and example, to free it from that venerable ruſt, which in a long ſucceſſion of ages it had contracted: and thus to him, in ſome meaſure, is owing the preſent ſyſtem of the mechanical, and even of the Newtonian philoſophy.

After the above detail, we ſhall not wonder that the Peripatetics, or Ariſtotelians, ſeconded by the influence of the clergy, who apprehended that the cauſe of religion was aimed at and endangered by the philoſophical innovations of Des Cartes, ſhould excite a clamour, and exert their utmoſt efforts to prevent the overthrow of their old ſyſtem, and to diminiſh the growing reputation of the new philoſophy. In order the more readily and effectually to execute this invidious purpoſe, they not only accuſed Des Cartes of the moſt dangerous and pernicious errors, but proceeded, in the extravagance of their malignity, to allege againſt him a charge of atheiſm, which thoſe who are acquainted with his avowed principles, and with the baſis of his ſyſtem, muſt perceive to have been altogether unfounded. The Theoſophiſts, Roſicrucians, and Chemiſts alſo entered into the conteſt againſt Des Cartes, though they conducted themſelves with greater moderation than the Ariſtotelians. The conſequences of this diſpute were, however, favourable to the progreſs of ſcience; for many European philoſophers, who were adverſe to the diſcriminating ſentiments of Des Cartes, were nevertheleſs encouraged by his example to purſue their inquiries with greater freedom from the reſtraints of tradition and perſonal authority, than they had formerly done, and to emancipate themſelves from that yoke of ſervitude under which Ariſtotle and his followers had ſo long kept them in ſubjection. Among the moſt eminent cotemporaries of Des Cartes, who applauded, in general, the efforts he made towards the reformation of philoſophy, and the noble reſolution with which he broke the ſhackles of magiſterial authority, and who alſo acknowledged that he had made valuable diſcoveries in philoſophy, there were ſome who diſcovered ſeveral eſſential defects in his philoſophy, and who conſidered it in various reſpects as hypothetical, founded on fancy rather than experience. They actually attacked the fundamental principles upon which his whole ſyſtem of philoſophy was built, ſuch as his ideas of the Deity, of the univerſe, of matter and ſpirit, of the laws of motion, and other points that were connected with theſe. Some of theſe principles they pronounced to be uncertain; others of a pernicious tendency, and adapted to produce the moſt dangerous errors; and others again they conſidered as directly contrary to the language of experience. At the head of theſe objectors was his own fellow-citizen Gaſſendi, who had made war before him upon the Ariſtotelians and Chemiſts; who, in genius, was his equal; in learning, far his ſuperior; and whoſe mathematical knowledge was moſt uncommon and extenſive. Gaſſendi firſt attacked thoſe mathematical principles, which ſupported the whole ſtructure of the Carteſian philoſophy; he then proceeded to ſubſtitute, in the place of the Carteſian ſyſtem, one that reſembled the natural philoſophy of Epicurus, though much more rational, conſiſtent, and perfect. See GASSENDI. The controverſy between theſe philoſophers, Gaſſendi and Des Cartes, produced two leading philoſophical ſects, denominated the *Mathematical* and *Metaphyſical*, which ſee.

Carteſianiſm was nearly prohibited by an arret of the parliament of Paris; and had been ſo in effect, if it had not been prevented by a burleſque addreſs preſented to the firſt preſident. After the Carteſian philoſophy had been favourably received, it was vehemently attacked, in the year 1639, by Voet, profeſſor of theology at Utrecht, who regarded it as a ſyſtem of impiety; and this aſſertion he grounded upon the following principles by which it was introduced: viz. "that the perſon who aſpires after the character of a true philoſopher muſt begin by doubting of all things, even of the exiſtence of a Supreme Being—that the nature or *eſſence* of ſpirit, and even of God himſelf, conſiſts in *thought*—that ſpace has no real exiſtence, is no more than the creature of fancy—and that, conſequently, *matter* is without bounds." Des Cartes defended his principles; but Voet was ſeconded by the moſt eminent Belgic divines, and applauded by the greateſt part of the Dutch clergy. In 1656, when the principles and tenets of Des Cartes were applied to the illuſtration of theological truth, an alarm was raiſed in the Dutch churches and ſchools of learning, and it was reſolved in ſeveral of their eccleſiaſtical aſſemblies not to permit that *imperious* philoſophy, as Carteſianiſm was called, to make ſuch encroachments upon the domain of theology. The ſtates of Holland approved this reſolution, and iſſued a public edict, forbidding both the profeſſors of philoſophy and theology either to explain the writings of Des Cartes to the youth under their care, or to illuſtrate the doctrines of the goſpel by the principles of philoſophy. It was further reſolved by an aſſembly of the clergy, held at Delft in the following year, that no candidate for holy orders ſhould be received into the miniſtry before he made a ſolemn declaration, that he would neither promote the Carteſian philoſophy, nor disfigure the divine ſimplicity of religion, by loading it with foreign ornaments. Laws of a like tenor were afterwards paſſed in the United Provinces, and in other countries. But all theſe meaſures were ineffectual to ſtop the progreſs of Carteſianiſm, which, at length, obtained a ſolid and permanent footing in the ſeminaries of learning, and was applied, both in the academies and pulpits, and ſometimes indeed very prepoſterouſly, to explain the truths and precepts of Chriſtianity. See on the ſubject of this article, Maclaurin's Account of ſir Iſaac Newton's Philoſophical Diſcoveries, b. i. c. 4. Brucker's Hiſt. of Phil. by Enfield, vol. ii. c. ii. § 6. Cudworth's Inſt. Syſt. ch. v. § 1. Reid's Eſſays on the Intellectual Powers of Man, ch. viii. Smith's Eſſ. on Philoſ. Subjects, p. 76. Moſheim's E. H. vol. v.

CARTHAGE, in *Ancient Geography*, one of the moſt powerful cities of antiquity, was for many ages the capital of Africa Propria, called alſo the territory of Carthage. See Africa. It was at firſt called *Cadmeia*, i. e. the eaſtern, from the name of Cadmus, which was common to the chiefs of the Phœnician colonies. It was alſo denominated *Caccabe*, which in the Phœnician language ſignified a horſe's head, found, as tradition reports, by the Tyrians, when they were digging for the foundations of the fortreſs called *Byrſa*, and conſidered as an omen portending the martial diſpoſition of the inhabitants, and the future greatneſs of the city. To this circumſtance Virgil refers, Æn. l. i. v. 447.

> " ——— Pœni
> Effodere loco ſignum, quod regia Juno
> Monſtrârat, caput acris equi ; ſic nam fore bello
> Egregium, et facilem victu per ſæcula gentem."
>
> " The Tyrians landing near this holy ground,
> And digging here, a proſp'rous omen found ;
> From under earth a courſer's head they drew,
> Their growth and future fortune to foreſhew :
> This fated ſign their foundreſs Juno gave,
> Of a ſoil fruitful, and a people brave." Dryden.

On account of this event the Carthaginians had frequently, upon the reverſes of their coins, either a horſe's head, or the body of a horſe dimidiated, or a horſe entire, with Victory mounted upon him. Others ſay, that when Dido arrived in this country, a city actually exiſted called *Utica*, or the ancient; and that ſhe called her city *Cartha-hadath*, or *Carthadt*, קרתא הדתא, that is, the new city ; and from this appellation the Greeks, interchanging χ and ϑ, deduced Καρχηδὼν, *Carchedon*, and the Romans *Carthago*. Among the more ancient Romans, however, the name of this city, derived from the Carthaginians themſelves, was *Cataco*, as appears from the Columna Roſtrata of Duilius.

Authors are much diſagreed with regard to the æra of the foundation of Carthage. It was built, according to Velleius, 65 years, but according to Trogus and Juſtin, 72 years, before Rome. Livy ſeems to place its foundation 20 years higher than theſe ; and Solinus exceeds him 27 years. From Menander the Epheſian, cited by Joſephus, and the Tyrian Annals, it appears to have preceded the Roman æra 140 years. According to Livy and Appian, Carthage ſtood ſomewhat above 700 years, and Solinus, adding the odd number of years, reckons the period of its exiſtence 737 years ; and as it was deſtroyed under the conſulate of Lentulus and Mummius, in the year of the Julian period 4568, the 608th of the Roman æra, and the 146th year before Chriſt, if we reckon backwards 737 years, we ſhall aſcend to the 883d year B. C. the ſecond year of Athaliah, queen of Judah ; and the encœnia, or dedication of the city, ſays ſir Iſaac Newton (Chron. apud Works by Horſley, vol. v. p. 50.). will fall upon the 16th year of Pygmalion, the brother of Dido, and king of Tyre. She fled in the 7th year of Pygmalion, i. e. in the year 874 B. C. the 4th year of Joaſh king of Judah ; but the æra of the city began with its encœnia. Joſephus (Cont. Ap. l. i. c. 18.) reckons 143 years from the building of Solomon's temple to the building of Carthage, which laſt epoch he ſeems not to diſtinguiſh from the flight of Dido in the 7th of Pygmalion. The temple was dedicated in the year 1004 B. C. and thus the 7th of Pygmalion will be the 861ſt year B.C. and the 16th of Pygmalion will be the 852d year B.C. Solomon ſurvived the building of the temple 30 years; and therefore the interval from Solomon's death to the flight of Dido will be 113 years, from which ſubtracting 7 years, there will remain 106 years for the interval between Solomon's death and the beginning of Pygmalion's reign ; and allowing that Solomon died in the 975th year B.C. the 7th of Pygmalion will be the 862d year, B. C. and the 16th of Pygmalion will be the 853d year, B. C. Petavius (Rat. Temp. l. ii. c. 13), after conſidering the contradictory opinions of the ancients with great attention, fixes the Carthaginian æra with an apparent exactneſs ; for, according to him, Dido began to build Carthage 137 years before the foundation of Rome, if, with Varro, we place this in the 4th year of the 6th Olympiad (753 years, B. C.) or 142 years, if, with archbiſhop Uſher, we prefer the account of Fabius Pictor, the moſt ancient of the Roman hiſtorians, and a writer of great authority, who maintains it to be near the beginning of the eighth, or 748 years, B. C. Blair, in his Tables, has aſſigned the æra of the building of Carthage to the 869th year, B. C. In order to reconcile the diſcordant accounts that have been given of this æra, it has been ſuggeſted, that Carthage conſiſted of different parts, which are ſuppoſed to have been built at different times. Cothon, or the port, together with the buildings belonging to it, was firſt built ; Megara, which, in reſpect of Cothon, was called the new town, or Carthada, was built about 194 years later, and Byrſa, about 166 years after Megara.

Whatever difference of opinion may have ſubſiſted among chronologers about the æra of Carthage, it is generally agreed that the Phœnicians were its founders. Euſebius (in Chron.) and Procopius (de bell. Vand.) affirm poſitively, that the Canaanites who fled from Joſhua retired hither ; and St. Auſtin (in Expoſ. ad Epiſt. ad Roman.) is of opinion, that the Carthaginians were deſcended from theſe Canaanites. Philiſtus of Syracuſe, who lived 550 years before Chriſt, relates (apud Euſeb. in Chron.) that the firſt traces of Carthage were owing to Zorus and Charchedon, two Tyrians or Phœnicians, 30 years before the deſtruction of Troy in the year 1184, B. C. according to Euſebius. Appian (in Libyc.) attributes this event to the ſame two Phœnicians, 50 years before that period ; and from him Scaliger corrects the numbers of Euſebius. Accordingly, Dido was induced to chuſe this place for her Tyrians in preference to any other, becauſe it had been inhabited for ſome time by the Phœnicians, who were her countrymen, and from whom ſhe had, therefore, reaſon to expect a friendly reception. To this Tyrian princeſs the concurrent voice of antiquity aſcribes the firſt ſettlement of Carthage. See Juſt. l. xviii. c. 4. 5, 6. App. de bell. Punic. p. 1. Strabo, l. xvii. p. 832. Paterc. l. i. c. 6. This princeſs, called Eliſa, but better known by the name of Dido, was the grand daughter of the famous Jezebel, called in ſcripture Ethbaal, and the great grand-daughter of Ithobal, king of Tyre. She married her near relation Acerbas, otherwiſe called Sicharbas and Sichæus, a very rich prince, and her brother was Pygmalion, king of Tyre. When this prince murdered Sichæus, in order to ſeize his immenſe treaſures, Dido, in order to elude the avarice of her brother, withdrew ſecretly with her deceaſed huſband's poſſeſſions ; and after having long wandered in queſt of a commodious ſettlement, ſhe, and her Tyrian attendants, landed on the coaſt of the Mediterranean, in the gulf where Utica ſtood ; fixed her reſidence at Carthage ; and either founded, or moſt probably, much enlarged this noble city. The wealth of her huſband, and the ſkill of the Tyrians, who accompanied her, and who were at this time the moſt poliſhed and ingenious people in the world, enabled her to enlarge and beautify the place, if ſhe did not lay the foundation of it ; to wall it round, and build a ſtrong citadel in it ; to lay the baſis of a moſt flouriſhing and extenſive commerce for which the Tyrian nation was ſo renowned ; and to introduce a form of government, which Ariſtotle ſeemed to think one of the moſt perfect that ever was known in the world. Some writers have affirmed, that Dido outwitted the natives, by deſiring to purchaſe of them, for her intended

tended ſettlement, only ſo much land as an ox's hide would compaſs. This modeſt requeſt was inſtantly complied with; upon which ſhe cut the hide into the ſmalleſt thongs, and with them compaſſed a large tract of ground, on which ſhe built a citadel, called Byrſa, from the hide. But this tale is generally exploded by the learned. This princeſs, it is ſaid, was afterwards courted by Jarbas, king of Getulia, and threatened with a war in caſe of refuſal. Dido having bound herſelf by an oath not to contract a ſecond marriage, and being incapable of violating her engagement to Sichæus, deſired time for deliberation, and for appeaſing the manes of her firſt huſband by ſacrifice. Having therefore ordered a pile to be raiſed, ſhe aſcended it; and drawing out a dagger which ſhe had concealed under her robe, ſtabbed herſelf with it. This ſtory is related with ſome different particulars by Juſtin, l. xviii. c. 6.

Virgil has much altered this hiſtory, by ſuppoſing that Æneas, his hero, was cotemporary with Dido, though there was an interval of nearly three centuries between the one and the other; the æra of the building of Carthage being fixed 300 years lower than the deſtruction of Troy. However, in the plan of his ſtory he has diſplayed great judgment; for as he wrote for the Romans he has contrived to intereſt them the more, by introducing the implacable hatred which ſubſiſted between Carthage and Rome, and ingeniouſly deducing the origin of it from the very remote foundation of theſe two rival cities.

Carthage was ſituated at the bottom of a gulf, upon a peninſula 360 ſtadia, or 45 miles in circumference; the iſthmus joining this peninſula to the continent of Africa being 25 ſtadia, or three miles and a furlong in breadth. Dr. Shaw, (Travels, p. 82.) concludes from an eſtimate made on the ſpot, that the peninſula is about 30 miles round, and that the city may have taken up nearly half that ſpace. On the weſt ſide, a long tract of land, half a ſtadium broad, projected from it, which running into the ſea ſeparated it from a lake, or moraſs, and was ſtrongly fortified on all ſides by rocks, and a ſingle wall. In the middle of the city ſtood the fortreſs, or citadel, erected by Dido, called *Byrſa*, which is a Greek corruption of the Punic, or Phœnician name *Bozra*, *Boſya*, or *Botſra*, denoting a fortreſs, or citadel; and this etymology excludes the fable of the ox's hide. Byrſa, according to Servius, (in Virgil), was 22 ſtadia, or near three Engliſh miles in circumference; though Eutropius maintains that it did not much exceed 2000 paces, or not quite two miles. It contained a rich, beautiful, and ſpacious temple ſacred to Æſculapius, ſeated on a very high hill, which was aſcended by 60 ſteps. Aſdrubal's wife ſet fire to it, and entirely conſumed it, together with herſelf, her children, and 900 Roman deſerters, who had fortified themſelves in this place in order to avoid falling into the hands of Scipio. On the ſouth ſide, towards the continent, where Byrſa ſtood, the city was ſurrounded by a triple wall 30 cubits high, excluſive of the parapets and towers, with which it was flanked at equal diſtances, each interval being 480 feet. Each tower had its foundation ſunk 30 feet deep, and was four ſtories high, though the wall was but two: they were arched, and in the lower part, correſponding in depth with the foundation above-mentioned, were ſtalls, large enough to hold 300 elephants, with their fodder; over theſe were ſtables for 4000 horſes, and lofts for their food. There was likewiſe room enough to lodge 20,000 foot and 4000 horſe. Here were two harbours, diſpoſed in ſuch a manner as to communicate with each other, and having a common entrance, 70 feet broad, ſecured with chains. The firſt was appropriated to the merchants, and included a great number of places of refreſhment and all kinds of accommodation for the ſeamen. The ſecond, or inner port, was, as well as the iſland, called *Cothon*, in the midſt of it, lined with large keys, in which were diſtinct receptacles for ſecuring and ſheltering from the weather 220 veſſels, and it was deſigned chiefly for ſhips of war. Strabo calls the ſmall iſland Cothon; but Appian applies the term likewiſe to the port, or harbour itſelf. So active were the Carthaginians, that before Scipio had blocked up the old port of Cothon, they in a ſhort time built a new haven, the traces of which are ſtill to be ſeen. See Cothon. Near the Cothon was a temple of Apollo, in which was a ſtatue of that deity of maſſive gold; and the inſide of the temple was covered with plates of the ſame metal, weighing 1000 talents. Over the receptacles juſt mentioned were magazines, or ſtore-houſes, containing all neceſſaries for the arming and equipping of fleets. The entrance into each of theſe receptacles was adorned with two marble pillars of the Ionic order; ſo that both the harbour and the iſland repreſented on each ſide two magnificent galleries. The admiral's palace was ſo ſituated on the iſland, juſt oppoſite to the mouth of the harbour, that he could diſcover whatever was doing at ſea, although no one there could perceive what was tranſacting in the inner part of the harbour; nor had the merchants, when they entered the port, any proſpect of the men of war, being ſeparated from them by a double wall, and each port having its ſeparate gate that led into the city, without paſſing through the other. The *Byrſa* was conſidered as the interior part of Carthage, and was ſurrounded by the *Megara*, or *Megaria*, that is, the houſes or towns, for ſo the word ſignifies in the Phœnician tongue, or its exterior part; and thus taken together, they formed a kind of double town.

As to the extent of the city, Livy informs us, that it was 23 miles in circumference; and Pliny (l. v. c. 4.) intimates, that Carthage, when poſſeſſed by the Phœnicians, was much larger than when it became a Roman colony; and Suidas affirms, that it was the greateſt and moſt powerful city in the world. The number of inhabitants contained in this city amounted, at the beginning of the third Punic war, to 700,000. The forces which they were able to bring into the field, and the power which they were capable of exerciſing at ſea, were very formidable. Hamilcar, in his expedition againſt Gelon, the tyrant of Syracuſe, commanded an army conſiſting of 300,000 men, and the fleet, co-operating with the land forces, was compoſed of more than 2000 ſhips of war, and above 3000 tranſports. Their riches were likewiſe immenſe; for at the final deſtruction of the town, even after it had been plundered, and ſuppoſed to be entirely exhauſted and conſumed, Scipio carried away nearly a million and a half ſterling. The dominion of Carthage was not long confined to Africa. Strabo obſerves (Geog. lib. xvii.) that the Carthaginians poſſeſſed 300 cities in Africa, before the beginning of the third Punic war; nor is this incredible, if we conſider, that the dominions of this ſtate in Africa, before that war extended from the weſtern confines of Cyrenaica to the pillars of Hercules, or the ſtraits of Gibraltar, a tract of land near 1500 miles in length. The inhabitants of its ambitious city extended their conqueſts into Europe, by invading Sardinia, ſeizing a great part of Sicily, and the iſlands W. of it, and reducing almoſt all Spain, even as far as the Pyrenées, and having ſent powerful colonies every where, they enjoyed the empire of the ſea for more than 600 years; and formed a ſtate which was able to diſpute pre-eminence with the greateſt empires of the world by their wealth, their commerce, their numerous armies, their formidable fleets, and, above all, by the courage and talents of their officers.

Carthage, as Dr. Shaw informs us, (Travels, p. 81.) was built upon three hills, ſomewhat inferior in elevation to thoſe upon which Rome was erected. This famous city, after undergoing a variety of revolutions, was at length deſtroyed by Scipio Æmilianus, under the conſulate of Lentulus and Mummius, in the 146th year B. C. The Romans, after having completely deſtroyed it, ordered that it ſhould never be inhabited, denouncing dreadful imprecations againſt thoſe, who, contrary to their prohibition, ſhould attempt to rebuild any part of it, eſpecially Byrſa and Megara. About 24 or 30 years after this event, C. Gracchus, tribune of the people, in order to ingratiate himſelf with them, undertook to rebuild it, and with that view conducted thither a colony of 6000 Roman citizens; and this was the firſt Roman colony that was ever ſent out of Italy. Plutarch intimates, that Gracchus executed his deſign, which was done in a very imperfect manner; but it is more probable that the work was entirely diſcontinued, however vigorouſly begun, in compliance with the orders of the ſenate. Julius Cæſar, as Appian informs us, conceived a deſign, in conſequence of a nightly dream or viſion, of rebuilding Carthage. But his untimely death prevented the completion of his purpoſe. However, Appian ſays, that his adopted ſon, Auguſtus Cæſar, built a city at a ſmall diſtance from the ſpot on which ancient Carthage ſtood, and called it by the ſame name; thus avoiding the ill effects of thoſe imprecations, which had been pronounced at the time of its deſtruction. Thither, it is ſaid, he ſent a colony of 3000 men, who were ſoon joined by conſiderable numbers from the neighbouring towns. Strabo, on the other hand, intimates, that both Carthage and Corinth were rebuilt at the ſame time by Julius Cæſar; and he affirms, that Carthage in his time, that is in the reign of Tiberius, was equal, if not ſuperior, to the largeſt city in Africa. Plutarch confirms the teſtimony of Strabo. Pliny alſo mentions it as a conſiderable colony in his days. Carthage was eſteemed the ſecond city in the Roman dominions, and conſidered as the capital of Africa for ſeveral centuries after the commencement of the Chriſtian æra. Its biſhops, who were ſubordinate to the biſhop of Rome, and not to the patriarchs of Alexandria, occupied a diſtinguiſhed rank in the weſtern church. Maxentius laid it in aſhes about the ſixth or ſeventh year of Conſtantine's reign, A. D. 311 or 312; and Genſeric, king of the Vandals, took it A. D. 439. At this time Carthage contained the manufactures, the arms, and the treaſures of the ſix provinces. Schools and gymnaſia were inſtituted for the education of the African youth; and the liberal arts and manners, grammar, rhetoric, and philoſophy, were publickly taught in the Greek and Latin languages. The buildings of the city were uniform and magnificent; a ſhady grove was planted in the midſt of it; the new port, a ſecure and capacious harbour, ſubſerved the commercial induſtry of citizens and ſtrangers; and the ſplendid games of the circus and theatre were exhibited almoſt in the preſence of the Barbarians. The reputation of the Carthaginians was not equal to that of their country, and the reproach of Punic faith ſtill adhered to their ſubtle and faithleſs character. The habits of trade, and the abuſe of luxury, had corrupted their manners; but their impious contempt of monks, and the ſhameleſs practice of unnatural luſts, are the two abominations which are particularly reprobated by Salvian, the preacher of that age. The king of the Vandals, however, ſeverely reformed the vices of a voluptuous people; and the ancient, noble, ingenuous freedom of Carthage was reduced by Genſeric into a ſtate of ignominious ſervitude. After he had permitted his licentious troops to ſatiate their rage and avarice, he inſtituted a more regular ſyſtem of rapine and oppreſſion. An edict was promulgated, which enjoined all perſons, without fraud or delay, to deliver their gold, ſilver, jewels, and valuable furniture or apparel, to the royal officers; and the attempt to ſecrete any part of their patrimony was inexorably puniſhed with death and torture, as an act of treaſon againſt the ſtate. The lands of the proconſular province, which formed the immediate diſtrict of Carthage, were accurately meaſured, and divided among the Barbarians; and the conqueror reſerved, for his peculiar domain, the fertile territory of Byzacium, and the adjacent parts of Numidia and Getulia. Beliſarius retook it in 533 and annexed it again to the Roman empire. In this revolution the trade of Carthage was not interrupted; the ſhops continued open and buſy; and the ſoldiers, after ſufficient guards had been poſted, modeſtly departed to the houſes, which were allotted for their reception. Beliſarius fixed his reſidence in the palace; ſeated himſelf on the throne of Genſeric; accepted and diſtributed the Barbaric ſpoil; granted their lives to the ſuppliant Vandals; and laboured to repair the damage which had been ſuſtained by the ſuburbs in the preceding night. At ſupper he entertained his principal officers with the form and magnificence of a royal banquet. He reſtored with incredible diſpatch the walls and ditches of the city, and re-eſtabliſhed the ſtrength of an impregnable fortreſs. At laſt the Saracens, under Mohammed's ſucceſſors, towards the cloſe of the ſeventh century, A. D. 698, ſo completely deſtroyed this city, that few traces of it are left. All the remains, ſays Dr. Shaw, of this once famous city are the area of a ſpacious room upon one of the hills on which it ſtood, commanding the ſouth-eaſt ſhore, with ſeveral ſmaller ones at a little diſtance from it; the common ſewers, which time hath not in the leaſt injured or impaired; and the ciſterns, which have ſhared only in a ſmall degree the general ruins of the city. The harbour, indeed, is now ſtopped up, and by the north-eaſt winds, with the river Mejerda, the ancient Bagrada, moved almoſt as far diſtant from the ſea as Utica; though it is ſtill called "El Merſa," or the Port, lying to the north and north-weſt of the city, and forms, with the lake of Tunis, the peninſula on which Carthage ſtood. Livy tells us, that Carthage was only 12 miles from Tunis, and this is the diſtance that ſtill ſubſiſts between that city and a fragment of the weſtern wall of Carthage. Polybius indeed makes the diſtance between Tunis and Carthage 15 miles. The ſpot on which it ſtood is, according to the lateſt obſervations, about N. lat. 36° 52′. E. long. 10° 40′. See CARTHAGINIANS.

CARTHAGENA, in *Geography*, *New Carthage*, a ſea-port town of Spain, in the province of Murcia; ſeated on the declivity of a hill, and ſeparated from the harbour by an intermediate plain. The city is protected from the ſouth and from the weſt by high mountains and barren rocks; but to the north and eaſt it is open, and communicates with an extenſive valley, which is divided from the plain of Penilla by a ridge of hills, whilſt to the north, another chain of mountains ſeparates it from the vale of Murcia. On the ſummit of the hill, commanding the city, is a caſtle now decaying; but, on the adjacent heights, are raiſed conſiderable works, to defend the harbour, with the arſenal and dock-yard. The harbour is the beſt in Spain, well ſheltered from winds, and well defended. The arſenal is large, and ſo amply furniſhed with naval ſtores, that a ſhip of the line, as it is ſaid, may be got ready for ſea in three days. The number of inhabitants is reckoned to be 60,000, who are diſtributed in 15,000 families. The ſtreets are wide, and the houſes are commodious. They have generally flat roofs, which afford, in this climate, an agreeable and cool retreat, where, after ſun-ſet, the inhabitants aſſemble to enjoy the refreſhing breeze; the new parade, extending eaſt and weſt at the head of the harbour, and looking through its entrance into the Mediterranean, is built on a regular plan; and as a high ſchiſtous rock has been cut away to make room for this long range of habitations, excellent vaults are excavated behind each houſe, for the ſervice of the merchants. At the end of this ſtands the royal hoſpital, deſtined to receive the ſick from the dock-yard and the army, with the "preſidiaros," or criminals condemned to the gallies, and in Spain reduced to the loweſt ſtate of ſervitude. The cathedral, which is a wretched pile, is now degraded, and the biſhop's ſee being removed to Murcia, it is become a pariſh church. Of nine convents, eight are occupied by the men. In the midſt of the dock-yard is a ſpacious baſon, and in this the ſhips of war are moored, each in front of the magazine deſtined to receive her rigging and her ſtores. The docks are kept dry by fire-engines, of which three are almoſt conſtantly at work. They have here 2000 criminals, chiefly ſmugglers, who, being condemned to work in chains, are called "preſidiaros." They are employed in the moſt ſervile labour, for 5 or for 7 years; and at the expiration of their terms, they are turned looſe upon the public, fitted only to purſue their original occupations. Theſe 2000 ſlaves require a conſtant guard of 500 ſoldiers; and independently of this expence, they coſt each to government, five reals a day for their maintenance, whilſt their work cannot be eſtimated at one-tenth of what they eat. In this dock-yard the maſts and timber are floated in water, without any apprehenſion of injury from the worm; becauſe, as they never open their ſluices till the water is become putrid, the rapid evaporation leaves a ſtrong brine, in which it is impoſſible for the worm to live.

The fiſhery of this ſea-port is conſiderable; and is divided into two branches, independent of each other; that within the port being the property of a fiſhing company, conſiſting of 18 aſſociates, eſtabliſhed here by charter, whilſt, in the open ſea, all enrolled mariners are at liberty to fiſh. Within the port they take chiefly the tunny and the melvas; but the former is the moſt profitable. Half the quantity of fiſh that is taken in the harbour, muſt be ſold for the benefit of the poor at a ſtipulated price; and the king takes one-half of all their profits, amounting to about 1000l. a year, as a compenſation for his claim of one-quarter of their fiſh. In the open ſea the fiſhermen are free from oppreſſion and have peculiar privileges.

At Carthagena they manufacture a large quantity of the "eſparto" ropes and cables, ſome of which are ſpun like hemp, and others platted. Theſe cables are excellent, as they float on the ſurface of the water, and are not therefore liable to be cut by the rocks on a foul coaſt. The eſparto ruſh makes good mats for houſes, "alpargates" for peaſants, and has lately been ſpun into fine thread for the purpoſe of making cloth. This ruſh, it is ſaid, is the peculiar and natural production of all the high and uncultivated mountains in the ſouth, and affords in the dry and elevated regions, where neither hemp nor flax will grow, materials proper for clothing, and for the employment of induſtry. The moſt important production of this country, and the moſt valuable article of commerce is barilla, uſed for making ſoap, for bleaching, and for glaſs. The country producing it is about ſixty leagues in length, and eight in breadth, on the borders of the Mediterranean. The quantity exported annually from Spain is about 150,000 quintals, paying a duty of 17 reals per quintal. The chief imports are bale goods and bacalao; the latter directly from Newfoundland; and of the former muſlins and cottons are prohibited, though they are ſecretly introduced in great quantities. The ſoil of the adjacent country is loamy, compoſed of calcareous matter, ſand, and clay, from the diſſolution of the neighbouring mountains, which conſiſt of ſchiſtous rock covered with limeſtone. In ſome places is found the ſiliceous grit or ſand-ſtone, with ſhingle or ſmooth gravel and ſea-ſhells; and at no great diſtance from the city is a mountain, from which they obtain the gypſum uſed for plaſter. The whole country abounds with ſalt-petre. Oxen are uſed for draught; but in tillage they employ mules and aſſes. Their courſe of huſbandry is wheat, barley, and fallow. They ſow their wheat in November, and in July reap from 10 to 100 for one, according to the wetneſs of the ſeaſon. They grind all their corn by wind-mills, 30 of which may be counted near the city; and water for common uſe is ſcarce and dear. The trees moſt common in the adjoining valley are elms, poplars, olives, figs, pomegranates, mulberries, apricots, palms, palmitos, and the ginjolero; the laſt of which bears a ſmall fruit reſembling, in ſize and form, the olive, with a ſmaller kernel, and remarkably ſweet. The palmitos is the *chamærops humilis*. The moſt endemical diſeaſes at Carthagena are intermittent and putrid fevers, which ariſe from the proximity of an extenſive ſwamp, containing many hundred acres. The municipal government of Carthagena is veſted in a military governor, with his alcalde mayor; 30 regidores, whoſe office paſſes by inheritance, if not previouſly ſold; and two ſyndics choſen by the people as their peculiar guardians. The governor is the ſupreme and independent judge for the army, and for ſtrangers ſettled in the country, while his alcalde preſides in the tribunal for the citizens. In conſequence of the vicious formation of the government and the mal-adminiſtration of the laws, murder and aſſaſſinations are frequent in Carthagena, and the moſt atrocious villains eſcape puniſhment. Want of fidelity to matrimonial engagements is equally prevalent at Carthagena, as in the other provinces of Spain. N. lat. 37° 37′. W. long. 1° 8′ 30″. Townſend's Journey through Spain, vol. iii.

This city was founded in the year of Rome 525, (B. C. 229.) by Aſdrubal, the Carthaginian general, in order to ſecure the ſubjection of the country. It was taken by Scipio Africanus in the year of Rome 542 (B. C. 212.), after the defeat of Hannibal under the walls of Carthage in Africa. It became a Roman colony in the time of Cæſar, who eſtabliſhed a colony in it after the battle of Munda, and was one of thoſe denominated "conventus;" its juriſdiction extending over 65 towns. After having been deſtroyed by the Goths, it was rebuilt by Philip II. Diamonds, rubies, amethyſts, and other precious ſtones were formerly found in its vicinity, ſo that it was reckoned the Indies of the Romans; and it was famous for its ſilver mines. Strabo (l. iii. p. 148.) mentions a mine near this city, which yielded daily 25,000 drachms of ſilver, or about 300,000l. a year.

Carthagena, a province or government of South America, in the country of Terra Firma, the juriſdiction of which reaches eaſtward to the great river of de la Magdalena, and along this river ſouthward, till, winding away, it borders on the province of Antioquia; from thence it ſtretches weſtward to the river of Darien; and from thence northward to the ocean, along the coaſts between the mouths of theſe two rivers. The extent of this government from eaſt to weſt is generally computed at 53 leagues; and from ſouth to north 85. In this ſpace, beſides mountains and foreſts, are ſeveral fruitful vallies, called by the natives Savannahs; as thoſe of Zamba, Zenu, Tolu, Mompox, Baranca, and others; and in them many ſettlements, large and ſmall, of Europeans, Spaniſh creoles, and Indians. According to an exiſting tradition this country formerly abounded in gold, but the old mines are now either neglected, or exhauſted. But the riches of the country were principally owing to the trade which it carried on with Choco and Darien; from whence were brought, in exchange for this metal, the ſeveral manufactures and works of art which were needed. Gold was ſo plentiful, that it was the common ornament of the Indians, both men and women. The country, more eſpecially about the capital, is ſo luxuriant, that the trees and plants which it ſpontaneouſly produces preſent to view a rich and perpetual verdure; and the interwoven branches of the trees form a ſhelter impenetrable both to heat and light. The trees are large and lofty, very various, and altogether different from thoſe of Europe. The principal, with regard to ſize, are the caobo or acajou, of which they make their canoes and champanes for fiſhing, the cedar both white and reddiſh, the maria, and the balſam tree, which two laſt, beſides the utility of their timber, diſtil the admirable balſams called maria oil and balſam of Tolu, ſo called from a village, where it is found moſt excellent and moſt abundant. Beſides theſe trees, here are alſo the tamarind, the medlar, the ſapote, the papayo, the guayabo, the caſſia, the palm, the mançanillo, and ſeveral others, moſt of which yield a wholeſome and palatable fruit, as well as a durable and variegated wood. In the woods about Carthagena is found a great quantity of bejucos, of different magnitude, figure, and colour; one ſpecies of which is particularly noticed on account of its fruit, called "habilla de Carthagena," or the bean of Carthage, which is conſidered as one of the moſt effectual antidotes which that country affords againſt the bites of vipers and ſerpents. See Hippocratea. This country alſo abounds with various animals, both tame and wild. The only tame eatable animals are the cow and the hog, which are very plentiful. Wild geeſe and other poultry are good and very abundant. There are alſo different kinds of game, as deer, rabbits, and wild boars, called ſajones; but theſe are eaten only by the country negroes and Indians, except the rabbits, which find a good market in the city. The wild beaſts are tigers, leopards, foxes, armadillos, ſquirrels, and monkies, the ſmalleſt and the moſt common of which are the micos. The birds are incalculably numerous, and their various plumage is exquiſitely beautiful and brilliant. The moſt ſingular are the guacamayo, beautiful beyond expreſſion in plumage, but no leſs diſagreeable for its croaking noiſe, the tulcan, or preacher, and the gallinazos, which latter are of great ſervice in cleaning the city of all filth and ordure, by devouring dead animals, &c. Bats are very common, and they are ſo numerous at Carthagena, that when they begin to fly, they may be ſaid to cover the ſtreets like clouds. Among the inſects and reptiles, the principal are the ſnakes, the centipeds, the ſcorpions, and ſpiders.

The conſtant moiſture and heat of this climate will not allow the cultivation of wheat, barley, and other grains of that kind; but maize and rice are produced in great abundance. Of the maize they make a kind of bread, called bollo, which is generally uſed; and they alſo uſe it in feeding hogs and fattening poultry. The caſava bread, made from the roots of yuca, names, and moniatos, is very common among the negroes. Plantations of ſugar-canes are ſo general, as to reduce the price of honey; and part of the juice is converted into ſpirit. Cotton-trees are alſo in part ſpontaneouſly produced, and others, which are the beſt, are planted and cultivated. The cacao trees of Carthagena excel thoſe of the Caracas and neighbouring diſtricts both in the ſize and goodneſs of the fruit. Beſides melons, grapes, oranges, dates, and fruits which belong to other countries, Carthagena has ſome more appropriate to itſelf, ſuch as the pine-apple, the plantane, the banana, the papayas, &c. The chief town of this country is "Carthagena."

Carthagena, a city and ſea-port of South America, and metropolis of the province above deſcribed. It is ſeated on a peninſula, or ſandy iſland, which is joined to the continent by two artificial necks of land, the broadeſt of which is not above 70 yards wide. The fortifications are regular and ſtrong, and conſtructed after the modern manner. At a ſmall diſtance from the ſuburb, called Xexemani, ſeated on an iſland, and connected with the city by a wooden bridge, is a hill, on which is conſtructed a fort called St Lazaro, that commands both the city and ſuburb. The height of the hill is between 20 and 21 toiſes, and it is joined to ſeveral higher hills, which run off in an eaſtern direction. Theſe terminate in another hill of the height of 84 toiſes, on the top of which is a convent of bare-footed Auguſtines. The city and ſuburbs are well laid out; the ſtreets being ſtraight, broad, uniform, and well paved. The houſes are moſtly built of ſtone; they conſiſt chiefly of only one ſtory above the ground-floor; and the apartments are well contrived. All the houſes have balconies of wood, which is more durable in this climate than iron. Carthagena has ſeveral churches and convents; and, including its ſuburbs, it is equal to a city of the third rank in Europe. It is well peopled: the number of its inhabitants, moſt of whom are deſcended from the Indian tribes, being eſtimated at 25,000. The governor reſides in the city, and in civil affairs, an appeal lies to the audience of Sta. Fé; and when in 1739 a vice-roy of Sta. Fé was created under the title of vice-roy of New Granada, the government of Carthagena became alſo ſubject to him in military affairs. Carthagena has alſo a biſhop, whoſe ſpiritual juriſdiction is of the ſame extent as the military and civil government. The eccleſiaſtical chapter is compoſed of the biſhop and prebends. There is alſo a court of inquiſition, whoſe power extends to the three provinces of Iſla Eſpanola, where it was firſt ſettled, Terra Firma, and Santa Fé. Beſides theſe tribunals, the police and adminiſtration of the city are conducted by a ſecular magiſtracy, conſiſting of regidores, from whoſe number are annually choſen two alcaldes. There is alſo an office of revenue, under an accomptant and treaſurer, where all taxes and royal revenues are received, and whence the proper iſſues are directed. A perſon of the law, under the title of "auditor de la gente de Guerra," determines proceſſes.

The bay, which we ſhall more particularly deſcribe in the ſequel of this article, and the country before called "Calamari," were diſcovered in 1502 by Roderigo de Baſtidas; and in 1504, Juan de la Coſa, and Chriſtopher Guerra began the war againſt the Indian inhabitants, who, being a martial people, and joined by their women in the fatigues and dangers of war, reſiſted them with a valour and obſtinacy which they did not expect. Their common arms were arrows, which they poiſoned with the juice of certain herbs, ſo that the ſlighteſt wounds were fatal. They were ſucceeded by Alonſo da Ojeda, attended by Juan de la Coſa, as his chief pilot, and Americo Veſpucio, a celebrated geographer of thoſe times; but they met with ſimilar reſiſtance, and made little impreſſion. Nor was Gregorio Hernandez de Oviedo more fortunate. At length, the conqueſt of the Indians was accompliſhed by don Pedro de Heredia, who, after gaining ſeveral victories over them, ſubjected this part of America to the crown of Spain in 1533. The advantageous ſituation of Carthagena, the extent and ſecurity of its bay, and the great ſhare it acquired of the commerce of that ſouthern continent, ſoon cauſed it to be erected into a biſhop's ſee. The ſame circumſtances contributed to its preſervation and increaſe, as the moſt eſteemed ſettlement and emporium of the Spaniards; but they alſo drew upon it the attention and hoſtilities of foreigners, who have ſeveral times, with a view to its wealth and importance, invaded, taken, and plundered it. Its chief importance is derived from its harbour, which is the ſafeſt and beſt fortified of any in the American dominions of Spain. In a ſituation ſo favourable, commerce ſoon began to flouriſh; and as early as the year 1544, it ſeems to have been a town of ſome note. At this period, ſoon after its eſtabliſhment, it was invaded by ſome French adventurers, conducted by a Corſican pilot. In 1585 it was pillaged and almoſt deſtroyed by ſir Francis Drake; but happily reſcued from the flames by a ranſom of 120,000 ducats, paid him by the neighbouring colonies. It was again invaded and pillaged by the French in 1597, under the command of M. de Pointis, with an armament, conſiſting of Flibuſtiers, or Buccaneers, little better than pirates, but as ſubjects to the king of France, they were under his protection. After obliging the fort of Bocca Chica to ſurrender, ſo that the entrance of the bay was laid open, fort Lazaro was beſieged, and this was followed by the ſurrender of the city. But though the town capitulated, avarice conſigned it to pillage. At a later period, viz. in 1741, an expedition againſt Carthagena was undertaken by the Engliſh, and the conduct of it entruſted with admiral Vernon, who commanded the fleet, and general Wentworth, who conducted the land force. When the Engliſh, after encountering many difficulties, got poſſeſſion of the harbour, neceſſary diſpoſitions were made for gaining the town; but here they failed; and the officers thought it better to retire with their fleet and army than to ſtay longer in a country, the unwholeſome climate of which was infinitely more to be dreaded than the utmoſt efforts of its timid inhabitants.

When Carthagena was choſen as the port, in which the galeons ſhould firſt begin to trade on their arrival from Europe, and to which they were directed to return, in order to prepare for their voyage homeward, the commerce of its inhabitants was ſo much favoured by this arrangement, that it ſoon became one of the moſt populous, opulent, and beautiful cities in America. On the arrival of the galeons, Carthagena was the mart to which the inhabitants of the neighbouring provinces reſorted; and the merchants of Sta. Fé, Popayan, and Quito, not only diſpoſed of all their ſtock, but alſo laid out all the money entruſted by commiſſion for ſuch goods as were moſt wanted in their reſpective countries. They brought gold and ſilver in ſpecie, ingots, and duſt; and alſo emeralds, the demand for which was then conſiderable, though it has ſince decreaſed. Afterwards, during the interval between the departure and the arrival of the galeons, the trade of Carthagena was wholly confined to the towns and villages within its juriſdiction, from whence the inhabitants were ſupplied with all the neceſſaries of life in exchange for European commodities. Carthagena, however, we may well imagine, has reached its higheſt point of exaltation; and it muſt have been ſo far affected by the change that has taken place in the Spaniſh ſyſtem of trade with America, which has withdrawn from it the deſirable viſits of the galeons, as to feel at leaſt a temporary decline. But the wealth, now collected there, muſt find or create employment for itſelf, or may be turned with advantage into ſome new channel. Its harbour is ſo ſafe, and ſo conveniently ſituated for receiving commodities from Europe, its merchants have been ſo long accuſtomed to convey thoſe into all the adjacent provinces, that it is probable they will ſtill retain this branch of trade, and Carthagena continue to be a city of great importance.

Carthagena bay, to which the importance and proſperity of this city has been chiefly owing, is one of the beſt, not only on this coaſt, but alſo in all the known parts of this country. It extends 2½ leagues from north to ſouth, has a ſufficient depth of water and good anchorage, and is ſo ſmooth that the ſhips are no more agitated than on a river, though the numerous ſhallows at the entrance render it neceſſary to ſecure a good pilot. The entrance into the bay is through the narrow ſtrait of Bocca Chica, or Little mouth, which, ſince the invaſion of the Engliſh, has been ſhut up, and a more commodious one opened and fortified. Towards Bocca Chica, and 2½ leagues diſtant ſeaward, there is a ſhoal of gravel and coarſe ſand, having in many parts of it not more than a foot and a half of water. This bay abounds with great variety of fiſh, ſuch as the ſhad, &c. The turtles are large and well taſted. But it is very much infeſted with ſharks, which are very dangerous to ſeamen both in the water, and even in their boats.

The inhabitants of Carthagena and its adjacent territory may be diſtributed into different caſts, or tribes, who claim their origin from a coalition of whites, negroes, and Indians. The whites may be divided into two claſſes, viz. the Europeans and Creoles, or whites born in the country. The former are commonly called "Chapetones," moſt of whom, when they have acquired a competent fortune, return to Spain, or remove into inland provinces in order to increaſe it. Thoſe who are ſettled at Carthagena carry on the whole trade of the place, and live in opulence; whilſt the other inhabitants are indigent, and obliged to recur to hard and mean labour for a ſubſiſtence. The families of the white Creoles compoſe the landed intereſt; and many of them have large eſtates. Others, however, are in mean circumſtances. Among the other tribes, which are derived from an intermarriage of the whites with the negroes, the firſt are the "Mulattos;" next to theſe are the "Tercerones," produced from a white and a Mulatto; after theſe follow the "Quarterones," proceeding from a white and a Terceron; and the laſt are the "Quinterones," who owe their origin to a white and Quarteron. The children of a white and Quinteron are called Spaniards, and conſider themſelves as totally exempt from all taint of the negro race. Between the ſeveral tribes, or caſts above enumerated, there are other intermediate claſſes, formed of an intermixture of the former. The ſeveral caſts from the Mulattos affect the Spaniſh dreſs, but wear very ſlight ſtuffs, on account of the heat of the climate; and they compoſe the mechanics of the city. The claſs of negroes conſiſts of the free and the ſlaves; and theſe are again ſubdivided into Creoles and Bozares, ſome of whom are employed in the cultivation of the lands belonging to the city. On account of the extreme heat, the only covering both of the males and females is a ſmall piece of cotton ſtuff about their waiſt. The dreſs of the whites, both men and women, differs very little from that worn in Spain. The whole exerciſe of the females in the houſe conſiſts in ſitting in their hammocks, made of twiſted cotton, and commonly knit in the form of a net, and ſwinging themſelves for air. Thus they paſs the greateſt part of the day; and men, as well as women, often ſleep in theſe hammocks. Of both ſexes it is remarked, that they poſſeſs a conſiderable ſhare of wit and penetration, and of a genius adapted to excel in all kinds of mechanic arts. But their faculties ſeem to attain an early maturity, and they retain them in a great degree of vigour to an advanced age. The females of every caſt are diſtinguiſhed by a mild and amiable diſpoſition, and by the promptitude with which they relieve the indigent and diſtreſſed. The principal cuſtoms, in a great degree prevalent to this place, are the uſe of brandy, chocolate, honey, ſweatmeats, and ſmoaking of tobacco; and the latter practice is common among perſons of all ranks and of both ſexes. One of the moſt favourite amuſements of the natives is a ball, or "fandango," which, among the populace, conſiſts principally in drinking brandy and wine, intermixed with indecent and ſcandalous motions and geſtures. Their burials are conducted with great pomp and oſtentation; and their lamentations over the dead are attended with the moſt frantic geſtures and the moſt clamorous vociferations. The mourning is continued in the houſe of the deceaſed for nine days after the corpſe has been laid in the grave.

The climate of Carthagena is exceſſively hot; the degrees of heat being continually the ſame as that of the hotteſt day at Paris. The nature of this climate is chiefly manifeſted from the month of May to the end of November, the ſeaſon here called winter; during which time, there is almoſt a conſtant ſucceſſion of thunder, rain, and tempeſts; and the rain deſcends in ſuch quantities, that the ſtreets appear like rivers, and the country like an ocean. This is the only opportunity which the inhabitants have for filling their ciſterns with freſh water; the water of their wells being thick and brackiſh. From the middle of December to the end of April the rains ceaſe, and the weather is agreeable; the heat being ſomewhat abated by the N.E. winds, which then ſet in. This ſeaſon they call ſummer; beſides which they have another ſummer of ſhort continuance about the feſtival of St. John. The invariable continuance of great heats occaſions ſuch profuſe perſpiration, that the complexion of the inhabitants appears wan and livid, and all their motions are ſluggiſh. Yet upon the whole, they enjoy a good ſtate of health, and commonly live even to 80 years and upwards. The ſingularity of the climate occaſions diſorders of a peculiar kind: ſome of which attack the Europeans upon their firſt landing; and the others are common both to Creoles and Chapetones. Thoſe of the firſt kind are rapid in their progreſs, and terminate fatally when they bring on the black vomit. The inhabitants of Carthagena and its territory are very ſubject to the leproſy, in order to ſtop the contagion of which they have, without the city, a hoſpital called "San Lazaro," from the hill on which it ſtands, and in which perſons of both ſexes, labouring under this diſtemper, are confined. Another very ſingular diſtemper is the cobrilla, or little ſnake, which is a kind of tumour, which moſt commonly affects the arm, thigh, or leg; and which they cure by firſt applying a ſuppurative plaiſter, and fomenting the whole tumour with oil, and then faſtening a thread of ſilk to a kind of white fibre, that diſcovers itſelf, called the cobrilla's head, and winding the other end of it about a card, rolled up like a cylinder: they repeat the fomentation with oil, and the following day continue to wind about the cylindric card the part of the ſmall fibre, which appears in ſight, and thus proceed till the whole is extracted, and the patient cured. CARTHAGINIANS, in *Ancient Hiſtory*, are ſuppoſed to have derived their origin from the Canaanites. See CANAAN and CANAANITES. They were called by the Greeks, ſometimes Libyans, on account of the country they poſſeſſed; and ſometimes Phœnicians, on account of the country from which they were originally deſcended. The Romans ſtyled them Pœni, or Phœnicians, for the ſame reaſon; and every thing belonging to them, or their city, Pœnic, or Punic, that is Phœnician, or belonging to the Phœnicians. Between the Phœnicians and Carthaginians there always ſubſiſted the ſtricteſt union. To this purpoſe Herodotus informs us (lib. iii.) that when Cambyſes had determined to make war upon the latter, the Phœnicians, who formed the chief ſtrength of his fleet, poſitively declined to ſerve him againſt their countrymen; and on this account he was obliged to lay aſide his deſign. The Carthaginians, on their part, were never forgetful of the country from which they derived their origin. Accordingly, we learn from Polybius and Quintus Curtius, that they regularly ſent every year to Tyre a ſhip freighted with preſents, as a quit rent or acknowledgment paid to their ancient country; and its tutelar gods had an annual ſacrifice offered to them by the Carthaginians, who conſidered them as their protectors. They never failed to ſend thither the firſt-fruits of their revenues, and alſo the tythe of the ſpoils taken from their enemies, as offerings to Hercules, one of the principal gods of Tyre and Carthage. The Tyrians, on the other hand, when they wiſhed to ſecure their wives and children from Alexander, who was beſieging their city, ſent them to Carthage, where they were kindly received and hoſpitably entertained.

The *language* of the Carthaginians muſt at firſt have been the Phœnician; and this was the ſame with that of the Canaanites or Iſraelites, that is, the Hebrew, or at leaſt a language wholly derived from it. In proceſs of time, however, conſidering their diſtance from Phœnicia, their mother-country, and their intercourſe with other nations, their original tongue would be ſubject to ſome variation; and yet, notwithſtanding theſe variations, it ever continued to be the ſame in ſubſtance with the Hebrew or Phœnician. In the latter ages the Punic tongue acquired a tincture of the Chaldee and Syriac. As the iſland of Malta was, for a conſiderable time, ſubject to the Carthaginians, the Punic tongue muſt have long remained in it; and it appears, that about the middle of the 16th century, there were ſome pillars in the iſland, which had Punic inſcriptions upon them, and ſo late as that period the Punic tongue was ſpoken in Malta. The Punic letters, as well as language, muſt certainly at firſt have been the Phœnician; and though time produced a change in them, yet they always retained a great reſemblance of their original, as the curious inſpector may diſcern in the characters that are found upon the moſt elegant Phœnician and Punic coins.

The firſt *government* ſettled at Carthage was probably monarchical; but it expired either with Dido, or during her life, and was changed into a republic. Ariſtotle ſays, that it was partly ariſtocratical, and partly political, that is, democratical. According to Polybius, it was compoſed of monarchy, ariſtocracy, and democracy. But Iſocrates repreſents the civil government as oligarchical, and the military as monarchical. Ariſtotle, who intimates, that the Cretan, Lacedæmonian, and Carthaginian republics were the moſt perfect of any in the world, gives the preference, in ſeveral reſpects, to the Carthaginian. Of its excellent conſtitution it has been alleged, as a ſtriking evidence, that, notwithſtanding the great authority veſted in the people at Carthage, no inſtance occurred, from the foundation of the city to his time, of any popular commotions ſufficient to diſturb the public tranquillity, nor of any tyrant, who had been able, at the expence of liberty, to introduce oppreſſion. Hence, it has been inferred, that the three principal powers, of which the conſtitution of Carthage was compoſed, were of ſuch a nature as to counterpoiſe one another, and by their mutual harmony, to preſerve the public tranquillity and promote the public happineſs. Theſe were the ſuffetes, the ſenate, and the people. The ſuffetes, *ſophetim*, ſignifying, with the Hebrews and Phœnicians, judges, were two in number, of equal dignity and power, and the chief magiſtrates of Carthage. They correſponded to the two kings of Lacedæmon, as well as to the Roman conſuls: and hence they are ſometimes called kings and conſuls. They were annually elected out of the nobleſt families, and preferred on account of their virtue and talents, as well as their wealth. It was their province to aſſemble the ſenate, in which they preſided, to propoſe ſubjects for deliberation, to tell the number of voices, and to ſuperintend all emergent and deciſive debates. Their authority was not limited to the city, nor confined to civil affairs, as they ſometimes had the command of armies. Their concurrence with the ſenate in all points was neceſſary, in order to prevent any debate from coming before the people. Some ſay that they had the power of life and death, and that it was their prerogative to puniſh all ſorts of crimes. Moſt cities of note in the Carthaginian dominions, as well as the metropolis, had their ſuffetes, or chief magiſtrates. When their employment expired, they were made prætors; and this was an office of conſiderable authority and influence.

The ſenate was compoſed of perſons venerable for their age and experience, as well as illuſtrious for their birth, riches and merit. This honour was conferred upon them by election; but their number is not known. It was probably a numerous body, becauſe we find that 100 were ſelected from the ſenate to inquire into the conduct of their generals. This was the grand council of ſtate, in which every thing relating to peace and war, negociations and alliances, trade and navigation, in ſhort, to all affairs of moment, foreign or domeſtic, was debated, and, for the moſt part, determined. If the votes of the ſenate were unanimous, they had the force of laws, and from hence there lay no appeal. If they were divided among themſelves, or diſagreed with the ſuffetes, the affair was referred to the people, who had the liberty to expreſs their ſentiments freely, and of contradicting even the other parts of the legiſlature. What ſhare of power belonged to the people, whilſt the conſtitution remained in its moſt perfect ſtate, does not appear. But it is probable, that they had a vote in the election of magiſtrates, and in the enacting of laws, particularly ſuch as concerned themſelves. In the time of Ariſtotle, the republic verged towards popular government; though the ſenate ſtill retained a conſiderable degree of authority, and the power of the people was not uncontroulable; but about 100 years after, in the time of Hannibal, the ſenate was diſregarded; the people arrogated to themſelves almoſt the whole power; and ambitious demagogues obtained a very pernicious influence. From this period the public affairs were tranſacted by cabals and factions; the reputation and proſperity of the ſtate began to decline; and this circumſtance Polybius aſſigns as one of the chief cauſes of the ruin of Carthage.

The centumvirate, or tribunal of 100, conſiſted of 104 perſons, correſponding to the Ephori of Sparta, and formed a tribunal, which was intended to balance the power of the nobles and ſenate; it ſerved particularly to counteract the machinations of Mago, the Carthaginian general, and thoſe of his family, who, by engroſſing the chief employments of the ſtate and army, had acquired the ſole direction and management of all affairs. Of theſe 104 judges, five had a juriſdiction ſuperior to that of the reſt: and they had a power of filling all vacancies in their own body, and of chuſing thoſe perſons who compoſed the tribunal of the hundred; under the ſuffetes, they were at the head of this tribunal, and upon them, in a great meaſure, depended the life, fortune, and reputation of all the citizens. None were elected into this office but perſons of very diſtinguiſhed merit; and it had no ſalary or reward annexed to it. The centumvirate was, probably, a perpetual office till the time of Hannibal, who cauſed a law to be paſſed, which required all the judges to be choſen annually, and that none ſhould continue in office beyond that term. This took place about 200 years after the firſt eſtabliſhment of the tribunal of 100. The principal, if not the only, civil officers, eſtabliſhed at Carthage, beſides the ſuffetes, were the prætor, who had great influence in paſſing and repealing laws, and to whom was committed the charge of the public revenues; the quæſtor, who belonged to the bench of judges, who collected and managed the public money under the quæſtor; and the cenſor, whoſe buſineſs was to inſpect the manners of the citizens.

The *religion* of the Carthaginians, as they were deſcended from the Tyrians, agreed at firſt in all points with that of the Phœnicians. But by their intercourſe with the Greeks, they were led to adopt ſeveral new deities before unknown, and to blend ſome of the religious ceremonies of the Greeks with the Tyrian. Beſides, by their extended commerce, they became acquainted with the various kinds of ſuperſtition eſtabliſhed in other nations, which of courſe would give a tincture to their own; and hence it happened, that the religion of Carthage was a very groſs and multifarious idolatry. It may be alſo preſumed, that the Greek and Roman writers, in tranſmitting to us the hiſtory of theſe people, and of the objects of their worſhip, would affix the names of their own gods to thoſe of the Carthaginians. The principal deity at Carthage was Chronus, or Saturn, to whom were offered in ſacrifice children of the moſt diſtinguiſhed families. We read that upon the ſignal defeat of the Carthaginian army by Agathocles, 300 citizens voluntarily ſacrificed themſelves in order to render him more propitious to their country. This deity had a brazen ſtatue with extended arms, ſo diſpoſed that a child preſented to it dropped down into a hollow where was a fiery furnace. This deity, from various circumſtances, appears to have been the Moloch or Milchem of Scripture, the famous idol of the Ammonites, Canaanites, and neighbouring nations. This is ſuppoſed to have been alſo the ſame god with the Baal, Bel, or Belus of the Sidonians, Babylonians, and Aſſyrians. The goddeſs Cæleſtis, or Urania, was held in the higheſt veneration by the Carthaginians. This is ſuppoſed to have been the deity called by the prophet Jeremiah, (vii. 18. xliv. 17.) Baaleth Shemaim, the queen of heaven; by Megaſthenes, in Euſebius, Beltis; by Sanchoniatho, Dione and Baaltis; and by Heſychius, Belthes, which name was applied both to Juno and Venus. St. Auguſtin informs us, that Venus eſtabliſhed her reign at Carthage; and Virgil ſays, that Juno preferred that ſpot to all others. Aſhteroth and Aſtarte were ſynonymous to Urania and Baaltis, and denoted the moon as well as Venus and Juno, who was invoked in great calamities, particularly in droughts, to obtain rain. Jupiter was worſhipped by the Carthaginians under the name of Belus or Baal (ſee BAAL); Mars alſo was dignified by the ſame title; and ſo were likewiſe Bacchus and Apollo or the ſun. Baal-ſamen, or Baal-ſhemaim, that is, the god of heaven, appears to have been the ſun, and Beliſama, or the queen of heaven, the moon. The Carthaginians introduced Ceres and Proſerpina as Greek deities, and alſo Mercury, who received divine honours under the name of Aſumes or Aſoumes. The worſhip of the Tyrian Hercules was brought to Carthage by Dido, and diffuſed itſelf afterwards over all the coaſts of Africa, and as far as Gades or Cadiz, where he had a magnificent temple. Beſides other honours that were rendered to him at Carthage, he was annually gratified with human victims. Jolaus, as the relation of Hercules, was honoured as an object of veneration at Sardinia, which iſland was for a conſiderable time in the poſſeſſion of the Carthaginians. The Dea Syria, or Syrian goddeſs, who is ſuppoſed to have been either Juno, or a group of all the goddeſſes, was a deity of the Carthaginians. The people of Carthage likewiſe addreſſed themſelves to

Æſculapius, who had a ſpacious temple in the fortreſs of Byrſa. Herebus, another Carthaginian deity, is ſuppoſed to have been Pluto, or Dis. Triton, the ſea-god, had alſo a place among the deities of Carthage. Mopſus, a famous ſooth-ſayer, had temples erected to his honour by the Carthaginians, and reſponſes were iſſued from them, as from ſo many oracles. Rivers, meads, and waters, or rather the genii that preſided over them, were objects of adoration with theſe people; and as the old Africans paid a religious homage to fire, this was probably the cuſtom alſo at Carthage. The air and winds likewiſe ſhared divine honours. The ſiſter of Dido paſſed for a goddeſs, under the name of Anna Perenna; Dido herſelf received ſimilar honours after her death, and Ovid ſays, that in her life time ſhe procured it for her huſband Sichæus. Tellus, or the earth, was worſhipped by the Carthaginians. Moreover, it is not unlikely that the Carthaginians adopted their famous generals, ſuch as Hamilcar, Hannibal, and others, into the number of their gods; and that theſe were deities of the ſame kind with the dii indigetes of the Latins. The Carthaginians alſo ranked among their gods the two Philæni, who, for the purpoſe of extending the territory of Carthage, conſented to be buried alive in the place which they had pitched upon for its boundary. Portable temples were in uſe among the Carthaginians; which were covered chariots that carried ſmall images repreſenting certain gods. The tabernacle of Moloch, mentioned in ſcripture, is thought to have been a machine of this kind. The Cabiri were likewiſe adored at Carthage (ſee CABIRI); and alſo the Anaces, Anactes, or Dioſcuri. The gods, called Patæci, had the ſame reſpect from their votaries the Phœnicians and Carthaginians as the Penates had from the Romans. The cuſtom of offering human ſacrifices to theſe gods continued in Carthage till the ruin of their city; nor did it ceaſe among the Africans till the proconſulate of Tiberius; who ordered the prieſts concerned in this horrid impiety to be hanged. We may obſerve, in general, that the Carthaginians were extremely addicted to ſuperſtition; and yet they ſeemed to be influenced by ſome good principles; for it was their cuſtom to addreſs themſelves to the gods before they attempted to execute any enterpriſe, and, after having gained any advantage, they made proper acknowledgment to ſuperior powers.

In this connection it may not be improper to ſay ſomething on the *character* of the Carthaginians. As they were intent upon amaſſing wealth, they were mean-ſpirited, groveling, and ſordid, to an incredible degree. This at leaſt ſeemed to have been their diſpoſition towards the decline of their ſtate, though in their earlier ages they were of a ſuperior turn of mind, and even to the laſt, they had ſome perſons among them who poſſeſſed generous and heroic ſpirits. In forming an opinion of theſe people, we ſhould remember, that their character is tranſmitted to us chiefly by the Romans, who were their avowed and implacable enemies; and who took care to deſtroy not only the Punic archives, but every record of Punic literature, or of true hiſtory. Of the Carthaginian perfidiouſneſs and ingratitude, their hiſtory will furniſh abundant proof. Craft and cunning, which, according to Cicero, were the diſtinguiſhing characteriſtics of the Carthaginians, naturally led to falſehood, hypocriſy, and breach of faith, and theſe terminated in the baſeſt frauds and the moſt perfidious actions. Theſe qualities of the Carthaginians were ſo notorious, that, to ſignify any remarkable diſhoneſty, it was uſual to call it "Punic Honour," "Fides Punica;" and to denote a knaviſh, deceitful mind, no expreſſion was thought more proper than "Ingenium Punicum," a Carthaginian mind. Plutarch deſcribes them as actuated by a moroſe, saturnine, and ſavage diſpoſition; utterly averſe from every thing that had the leaſt appearance of wit or raillery. Some of them were vain, arrogant, and ambitious to a very high degree, and, indeed, avarice and ambition ſeemed to be with many of them ruling paſſions.

As commerce, the army, and the marine, were the principal objects of attention at Carthage, and as theſe engaged the purſuits and engroſſed the thoughts of the people in general, we cannot expect to find that they ſhould have cultivated any very diſtinguiſhed taſte for the liberal *arts and ſciences*. However, they muſt have been acquainted with the rudiments of aſtronomy, without which they could not have been tolerably verſed in the art of navigation. They had ſome notion likewiſe of ſculpture and painting, as we may learn from the ſtatues of their dii patæci, which they carried with them in their voyages, and from the pictures with which their ſhips of war and other veſſels were adorned. They muſt alſo have made a conſiderable proficiency in the inferior mechanical arts; as we may undeniably conclude from their ſuperb temples, magnificent palaces, rich furniture, and great variety of arms, and domeſtic utenſils. Their records of literature were deſtroyed by the Romans; nevertheleſs, the names of their principal writers have been tranſmitted with honour to poſterity. Hannibal, it is ſaid, was well acquainted with the Greek, and wrote ſeveral pieces in this language. Mago, another celebrated Carthaginian general, compoſed 28 volumes upon huſbandry, which, after the taking of Carthage, were held in ſuch high eſtimation by the Roman ſenate, that they ordered them to be tranſlated into Latin. Philinus, who wrote a hiſtory of the wars betwixt the Romans and the ſtate of Carthage, is reckoned by Polybius a good though a partial hiſtorian; but no part of his work is extant. Himilco, a ſea-officer, who was deputed by the ſenate of Carthage to diſcover the weſtern ſhores and ports of Europe, wrote a journal of his voyage, together with an account of his diſcoveries. Hanno, another Carthaginian general, ſailed, by order of the ſenate, along the coaſt of Africa. Having entered the ocean through the ſtraits of Gibraltar, he arrived firſt at the iſland of Cerne, ſuppoſed to be the modern iſle of Arguim, which became the chief ſtation of the Carthaginians on that coaſt; proceeding thence he reached a promontory, which he called the "Weſt Horn," probably Cape Palmas; and from this he advanced to another promontory, which he named the "South Horn," which is the preſent Cape de Tres Palmas, about 5 degrees N. of the line. He wrote a relation of his voyage, and a Greek fragment of it is ſtill remaining; the authenticity of which ſome have doubted. See AFRICA.

Among other inventions aſcribed to the Carthaginians, that of the quadriremes, or four-oared gallies, deſerves mention; and it is not improbable, that they were the firſt who made cables of the ſhrub "ſpartum" (ſee CARTHAGENA); at leaſt they were the firſt who communicated this invention to the Romans. Their navigation was extended to all the ports of the Mediterranean, both to the eaſt and to the weſt; Britain and the Canaries are ſaid to have been known to them; the weſtern coaſt of Africa they were acquainted with to a conſiderable extent, as we have already obſerved; and ſome have aſſerted, but without ſufficient evidence, that their nautical ſkill had led them to traverſe the ocean and to viſit the coaſt of America. They were, however, without doubt, for a long time univerſally acknowledged maſters of the ſea. It muſt be allowed, that, with the exception of thoſe already mentioned, to whom we may add Clitomachus the philoſopher, called in the Punic language Aſdrubal, and the celebrated poet Terence, who was born at Carthage, the Carthaginians could not boaſt of their men of literature and ſcience; although they had a correſpondence with Greece and the moſt civilized nations, their views were directed to trade; nor do they ſeem to have had any emulation to avail themſelves of their learning. Eloquence, poetry, philoſophy, and hiſtory ſeem to have been little known among them; and the education of youth, though Carthage was provided at an early period with an excellent ſchool, muſt have been very much neglected. The knowledge that was principally ſought and valued was reſtricted in a conſiderable degree to writing, arithmetic, book-keeping, and the buying and ſelling of goods; ſo that it was ſubordinate to traffic. In the latter years of their ſtate the laws forbade any Carthaginian to learn the Greek tongue, leſt it might qualify him for carrying on a dangerous correſpondence with the enemy, either orally or by letter.

After all, *commerce*, independently of the wars in which they were engaged, muſt occupy the chief place in the hiſtory of the Carthaginians. This formed the greateſt ſtrength and chief ſupport of their commonwealth, and we may venture to affirm, that the power, the conqueſts, the credit, and glory of the Carthaginians, all flowed from trade. From their Tyrian progenitors they inherited their genius for commerce, and in proceſs of time eclipſed the glory of their anceſtors, inſomuch that Pliny derives the origin of trade, not from the Phœnicians, but from the Pœni or Carthaginians. The natural fertility of its ſoil, the ſurpriſing ſkill of its artificers, and its peculiarly happy ſituation for commerce, rendered Carthage the centre of traffic, the great mart, not only of the Mediterranean, but even of the moſt remote nations. Without contending for the trade of the eaſt with their mother-country, they extended their navigation chiefly towards the weſt and north. Following the courſe which the Phœnicians had opened, they paſſed the ſtraits of Gades, and viſited not only all the coaſts of Spain, but thoſe of Gaul, and penetrated at laſt into Britain. They alſo extended their reſearches towards the ſouth, and planted along the weſtern coaſt of the great continent of Africa ſeveral colonies, in order to civilize the natives, and accuſtom them to commerce. They made conſiderable progreſs, by land, into the interior provinces of Africa, traded with ſome of them, and ſubjected others to their empire. The commodities with which they ſupplied other countries, ſeem to have been corn and fruits of all kinds; divers ſorts of proviſions, and high ſauces; wax, honey, oil, and the ſkins of wild beaſts, all the natural produce of their own territories. Their ſtaple manufactures were utenſils, toys, cables, all kinds of naval ſtores, and the colour from them called Punic, the preparation of which ſeems to have been peculiar to themſelves. From Egypt they fetched fine flax and paper; from the coaſts of the Red Sea, ſpices, frankincenſe, perfumes, gold, pearls, and precious ſtones; from Tyre and Phœnicia, purple and ſcarlet, rich ſtuffs, tapeſtry, coſtly furniture, and various artificial curioſities; from the weſtern parts of the world, in return for the commodities carried thither, they imported iron, tin, lead, and copper. By thus purchaſing the ſuperfluities of all nations, with which they had intercourſe, at an eaſy price, and ſelling them at an advanced rate, they brought immenſe treaſures to Carthage, rendered this republic formidable to her neighbours, and enabled her to contend with Rome itſelf for the empire of the world.

The gold and ſilver mines of Spain furniſhed the Carthaginians with an inexhauſtible ſource of wealth. Polybius, quoted by Strabo, ſays, that in his time upwards of 40,000 men were employed in the mines near Nova Carthago, and ſupplied the Romans, at a ſubſequent period, every day with 25,000 drachmas, or 859l. 7*s.* 6d. ſterling. Beſides, the Carthaginians carried on, by means of their caravans, an annual intercourſe with the Perſians, Garamantes, and Ethiopians; and brought from theſe remote nations, together with other rich commodities, carbuncles of ineſtimable value; which gems, from the plenty of them at Carthage, were called by the ancients Carchedonian or Carthaginian. We may add, that no profeſſion was more honourable than that of the merchant in the dominions of this ſtate; nor is this any wonder, when we conſider the numberleſs advantages that accrued from it. Herodotus (lib. iv.) mentions a ſingular mode of carrying on traffic between the Carthaginians and the Libyans, who bordered on the ſea-coaſts, beyond the ſtraits or pillars of Hercules. After they had run into ſome creek, they landed their goods, and leaving them expoſed on a point of land, returned on board their ſhips. They then cauſed a great ſmoke to be raiſed, at the ſight of which the Libyans came to the ſpot where the wares had been left, and laying down a quantity of gold, retired to a diſtance. The Carthaginians went on ſhore a ſecond time, and if the gold appeared to them ſufficient, they carried it off and ſailed without delay; if not, they remained quiet on board their ſhips for ſome time. The Libyans, finding they were not ſatisfied, made an addition to what they had before depoſited; and they continued increaſing the quantity of gold, till the Carthaginians were ſatisfied and the bargain made. Neither of theſe nations offered the leaſt injuſtice to the other. The Carthaginians did not touch the Libyan gold till it was of equal value with their wares; nor did the Libyans meddle with the Carthaginian merchandiſe till the gold they offered as an equivalent was accepted and taken away. A ſimilar mode of traffic ſeems to ſubſiſt among the Bedas of Ceylon. See BEDAS.

In order to ſketch out the hiſtory of the Carthaginians, as our limits will not admit of a minute detail, we ſhall diſtribute the duration of their ſtate, which, according to Appian, was 700 years, and which others make 746 years, but which we ſhall lay down, conformably to the teſtimony of Cato, ſanctioned by Solinus, at 737 years, into three diſtinct periods or epochas. The firſt commences with the foundation of Carthage, in the year 883 B. C. and extends to the invaſion of Sicily, in the year 480 B. C.; comprehending an interval of 403 years. The ſecond extends from this invaſion to the rupture with the Romans, in the year 264 B. C. or the commencement of the firſt Punic war, being an interval of 216 years. The third period laſted 118 years, during which the three Punic wars occurred; the firſt continued 24 years, from the year 264 B. C. to 241 B. C.; the ſecond continued 17 years, from the year 218 B. C. to 201 B. C.; and the third continued 4 years, from the year 149 B. C. to 146 B. C. when Carthage was deſtroyed.

The *firſt period*, according to the above diſtribution, is imperfectly known. We have already ſtated (ſee CARTHAGE) that Eliſa, known by the name of Dido, fled from Tyre in the 7th year of the reign of Pygmalion, king of that city, and landing on the coaſt of Africa, founded either the city of Carthage, or at leaſt the citadel of Byrſa. For 300 years after the tragical death of Dido, there is a chaſm in the hiſtory of the Carthaginian ſtate. During this period their whole attention ſeems to have been engaged in the extenſion of their commerce, and in forming eſtabliſhments, with this view, in various parts of the world. It appears that at a very early period this republic had made conſiderable acquiſitions in Sicily and Sardinia, and other places; and that it was formidable by ſea in the time of Cyrus and Cambyſes. This latter prince, in the 6th year of his reign, was obliged to abandon an expedition which he had projected againſt the Carthaginians, becauſe the Phœnicians would not ſuccour him; and hence it appears, that the whole naval power of the Perſian empire was unable to contend with that of Carthage, without the aſſiſtance of the Tyrians. In the year 508 B. C. the year after the regiſage, the Carthaginians concluded a treaty with the Romans, chiefly relating to navigation and commerce; and they were the firſt people out of Italy with whom the Romans entered into an alliance. From this treaty, which was ſigned 28 years before Xerxes invaded Greece, we learn, that the whole iſland of Sardinia, and part of that of Sicily, were then ſubject to the Carthaginians. At this time they were well acquainted with the coaſts of Italy; and they manifeſted on various occaſions a jealouſy of the enterpriſing ſpirit and growing power of the Romans; nor would they permit them to ſail beyond the promontory called the "Fair Promontory," lying to the north of Carthage, leſt they ſhould diſcover the fertility of the land, as well as the favourable ſituation of the cities, and be tempted to make a ſettlement. Under Mago, a Carthaginian general of conſummate abilities and merit, and who is ſaid to have firſt introduced military diſcipline among the ſoldiery, the dominions of Carthage were much enlarged, its commerce extended, its riches increaſed, and virtue alone was countenanced both in the army and the ſtate. He left the country in the moſt flouriſhing condition, and was ſucceeded in his high employments by his ſons Aſdrubal and Hamilcar. To them was committed the command of the army againſt Sardinia, which had revolted, and in the war that was proſecuted on this occaſion, Aſdrubal was mortally wounded. His death was much lamented by the Carthaginians. About this time the Carthaginians, determined to ſhake off the African yoke, by diſcontinuing the tribute which, by their original contract, they were obliged to pay, declared war; but being unſucceſsful, it was terminated by a treaty, the chief article of which required, that the tribute as at firſt impoſed upon them for the ground on which the city ſtood, ſhould be continued. In proceſs of time, however, the tribute was aboliſhed. It was about this time that Darius Hyſtaſpis, king of Perſia, ſent an embaſſy to Carthage, requiring the inhabitants to abſtain from human ſacrifices, and from eating dog's fleſh; to burn their dead, and not to bury them, as had been the uſual practice; and to furniſh him with a body of auxiliary forces to ſerve in the war which he had declared againſt Greece. With the laſt article the Carthaginians did not think proper to comply, becauſe their troops were otherwiſe engaged. Towards the cloſe of Darius's reign, it ſeems probable that an offenſive and defenſive league was formed betwixt theſe two powers; however, it is certain, that an alliance was entered into between Xerxes, the ſucceſſor of Darius, and the ſtates of Carthage: and that the Carthaginians engaged to invade Sicily with all their forces, and endeavour to drive the Greeks from thence, as well as the continent of Italy, whilſt that prince marched in perſon, with the whole ſtrength of the Perſian army, againſt Greece itſelf. The firſt ſettlement of the Carthaginians in Spain muſt have preceded the period of which we are now ſpeaking; and it is moſt probable that the nerves of their power were the mines of Spain, by which they were enabled to equip ſuch powerful fleets and collect ſuch formidable armies; and that, by their aſſiſtance, they made ſuch extenſive conqueſts in Sicily and Africa. But, though the firſt Carthaginian ſettlement in Spain muſt have preceded the reigns of Xerxes and Darius, and even that of Cyrus, and have occurred when the city of Gades, now Cadiz, was in its infancy, yet we learn from Livy and Polybius, that the greateſt part of Spain remained unſubdued till the wars of Hamilcar and Hannibal. Diodorus Siculus informs us, that the Carthaginians ſent a colony into the iſland Ebuſus, or Ereſus, now Yvica, 160 years after the foundation of their city; and it is highly probable, that about this time the Balearic iſlands, now called Majorca and Minorca, were likewiſe either planted or reduced by the ſame people, and that they were furniſhed by theſe iſlands with the moſt expert ſlingers in the world, who did them great ſervice in their battles and ſieges. See Baleares *Inſulæ*. To this period alſo it is reaſonable to refer the firſt deſcent of the Carthaginians in Spain. As Sardinia was in the poſſeſſion of the Carthaginians when they made their firſt treaty with the Romans, we are warranted in concluding that Corſica, ſeparated from the former by a ſtrait of about 3 leagues in breadth, was poſſeſſed by them, either wholly or in part, in very ancient times; and Herodotus expreſsly informs us, that the Cyrnians, or Corſicans, were one of thoſe nations which enabled the Carthaginians to form that great army, with which they invaded Sicily, in the days of Gelon.

After the concluſion of the treaty with Xerxes, already mentioned, the Carthaginians, in purſuance of their engagements, made great preparations for war againſt the Greeks of Sicily, both by ſea and land. This brings us to the *ſecond period* of the hiſtory of Carthage, which commenced with the year 481 B. C. The preparations for this expedition laſted 3 years, and large ſums of money were ſent by Xerxes from Perſia to aſſiſt the Carthaginians in completing them. When every thing was ready, Hamilcar, the ſon of Hanno, according to Herodotus, but of Mago, according to Juſtin, was appointed to the command; and he ſailed from Carthage with 300,000 men, compoſed of different nations, and a fleet of above 2000 ſhips of war, with 3000 tranſports, not doubting to make an entire conqueſt of Sicily in the firſt campaign, B. C. 480. Notwithſtanding an ominous diſaſter in the paſſage, by which the horſes and chariots of Hamilcar periſhed in a ſtorm, the general, on his arrival at Panormus, now Palermo, endeavoured to diſſipate the gloomy apprehenſions of his followers, by repreſenting the certainty of ſucceſs, and expreſſing his fear leſt the Sicilians, by reaſon of the ſtorm, would eſcape the danger that threatened them. Having laid ſiege to Himera, he was attacked by Gelon and Theron, the tyrants of Syracuſe and Agrigentum, with their united forces; and after a long and bloody conteſt, Hamilcar was ſlain, and the whole Carthaginian army either put to the ſword, or obliged to ſurrender at diſcretion. The Carthaginian fleet was likewiſe totally deſtroyed. The news of this defeat arrived at Carthage by one ſmall boat, the ſolitary remnant of their fleet; and produced lamentation and terror through the whole city. Such was the indignation which this diſaſter produced in the public mind againſt Hamilcar, that, notwithſtanding all his paſt ſervices, it was determined to make his family ſuffer; and therefore Giſco, his ſon, was baniſhed, and retiring to Selinus, he died there for want of neceſſaries. Gelon granted the Carthaginians peace on the following terms: that they ſhould pay two talents of ſilver towards defraying the expences of the war;—that they ſhould build two temples (one to Ceres and another to Proſerpine) where this treaty ſhould be depoſited, and at all times be expoſed to public view;—and that, for the future, they ſhould abſtain from human ſacrifices. From this time to the cloſe of the 92d, or beginning of the 93d olympiad, B. C. 409 or 408, the Carthaginians are ſcarcely mentioned in the Sicilian hiſtory; though during this interval they turned their arms againſt the Moors, Numidians, and other African nations, and greatly extended their frontiers in Africa; they alſo releaſed themſelves from the tribute which they had been accuſtomed to pay, and became abſolutely independent. They had likewiſe warm diſputes with the people of Cyrene, the capital of Cyrenaica, and after ſhedding much blood, accommodated their differences by the interpoſition of two brothers, called Philæni, who extended their territory, and conſented to be buried alive in the place fixed upon as their boundary. See Philæni. In the year B. C. 409, the Egeſtines, or Segeſtans, who had declared in favour of the Athenians, againſt the Syracuſans, dreading their reſentment, and being actually attacked by the people of Selinuntum, implored the aid of the Carthaginians; and for their more effectual ſuccour, Hannibal, one of the Suffetes, grandſon to Hamilcar, and ſon to Giſco, who had been exiled, was entruſted with the command of an army, conſiſting, as ſome ſay, of 200,000 foot and 4000 horſe, or, according to others, of about 100,000. Having captured Selinuntum, or Selinus, with circumſtances of peculiar barbarity, and alſo Himera, he returned to Carthage, laden with ſpoils, and was received with loud and joyful acclamations. The Carthaginians, elated with this ſucceſs, meditated the reduction of the whole iſland of Sicily; and in the year B.C. 406, they deputed Hannibal, aided, on account of his age and infirmities, by Imilcar, or Imilcon, the ſon of Hanno, with a large fleet and army, for this purpoſe. The campaign was opened with the ſiege of Agrigentum, which, after a vigorous reſiſtance, was taken and plundered, and laid in ruins. See AGRIGENTUM. Gela and Camarina ſhared the ſame fate. This war was terminated by a treaty with the tyrant Dionyſius; after which Imilcar, whoſe army had been much weakened by the caſualties of war, and by the plague, which had broke out in it, returned to Carthage, where this diſorder made dreadful havock, as it alſo did in other parts of Africa.

Dionyſius, having by the fore-mentioned treaty gained time for eſtabliſhing his authority at Syracuſe, began his preparations for renewing the war with the Carthaginians; and when he had fortified the city and completed his naval and military arrangements, he communicated his deſign to the Syracuſans, which was that of inſtantly attacking the Carthaginian territories, without a previous declaration of war. Accordingly in the year 397, B.C., he commenced hoſtilities, by abandoning to the fury of the populace the perſons and the poſſeſſions of the Carthaginians who reſided at Syracuſe, and traded on the faith of treaties. This example of perfidiouſneſs and barbarity was followed throughout the whole iſland of Sicily. Having thus begun, he diſpatched a herald to Carthage, with a meſſage to the ſenate and people, requiring them to withdraw their garriſons from all the Greek cities in Sicily, and threatening them, on refuſal, with treating all the Carthaginians that were found in them as enemies. This intelligence occaſioned a general alarm through the city, which the plague had already reduced to a very miſerable condition. But the Carthaginians, though alarmed, were not intimidated; nor did they loſe any time in preparing for defence, and in collecting an army, the command of which they conferred on Himilco. Dionyſius, without waiting for their reply, put his army in motion, and opened the campaign with the ſiege of Motya, which was the magazine of the Carthaginians in Sicily; and after a long and obſtinate reſiſtance, the city was taken by ſtorm, and all the inhabitants put to the ſword, thoſe excepted who took ſanctuary in the temples. Himilco, unable to prevent its capture, returned to Africa; but in the following year he was appointed one of the ſuffetes, and returned to Sicily with a far greater army than before. He landed at Panormus or Palermo, took ſeveral cities, and recovered Motya by force of arms. Animated by theſe ſucceſſes, and alſo by the capture of Meſſina, he advanced towards Syracuſe, with a deſign of beſieging it; marching his infantry by land, whilſt his fleet, under the command of Mago, ſailed along the coaſt. His army conſiſted, as ſome ſay, of 300,000 foot, and 3000 horſe, or as others ſay, 30,000 foot, and his fleet of 200 ſhips, and 500 barks. Whilſt he was making progreſs in the ſiege, a contagious diſtemper made dreadful havock among his troops. Dionyſius availed himſelf of this favourable opportunity for attacking the Carthaginian forces; whilſt moſt of the ſhips were either taken or burnt, great ſlaughter was committed in the Carthaginian camp; and Himilco, by a private capitulation with Dionyſius, and for the ſum of 300 talents (54,000l. according to ſome, or by another eſtimate 61,800l.) obtained permiſſion to depart in the night, with all the ſurviving citizens of Carthage, to Africa. The remainder of his army was left to the mercy of the conqueror. The Carthaginians received intelligence of this diſaſtrous event with inexpreſſible grief and conſternation; and Himilco, unable to ſurvive his misfortune, and bewailing his own fate and that of his country, put an end to his own life. The news of Dionyſius's ſucceſs induced the Africans to revolt from the Carthaginians, whom they naturally hated, and againſt whom they were now particularly incenſed for having ſaved only their own citizens, and for having left the confederates to the mercy of the enemy. Accordingly an army of 200,000 effective men was ſoon collected; and having taken Tunis in their march, they advanced towards Carthage; but, deſtitute of experienced commanders, and unaccuſtomed to military diſcipline, they were ſoon obliged to diſperſe, and Carthage was delivered from one of the moſt imminent dangers that ever threatened it. Notwithſtanding the great loſſes which the Carthaginians had ſuſtained in the courſe of this war, which laſted about five years, they could not forbear making new attempts upon the iſland of Sicily; and an army of 80,000 men was committed to the conduct of Mago. Although he gained many advantages, he found himſelf in an enemy's country, and diſtreſſed for want of proviſions, he thought it moſt prudent to conclude a treaty of peace with Dionyſius, and to return to Carthage. For nine years after this peace the Carthaginians ſeem to have enjoyed uninterrupted tranquillity; but in the ſecond year of the 99th olympiad, B. C. 383, Dionyſius, meditating a war againſt them, formed a project for improving his finances, that he might be enabled to carry it on with ſucceſs. The Carthaginians, appriſed of his intentions, ſtrengthened themſelves by alliances with their neighbours, and adopted all other neceſſary meaſures for ſelf-defence. After ſome alternate ſucceſſes and defeats, Mago, the Carthaginian general, and ſon of the former general, who loſt his life at the battle of Cabala, concluded a peace with Dionyſius upon condition of his ceding to the Carthaginians the city and territory of Selinus, as well as that part of the diſtrict of Agrigentum, bordering on the territory of Selinus, and extending as far as the river Halycus, and alſo of his paying them 1000 talents towards defraying the expences of the war. Between three and four years after the concluſion of this war, (B. C. 378,) Carthage ſuffered much from the plague, which ſwept away a very great number of its inhabitants. The Africans and Sardinians took the advantage of it, and made ſome attempts for throwing off a yoke which was hateful and grievous; but their efforts were ineffectual, and they were ſoon reduced to their former allegiance. Towards the beginning of the 103d olympiad (B. C. 368) Dionyſius, emboldened by the weakened ſtate of Carthage, formed an enterpriſe in Sicily, which was unſucceſsful and terminated in a truce; but he did not long ſurvive this event. This truce was changed by his ſon and ſucceſſor, Dionyſius II., into a perpetual peace. Soon after this time, A. U. C. 402, (B. C. 352) the Carthaginians concluded a ſecond treaty with the Romans, nearly of the ſame tenor with the firſt, excepting that the inhabitants of Tyre and Utica were expreſsly comprehended in it, and joined with the Carthaginians. After the death of the elder Dionyſius, Syracuſe was involved in great troubles; and Dionyſius, the reigning prince, was under a neceſſity of quitting his throne, and continuing 10 years in exile; but he was afterwards reſtored, and found means to reinſtate himſelf in his dominions. However, his temper was ſavage and brutal, and he exerciſed great cruelties among his ſubjects. This ſeemed a favourable opportunity for the Carthaginians to make themſelves abſolute maſters of Sicily; and accordingly they equipped a large fleet, and entered into an alliance with Icetas, tyrant of the Leontines, who had taken Syracuſe under his protection. The two powers engaged, by this treaty, to unite their forces in order to expel Dionyſius; and, after his expulſion, to divide Sicily between them. The Syracuſans, diſcovering this deſign, applied to the Corinthians for aſſiſtance; who ſent over Timoleon, a general of conſummate abilities, and an ardent friend to liberty, with a body of troops to their aſſiſtance. Accordingly, in the year B. C. 345, he ſet ſail from Corinth for Sicily with 10 ſhips and 1000 ſoldiers, and purſuing his voyage over the Ionian ſea, he arrived ſafely, with his ſmall fleet, at Metapontum, on the coaſt of Italy. From thence he advanced to Rhegium, where, by a happy ſtratagem, he eluded the vigilance of the Carthaginians, and landed his forces at Taurominium in Sicily. Timoleon, with his ſmall force, advanced boldly to the relief of Syracuſe; and made his way into one part of the town before the enemy had any notice of his approach. Here he defended himſelf with ſuch reſolution that he could not be diſlodged by the united powers of Icetas and the Carthaginians. Dionyſius, having ſurrendered the citadel to Timoleon, with all the forces, arms, and ammunition in it, eſcaped, by his aſſiſtance, to Corinth: and a diſſatisfaction having taken place among Mago's ſoldiers, in conſequence of an artful repreſentation made by the emiſſaries of the Corinthian general, that it was aſtoniſhing to ſee Greeks, who formed a great part of the Carthaginian army, uſing their endeavours to make barbarians maſters of Sicily, from whence they would, in a very little time, paſs over into Greece; Mago himſelf, wanting a pretence to retire, intimated that his forces were about to betray and deſert him, and, therefore, ſailed with his fleet out of the harbour, and ſteered for Carthage. Icetas could not maintain his poſition againſt the Corinthians; and thus they got poſſeſſion of the whole city. Mago, on his arrival at Carthage, was impeached; but he prevented the execution of the ſentence paſſed upon him, by a voluntary death. The Carthaginians, with a view of repairing the loſſes they had ſuſtained, levied new forces, and ſent to Sicily a greater and more powerful fleet than the former. It conſiſted of 200 ſhips of war, beſides 1000 tranſports; and the army amounted to upwards of 70,000 men. They landed at Lilybæum; and Timoleon, with 7000 men, marched out to meet them. Of the 4000 mercenaries, which compoſed his ſmall army, a thouſand deſerted upon the march to the river Crimeſus or Crimiſa, on the banks of which the enemies were encamped: and yet, with perfect confidence in the valour of his own ſoldiers, he was determined to hazard a battle. The event juſtified his expectation; the Carthaginians were completely routed; more than 10,000 fell on the field of battle, of whom 3000 were Carthaginian citizens, and 2500 formed what was called the ſacred cohort, ſo that this event filled their city with mourning and conſternation. Their camp was taken; and with it immenſe riches, and a great number of priſoners. This memorable battle was fought on the 27th day of the month Thargelion (June 13th) B. C. 340. It was followed with a treaty of peace, between Timoleon and the Carthaginians, which ſtipulated that all the Greek cities ſhould be declared free; that the river Halycus or Lycus ſhould be the boundary between the territories of both parties; that the natives of the cities ſubject to the Carthaginians ſhould be allowed to withdraw, if they pleaſed, to Syracuſe, or its dependencies, with their families and effects; and that Carthage ſhould not for the future afford any aſſiſtance to the remaining tyrants againſt the Syracuſans. It was about this time that Hanno, an opulent and powerful citizen of Carthage, formed a deſign of ſubverting the conſtitution, and introducing arbitrary power. With a view to the accompliſhment of this project, he propoſed to invite the ſenators to a grand feaſt made on occaſion of his daughter's marriage: and by mixing poiſon with wine to deſtroy them all; not doubting but ſuch a tragical event would at once make him maſter of the republic. The plot was diſcovered, but Hanno's intereſt in the city was ſo great, that the government could not venture to puniſh him, even for ſo execrable a crime. Hanno, finding that his firſt ſtratagem was defeated, had recourſe to arms, and collected together all his ſlaves for the execution of his purpoſe. This plot was alſo diſcovered. In order to avoid merited puniſhment, he retired with 20,000 armed ſlaves to a caſtle that was ſtrongly fortified, and from thence ſought the aſſiſtance of the Africans, and of the king of Mauritania; but when all his projects had failed, he was taken priſoner, and carried to Carthage; where, after being ſeverely ſcourged, his eyes were put out, his arms and thighs broken; and at laſt he was executed in the preſence of all the people, and his body was ſuſpended on a gibbet. His children and all his relations, though they had not participated his guilt, ſhared his puniſhment. They were all ſentenced to die, that not a ſingle perſon of his family might ſurvive, either to imitate his crime or to revenge his death. It was probably about this period, or ſomewhat later, that the Tyrians ſent ambaſſadors to Carthage, to implore aſſiſtance againſt Alexander, but being incapable of ſending them any ſuccour, they diſpatched 30 of their principal citizens to Tyre, to condole with them on this afflictive occaſion, and to expreſs their concern, that the bad ſituation of their own affairs would not permit them to ſpare any troops. The Carthaginians themſelves, when they heard of Alexander's progreſs in the Eaſt, began to entertain apprehenſions for their own ſafety; and deputed Hamilcar, or as Gellius ſays, Aſdrubal, ſurnamed Rhodanus, a perſon of wonderful addreſs and eloquence, to wait upon that prince; and having been introduced to him by means of Parmenio, he ſo far inſinuated himſelf into his favour, as to have the honour of attending him in all his future expeditions. Having obtained this degree of confidence with Alexander, he did ſignal ſervice to his country, by communicating many important diſcoveries relating to the conqueror's ſchemes. Although the treachery of this Carthaginian eſcaped the diſcovery, or even the ſuſpicion of Alexander, he was, after his return to his own country, notwithſtanding all his ſervices, conſidered as a betrayer of his country, and was accordingly put to death at Carthage, by a ſentence as barbarous as it was ungrateful. About the year 319 B. C. Agathocles, a Sicilian, of obſcure birth and low fortune, roſe into notice; and ſupported at firſt by the power of the Carthaginians, he invaded the ſovereignty of Syracuſe, and made himſelf tyrant over it. In the infancy of his power, the Carthaginians kept him within bounds, and Hamilcar, their chief, forced him to agree to a peace, which reſtored tranquillity to Sicily. But he ſoon infringed the ſtipulated articles of it, and declared war againſt the Carthaginians themſelves, who under the conduct of Hamilcar, obtained a ſignal victory over him, near Himera, in the year B. C. 310, and forced him to ſhut himſelf up in Syracuſe. The Carthaginians purſued him thither, and laid ſiege to that important city; and if they could have taken it, they would have gained poſſeſſion of all Sicily. Agathocles, finding himſelf deſerted by his allies from an abhorrence of his cruelties, formed a moſt daring, and to appearance, an impracticable ſcheme, of transferring the war to Africa, and inveſting Carthage, at a time when he himſelf was beſieged, and had only one city left in Sicily. His profound ſecreſy in the execution is no leſs aſtoniſhing than the deſign itſelf. Without imparting his ſcheme to any confidential friend, he merely declared that he had diſcovered an infallible method of reſcuing the Syracuſans from the dangers that ſurrounded them; that ſome inconvenience would attend a ſhort ſiege; but that thoſe who choſe to eſcape, might freely leave the city. Sixteen hundred perſons quitted it; and all ſlaves who were able to bear arms were ſet at liberty, and joined his forces. With a ſtock of 50 talents for the ſupply of his preſent wants he ſet ſail with two of his ſons, without informing either of his followers whither he intended to direct his courſe. The Carthaginians endeavoured to prevent the departure of the fleet, but Agathocles eluded their purſuit, and made his eſcape to the main ocean. When he arrived in Africa, he communicated to his troops the deſign of this expedition and the motives that had prompted him to undertake it. The ſoldiers heard his ſpeech with acclamations; flattered themſelves with the proſpect of ſucceſs; and thought that they were already maſters of Carthage. As he approached the city, the inhabitants were alarmed, and could not help imagining that their army before Syracuſe had been defeated and their fleet loſt. After ſome deliberation, they reſolved to arm the citizens; and with 40,000 foot, 1000 horſe, and 2000 armed chariots, under the command of Hanno and Bomilcar, they marched to meet the enemy, whoſe force conſiſted of 13 or 14,000 men. The battle was obſtinate and bloody; at length Hanno and the ſacred cohort, who long ſuſtained the fury of the Greeks, were overwhelmed with a ſhower of ſtones, and the general fell, ſword in hand; while Bomilcar proved treacherous, retired with the army under his command, and left the field to Agathocles.

After this defeat, the Carthaginians determined to recal Hamilcar from Sicily; accordingly he raiſed the ſiege of Syracuſe, withdrew his troops from the place, and ſent a detachment of 5000 men to reinforce the troops in Africa. Hamilcar and his remaining forces were attacked by the Syracuſans; upon which, being deſerted by his army, which before the engagement amounted to 120,000 foot, and 5,000 horſe, he was taken priſoner and carried into Syracuſe. In the mean while Agathocles, having gained ſeveral advantages in Africa, was preparing to beſiege Carthage itſelf; and advancing to the camp of the Carthaginians which covered the city, he communicated to them the diſtreſſing intelligence of the total deſtruction of their army in Sicily. This news filled them with conſternation, and Carthage itſelf would have been loſt, if an unexpected mutiny had not occurred in the camp of Agathocles, which proved almoſt fatal to the tyrant himſelf, and gave the Carthaginians an opportunity of rallying and recovering ſtrength. This was followed by an indeciſive battle betwixt Agathocles and the Carthaginians, who had ſent an army to puniſh and reclaim Numidia, which had revolted. During theſe tranſactions, Bomilcar, who poſſeſſed the firſt employment in the ſtate, attempted to effect a revolution at Carthage, and to obtain the ſovereignty of that city, to which he had long aſpired. A dreadful maſſacre was the means by which this revolution was to be accompliſhed; but as ſoon as it was known that Bomilcar was the cauſe of this diſturbance, and that he had cauſed himſelf to be proclaimed king of Carthage, the indignation of the people was rouſed; the traitor was apprehended, and executed on a croſs in the middle of the forum; and thus the Carthaginians were reſcued from the moſt dangerous domeſtic enemy their ſtate had ever produced. Agathocles finding himſelf at the head of a numerous army, aſſumed the title of king of Africa, and propoſed ſoon to complete his conqueſts in that country by the reduction of Carthage. But after having taken Utica, he was diverted from his further progreſs by a commotion in Sicily, which required his preſence. His ſon Archagathus, with whom he had entruſted the command in Africa, was for ſome time ſucceſsful in extending his conqueſts; his career of victory, however, was interrupted by ſome deciſive advantages gained on the part of the Carthaginians; and it became neceſſary to ſummon Agathocles from Sicily. Upon his arrival in Africa, he took the earlieſt opportunity that occurred of attacking the Carthaginian camp, but met with a total defeat. This diſaſter, together with ſome other unfavourable circumſtances that happened, induced Agathocles to quit Africa. After his departure his two ſons were aſſaſſinated by the ſoldiers, (B. C. 285.) who, chuſing leaders from among themſelves, concluded a peace with the Carthaginians, which was in the following year ratified by Agathocles. The Carthaginians by this peace had all the cities reſtored to them, which they had formerly poſſeſſed in Sicily, and deriving this advantage from the termination of the war, they left Agathocles at liberty to purſue his deſigns in Sicily. Urged by his implacable hatred to the Carthaginians he prepared for a new war; but this, and other projects which he had formed, were fruſtrated by his death, B. C. 283. In the year, B. C. 280, Pyrrhus, king of Epirus, turned his arms againſt Italy; but before he landed, the Romans renewed their treaties with the Carthaginians, with an additional engagement of mutual aſſiſtance, if either of the contracting powers ſhould be attacked by this prince. Accordingly the Carthaginians, as ſoon as they heard of Pyrrhus's deſcent in Italy, ſent a fleet of 120 ſail under the command of Mago; who, in an audience before the ſenate, ſignified the concern with which his principals had heard of the hoſtilities of Pyrrhus, and offered, in the name of his republic, a body of auxiliary troops to enable them to repel their foreign invader. The ſenate returned thanks for this obliging offer of the Carthaginians; but at the ſame time declined accepting it. Some days after this interview with the ſenate, Mago repaired to Pyrrhus, on pretence of offering the mediation of Carthage for terminating his quarrel with the Romans; but the real motive of this viſit was to diſcover, if poſſible, what were his deſigns with regard to Sicily, which common fame reported he was going to invade. The Syracuſans, indeed, who had been for ſome time beſieged by the Carthaginians, had ſent preſſing intreaties for ſuccour to Pyrrhus. Accordingly he at laſt ſailed from Tarentum, paſſed the ſtrait, and arrived in Sicily. His conqueſts were at firſt ſo rapid, that he left the Carthaginians, in the whole iſland, only the ſingle town of Lilybæum. To this he laid ſiege, but finding a vigorous reſiſtance, and being ſummoned back to Italy, he gave up his deſign. Upon his departure, Sicily immediately returned to its former maſters; ſo that he loſt the iſland with the ſame rapidity that he gained it. As he was embarking, turning his eyes back to Sicily, he exclaimed, "what a fine field of battle do we leave to the Carthaginians and Romans!" and his prediction was ſoon verified. After his departure, Hiero was appointed prætor of Syracuſe and general of the Syracuſan army. Under his command, they obtained ſeveral advantages over the Carthaginians, and in a ſhort time became formidable to that republic. It was not long, however, before the Romans, who were extending their views beyond the boundaries of Italy, formed a reſolution of eſtabliſhing themſelves in Sicily; and this ſoon occaſioned a rupture between them and the Carthaginians, which was followed by the firſt Punic war:

and with this commences the *third period* in the hiſtory of Carthage.

The *firſt Punic war* commenced in the year, B. C. 264, and it aroſe from the following circumſtances. Some Campanian ſoldiers, who had belonged to the army of Agathocles, were kindly received at Meſſina, as they were leaving Sicily and embarking for their own country. But with an atrocious ingratitude and perfidy, they took occaſion, in the night, either to expel or aſſaſſinate all the men; after which they married their wives, ſeized their effects, and remained ſole maſters of that important city. After they had divided the land and riches of the inhabitants among themſelves, they called the city Mamertina, and aſſumed the name of Mamertini, that is, a martial or warlike people, from *Mamers*, a word which, in their language, ſignified *Mars*, the god of war. In imitation of their conduct, and by their aſſiſtance, a Roman legion treated in the ſame cruel manner the city of Rhegium, which lay directly oppoſite to Meſſina, on the other ſide of the ſtrait. Theſe two perfidious cities, concurring and mutually ſupporting each other, became formidable to their neighbours. Meſſina, in particular, being very powerful, gave great umbrage and uneaſineſs both to the Syracuſans and Carthaginians, who poſſeſſed one part of Sicily. The Romans, after the departure of Pyrrhus, determined to puniſh the revolters at Rhegium; and for this purpoſe they took the city, killed moſt of the inhabitants in the attack, and carried about 300, who ſurvived, to Rome, where they were ſcourged, and publicly beheaded in the forum. By this ſanguinary execution the Romans wiſhed to teſtify to their allies their own innocence and integrity. Rhegium was then reſtored to its lawful poſſeſſors. The Mamertines were thus conſiderably weakened; and while they were concerting means for their own ſafety, they diſagreed among themſelves, ſo that one party ſurrendered the citadel to the Carthaginians, and the other called the Romans to their aſſiſtance and reſolved to put them in poſſeſſion of their city. Thus commenced the firſt Punic war. Although the Roman ſenate declined to take part with the Mamertines, who had acted a treacherous and cruel part; the people were leſs ſcrupulous, and determined to aſſiſt them. With this view the conſul Appius Claudius croſſed the ſtrait with his army, and contrived to elude the vigilance of the Carthaginian general. The Carthaginians, partly by art and partly by force, were driven out of the citadel, and the city immediately ſurrendered to the conſul. The Carthaginians, having executed their general, prepared to beſiege the town with all their forces, which were alſo joined by thoſe of Hiero. The conſul, however, defeated them ſeparately, and having raiſed the ſiege, laid waſte the country. This was the firſt expedition, which the Romans made out of Italy. Hiero afterwards entered into an alliance with the Romans, which the Carthaginians were unable to prevent. The Carthaginians, thus deſerted by their ally, determined to make every poſſible effort for driving the Romans out of Sicily; but theſe efforts were ſo far from being effectual, that they loſt ſeveral towns, and particularly Agrigentum, which Hanno, commander in chief of all the Carthaginian forces, had made a place of arms, and his principal magazine. Notwithſtanding theſe acquiſitions, the Romans were well apprized, that as long as the Carthaginians retained the dominion of the ſea, it would not be in their power to drive them out of Sicily; and, therefore, they now formed the firſt deſign of having a fleet, and of diſputing with the Carthaginians the empire of the ſea. At this time they had not a ſingle veſſel, which they could call their own; but though they were deſtitute of experience in maritime affairs, they applied to them with ſuch ardour and induſtry, that in two months they built 100 five-oared, and 20 three-oared gallies; and after ſome time ſpent in exerciſing the rowers, their fleet put to ſea, under the command of the conſul Duilius, and ſailed in queſt of the enemy. The Romans coming up with the Carthaginians near the coaſt of Mylæ, prepared for an engagement; and availing themſelves of a grappling inſtrument, called *Corvus* or crow, they were able to board the enemies' ſhips and to come to a cloſe fight. The Carthaginian fleet conſiſted of 130 ſail, under the command of Hannibal. At firſt the Carthaginians deſpiſed their enemies; but when they ſaw the abovementioned engines raiſed on the prow of every one of their ſhips, and found that they were thrown forcibly into their veſſels ſo as to grapple them in ſpite of all reſiſtance, they were not a little aſtoniſhed. Being thus compelled to fight as if they had been on land, they were unable to ſuſtain the attack of the Roman veſſels, which produced a great ſlaughter among the Carthaginians, and the loſs of 80 veſſels. This unexpected victory raiſed the ſpirits of the Romans; and extraordinary honours were conferred on Duilius, as the firſt Roman to whom a naval triumph was decreed. After ſeveral maritime conflicts, in which ſometimes the Romans and ſometimes the Carthaginians were victorious, the advantage upon the whole was on the ſide of the former. Determined, however, to combat the Carthaginians in their own country, they both prepared for a deciſive engagement. The Roman fleet, conſiſting of 330 gallies, on board of which were about 140,000 men, was commanded by the conſuls L. Manlius Vulſo and C. Attilius Regulus, and rendezvouſed at Meſſina; and the Carthaginian ſquadron, compoſed of 350 ſail, and about 150,000 men, and commanded by Hanno and Hamilcar, after aſſembling at Lilybæum, took their ſtation at Heraclea Minoa. The two fleets at length came within view of each other, and made the neceſſary diſpoſitions for battle. The Roman ſquadron conſiſted of four diviſions; the firſt of which was ſtationed on the right and the ſecond on the left, and the third in the rear of the other two, ſo as to form a triangle, the vertex of which was compoſed of the two admiral gallies, in which were the conſuls, placed in the front of their reſpective ſquadrons. The triarians, forming the 4th diviſion, were drawn up in the rear of the whole fleet, parallel to the third diviſion, the baſe of the fore-mentioned triangle, but extending beyond the two angles. The tranſports, with the horſe and baggage on board, lay between the third diviſion and the triarians, this being the ſituation in which they would be moſt ſecure from any attacks of the enemy. The Carthaginians, having perceived the diſpoſition of the Roman ſquadron, immediately ranged their own in order of battle. They divided it into four ſmaller ſquadrons, which they drew up in one line. The three firſt diviſions, poſted to the right, ſtretched far into the ſea, as if they intended to ſurround the Romans, pointing their prows directly upon them; the 4th lying to the left, kept cloſe under ſhore, being diſpoſed in the form of an outwork or tenaille. Hanno commanded on the right, and Hamilcar on the left. In this action, which was conducted on both ſides with great ſkill and valour, the Romans loſt 24 gallies: but the Carthaginians, who were entirely defeated, had 30 ſunk, and 63 taken by the victors. After this battle, which happened near Heraclea Minoa, Hamilcar made propoſals of peace to the Romans, chiefly with a view of diverting them from the African expedition; but the Romans, rejecting the propoſal, carried on the war; and the conſuls, ſoon after ſailing for Africa, with their whole fleet, and a powerful army on board, landed at Clypea without oppoſition. Regulus with the forces under his command committed great ravages along the ſea-coaſts, and even penetrated into the heart of the country. Having laid ſiege to Adis, or Adda, a fortreſs of great conſequence to Carthage, the Carthaginians advanced to meet him; an encounter enſued, and the Carthaginians were defeated, with the loſs of 17,000 men, and 18 elephants. Regulus, after this action, burnt all the open places, and, as Eutropius informs us, conquered 73 towns. Utica and Tunis were both obliged to ſubmit, and nothing ſeemed now to remain but the ſiege of Carthage itſelf. To complete the misfortunes of the Carthaginians, the Numidians entered the territories of Carthage and committed ſuch dreadful devaſtations, that a famine ſeemed to be inevitable. The African nations likewiſe, more immediately ſubject to Carthage, being weary of the Carthaginian yoke, joined the Romans. Regulus, well knowing the diſtreſſed ſituation of the Carthaginians, offered to negociate a peace; but his terms were ſo humiliating, that the Carthaginians reſolved to ſuffer any extremities rather than ſubmit. Regulus and the Romans were become inſufferably arrogant, in conſequence of their ſucceſs; and after having deſolated the country, had advanced to the great moraſs, on which Carthage ſtood, reſolving, upon the rejection of his propoſals, to attack the capital of the African republic. At this moment of alarm and danger, Xantippus, a Lacedæmonian of great bravery and military ſkill, with a body of Greek mercenaries, arrived at Carthage. Having aſſumed the command of the Carthaginian forces, he taught them to form all the evolutions and movements of the military art, according to the Lacedæmonian manner. The Carthaginians, thus inſtructed and inſpirited, thought themſelves invincible under the conduct of Xantippus, who drew them up in order of battle in a large plain before the city, and boldly advanced towards the Romans. After calling a council of war, in deference to the Carthaginian commanders, it was reſolved to give the enemy battle on the following day. Regulus was become vain and ſelf-confident, and by his miſconduct occaſioned the total ruin of his army. Xantippus availed himſelf of the error which he committed, and either put to the ſword, or took priſoners, all, except 2000 men, who broke his right wing and made their eſcape to Clypea. Of the Carthaginians 800 were ſlain; and on the ſide of the Romans the number of thoſe who fell in the battle and purſuit muſt have been about 13,000. Xantippus took Regulus himſelf, and 500 of his men, priſoners in the purſuit, and immediately carried them to Carthage, where all, except Regulus, were treated with great humanity. Regulus had in his proſperity ſo inſulted the Carthaginians, that he is ſaid to have been confined in a dungeon, with ſuſtenance barely ſufficient to keep him alive, and a huge elephant, at the ſight of which animal he was always greatly terrified, was conſtantly placed near him. On this occaſion the Carthaginian army did not conſiſt of above 16,000 men, beſides the elephants; and therefore, conſidering the number and valour of the Roman legions, this was a wonderful victory, and juſtly attributed to the conduct and bravery of Xantippus. This battle was fought in the year, B. C. 256. The Romans were not diſcouraged; but in the following campaign they put to ſea with 360 veſſels, and in an engagement with the Carthaginians, who met them with 200, proved victorious, took 114 ſhips and ſailed to Africa in order to bring away the ſmall remnant of the army of Regulus. The Romans afterwards ſuſtained, by ſtorms and other occurrences, ſuch prodigious loſſes at ſea, that they entertained thoughts of declining all preparations for the future againſt the Carthaginians, and to leave them maſters of the ocean. However they were encouraged to renew their attention to maritime operations by ſome ſubſequent events of a more favourable kind; and arriving in Sicily with a fleet of 200 ſhips, they formed the bold deſign of beſieging Lilybæum, the ſtrongeſt town poſſeſſed by the Carthaginians on that iſland, the loſs of which would be attended with that of every part of it, and open to the Romans a free paſſage into Africa. In the proſecution of this ſiege the Romans encountered many loſſes and diſaſters, and were at length reduced to the neceſſity of turning the ſiege into a blockade, and of drawing a line round the place, to prevent the garriſon from receiving any ſuccours. The beſieged, on the other hand, repaired their works and determined to defend the town to the laſt extremity.

In the year B. C. 249, the conſul Claudius put to ſea with a powerful fleet in order to ſurpriſe Drepanum; but he was vanquiſhed by Adherbal, a Carthaginian admiral of great conduct and bravery. Claudius, with 30 veſſels, eſcaped out of the engagement to the camp at Lilybæum, with intelligence of this defeat; which was the greateſt ever ſuſtained by the Romans at ſea ſince the commencement of this war. In the conſulate of Lutatius Catulus and A. Poſthumius, B. C. 242, the Romans equipped a fleet of 200 veſſels, at the expence of private perſons; and the command was given to Lutatius. As the Carthaginian fleet had retired to Africa, the conſul ſeized all the advantageous poſts in the neighbourhood of Lilybæum, and prepared for an engagement, which he knew to be inevitable, by exerciſing his ſoldiers and ſeamen at ſea. As ſoon as he was informed that the Carthaginian fleet drew near, under the command of Hanno, he aſſembled all his beſt forces and ſailed for the ſmall iſland Œguſa, which lay near Eryx, whither Hanno propoſed to have repaired in order to obtain a ſupply for his army, and to reinforce his troops. The engagement commenced with great advantage on the ſide of the Romans, as their veſſels were much better equipped and manned than thoſe of the Carthaginians. They were, therefore, unable to ſuſtain the firſt attack. Forty of their veſſels were ſunk, and ſeventy taken with their whole crews. The reſt, favoured by a wind, which roſe very ſeaſonably for them, made the beſt of their way to Hiera, the little iſland, oppoſite to Drepanum, from which they had ſailed. There were upwards of 10,000 taken priſoners. Lutatius then advanced to the city of Eryx, where he engaged the Carthaginians, and cut off 2000 men. This laſt action concluded the operations of the firſt Punic war, in the year B. C. 241, after it had continued twenty-four years, and was followed by a peace, the terms of which were dictated by the victorious conſul. The treaty, though it adjuſts the intereſts both by ſea and land of two powerful republics and their allies, is compriſed in a ſmall compaſs, and very clearly and accurately expreſſed. "There ſhall be peace between Rome and Carthage (in caſe the Roman people approve of it) on the following conditions: the Carthaginians ſhall evacuate entirely all Sicily; and ſhall no longer make war upon Hiero, the Syracuſans, or their allies; they ſhall reſtore to the Romans, without ranſom, all the priſoners which they have taken from them; and pay them, within twenty years, 2200 Euboic talents of ſilver;" amounting to 515,000*l.* ſterling. When theſe conditions were brought to Rome, the people, diſapproving them, ſent ten commiſſioners to Sicily, to terminate the affair. Theſe made no alteration as to the ſubſtance of the treaty; but required that the time appointed for the payment of the ſum demanded ſhould be reduced to ten years; that 1000 additional talents ſhould be paid immediately; and that the

Carthaginians ſhould depart out of all the iſlands, ſituate between Italy and Sicily.

Soon after the concluſion of the war waged by the Carthaginians againſt the Romans, they were under a neceſſity of commencing another with their mercenary troops, who had ſerved under them in Sicily ; which has been commonly called the African or Libyan war. It was principally occaſioned by a neglect on the part of the Carthaginians in ſettling the arrears of their pay, or fulfilling the promiſes made to them by Hanno ; and although it laſted only three years and four months, terminating in the year, B. C. 238, it was uncommonly barbarous and bloody. Hanno, who was employed to negociate with them at Sicca, whither they had been compelled to retire, imprudently propoſed, that they ſhould be content with receiving only a part of the arrears due to them, and remit the remainder on account of the preſſing exigencies of the republic. This propoſal was heard with diſſatisfaction and murmur, which terminated in open rebellion. Accordingly about 20,000 of them marched towards Carthage, and encamped at Tunis, not far from that metropolis. No conceſſions now ſatisfied them ; but the ſeeming condeſcenſion of the Carthaginians was aſcribed to weakneſs and timidity. At length the ſettlement of this buſineſs was referred to ſome general of their own choice ; and as they ſelected Giſco, for whom they profeſſed great reſpect, he was employed to mediate between the contending parties. This general addreſſed them in mild and ſoothing language ; recalled to their memories the long time they had been in the Carthaginian ſervice, as well as the conſiderable ſums they had received from the republic ; and granted almoſt all their demands. When the treaty was almoſt concluded, two mutineers occaſioned a tumult in every part of the camp. Theſe were appointed chiefs of the furious multitude ; Giſco's tent was plundered of the money deſigned for the payment of the forces ; and the general himſelf, with his attendants, were dragged to priſon and treated with great indignity. All the cities of Africa, which they had ſolicited to join them in the recovery of their liberty, united with them ; except Utica and Hippacra, which they beſieged. Carthage had never been before this time in circumſtances ſo diſtreſſed and perilous. Every thing ſeemed to conſpire to its ruin. The citizens drew their ſubſiſtence from the rents or revenues of their lands, and the public expences from the tribute paid from Africa ; of which they were not only deprived at once, but it was employed againſt them. They were alſo deſtitute of arms and forces either for ſea or land ; they had made no preparations for ſuſtaining a ſiege, or equipping a fleet ; and, to complete their misfortunes, they had not the leaſt proſpect of receiving aſſiſtance from any foreign friend or ally. At the ſame time they had reaſon to reproach themſelves for numerous inſtances of oppreſſion and cruelty in their conduct towards the African nations. The Africans were therefore eaſily prevailed upon to engage in this rebellion ; and the women, whoſe huſbands and fathers had been dragged to priſon for non-payment of heavy tributes, were more exaſperated than the men, and were eager to deliver up all their ornaments towards the expences of the war. The Carthaginians, however, though deeply diſtreſſed, did not deſpond ; but exerted themſelves in levying troops and fitting out ſhips, the command of which was intruſted with Hanno. The army of the rebels had increaſed to 70,000 men, and whilſt they were beſieging the two cities already mentioned, their camp was pitched at Tunis, and Carthage was held in a kind of blockade. Hanno's firſt object was the relief of Utica ; but on account of ſeveral errors with which he was chargeable in the conduct of this buſineſs, he was ſuperſeded by Hamilcar Barcas. Hamilcar having obliged the rebels to raiſe the ſiege of Utica, marched againſt their main army, defeated part of it, and ſeized almoſt all their advantageous poſts. Being afterwards joined by a young Numidian nobleman, named Naravaſus, with 2000 of his countrymen, he fell upon the rebels, killed 10,000 of them, and took 4000 priſoners. Thoſe who ſurvived were treated with ſingular lenity. Spondius, the chief of the rebels, with a view of counteracting this clemency and preventing a deſertion among his troops, engaged them in a ſervice which would deprive them of all hopes of being reunited to the enemy ; and this was no other than the murder of Giſco, and about 700 of his comrades, who had been confined with him in priſon. The rebels alſo reſolved to treat all ſuch Carthaginians, who ſhould fall into their hands, in the ſame barbarous manner. Several circumſtances occurred at this time that ſerved to diſpirit the Carthaginians ; one of which was the revolt of Utica and Hippacra, the only cities which had uniformly preſerved their allegiance, and always adhered inviolably to the republic, even when Agathocles and the Romans had made their deſcents in Africa. A diviſion alſo took place among their generals, and Hannibal was deputed to ſuperſede Hanno. After Hannibal's arrival in the camp, the affairs of the Carthaginians took a favourable turn ; Hiero, king of Syracuſe, afforded them aſſiſtance ; and in a battle with the rebels, diſtreſſed by famine, and deprived of their chiefs who had been ſeized, 40,000 of them were cut to pieces. The conſequence of this victory was the reduction of almoſt all the cities of Africa, which immediately returned to their allegiance. Hamilcar, without loſs of time, marched againſt Tunis, which, ever ſince the beginning of the war, had been the aſylum of the rebels and their place of arms ; and Hannibal joined him in beſieging it. In order to ſtrike terror into the enemy, croſſes were ſet up near the walls, and Spondius was hung on one of them, and his companions who had been taken with him, on the reſt, and thus they all expired. Matho, the other chief of the rebels, who commanded in the city, ſaw what he had to expect, and became deſperate in his own defence. Perceiving Hannibal off his guard, through confidence of ſucceſs, he made a ſally, attacked his quarters, killed many of his men, took ſeveral priſoners, among whom was Hannibal himſelf, and plundered his camp. He then placed Hannibal on the croſs, in the room of Spondius, after having firſt made him to endure inexpreſſible torments, and ſacrificed around the body of Spondius, thirty citizens of the firſt quality in Carthage, as ſo many victims of his vengeance. When the news of this event reached Carthage, it cauſed great conſternation, and it was thought adviſable to make one grand effort. Accordingly, all the young perſons capable of bearing arms were preſſed into the ſervice. Hanno was ſent to join Hamilcar ; and thirty ſenators were deputed to conjure thoſe generals to forget paſt quarrels, and to ſacrifice their reſentments to their country's welfare. Their interpoſition was effectual ; the generals were reconciled ; and from this time the Carthaginians were ſucceſsful in all the meaſures which they adopted. Matho was eager to hazard a battle ; and when an engagement took place, victory did not long remain doubtful. The rebels gave way, the Africans were almoſt all ſlain, and the reſt ſurrendered. Matho was taken alive, and carried to Carthage, where he and his ſoldiers, after having adorned the public triumph, were led to execution, and finiſhed, by a painful and ignominious death, a life that had been polluted with the blackeſt treaſons, and unparalleled barbarities. From the exceſſes of cruelty committed in it, Polybius informs us, that this war was generally diſtinguiſhed among the Greeks by the name of the "Inexpiable war." During the Libyan war, the mercenaries in Sardinia declared againſt the Carthaginians, excited by the example of Matho and Spondius in Africa. They ſeized upon the perſon of Boſtar, who commanded in the citadel of Olbia, and maſſacred both him and the Carthaginian garriſon. The ſenate, appriſed of this revolt, ſent Hanno, with a ſtrong reinforcement of troops, to bring the mutineers to reaſon; but Hanno, on his arrival, was abandoned by his men who joined the mercenaries, and not only crucified their leader, but put to the ſword all the Carthaginians, whom they could find in the iſland. They then beſieged all the cities one after another, and ſoon gained poſſeſſion of the whole country. Feuds, however, ariſing between them and the natives, the mercenaries were driven entirely out of the iſland, and took ſanctuary in Italy. Thus the Carthaginians loſt Sardinia, which was to them an iſland of great importance, an account of its extent, its fertility, and the great number of its inhabitants. The Sardinian war began in the year 234 B. C. and continued three years.

The Romans ever ſince their treaty with the Carthaginians, had behaved towards them with great juſtice and moderation; and yet, notwithſtanding their profeſſions of friendſhip, they countenanced and protected the fugitive mercenaries. They ſent the conſul Sempronius, on trivial pretences, with a fleet, to reinſtate the malcontents, and take poſſeſſion of Sardinia, which the Carthaginians were obliged to cede. They alſo obliged the Carthaginians to defray the expence of their armament, and, beſides, extorted from them the ſum of 1200 talents. Such perfidious conduct could not fail of heightening the averſion Hamilcar had already conceived, and did not a little contribute to the ſecond Punic war, and to thoſe dreadful devaſtations which Hannibal afterwards committed in Italy.

Hamilcar, by the happy concluſion of the Libyan war, not only reſtored tranquillity to the republic, but greatly extended the conqueſts of the Carthaginians in Africa. But as his country was not in a condition to commence an immediate war with Rome, he determined, by a new plan of operations, to place it upon a level with the imperious republic; and with this view to make an entire conqueſt of Spain, that the Carthaginians might have troops capable of oppoſing the Romans. For this purpoſe Hamilcar inſpired both his ſon-in-law Aſdrubal and his ſon Hannibal with an implacable averſion to the Romans, as the inveterate enemies both of his grandeur and that of his country. Immediately after the troubles in Africa were appeaſed, the ſenate ſent Hamilcar on an expedition againſt the Numidians, in which he conducted himſelf with ſuch a degree of ſkill and valour, and alſo with ſuch ſucceſs, that he was veſted with the command of the army deſtined againſt Spain. His ſon Hannibal, although at this time only nine years of age, importuned his father for permiſſion to accompany him on this occaſion; and Hamilcar having granted his requeſt, previouſly ordered him to put his hand on the altar, and to ſwear, that he would be an irreconcileable enemy to the Romans, and act as ſuch when his age allowed. He likewiſe took with him Aſdrubal, after he had beſtowed his daughter in marriage upon that general.

As ſoon as the military preparations were completed, Hamilcar advanced with a powerful army to Abyla, and croſſing the ſtraits of Hercules, landed in Spain without oppoſition. He commanded in this country during nine years, in that interval ſubdued many warlike nations, and acquired an immenſe treaſure, which he wiſely diſtributed, partly among his troops, and partly among the great men at Carthage; thus ſecuring his intereſt with both theſe powerful bodies. At length, in a battle with the Vettones, or Vectones, a nation of Luſitania, he fell on the field, and died gloriouſly, as Polybius ſays, at the head of his troops, in the year B. C. 228. Upon Hamilcar's death, the army elected his ſon-in-law Aſdrubal, then the Carthaginian admiral, to ſucceed him in the command. The choice was confirmed by the ſenate; and it was amply juſtified by his ſubſequent conduct, though Hanno and his adherents affected to depreciate his merit. He built, or at leaſt fortified, New Carthage. See CARTHAGENA. The Romans, alarmed by the great progreſs which Aſdrubal was making in Spain, prevailed upon him, partly by menaces, and partly by perſuaſion, to conclude a new treaty with them, importing, that the Carthaginians ſhould not paſs the Iberus, and that Saguntum, a colony of Zacynthians, and a city between the Iberus, and that part of Spain, ſubject to the Carthaginians, as well as the other Greek colonies, ſhould enjoy their ancient rights and privileges. Aſdrubal did not paſs beyond the limits ſtipulated by the treaty, though he ſtill puſhed on his conqueſts, and ſubdued all that part of Spain extending from the weſtern ocean to the Iberus, within five days' journey of the Pyrenées. His engaging addreſs and affable deportment made him popular among the Reguli of Spain, and brought them over to the intereſt of Carthage. Having governed the Carthaginian dominions in Spain eight years, he was treacherouſly murdered by a Gaul, whoſe maſter he had put to death, B. C. 220. Three years before his death, Aſdrubal had written to Carthage, requeſting that Hannibal, who was then in the 24th year of his age, might be ſent to him; and on his firſt arrival in the camp, he manifeſted indications of extraordinary courage and greatneſs of mind, and intereſted the attachment of the whole army. Under Aſdrubal he made three campaigns, and was always employed in enterpriſes of the greateſt importance; and after his death, the army immediately ſaluted him general. At this time (viz. 220, B. C.) he was in the twenty-ſeventh year of his age, admitting (See Blair's tables) that he was born in the year 247 B. C. The ſenate, as well as the people of Carthage, confirmed this election, although Hanno and his faction were ſecretly averſe from his promotion. As ſoon as he aſſumed the command, he commenced a plan of operations, which all the officers approved. He began his career with marching againſt the Olcades, who were ſeated near the Iberus, and having reduced Althæa, their capital, their other towns immediately ſubmitted. With the opening of the next campaign he ſubdued the Vaccæi, and prepared to meet an army of 100,000 men, collected by the Carpetani, one of the moſt powerful nations in Spain, who had been induced to declare war againſt the Carthaginians. Having routed this formidable army, he deſolated the whole country of the Carpetani, who thought proper to ſubmit to the conqueror. His next object was the ſiege of Saguntum, and as the inhabitants had applied to the Romans for aſſiſtance, he made a vigorous effort for reducing the place before they could take any ſtep towards its relief. The progreſs of this ſiege was retarded by the valiant reſiſtance of the Saguntines, who, by their repeated ſallies, deſtroyed many of the beſiegers; though they were hardly ſenſible of their loſs, as Hannibal's army conſiſted of 150,000 foot, and 20,000 horſe. The fate of the city, however, was for ſome time reſpited, by a wound which Hannibal received as he was reconnoitring ſome of the works. As ſoon as he recovered, hoſtilities recommenced, after a ſhort ceſſation, with double fury; but the Saguntines, irritated by deſpair, at length forced the Carthaginians not only to abandon the breach they had made in the wall of the city, but to take refuge in their camp. After this repulſe, Hannibal remained for ſome days in a ſtate of inaction; but having inſpired his troops with courage and promiſed them great rewards from the plunder of the place, they made a vigorous attack, whilſt he placed himſelf on the top of a tower, which overlooked the works of the beſieged and the whole city. At laſt the Saguntines, having defended themſelves with an almoſt invincible valour and obſtinacy, found themſelves reduced by want of proviſions to the greateſt extremities, and to increaſe their diſtreſs, the Romans ſeemed to have entirely deſerted them. In this ſtate of deſpair, the ſenators brought all their gold, ſilver, and precious effects into the market place, and cauſing a great fire to be kindled threw their treaſure and themſelves into the flame. At this time a tower, which had been battered by Hannibal's rams, falling with a dreadful craſh, the Carthaginians entered the town by the breach, ſoon made themſelves maſters of it and the citadel, and cut to pieces all the inhabitants who were able to bear arms. The reduction of Saguntum, after a ſiege of eight months, took place in the year B. C. 219.

The capture of Saguntum has by ſome been repreſented as the cauſe of the *ſecond Punic war*, which commenced in the year B. C. 218. But Polybius affirms this to have been a very miſtaken notion. The regret of the Carthaginians, for their having ſo tamely given up Sicily, by the treaty which terminated the firſt Punic war; the injuſtice and violence of the Romans, who took advantage from the troubles excited in Africa, to diſpoſſeſs the Carthaginians in Sardinia, and to impoſe a new tribute on them; and the ſucceſs and conqueſts of the latter in Spain, were the true cauſes of the violation of the treaty, as Livy (agreeing with Polybius) inſinuates, in few words, in the beginning of his hiſtory of the ſecond Punic war.

When the news of the reduction of Saguntum arrived at Rome, it occaſioned inexpreſſible grief and conſternation. As ſoon as the Romans were able to reſtrain or ſuppreſs the firſt emotions occaſioned by this humiliating and diſtreſſing intelligence, an aſſembly of the people was convened, and war againſt the Carthaginians was unanimouſly decreed. That no ceremony might be wanting, deputies were ſent to Carthage, to inquire whether Saguntum had been beſieged by order of the republic, and if ſo, to declare war; or in caſe this ſiege had been undertaken ſolely by the authority of Hannibal, to require that he ſhould be delivered up to the Romans. The deputies perceiving that the ſenate gave no direct anſwer to their demands, one of them taking up the folded lappet of his robe, "I bring here," ſays he in a haughty tone, "either peace or war; the choice is left to yourſelves." The ſenate anſwering that they left the choice to him: "I give you war then," ſays he, unfolding his robe. "And we," replied the Carthaginians, with the ſame haughtineſs, "as heartily accept it, and are reſolved to proſecute it with the ſame cheerfulneſs."

When war was reſolved upon and proclaimed on both ſides, Hannibal, who, after the reduction of Saguntum, had put his troops into winter-quarters at New Carthage, and who remained during the winter in a ſtate of inaction, made ſeveral wiſe regulations for the ſecurity of the Carthaginian dominions in Spain and Africa. With this view he marched the forces out of the one into the other, ſo that the Africans ſerved in Spain and the Spaniards in Africa. The command of the Spaniſh forces was entruſted by Hannibal with his brother Aſdrubal, with a fleet of about 60 ſhips to guard the coaſts; and he alſo gave him the wiſeſt counſel for the direction of his conduct. Before Hannibal himſelf ſet out for his expedition, he went to Gades or Cadiz to diſcharge the vows which he had made to Hercules, and to engage himſelf by new vows, in order to obtain ſucceſs in the war upon which he was entering.

Having made every neceſſary preparation for his march, he left his winter-quarters at New Carthage early in the ſpring, with an army conſiſting of above 100,000 men, of whom 12,000 were horſe, and about 40 elephants. Here he is ſaid to have been encouraged by dreams and omens to proſecute his enterpriſe. He paſſed the Iberus without obſtruction, and ſoon ſubdued the ſeveral nations which oppoſed him in his march, though he loſt a conſiderable part of his army in this expedition. Before he proceeded further, he committed the command of the country between the Iberus and the Pyrenæan hills to Hanno, and 11,000 men. He diſmiſſed the like number, ſending them back to their reſpective countries, and aſſuring thoſe who remained that they ſhould be allowed to return whenever they deſired it. He then croſſed the Pyrenæan hills, and advanced at the head of 50,000 foot and 9,000 horſe as far as the banks of the Rhone. The paſſage of the Rhone was diſputed by the Gauls, who had aſſembled with all their forces for this purpoſe. Having ſucceeded in this arduous and difficult enterpriſe, he continued his march, croſſing through the middle of Gaul, and moving northwards, in order to avoid Scipio, and to favour his deſign of marching all his forces, without diminution by any engagement which he could eſcape, into Italy. During his progreſs through the country of the Allobroges, he was choſen umpire between two brothers, who diſputed their right to the kingdom. Brancus, the elder brother, having been reinſtated by Hannibal in his dominions, furniſhed his whole army with proviſions, clothes, and arms; and eſcorted him through the countries of the Tricaſtini, Vocontii, and Tricorii, as far as the river Druentia, now the Durance; and from thence he reached the foot of the Alps without oppoſition. In the proſecution of his march to the ſummit of the Alps he encountered many difficulties. The ſight of theſe mountains, which ſeemed to touch the ſkies, covered with ſnow, and exhibiting ſcarce any thing to the eye but a few tottering cottages ſcattered on the ſharp tops of inacceſſible rocks, not a little intimidated his troops. The meagre flocks almoſt periſhed with cold, and hairy ſavages, with fierce aſpects, renewed alſo the terror which the diſtant proſpect of this ridge of mountains had raiſed, and ſtruck a prodigious damp on the hearts of the ſoldiery. Beſides, the whole army was brought upon the verge of deſtruction by the perfidy of a Gallic nation; whoſe deputies, under the ſpecious appearance of friends, perſuaded Hannibal to commit himſelf to their conduct. But theſe faithleſs guides led him into a ſteep paſs, out of which they thought it would be impoſſible for him to make his eſcape. However, Hannibal, by the wiſe diſpoſition of his forces, as well as the aſſiſtance of his elephants, and bravery of his infantry, who greatly diſtinguiſhed themſelves on this occaſion, at laſt diſperſed the enemy. After which adventure he ſurmounted all other difficulties, and the ninth day from his beginning the aſcent, arrived at the top of the mountains. It muſt be obſerved, that Hannibal was in a great meaſure obliged to the elephants for his eſcaping all the diſaſters the enemy threatened him with; for wherever theſe huge animals appeared, the Gauls were ſtruck with ſuch terror, that they immediately fled with precipitation, leaving the road clear for the Carthaginian general.

Hannibal halted two days on the ſummit of the Alps, to refreſh his wearied troops, which were greatly diſpirited by the ſnow that had lately fallen. In order to animate them to make another effort with alacrity, from one of the higheſt hills he gave them a proſpect of the fruitful plains watered by the Po, the day before he decamped. He likewiſe pointed towards the place where Rome ſtood; which, he aſſured them, a battle or two would make them maſters of, and conſequently put a glorious period to all their toils. This proſpect inſpired them with ſuch vigour, that they ſeemed to have forgot all the fatigues they had undergone, and to think only of taking poſſeſſion of that haughty city, whoſe conduct towards their ſtate had been nothing but one continued ſeries of inſults ſince the concluſion of the Sicilian war.

They therefore purſued their march; but the difficulty and danger increaſed, in proportion as they approached nearer the end of the deſcent. We are told, that about this time Hannibal meditated a retreat; but from the genius of that general, as well as the whole tenour of his conduct, this conjecture ſeems highly improbable. To omit many particulars, they came at laſt to a path naturally very ſteep and craggy; which being rendered impracticable by the late falling of the earth, terminated in a frightful precipice above a thouſand feet deep. In ſhort, Hannibal found it would be impoſſible to accompliſh his deſign, without cutting a way in the rock itſelf, through which his men, horſes, and elephants might paſs; and this, with immenſe labour, he effected. Approaching, therefore, gradually the Inſubrian foot of the Alps, he detached ſome parties of his horſe to forage, there appearing now ſome ſpots of paſture where the ground was not covered with ſnow. Livy informs us, that in order to open and enlarge the path, large trees were felled, and piled round the rock, after which fire was ſet to them. The wind, by good fortune, blowing hard, a fierce flame ſoon broke out; ſo that the rock glowed like the very coals with which it was ſurrounded. Then Hannibal, according to the ſame author, cauſed a great quantity of vinegar to be poured on the rock; which piercing into the veins, that were now cracked with the intenſe heat of the fire, calcined and ſoftened it. In this manner, taking a large compaſs, in order that the deſcent might be eaſier, he cut a way along the rock, which opened a free paſſage to the forces, baggage, and elephants. As Polybius has paſſed over in ſilence the uſe Hannibal made of vinegar on this occaſion, many reject that incident as fabulous.

At length Hannibal gained the fruitful plains of Inſubria, where, in reviewing his army he found, that in five months and a half's march (for ſo long was it ſince he had left New Carthage), he had loſt by ſickneſs, deſertion, fatigue, and various engagements, thirty thouſand foot, and three thouſand horſe. His army now amounted to no more than twenty-ſix thouſand effective men. Above twenty thouſand had periſhed ſince his departure from the Rhodanus. That we may have a more diſtinct idea of Hannibal's march, it will be proper to give the names and diſtances of ſome of the principal places through which that general paſſed in his way to Italy, tranſcribed from Polybius. From New Carthage to the Iberus were computed two thouſand ſix hundred ſtadia; from the Iberus to Emporium, a ſmall maritime town, which ſeparated Spain from the Gauls, according to Strabo, ſixteen hundred ſtadia; from Emporium to the banks of the Rhodanus, ſixteen hundred ſtadia; from the Rhodanus to the Alps, fourteen hundred ſtadia; from the Alps to the plains of Inſubria, twelve hundred ſtadia. In all eight thouſand four hundred ſtadia, making much about a thouſand Engliſh miles.

Upon Hannibal's arrival in Italy he refreſhed his troops, and then marched againſt the Taurini, who had refuſed to enter into an alliance with him; and having encamped before Taurinum (Turin) their chief city, he carried it in three days, and put all who had oppoſed him to the ſword. This expedition ſo terrified the neighbouring Gauls, that they ſurrendered at diſcretion. The reſt of the Gauls would probably have followed their example, if they had not been awed by the terror of the Roman arms, which were now approaching. Hannibal therefore, as he had no time to loſe, thought it the wiſeſt courſe which he could purſue to march directly into their country, and to make ſuch an attempt as would induce thoſe who had an inclination to join him to put themſelves under his protection. Rome was greatly alarmed by the rapid progreſs of Hannibal, and Sempronius was ordered to leave Sicily, and haſten to the relief of his country; whilſt Scipio, the other conſul, advanced with the utmoſt diligence towards the enemy, croſſed the Po, and pitched his camp near the Ticinus, now the Teſino in Lombardy. Here the Roman and Carthaginian armies came in ſight of each other; and the generals on each ſide prepared for battle by haranguing their reſpective ſoldiers. The conteſt continued for a long time with equal ſucceſs, and many fell on both ſides. At length the Roman troops were put into diſorder by the Numidians, who attacked them in the rear, and eſpecially by a wound which the conſul received, and by which he was diſabled. However, he retreated in good order, and was conveyed to his camp by a body of horſe, who covered him with their arms and bodies. He haſtened to the Po, which he croſſed with his army, and then broke down the bridge, ſo that he prevented Hannibal from overtaking him. For this firſt victory Hannibal was indebted to his cavalry; and it was hence inferred that the ſtrength of his army conſiſted in his horſe, and that on this account it would be proper for the Romans to avoid large open plains, like thoſe between the Po and the Alps. The battle of Ticinus was followed by that of Trebia, a ſmall river of Lombardy which falls into the Po a little above Placentia, where Sempronius, who had arrived from Sicily, joined his forces to thoſe of Scipio. Having gained an inconſiderable advantage over a party of Carthaginians, and finding himſelf at the head of 16,000 Romans and 20,000 allies, excluſive of cavalry, he determined, againſt the more prudent counſel of his colleague, to make immediate preparation for battle. On this occaſion the Carthaginians gained a complete victory, with a very inconſiderable loſs. Hannibal availed himſelf of the opportunity which winter-quarters afforded him for refreſhing his troops, and gaining the affections of the natives. For this purpoſe, after having declared to the priſoners he had taken from the Roman allies, that he was not come with the view of making war upon them, but to reſtore the Italians to their liberty, and protect them againſt the Romans, he ſent them all home to their reſpective countries, without requiring any ranſom. As ſoon as the winter was paſt, he ſet out towards Tuſcany; but in his march over the Apennines he was overtaken with a dreadful ſtorm, which deſtroyed great numbers of his men. He therefore marched back to Placentia, where he again engaged with Sempronius; the loſs in the conteſt on both ſides being nearly equal. Hannibal, having received information that C. Flaminius, one of the new conſuls, had advanced as far as Arretium, a town of Tuſcany, reſolved to march thither and engage him as ſoon as poſſible. Accordingly, after having encountered incredible hardſhips in his way, he pitched his camp between Arretium and Feſulæ, in the richeſt and moſt fruitful part of Tuſcany. Concluding from the character of Flaminius, who was arrogant, bold, and enterpriſing, that he ſhould ſoon be able to bring him to a battle, Hannibal loſt no opportunity of inflaming his impetuous ſpirit, and of accelerating the action in which he wiſhed to engage. He therefore laid waſte with fire and the ſword the country through which he paſſed, and advanced in his progreſs towards Rome. Having gained an eminence, at the termination of a narrow defile formed by the mountains of Cortona and the lake Thraſymene, and being purſued by the Roman conſul, he prepared for battle; and the event was the total defeat of the conſular army. Flaminius himſelf with 15,000 men were left dead on the field, and about 10,000 eſcaped to Rome by different roads. Hannibal loſt only 1500 men, moſt of whom were Gauls; though great numbers both of his ſoldiers and of the Romans died afterwards of their wounds. Having made diligent but ineffectual ſearch for the body of Flaminius, for the purpoſe of giving it an honourable burial, he put his troops into quarters of refreſhment, and ſolemnized the funerals of 30 of his chief officers, who had been ſlain in the action. This battle was fought in the year B.C. 217. Hannibal, not thinking it proper to advance directly to Rome, purſued his route through Umbria and Picenum; and after ten days' march arrived in the territory of Adria. As he plundered the country through which he paſſed, he was loaded with booty. Having attacked Spoletum, and being repulſed with loſs, he proceeded to the frontiers of Apulia, and ravaged the adjacent territories. Polybius informs us, that Hannibal treated the allies of the Romans with the utmoſt cruelty in this expedition. At this time Fabius, followed by Minucius and four legions, had marched from Rome in queſt of the enemy; but with a firm reſolution not to let him take the leaſt advantage, nor to advance one ſtep till he had firſt reconnoitered every place; nor hazard a battle, till he ſhould be ſure of ſucceſs. Hannibal made various attempts to provoke Fabius to a battle, but they were all ineffectual. The dictator, notwithſtanding all the artifices, the marches, counter-marches, and feints, of the Carthaginian general, inflexibly adhered to his firſt reſolution, and gave his crafty enemy to underſtand, that the Romans, inſtructed by their defeats, had at laſt made choice of a general capable of oppoſing Hannibal. Reſolved on leaving Campania with his immenſe ſpoils, Hannibal marched with his army towards the confines of Samnium; but was much incommoded in his progreſs by the prudent diſpoſitions and movements of Fabius. Having encamped at the foot of the mountains, he found himſelf involved in great difficulties, as the Romans had ſeized upon Caſilinum and Callicula, and pent up his army in ſuch a manner, that it ſeemed impoſſible for him to eſcape. Whilſt Fabius was preparing for an attack, the inventive genius of Hannibal contrived a ſtratagem, by which he eluded the efforts of the Roman dictator, and preſerved both himſelf and his army, when they were upon the very brink of deſtruction. He afterwards returned to Apulia, and having taken the town of Gerunium by aſſault, made this the place of his encampment. In the mean time, Fabius, being ordered to Rome, left the command of the army to Minucius, his general of horſe, with orders to obſerve the motions of Hannibal at a proper diſtance; but by no means to engage him. The ſequel is related under the article CANNÆ, where the Carthaginian general obtained a complete victory over the Romans. See alſo CAPUA.

Whilſt Hannibal was purſuing his conqueſts in Italy, the Carthaginian affairs in Spain, in conſequence of the defeat of Aſdrubal by Scipio, began to wear an unpromiſing aſpect. Scipio, improving his naval victory, took Honoſca by ſtorm, and levelled it with the ground. From thence he proceeded to New Carthage; laid waſte the adjacent territory, and ſet fire to the ſuburbs of that city. He alſo obtained ſeveral other advantages in the iſland Ebuſus, now Yvica, and in other places; and concluded a treaty with the inhabitants of the Balearic iſlands. After theſe exploits Livy ſays, that 20 different cantons of Spaniards ſubmitted to the Romans; and Aſdrubal was compelled to retire into Luſitania, and thoſe parts of Spain, that border upon the ocean. The Carthaginian commander was alſo reduced to great difficulties by the irruption of the Celtiberian princes, under the order of Scipio, into the Carthaginian territories; by their capture of three fortreſſes; and by two defeats, in which 15,000 men belonging to Aſdrubal's army were killed, and 4000 taken priſoners. The two Scipios in this campaign paſſed the Iberus, and penetrated into the Carthaginian dominions, as far as Saguntum. Whilſt their arms were making conſiderable progreſs in Spain, Aſdrubal received orders from Carthage to march into Italy for the relief of his brother; but the two Roman generals reſolved to prevent, if poſſible, his leaving Spain. They therefore forced him to fight, and defeated him, ſo that he could neither continue his march for Italy, nor remain with any ſafety in Spain. In Sardinia the Carthaginians were no leſs unſucceſsful; for, in a battle fought againſt the Romans, they loſt 12,000 men, and a greater number of priſoners, among whom were Aſdrubal, ſurnamed Calvus, Hanno, and Mago, who were diſtinguiſhed by their birth as well as military exploits. Afterwards the face of affairs was very much changed in Spain. The two Scipios were defeated and killed, and the Roman territories in that country ſeemed to be inevitably loſt. They were preſerved, however, by the valour of L. Marcus, a private officer of the Equeſtrian order; and ſhortly after, the younger Scipio was ſent thither, who revenged the death of his father and uncle, and reſtored the affairs of the Romans in Spain to their former flouriſhing condition.

From the period of Hannibal's abode at Capua, the Carthaginian affairs in Italy no longer ſupported their reputation. M. Marcellus, firſt as prætor and afterwards as conſul, contributed very much to this revolution. He haraſſed Hannibal's army on every occaſion, ſeized upon his quarters, forced him to raiſe ſieges, and even defeated him in ſeveral engagements; ſo that he was called the ſword of Rome, as Fabius had before been named its buckler. But what moſt affected the Carthaginian general, was to ſee Capua beſieged by the Romans. In order to preſerve his reputation among his allies, he flew to its relief, attacked the Romans, and fought ſeveral battles in order to oblige them to raiſe the ſiege. But all his meaſures for this purpoſe being defeated, he marched haſtily towards Rome, that he might thus make a powerful diverſion. Rome was at firſt much alarmed; and one of the ſenators propoſed to recal all the armies to ſuccour the capital. Fabius, however, declared, that it would be ſhameful in them to be terrified, and forced to change their meaſures upon every motion of Hannibal. They, therefore, contented themſelves with recalling only part of their army; and whilſt Hannibal and the Roman conſul, having drawn up their reſpective armies before the city, were preparing for a deciſive battle, of which Rome was to be the recompence, a violent ſtorm obliged them to ſeparate. When they again repeatedly rallied, the ſame impediment to action occurred; ſo that Hannibal, believing ſomething ſupernatural in the event, ſaid, according to Livy, that ſometimes his own will, and ſometimes fortune, would not ſuffer him to take Rome. At length he retired, and in his march plundered the rich temple of the goddeſs Feronia. The ſucceſs of the Romans in the ſiege of Capua gave them a viſible ſuperiority over the Carthaginians; and diſplayed, at the ſame time, how formidable the power of the Romans was, when they undertook to puniſh their perfidious allies; and the feeble protection which Hannibal could afford his friends, at a time when they moſt wanted it. It remains that we mention one unforeſeen defeat that ruined all the meaſures, and blaſted all the hopes of Hannibal with regard to Italy. The conſuls of the 11th year of the ſecond Punic war (B. C. 207.) were C. Claudius Nero, and M. Livius. The province of the latter was the Ciſalpine Gaul, where he was to oppoſe Aſdrubal, who, according to report, was preparing to paſs the Alps. The former commanded in the country of the Brutians, and in Lucania, that is, in the oppoſite extremity of Italy, and was there making head againſt Hannibal. The paſſage of the Alps gave Aſdrubal very little trouble: the way having been previouſly cleared by his brother, and all nations being diſpoſed to receive him. Some time after this he diſpatched couriers to Hannibal, who were intercepted; and by their letters Nero found, that Aſdrubal was haſtening to join his brother in Umbria. In order to diſconcert and defeat this plan, Nero ſet out with a detachment of his army conſiſting of 7000 men, and marching with extraordinary diligence, joined the other conſul in the night. When Aſdrubal diſcovered, by reconnoitering the enemy's army, that freſh troops were arrived, he concluded that they belonged to the other conſul, and was thus led to conjecture, that his brother had ſuſtained a conſiderable loſs, and alſo to fear, that he was come too late for his aſſiſtance. He therefore ſounded a retreat, and his army began to march in great diſorder. Whilſt he was preparing to croſs the river Metaurus, the army of the enemy came up with him, and in this extremity it was impoſſible to avoid an engagement. The battle that enſued was long and obſtinate; and Aſdrubal diſtinguiſhed himſelf by his ſelf-poſſeſſion and valour. At length, when victory declared for the Romans, being unable to ſurvive the loſs of ſo many thouſand men, who had quitted their country to follow his fortune, he ruſhed at once into the middle of a Roman cohort, and there died in a manner worthy of the ſon of Hamilcar, and brother of Hannibal. This was the moſt bloody battle which the Carthaginians had fought during this war; and whether we conſider the death of the general, or the ſlaughter made of the Carthaginian forces, it may be looked upon as a repriſal for the battle of Cannæ. The Carthaginians loſt 55,000 men, and 6000 were taken priſoners. The Romans loſt 8000. Theſe were ſo weary of killing, that ſome perſon telling Livius, that he might very eaſily cut to pieces a body of the enemy who were flying; "It is fit," ſays he, "that ſome ſhould ſurvive, in order that they may carry the news of this defeat to the Carthaginians." Aſdrubal's head being thown into the camp of the Carthaginians, informed Hannibal of his brother's fate. Hannibal perceived by this cruel ſtroke the fortune of Carthage; "It is done," ſays he, "I will no longer ſend triumphant meſſages to Carthage. In loſing Aſdrubal, I have loſt at once all my hope, all my good fortune." He afterwards retired to the extremity of the country of the Brutians, where he aſſembled all his forces, who found it a very difficult matter to ſubſiſt there, as no proviſions were ſent them from Carthage. The fate of arms was not more propitious to the Carthaginians of Spain. The three Carthaginian generals in that country, Aſdrubal, ſon of Giſco, Hanno, and Mago, having been defeated with their numerous armies, by the Romans, in ſeveral engagements, Scipio the younger at laſt poſſeſſed himſelf of Spain, and ſubjected it entirely to the Roman power. Upon his return to Rome, he was declared conſul, at the age of 30 years, and Sicily was allotted to him. He ſet out with all imaginable expedition for this province; whilſt his colleague in the conſulate, P. Licinius Craſſus, was to command in the country to which Hannibal had retired. Soon after Scipio croſſed over to Africa, and made this country the ſeat of war. The devaſtation of the country; the ſiege of Utica; the entire defeat of the two armies under Syphax and Aſdrubal, whoſe camp was burnt by Scipio; and afterwards the capture of Syphax himſelf, in whom the Carthaginians repoſed their chief confidence;—all theſe things forced them at laſt to turn their thoughts to peace. Accordingly, they deputed 30 of their principal ſenators, ſelected out of the powerful body at Carthage, called the "Council of the Hundred," to wait on the Roman general in his tent; who accuſed Hannibal as the author of all their calamities, and promiſed, in the name of the ſenate, an implicit obedience to whatever the Romans ſhould pleaſe to ordain. Scipio replied, that he would grant them a peace, upon condition that they ſhould deliver up all the priſoners and deſerters to the Romans; that they ſhould recal their armies out of Italy and Gaul; ſhould never again ſet foot in Spain; ſhould retire out of all the iſlands between Italy and Africa; ſhould deliver up all their ſhips, 20 excepted, to the victor; ſhould give to the Romans 500,000 buſhels of wheat, 300,000 of barley, and pay 15,000 talents:—and that, in caſe they were pleaſed with theſe conditions, they then might ſend ambaſſadors to the ſenate. The Carthaginians feigned compliance, in order to gain time till Hannibal returned. A truce was then granted to the Carthaginians, who immediately ſent deputies to Rome, and at the ſame time an expreſs to Hannibal to order his return into Africa. Hannibal received the orders from Carthage with inexpreſſible concern; and he returned home, turning his eyes wiſhfully to Italy, accuſing gods and men of his misfortunes, and calling down a thouſand curſes, as Livy ſays, upon himſelf for not having marched his ſoldiers directly to Rome after the battle of Cannæ, whilſt they were ſtill reeking with the blood of its citizens. The deciſion of the whole matter was referred by the Roman ſenate to Scipio, who, being upon the ſpot, could beſt judge what conditions were moſt ſuitable to the welfare of the ſtate. About this time a Roman fleet of about 200 veſſels of burthen was diſperſed near Carthage by a ſtorm; and Aſdrubal ſailed out of the harbour, by order of the ſenate, ſeized the greateſt part of them, and brought them to Carthage, though the truce was ſtill ſubſiſting. This act of aggreſſion was complained of by Scipio; but his remonſtrances were little regarded by the Carthaginians. Hannibal's approach had revived their courage, and inſpired them with very flattering hopes. This circumſtance afforded a new occaſion of war between the two nations. Hannibal, now deſirous of peace more than a renewal of the war, flattered himſelf that the conditions of it would be more honourable, as he was at the head of an army, and as the fate of arms might ſtill appear uncertain. He therefore ſolicited an interview with Scipio, which was agreed to at a time and place that were fixed. This interview proving ineffectual, the generals left one another with a reſolution to decide the fate of Carthage by a general battle, fought on the plains of Zama, about five days' march from Carthage, in the year B. C. 202. The Carthaginians, after a very obſtinate fight, were obliged to fly, leaving 20,000 men on the field of battle, and the like number of priſoners were taken by the Romans. Hannibal eſcaped in the tumult, and entering Carthage, owned that he was irrecoverably defeated, and that the citizens had no alternative left, but the acceptance of peace on any conditions. Thirty deputies waited upon the conqueror at Tunis, and ſued for peace on the moſt ſubmiſſive terms. Scipio called a council, the majority of which were for raſing Carthage and treating the inhabitants with the utmoſt ſeverity. But the conſideration of the time which it would require before a city ſo ſtrongly fortified could be taken, and Scipio's fear leſt a ſucceſſor might be appointed to him whilſt he ſhould be employed in the ſiege, made him incline to clemency. Accordingly a peace, terminating the ſecond Punic war, was concluded between the Carthaginians and Romans, upon the following conditions dictated by Scipio: "that the Carthaginians ſhould continue free and preſerve their laws, their territories, and the cities they poſſeſſed in Africa before the war:—that they ſhould deliver up to the Romans all deſerters, ſlaves, and captives belonging to them; all their ſhips, except 10 triremes; all their tame elephants, and that they ſhould not train up any more for war:—that they ſhould not make war out of Africa, nor even in that country, without firſt obtaining leave for that purpoſe from the Roman people:—that they ſhould reſtore to Maſiniſſa all they had diſpoſſeſſed either him or his anceſtors of:—that they ſhould furniſh money and corn to the Roman auxiliaries, till their ambaſſadors ſhould be returned from Rome:—that they ſhould pay to the Romans 10,000 Euboic talents of ſilver, (1,750,000l.) in 50 annual payments; and give 100 hoſtages, who ſhould be nominated by Scipio:—and in order that they might have time to ſend to Rome, it was agreed to grant them a truce, upon condition that they ſhould reſtore the ſhips taken during the former war, without which they were not to expect either a truce or peace." Soon after the treaty of peace with the Romans, an article in this treaty involved the Carthaginians in a diſpute with Maſiniſſa. This article required them to reſtore to Maſiniſſa all the territories and cities which he poſſeſſed before the war; and, moreover, Scipio, in recompence of the zeal and fidelity which that monarch had ſhewn with regard to the Romans, had added his dominions to thoſe of Syphax. From this circumſtance originated the contention that afterwards took place between the Carthaginians and Numidians. Syphax and Maſiniſſa were both kings in Numidia; but occupied different parts of this country. The ſubjects of the former were called Maſæſuli, and their capital was Cirtha: thoſe of the latter were the Maſſyli; but the name of Numidians was common to both. Their principal ſtrength conſiſted in their cavalry; and they always rode without ſaddles, and ſome even without bridles, whence Virgil (Æn. l. iv. v. 41.) called them "Numidæ Infræni." A conteſt having occurred between theſe two princes, in the progreſs of which Syphax was defeated and captured, the dominions of this prince were beſtowed upon Maſiniſſa, and the Carthaginians were obliged to reſtore all which he poſſeſſed before. Maſiniſſa had likewiſe ſeized part of a fertile territory, ſituated towards the ſea-ſide, near the leſſer Syrtis, which had been accuſtomed to pay tribute to the Carthaginians. Appeals had been made to Rome; but the conteſt remained undecided, though it was evident that the Roman ſenate favoured Maſiniſſa. In a courſe of time the Carthaginians farther remonſtrated againſt the encroachments of the Numidian prince; and complained to the ſenate of Rome, that, beſides the lands at firſt conteſted, he had diſpoſſeſſed them of upwards of 70 towns and caſtles. They likewiſe ſtated that they were reſtricted from ſeeking redreſs by the above-mentioned article of the laſt treaty. To their earneſt application, and the counter-ſtatement of Maſiniſſa, the Roman ſenate replied, that the ancient limits ſhould be preſerved; and that it was far from being their intention to have the Carthaginians diſpoſſeſſed, during the peace, of thoſe territories and cities which had been reſerved to them by the treaty. But theſe aſſurances, apparently impartial and even favourable to the Carthaginians, were mere words. The Romans were ſecretly in the intereſt of Maſiniſſa, and protracted the buſineſs, in order to give him an opportunity of eſtabliſhing himſelf in his uſurpation, and of weakening his enemies. A new deputation was ſent from Rome in order to ſettle the diſpute; and Cato was one of the commiſſioners. Maſiniſſa profeſſed to acquieſce in their deciſion; and the Carthaginians avowed their adherence to the treaty which they had concluded with Scipio. The deputies, after having viſited the country and examined the ſtate of Carthage, expreſſed their aſtoniſhment, that, after the calamities which it had ſuffered, it ſhould have riſen again, and ſo ſoon, to ſuch a pitch of power and grandeur. When the members of the ſenate received this intelligence from the deputies, they declared, that Rome could never be in ſafety ſo long as Carthage ſhould ſubſiſt. From this time, whatever affair was debated in the ſenate, Cato always added the following words to his opinion: "I conclude that Carthage ought to be deſtroyed." At this time diviſions broke out in Carthage; 40 citizens were ſent into baniſhment; and the exiles withdrew to the court of Maſiniſſa, who ſent his ſons to Carthage, to ſolicit their return. But the gates of the city were ſhut againſt them, and one of them was cloſely purſued by Hamilcar, one of the generals of the republic: this gave occaſion to a new war; armies were levied on both ſides; and a battle was fought in the preſence of the younger Scipio, who afterwards ruined Carthage. The fight was long and obſtinate, but at laſt the Carthaginians gave way. When the battle had terminated, the Carthaginians intreated Scipio to put an end to their conteſts with Maſiniſſa; but having completed the object of his miſſion, he returned to Rome without ſettling the diſpute, and reconciling the contending parties. In the progreſs of the conteſt, the Carthaginians, reduced to the greateſt extremity by famine and the plague, ſurrendered to Maſiniſſa, promiſing to deliver up the deſerters, to pay him 5000 talents of ſilver in 50 years, and to reſtore the exiles, notwithſtanding the oaths by which they had bound themſelves to the contrary. They all ſubmitted to the ignominious ceremony of paſſing under the yoke, which was a kind of gallows, made by two forked ſticks ſtanding upright, with a ſpear laid acroſs, under which vanquiſhed enemies were obliged to paſs: and of 58,000 men, very few returned to Carthage.

The Carthaginians in this humbled and diſtreſſed ſtate renewed their application to Rome; but their deputies, commiſſioned once and again to the ſenate, returned without ſatisfaction. At Rome diſputes occurred between Cato and Scipio Naſica with reſpect to the meaſures that were proper to be purſued. Cato delivered a ſpeech, in which he deſcanted on the powerful and proſperous ſtate of Carthage, and ending his ſpeech threw down ſome African figs, the ſize and beauty of which were much admired by the ſenators: "Know," ſays he, "that it is but three days ſince theſe figs were gathered; ſuch is the diſtance between the enemy and us." Naſica, on the contrary, was of opinion, that the Carthaginians were too weak to ſubdue the Romans, and, at the ſame time, ſo powerful, that it was not for the intereſt of the Romans to conſider them in a contemptible light. The ſenate, however, reſolved to declare war againſt the Carthaginians; and the reaſons or pretences for it were, their keeping up ſhips, contrary to the tenor of treaties, and their ſending an army out of their territories, againſt a prince who was in alliance with Rome, and whoſe ſon they treated ill, at the time he was accompanied by a Roman ambaſſador. At the moment of their deliberation, deputies arrived from Utica, the ſecond city of Africa, poſſeſſing a ſpacious harbour, and within 60 furlongs of Carthage, ſo that it might ſerve as a place of arms in the attack of that city, ſurrendering themſelves, their effects, their lands, and their city, into the hands of the Romans. They, therefore, heſitated no longer; but immediately proclaimed war, committing the conduct of it to the two conſuls Manilius and L. Marcius Cenſorinus, and giving them ſecret orders not to end the war but by the deſtruction of Carthage. To them was committed a conſiderable fleet, on board of which were 80,000 foot, and about 4000 horſe. Thus commenced, in the year B. C. 149, the *third Punic war*, about 53 years after the termination of the ſecond, which, though much leſs conſiderable than either of the former, with regard to the number and importance of the battles that were fought, and its continuance, which was leſs than 4 years, was nevertheleſs much more remarkable, with reſpect to the ſucceſs and event of it, as it ended in the total deſtruction and ruin of Carthage.

As ſoon as the ſenate had formed its reſolution, a courier was ſent to Carthage with its decree, and with information that the Roman fleet had ſailed. After many former and recent loſſes, which the Carthaginians had ſuſtained, they were by no means in a condition to reſiſt ſuch an enemy, ſince they had not been able ſucceſsfully to oppoſe Maſiniſſa. Troops, proviſions, ſhips, allies, in a word, every thing was wanting; and hope and vigour more than all the reſt. As ſoon as it was known that the fleet was arrived at Utica, the deputies of Carthage repaired to the Roman camp, ſignifying that they were come in the name of the republic, in order to receive their commands, which they were ready to obey. The conſul required the immediate ſurrender of all their arms. The order was inſtantly complied with; and there arrived in the camp a long train of waggons, loaded with all the preparatory implements of war, taken out of Carthage; 200,000 complete ſets of armour, a numberleſs multitude of darts and javelins, with 2000 engines for ſhooting darts and ſtones. The deputies, accompanied by the moſt venerable ſenators and prieſts, followed, and received from Cenſorinus the conſul, the heart-rending decree of the ſenate, "that it was their abſolute will and pleaſure that you depart out of Carthage, which they have reſolved to deſtroy, and that you remove into any other part of your dominions, as you ſhall think proper, provided it be at the diſtance of 80 ſtadia from the ſea." This decree was received with the moſt bitter anguiſh, and when it was communicated to the people, nothing was ſeen and heard in every part of the city but howling and deſpair, madneſs and fury. After this tranſaction, the conſuls made no great haſte to march againſt Carthage, as they knew the city was diſarmed. However, the inhabitants, being unanimouſly reſolved not to quit the city, took the advantage of this delay to put themſelves in a poſture of defence. They appointed as general, without the walls, Aſdrubal, who was at the head of 20,000 men, and within the walls the command was given to another Aſdrubal, the grandſon of Maſiniſſa. They then applied with great diligence and expedition to the manufacture of arms. The temples, the palaces, the open markets and ſquares, were all changed into arſenals, where men and women worked day and night. Every day were made 140 ſhields, 300 ſwords, 500 pikes or javelins, 1000 arrows, and a great number of engines to diſcharge them; and becauſe they wanted materials to make ropes, the women cut off their hair for this purpoſe. During this interval the conſuls were advancing towards the city in order to beſiege it. The Carthaginians defended themſelves with incredible reſolution and vigour; and renewed the boldeſt ſallies, for repulſing the beſiegers, burning their engines, and haraſſing their foragers. Cenſorinus attacked the city on one ſide, and Manilius on the other. Scipio, afterwards ſurnamed Africanus, was then a tribune in the army; and diſtinguiſhed himſelf above the reſt of the officers, by his prudence as well as his bravery. The beſieged, though thus powerfully aſſailed, were recovering their ſpirits, in conſequence of ſome advantages which they gained. Their troops increaſed, and they obtained an acceſſion of allies. This news occaſioned ſome uneaſineſs at Rome; but the fame of Scipio had alſo arrived in the city; and when he appeared in the aſſembly, as a candidate for the ædileſhip, a general perſuaſion prevailed, that he was deſigned by the gods to end the third Punic war, as the firſt Scipio, his grandfather by adoption, had terminated the ſecond. Inſtead, therefore, of granting him the ædileſhip, for which he was a candidate, they for once diſregarded the laws, and conferred upon him the conſulſhip, aſſigning him Africa for his province. As ſoon as Scipio had completed his recruits, he ſet out for Sicily, and ſoon after arrived at Utica. Immediately upon his arrival, he revived the diſcipline among the troops, and made ſeveral neceſſary regulations. Having ordered his troops to provide themſelves with axes, levers, and ſcaling ladders, he led them in the dead of the night, and without the leaſt noiſe, to a diſtrict of the city called Megara; when ordering them to give a general and ſudden ſhout, he attacked it with great vigour. The enemy, though ſomewhat terrified by this unexpected attack, defended themſelves ſo courageouſly, that Scipio could not ſcale the walls. But perceiving a tower that was forſaken, and which ſtood without the city, very near the walls, he detached thither a party of intrepid ſoldiers, who, by the help of pontons, got from the tower to the walls, and from thence into Megara, the gates of which they broke down. Scipio entered it immediately after, and drove the enemies out of that poſt; who, terrified at this unapprehended aſſault, and imagining that the whole city was taken, fled into the citadel; whither they were followed even by thoſe forces that were encamped without the city, who abandoned their camp to the Romans, and thought it neceſſary to fly into a place of ſecurity. At day-break, Aſdrubal perceiving the ignominious defeat of his troops, in order to be revenged on the Romans, and, at the ſame time, to deprive the inhabitants of all hopes of accommodation and pardon, brought all the Roman priſoners he had taken upon the walls, in the ſight of the whole army. There he put them to the moſt exquiſite tortures; putting out their eyes, cutting off their noſes, ears, and fingers; tearing their ſkin to pieces with iron rakes or harrows; and then threw them headlong from the top of the battlements. This inhuman treatment filled the Carthaginians with horror; however, he did not ſpare even them, but murdered many ſenators who had been ſo brave as to oppoſe his tyranny. Scipio, having made himſelf abſolute maſter of the iſthmus, burnt the camp which had been deſerted by the enemy, and built a new one for his troops; and by means of a high wall which he conſtructed, equal to the whole breadth of the iſthmus, that is, 25 ſtadia, with towers and redoubts at proper diſtances, he lodged his forces in ſafety, and cut off all proviſions from the beſieged, thus producing a famine which ſoon after raged in the city. To deprive them more completely of neceſſary ſupplies, he attempted to ſtop up the mouth of the haven by a mole. This effort, however, was ineffectual; as the Carthaginians opened, on a ſudden, a new outlet on the other ſide of the haven, and appeared at ſea with a numerous fleet, which they had then built with the old materials found in their magazines. Having thus offered a kind of inſult or bravado to the Romans, without immediately attacking their fleet, which it is ſaid they ought to have done, they returned into the harbour. In a ſubſequent naval engagement, they were defeated. Scipio having made ſome further advances towards the diſtreſs and capture of the city, terminated this campaign. During the winter-quarters, he endeavoured to overpower the enemy's troops without the city; and in his laſt action cut to pieces above 70,000 of the enemy, as well ſoldiers as peaſants, who had been enliſted, and carried a neighbouring fort, called Nepheris, after ſuſtaining a ſiege of 22 days. The ſeizure of this fort was followed by the ſurrender of almoſt all the ſtrong holds in Africa; and contributed very much to the taking of Carthage itſelf, into which, from that time, it was almoſt impoſſible to bring any proviſions. Early in the ſpring, Scipio attacked, at one and the ſame time, the harbour called Cothon, and the citadel. In the progreſs of this buſineſs a dreadful ſlaughter took place for 6 days; but on the 7th day, when it was expected the ſiege would have continued much longer, and much more blood have been ſhed, there appeared a company of men in a ſuppliant poſture and habit, who deſired no other conditions but that the Romans would pleaſe to ſpare the lives of all thoſe who ſhould be willing to leave the citadel. The requeſt was granted to all, except the deſerters; and, accordingly, 50,000 men and women came out. The deſerters, about 900 in number, finding that they had no quarter to expect, fortified themſelves in the temple of Æſculapius, with Aſdrubal, his wife, and two children; where they might have held out a long time, though their number was ſmall, as the temple ſtood on a very high eminence of rocks, to which the aſcent was by 60 ſteps. But at length their patience was exhauſted, and they abandoned the lower part of the temple, and retired to the uppermoſt ſtory, reſolving not to quit it but with their lives. Aſdrubal came down privately to Scipio, and, being deſirous of ſaving his life, threw himſelf at the feet of the Roman general; by whom he was exhibited to the deſerters, who, tranſported with rage at the ſight, poured out their imprecations againſt him, and ſet fire to the temple. Whilſt it was lighting, we are told, that Aſdrubal's wife, dreſſing herſelf as ſplendidly as poſſible, and placing herſelf with her two children in ſight of Scipio, addreſſed him with a loud voice: "I call not down," ſays ſhe, "curſes upon thy head, O Roman; for thou only takeſt the privilege allowed thee by the laws of war; but may the gods of Carthage, and thou, in concert with them, puniſh, according to his deſerts, the falſe wretch, who has betrayed his country, his gods, his wife, his children!" Then, directing herſelf to Aſdrubal, "Perfidious wretch," ſays ſhe, "thou baſeſt of creatures! this fire will preſently conſume both me and my children; but as to thee (too ſhameful general of Carthage!) go—adorn the gay triumph of thy conqueror—ſuffer, in the ſight of all Rome, the tortures thou ſo juſtly deſerveſt!" She had no ſooner pronounced theſe words, but ſeizing her children, ſhe cut their throats, threw them into the flames, and afterwards ruſhed into them herſelf, in which ſhe was imitated by all the deſerters.

As for Scipio himſelf, when he ſaw the ruin of this famous city, he ſhed tears over its fate; and reflecting that cities, nations, and empires, are liable to revolutions no leſs than individuals; that the like ſad fate had befallen Troy, anciently ſo powerful; and, in later times, the Aſſyrians, Medes, and Perſians, whoſe dominions were once ſo extenſive; and, laſtly, the Macedonians, whoſe empire had been ſo glorious throughout the world; theſe mournful ideas ſuggeſted to him the following verſes of Homer, which he repeated:

> "Ἔσσεται ἦμαρ, ὅταν ποτ' ὀλώλῃ Ἴλιος ἱρὴ,
> Καὶ Πρίαμος καὶ λαὸς ἐϋμμελίω Πριάμοιο."
> Il. δ. 164, 165.

> "The day ſhall come, that great avenging day,
> Which Troy's proud glories in the duſt ſhall lay,
> When Priam's pow'rs and Priam's ſelf ſhall fall,
> And one prodigious ruin ſwallow all." Pope.

By this citation he denounced the future deſtiny of Rome, as he himſelf confeſſed to Polybius, who deſired Scipio to explain himſelf on that occaſion.

After the capture of Carthage, Scipio gave the plunder of it (the treaſures of the temples excepted) to his ſoldiers for ſome days. He alſo ordered the inhabitants of Sicily to come and take poſſeſſion of the pictures and ſtatues which the Carthaginians had deſpoiled them of, in the former wars; and he reſtored to the citizens of Agrigentum, Phalaris's famous bull (ſee Bull), admoniſhing them, that this bull, which was a monument of the cruelty of their ancient kings, and of the lenity of their preſent ſovereigns, ought to make them ſenſible, which would be moſt advantageous for them, to live under the yoke of the Sicilians, or the government of the Romans. When he expoſed to ſale part of the ſpoils of Carthage, he expreſsly prohibited, under the ſevereſt penalties, his own family from taking or buying any of them; thus preventing any ſuſpicion of avarice from being attached to himſelf. When the news of this event arrived at Rome, the ſenators ſent 10 commiſſioners to Africa, whoſe firſt care was to demoliſh every remnant of Carthage; and they alſo iſſued orders, that it ſhould never again be inhabited, and denounced dreadful imprecations againſt thoſe, who, contrary to this prohibition, ſhould attempt to rebuild any parts of it, eſpecially thoſe called Byrſa and Megara. The commiſſioners further decreed, that thoſe cities, which, during this war, had joined with the enemy, ſhould be all razed, and their territories be given to the Roman allies; making a particular grant to the citizens of Utica of the whole country lying between Carthage and Hippo. All the reſt they made tributary, and reduced it into a Roman province, whither a prætor was ſent annually. See Carthage.

Such was the termination of the third Punic war; and ſuch was the final cataſtrophe of the Carthaginian ſtate, in the year B. C. 146; after it had ſubſiſted, through various viciſſitudes, for 737 years. Rollin's Anc. Hiſt. vol. i. Rollin's Rom. Hiſt. vols. iii, iv, v. Anc. Univ. Hiſt. vols. xv, xvi.

Schreb. 1261. Willd. 445. Gært. 929. Juſſ. p. 174. Vent. vol. ii. p. 496. Claſs and order, *ſyngeneſia polygamia æqualis*. Nat. ord. *Compoſitæ capitatæ*, Linn. *Cinarocephalæ*, Juſſ.

Gen. Ch. *Calyx common* ovate, imbricated; ſcales with lateral and terminal ſpines, and in moſt ſpecies with a foliaceous appendicle at their ſummit. *Cor. common* uniform; florets all androgynous, equal, monopetalous, funnel-ſhaped; border five-cleft, erect, nearly equal. *Stam.* Filaments five, capillary, very ſhort; anthers united into a tubular cylinder. *Piſt.* Germ very ſhort; ſtyle filiform, longer than the ſtamens. *Peric.* none, except the cloſing calyx. *Seeds* ſolitary;

tary; down none, or chaffy. *Recep.* flat, hairy; hairs longer than the ſeeds.

Eſſ. Ch. Outward calyx-ſcales with more than one ſpine. Lam.

Sp. 1. C. *tinctorius*, baſtard ſaffron, or ſafflower, Linn. Sp. Pl. 1. Mart. 1. Willd. 1. Gært. tab. 161. fig. 2. Lam. Ill. Pl. 661. fig. 3. Carthamus officinarum, Tourn. Bauh. pin. "Leaves ovate, entire, ſerrate-aculeate." Linn. "Stem perfectly ſmooth; leaves ovate, entire, ſpinous-toothed; ſeeds naked." Willd. *Root* annual. *Herb* ſmooth in all its parts. *Stem* about two feet high, erect, cylindrical, woody, branched toward the ſummit. *Leaves* ſimple, entire, acuminate, veined, with ſpinous teeth at their edges; root-leaves oblong, narrowed at the baſe; ſtem-leaves ſmall, ovate, half-embracing the ſtem. *Flowers* rather large, terminal, ſolitary; calyx-ſcales broad at the baſe, flat, reſembling the leaves; florets of a fine ſaffron colour. *Seeds* white, naked. A native of Egypt and the warmer parts of Aſia. The ſeeds have a purgative quality, and are ſaid to be particularly uſeful when the firſt paſſages are ſurcharged with a thick viſcous mucus. They are a favourite food of parrots, on whom they do not produce a ſimilar effect. The flowers are ſuppoſed to have the ſame medicinal properties as ſaffron: but they are chiefly uſed as a material for dyeing ſilk and cotton ſtuffs, to which they give a beautiful, but fugitive roſe-colour. A red pigment is likewiſe prepared from the ſtamens, uſed by painters, and known as a coſmetic rouge by the Pariſian ladies, under the name of vegetable rouge, Spaniſh vermillion, or lake of carthamus. 2. C. *flaveſcens*, Willd. 2. (C. orientalis, Tourn. cor. 33.) "Stem perfectly ſmooth; leaves oblong, entire, ſpinous-toothed, ſeeds crowned with down." Willd. *Root* annual. *Stem* erect, white, branched. *Leaves* oblong, narrower than thoſe of C. tinctorius, ſeſſile, undivided, toothed; teeth ſpinous; ſpines awl ſhaped, yellowiſh, long. *Florets* yellow. A native of Armenia. 3. C. *perſicus*, Willd. 3. Deſfont. "Stem perfectly ſmooth; leaves lanceolate, entire, ſpinous-toothed; outer calyx-ſcales longer than the flower, ſpreading, ſpinous-toothed at the baſe." *Root* annual. *Spines* white. A native of Perſia. 4. C *dentatus*, Willd. 4. Vahl. ſymb. 1. tab. 17. Forſk. deſcrip. 217. (Cnicus atractylidis folio, flore purpuraſcente, Tourn. Cor. 33.) "Stem villous; leaves pubeſcent, lanceolate, entire, ſpinous-toothed, inner calyx-ſcales ſomewhat roundly dilated at the ſummit, ſcarious, toothed. A native of Aſia Minor. 5. C. *lanatus*, yellow diſtaff thiſtle, or woolly carthamus, Linn. 2. Mart. 2. Lam. 2. Willd. 5 (Cnicus atractylis lutea dictus, Tourn. 451. Atractylis lutea, Bauh. pin. 379. Atractylis fuſus agreſtis, Gært. tab. 161. fig. 2. Chardon beni of the Pariſians.) "Stem hairy, woolly towards the top; lower leaves pinnatifid, upper ones embracing the ſtem, toothed." Linn. "Stem woolly; lower leaves pinnatifid, toothed; upper ones embracing the ſtem, pinnatifid, toothed." Willd. *Root* annual. *Stem* about two feet high, upright, cylindrical, branched towards the ſummit, cobwebbed between the bractes. *Leaves* oblong, ſpinous. *Flowers* yellow, ſolitary at the end of each branch, forming all together a kind of corymb; outer ſcales of the calyx foliaceous, reticularly nerved, pinnatifid-ſpinous, very prickly; inner ones cartilaginous, appendicled, ciliated, ending in a ſharp ſpine; receptacle beſet with briſtle ſhaped chaff. *Seeds* inverſely pyramidal; thoſe in the circumference differing a little in ſhape from thoſe of the circumference. Lam. and Gært. The leaves are rather bitter, and are ſometimes uſed as a febrifuge and ſudorific. A native of uncultivated ground and the borders of fields in the ſouth of France, Spain, and Italy, where the women uſe its ſtalks for diſtaffs. 6. C. *creticus*, Linn. 3. Mart. 3. Lam. 3. Willd. 6. (Cnicus creticus flore leucophæo, Tourn. Cor. 33.) "Stem nearly even; calyxes a little woolly; florets about nine; lower leaves lyrate; upper ones half-embracing the ſtem, toothed." Linn. "Stem even; calyxes nearly ſmooth; flowers whitiſh." Lam. *Root* annual. *Stem* near four feet high, very white. *Leaves* ſtiff, deeply indented, armed with ſtrong ſpines. *Florets* few, whitiſh, and according to Haller with five black lines at the opening, which divide and make the edges of the ſegments black. Haller alſo aſſerts that the radical florets of this and the preceding ſpecies are neuter and abortive, whence Juſſieu refers them both to his genus calcitrapa, formed from the centaurea of Linnæus. Gathered by Tournefort in the Iſland of Candia, who ſent the ſeeds to the royal garden at Paris. 7. C. *pectinatus*, Willd. 7. Deſf. Atl. tab. 228. "Stem villous; calyxes ſmooth; leaves pectinate toothed, ſpinous; lower ones linear-lanceolate; upper ones ovate." Lam. *Root* perennial. *Leaves* ſmooth. *Flowers* in a corymb; calyx-ſcales ſpinous-ciliated on each ſide; awl ſhaped and pungent at the ſummit. Deſf. A native of uncultivated mountains in Barbary. 8. C. *multifidus*, Willd. 8. Deſf. Atl. tab. 227. "Stem ſomewhat villous; lower leaves pinnatifid; ſegments gaſh-toothed, ſpinous; upper ones ovate-lanceolate, ſpinous-toothed." *Flowers* in a corymb; calyx-ſcales ciliate-ſpinous at the edges, awl-ſhaped at the tip. Deſf. A native of uncultivated hills about Algiers. 9. C. *tingitanus*, Linn. 4. Mart. 4. Willd. 9. (Carduus cæruleus erectus, Moriſ. hiſt. tab. 34. fig. 19.) "Root-leaves pinnate; ſtem-leaves pinnatifid; ſtem one flowered." Linn. *Root* perennial. *Stem* a foot and half high, ſeldom branched. *Leaves* narrow-ſpear-ſhaped, deeply ſerrated; each of the ſerratures ending in a ſharp point. *Flowers* blue; ſcarcely diſtinct from the next ſpecies. Linn. A native of Barbary, about Tangier. 10. C. *cæruleus*, Linn. 5. Mart. 5. Lam. 4. Willd. 10. (Onobroma cæruleum, Gært. tab. 160. fig. 7. Cnicus cæruleus aſperior, Bauh. pin. 378. Tourn. 350. Cn. alter, Cluſ. hiſt. 2. p. 152. Lob. ic. 2. p. 19.) "Leaves lanceolate, ſpinous-toothed; ſtem generally one-flowered." Linn. *Root* perennial. *Stem* ſingle, purpliſh, hairy and channelled. *Leaves* covered with a ſhort, hairy down. *Flowers* blue; outer calyx-ſcales broad, long, with ſharp ſpines on their edges; inner ones narrow, terminated with a ſharp thorn. A native of Spain and the coaſt of Barbary. Miller aſſerts that it is extremely different from the preceding: but La Marck obſerves, that though the tingitanus of Linnæus may perhaps be a diſtinct ſpecies, Moriſon's carduus cæruleus appears to him to be only a variety of the preſent. 11. C. *helenoides*, Willd. Deſf. Atl. tab. 230. "Stem generally one-flowered; leaves ovate; lower ones quite entire; upper ones ſlightly toothed, not ſpinous." *Root* annual. *Leaves* ſmooth, embracing the ſtem. *Flowers* yellow; calyx-ſcales ſerrated, a little ſpinous. A native of corn fields in Barbary, near Maſcar. 12. C. *pinnatus*, Willd. 12. Deſf. tab. 229. "Stem one-flowered; leaves pinnate; pinnæ often trifid, ſpinous ſerrated; inner calyx-ſcales ſcarious and toothed at the tip." *Root* perennial. *Flowers* blue. A native of Barbary. 13. C. *carduncellus*, Linn. 7. Mart. 7. Lam. 5. Willd. 14. (Cnicus cæruleus humilis montis Lupi, Tourn. 451. Carduncellus, Moriſ. tab. 33. fig. 15.) "Stem-leaves linear, pinnate, the length of the plant." Linn. "Stems weak, one-flowered; leaves long, ſcarcely ſpinous; root-leaves lyrate; ſtem-leaves pinnate; pinnæ narrow, decurrent." Lam. *Root* perennial. *Stems* ſeveral, about ſix inches high, ſimple, ſometimes a little woolly. *Flower* blue, large, terminal: outer calyx-ſcales foliaceous, inner ones ſmooth, ciliated at their ſummit, and terminated by a ſmall ſcarious appendage; down of the ſeed capillary, unequal, deciduous. A native of the fouth of France. 14. C. *mitiſſimus*, Linn. 6. Mart. 6. Willd. 13. (C. humilis, Lam 6.?) "Leaves not fpinous; root-leaves toothed; ftem-leaves pinnate." Linn. "Generally ftemlefs; leaves fpreading on the ground; flower large." Lam. *Root* perennial. *Stem* fometimes none; fometimes four inches high, fmooth, flightly ftriated, with one or two leaves. *Root-leaves*, fome lanceolate, dilated at the end, and very fmooth, toothed from the middle to the end; teeth turned upwards, fharp, ending in a fmall thorn; others pinnatifid; pinnæ linear-lanceolate, refalcated, quite entire, fome of them eared at the bafe underneath. *Stem-leaves* interruptedly pinnatifid. *Flower* bright blue; calyx large; outer fcales foliaceous, concave, fpinous-ciliated, often quite entire, feldom laciniated, and generally deftitute of confpicuous veins or nerves; inner ones narrower, obtufe; membranous, dilated, and ciliated at the tip. *Down* of the feed capillary. Gouan. A native of France. 15. C. *arboreſcens*, Linn. 9. Mart. 8. Lam. 7. Willd. 15. (Cnicus hifpanicus arboreus, Tourn. 451.) "Leaves fword fhaped, finuate-toothed." Linn. *Root* perennial. Whole plant pubefcent. *Stem* fix feet high, firm, ever-green. *Leaves* clafping the ftem, green, veined, very fpinous at their edges; lower ones near a foot long, finuated, or pinnatifid, with fpinous teeth. *Flower* moft commonly folitary, yellow, of a pleafant fmell; outer calyx-fcales foliaceous, fpinous; inner ones ciliated; down of the feed capillary. A native of Spain. 16. C. *maculatus*, Lam. 8. (Carduus marianus, Linn. Eng. bot. 976. Curt. Lond. tab. 54. Silybum marianum, Gært. tab. 162. fig. 2.) "Leaves finuated, toothed-fpinous, embracing the ftem; calyx-fcales appendicled, fpinous at the margin and tip." Lam. *Root* annual. *Stem* five or fix feet high, branched, furrowed, fmooth. *Leaves* large, deep green, beautifully variegated with milk-white veins; root-leaves pinnatifid; ftem-leaves alternate, recurved, oblong, acute, repand, generally fmooth, ciliated at the edge with unequal fpines. *Flowers* purple, terminal, folitary, large, on naked peduncles; calyx-fcales very different from thofe of carduus, diftinctly appendicled, armed with lateral and terminal fpines. A native of road fides, &c. in England, France, and other parts of Europe. There is a variety not unfrequent in the neighbourhood of London without variegated leaves. The common fort was held in great veneration by the phyficians and botanifts of the dark ages, having, as they imagined, derived its white veins from the milk of the Virgin Mary, which accidentally dropt upon it. Its root, leaves and feeds are fudorific, cooling, and diuretic. It has alfo been recommended as a pectoral, and is faid to have been taken with effect in pleurify. 17. C. *corymboſus*, Linn. 8. Mart. 10. Lam. 9. (Chamæleon niger, Bauh. pin. 380. Dalech. hift. 1454. Lob. ic. 2. p. 5. Carduus chamæleon, Morif. tab. 33. fig. 17. Brotera corymbofa, Willd.) "Flowers in a corymb, numerous." Linn. Whole plant formidably fpinous. *Root* perennial. *Stem* from fix to nine inches high, upright, channelled, branching into a corymb at its fummit. *Root-leaves* rather large, fpreading on the ground, dark green, fmooth, deeply divided; divifions pinnatifid, toothed and fpinous. *Stem-leaves* fmall, oblong, feffile; armed at their edges with fhort, ftiff, double fpines. *Flowers* fmall, of a clear blue colour, (white, Miller), forming with their bractes a denfe clufter at the ends of the branches; calyx oblong; fcales armed with fpines at their edges and fummit. A native of the fouth of Italy, Romania, and Sardinia. It has the habit of echinops, and according to Willdenow, properly belongs to the order fegregata, where he has placed it as a diftinct genus next to echinops, but La Marck afferts that it has all the characters of carduus, and ought not to be feparated from the other fpecies of this genus. No author befides Willdenow has mentioned a proper calyx to each flo[illegible] C. *caneſcens*, Lam. 10. (C. acarna, Juff. Cni[illegible] Linn. 7. Mart. 5. Willd. 8. Cnicus polycephalus, Tourn. 451, &c. Acarna major caule foliofa, Bauh. pin. Chamæleon falmanticenfis, Cluf. hift. 2. p. 155. Lob. ic. 2. p. 17.) "Leaves narrow-lanceolate, decurrent, toothed, armed with yellowifh fpines; calyxes conical, woolly; fcales pinnate-fpinous near the tip." Lam. *Root* perennial. *Stem* a foot and half high, erect, winged, branched, forming a corymb at its fummit. *Leaves* whitifh. *Flowers* purple, oblong or conical, cluftered and feffile at the fummits of the branches, furrounded by bractes; florets fmall; calyx woolly; fcales terminated by an appendage, armed with yellowifh lateral and terminal fpines. A native of Spain and the fouth of France. 19. C. *magellanicus*, Lam. 14. "Leaves linear, quite entire, fmooth; ftem herbaceous, one-flowered." *Stem* fix or feven inches high, fimple. *Leaves* fmooth, without fpines; lower ones long, numerous, growing near together. *Flower* terminal, fmall, naked; outer calyx-fcales ovate, fmooth, a little appendicled, with very fhort lateral fpines. Found in the Straits of Magellan by Commerfon. 20. C. *ſalicifolius*, Linn. Jun. Supp. p. 550. Mart. 9. Lam. 15. Willd. 16. "Stem fhrubby; petioles fpinous; leaves lanceolate, entire, downy underneath, prickly at the tip; branches one flowered." *Branches* long, whitifh, cottony. *Leaves* fcattered, nearly feffile, fmooth and veined above, cloathed with a white cottony, or filky procumbent down underneath, terminated by a feeble fpine. *Flowers* white, folitary, terminal, naked; calyx fhort; fcales imbricated, appendicled, white on the outfide, bordered with fpinous teeth; down of the feed feathery, on which account Ventenat is inclined to think it an atractylis. A native of the Ifland of Madeira. La Marck, Encyc. vol. i. p. 639, 640, has removed atractylis cancellata and gummifera of Linnæus to this genus; but his fucceffor Poiret has remanded them back again to their former ftation. See Encyc. vol. vi. p. 29, 30, fub Quenouillette and Atractylis of this dictionary.

Obf. Gærtner makes *naked feeds* an effential part of the generic character. His carthamus of courfe includes only the firft fpecies, all the others having their feeds crowned with down; and even in that, the feeds are faid by Juffieu, Ventenat, and du Tour, not to be naturally naked, though the down, being extremely caducous, has efcaped the notice of moft authors.

*Propagation and Culture.*—The firft fpecies has been cultivated in Egypt from the earlieft ages for the ufe of dyers. From 16 to 18,000 hundred weight of flowers is the prefent average annual produce; feven eighths of which are exported to Europe; the reft is confumed in the country and other parts. It was not known in Italy in the time of the elder Pliny, but it is faid by Allioni to be now found apparently wild, or at leaft perfectly naturalized in the neighbourhood of Nice. It is cultivated with fuccefs in fome parts of Germany, where its feeds come to compleat maturity; and was introduced into England, as appears from Turner's herbal, as early as 1551. In the year 1683, twenty-five acres in the vale of Evefham, in Gloucefterfhire, were fowed with its feed, and the produce was fuch as might have juftified a farther trial. No attempt of the kind, however, has fince been made; and there is perhaps reafon to apprehend that in our variable climate, and with our frequent wet fummers, the crop would always be uncertain; for the quality of the flowers is confiderably impaired if they are expofed to rain in the interval between their opening and being gathered for uſe. In Germany it is ſown in the lighteſt land, which has always a double fallow given to it, firſt to deſtroy the weeds, and afterwards to make it fine. After it has been fallowed a ſummer and a winter, and has been ploughed and harrowed four times, it receives its laſt ploughing and harrowing in the latter end of March. The ſeeds are then ſcattered thinly in drills, made with a ſmall plough, about a foot and half from each other, and the earth is drawn into them with a harrow, whoſe teeth are little more than an inch long: a roller is finally drawn over the ground to ſmooth and to ſettle it. After the plants are come up they are hoed three times, about five or ſix weeks between each time; and as ſoon as the flowers begin to open, the field is gone over once a week to gather ſuch as are ready. There is uſually a ſucceſſion of flowers for five or ſix weeks; but great care ſhould be taken that there be no dew upon them when they are gathered. They are immediately dried in a kiln, and may then be preſſed cloſe without fear of detriment. In Spain this plant is cultivated in their gardens, as marigolds are in England, to give a colour to their ſoups, olios, and other viands. Conſidered merely as an ornament, it is worthy of a place in the borders of our large gardens, as it continues in flower eight or ten weeks. The ſeeds ſhould be ſown about the beginning of April, in the ground where the plants are intended to remain, for the roots are injured by tranſplanting. Moſt of the other ſpecies will ſtand our winter in the open ground, but ſeveral of them will ſcarcely ripen their ſeeds; ſuch of them as are perennial may, however, be readily increaſed by parting the roots. See SAFFLOWER.

CARTHAMUS *Africanus fruteſcens*, Walth. hort. See ATRACTYLIS *oppoſitifolia*.

CARTHARA, in *Ancient Geography*, a town of Meſopotamia.

CARTHEUSER, JOHN FREDERIC, in *Biography*, profeſſor of medicine at Francfort on the Oder, acquired conſiderable reputation about the middle of the laſt century, by ſeveral very luminous works on the ſubjects of botany and pharmacy. The principal of theſe are "Rudimenta Materiæ medicæ rationalis." Francof. 8vo. 1741, reprinted in 1749, much enlarged and improved, in two volumes 8vo. Beſides deſcribing the ſimples, and the method of preparing and compounding them, the author has given the reſult of his own experience of their virtues. "De Genericis quibuſdam Plantarum Principiis, hactenus plerumque neglectis." Francof. 1754, 8vo. A valuable work, Haller ſays, in which the author introduces ſeveral articles not before found in ſimilar publications, particularly of the trees producing wax, a ſubſtance like butter, and a kind of ſuet. The trees are natives of China. Beſides the above, there is a variety of diſſertations, moſtly on intereſting ſubjects. The titles, with ſhort accounts of them, are given in Haller's Bib. Botan. See alſo Eloy. Dict. Hiſt.

His two ſons, Frederic Auguſtus, and William, became alſo doctors in medicine, under the auſpices of their father. The principal of the works left by them are, "Elementa Mineralogiæ ſyſtematicè diſpoſita." Francof. 1755, 8vo, by the elder; and "Diſſertationes phyſico-chemico-medicæ, de quibuſdam materiæ medicæ ſubjectis," 8vo. 1774; and "Diſſertationes nonnullæ ſelectiores, phyſ. chem." 8vo. 1775, including ſome written by the father, and by other writers.

CARTHUSIANS, in *Eccleſiaſtical Hiſtory*, a branch of the BENEDICTINS, an order of religious, inſtituted by S. Bruno, about the year 1084 (ſome ſay in 1080, and others in 1086), remarkable for the auſterity of their rule, which obliges them to a perpetual ſolitude; a total abſtinence from fleſh even at the peril of their lives; and to feed on bread, water, and ſalt, one day in every week; and abſolute ſilence, except at certain ſtated times.

Their houſes were uſually built in deſerts, their fare coarſe, and their diſcipline ſevere. It is obſerved, that the monaſtical piety is ſtill better preſerved in this, than in any of the other orders. M. l'Abbé de la Trappe, however, endeavours to ſhew, that the Carthuſians do not live up to the auſterity enjoined by the ancient ſtatutes of Guigues, their fifth general. M. Maſſon, general of the order, anſwers the abbé; and ſhews that what he calls the ſtatutes, or conſtitutions of Guigues, are, in reality, only cuſtoms compiled by father Guigues; and that they did not become laws till long after.

The word is formed from *Carthuſianus*, or *Carthuſienſis*, a denomination given them in Latin, from a village in Dauphiny called *Chartreuſe*, in Latin *Cartuſium*, *Caturſium*, as ſome ſay, where the firſt monaſtery of this kind was erected. Hence the French call the religious of this order *Chartreu*, and their convents *Chartreuſes*; an appellation which alſo appears to have anciently obtained in England; whence the name of that celebrated hoſpital, or rather college, in London, the Charter-houſe; by corruption from *Chartreuſe*.

The Carthuſian habit is all white within, their ſcapular being joined in the ſides by two pieces of the ſame ſtuff. They wore a hair ſhirt next their ſkin. Their prior and procurator, who may go abroad upon the neceſſary affairs of the houſe, appear in a black cloak down to the ground, and a black hood over the white one; the hood not round, but tapering to a point.

There are few nuns of this order. There have, however, been ſome female Carthuſian convents; but the increaſe of them was prohibited in 1368; ſo that there remained only five, four in France, and one at Bruges in Flanders. As the rigorous diſcipline of the Carthuſians is altogether inconſiſtent with the tenderneſs and delicacy of the female ſex, the auſterity of the order has been diminiſhed in the female convents; and it was more particularly found neceſſary to abrogate thoſe ſevere injunctions of ſilence and ſolitude, that are ſo little adapted to the known character and genius of the ſex. They were brought into England by Henry II. about the year 1180, and had only nine houſes; their firſt houſe being at Witham in Somerſetſhire.

CARTHUSIAN *powder, poudre des Chartreux*. See KERMES *mineral*.

CARTIER, or QUARTIER, JAMES, in *Biography*, an eminent navigator, was born at St. Malo's, where he diſtinguiſhed himſelf as a ſkilful pilot. Francis I. employed him to proſecute diſcoveries in Canada, for which purpoſe he made a voyage thither in 1534, examined the country with great attention, and gave an exact deſcription of all its iſlands, coaſts, capes, bays, &c. which was of great uſe to ſubſequent navigators.

CARTILAGE, in *Anatomy*, is a ſemipellucid ſubſtance, of a milk-white or pearly colour, entering into the compoſition of ſeveral parts of the body. It holds a middle rank in point of firmneſs, between bones, or hard parts, and the ſofter conſtituents of the human frame. It appears, on a ſuperficial examination, to be homogeneous in its texture: for, when cut, the ſurface is uniform, and contains no viſible cells, cavities, or pores, but reſembles the ſection of a piece of glue. The cartilages of the ribs, however, particularly in adults, preſent a kind of fibrous appearance in their texture: and Dr. Hunter has diſcovered, by microſcopical examination, that the cartilaginous cruſts of articular ſurfaces are compoſed of ſtraight parallel fibres directed towards the cavity of the joint. (Philoſ. Tranſact. N° 470.) This ſubſtance poſſeſſes a very high degree of elaſticity ; which properly diſtinguiſhes it from all other parts of the body. Hence it enters into the compoſition of parts, whoſe functions require the combination of firmneſs, with pliancy and flexibility : the preſervation of a certain external form, with the power of yielding to external force or preſſure.

Cartilages are covered by a membrane, reſembling in texture and appearance, as well as in its office, the perioſteum of bones : this is termed the perichondrium. They receive arteries and veins from this membrane : theſe veſſels, however, have never been demonſtrated in the cartilaginous cruſts of articular ſurfaces. Abſorbent veſſels cannot be actually ſhewn : but their exiſtence is abundantly proved by many phenomena. The converſion of cartilage into bone is alone ſufficient for this purpoſe. The cartilaginous ſubſtance is gradually removed as the formation of the bone advances. In affections of the joints their cartilaginous coverings are often both entirely deſtroyed, or partially removed ; which appearance can only be aſcribed to the action of abſorbent veſſels. It does not ſeem to poſſeſs nerves, as it is entirely deſtitute of ſenſibility.

Its colour is not affected by feeding an animal with madder.

It reſiſts the effects of preſſure from contiguous diſeaſe, longer than the bones, or the ſoft parts of the body. Dr. Hunter has obſerved this in the cartilages of the ribs ; and the ſame fact is alſo witneſſed in thoſe of the vertebræ, in the caſe of aneuryſm in the deſcending aorta.

It does not exfoliate like the ſubſtance of bones.

When deſtroyed, it is never reproduced. We have obſerved a curious exemplification of this fact in caſes of unreduced luxation. The head of the diſlocated bone has its cartilaginous cruſt gradually worn away by friction againſt the ſurrounding parts ; this is never replaced ; but the ſubſtance of the bone itſelf becomes highly poliſhed. The new cavity, which is ultimately formed for it in the bone, on which it lies, has no cartilaginous ſurface, but is poliſhed in the ſame way.

The thinner cartilages of the body are reſolved by maceration into a kind of fibrous ſubſtance : e. g. thoſe of the organs of ſenſe. Theſe are the ſofteſt, and moſt flexible in the body. Thoſe of the ribs, if boiled or macerated for ſome months, ſeem to conſiſt of oval laminæ, ſurrounding each other concentrically, and connected by tranſverſe fibres. Theſe are much more denſe and elaſtic. The intervertebral and interarticular cartilages, with that of the ſymphyſis pubis, obviouſly contain a conſiderable intermixture of tendinous fibres ; and may be reſolved into a cellular texture.

Digeſtion, in a cloſe veſſel, diſſolves cartilages, and converts it into a jelly.

The cartilages of the body are divided, by anatomiſts, into two kinds : the temporary and the permanent. The former are confined to the earlier ſtages of exiſtence ; the latter commonly retain their cartilaginous ſtructure throughout every period of life. The temporary cartilages are thoſe in which the bones of the body are formed. They are hence called by Latin writers Oſſeocentes. All the bones in the body, except the teeth, are formed in a nidus of cartilage. The form of the bone, with its various proceſſes, is accurately repreſented in theſe cartilaginous primordia ; and it is the ſubſtance alone which changes. In the early periods of fœtal exiſtence, theſe cartilages are of a ſoft and gelatinous texture : they become firmer and harder as the growth of the ſubject advances. No difference is obſerved in the cartilage, whether a long or a broad bone is to be formed in it ; whether the future bone be of the reticulated or compact ſtructure. As the oſſific matter is depoſited, the cartilaginous ſubſtance is abſorbed. The epiphyſes are ſtill connected to the body of the bone by cartilaginous cruſts, after they are completely oſſified ; but this part is ultimately conſolidated.

The permanent cartilages are of various kinds. The external ear, the external aperture of the noſtrils, and the eyelids, are compoſed of a thin and flexible cartilage, incloſed in a duplicature of the common integuments. See Eye, Ear, and Nose.

The larynx is entirely compoſed of this ſubſtance, and the trachea, with its branches, is furniſhed with pieces of cartilage, by which theſe tubes are kept permanently open, for the ready paſſage of air to and from the lungs. See Larynx and Trachea.

Portions of a denſe and elaſtic cartilage are annexed to the anterior extremities of the ribs ; and in the ſeven firſt ribs are articulated to the ſide of the ſternum. The elaſticity of theſe parts conſtitutes a chief inſtrument of reſpiration, by reſtoring the ribs to their former poſition when the action of the intercoſtal muſcles has ceaſed.

Contiguous bones are ſometimes united by the intervention of cartilage : as the two oſſa pubis, the ſacrum and oſſa innominata, and the two bones of the ſternum. This ſpecies of junction is technically termed ſynchondroſis.

The bodies of the vertebræ are joined by large maſſes of a peculiar ſubſtance, partaking of the properties and appearance of cartilage and ligament ; which allow of the motions of theſe parts on each other, without weakening the ſupport which is afforded to the upper parts of the body in general, and to the head in particular, by the vertebral column. Theſe cartilages impart a great elaſticity to the ſpine ; by which the effects of concuſſion, from jumping, from falls, &c. are weakened, and deſtroyed, before they can be propagated to the head. When the body has been long in an erect poſition, the compreſſion of theſe cartilages by the weight of the upper parts of the body, diminiſhes the height of the perſon. They recover their former length, when freed from the preſſure of the ſuperincumbent parts. Hence a perſon is taller when he riſes in a morning, than after ſuſtaining the fatigues of the day ; and the difference has ſometimes amounted to an inch. (Philoſophical Tranſactions, No. 383. Hiſt. de l'Acad. des Sciences, an. 1725.)

Cartilages are ſometimes interpoſed between the articular ſurfaces of bones ; where they fill up irregularities, that might otherwiſe impede the motions of the part ; and increaſe the ſecurity of the joint, by adapting the articular ſurfaces to each other. Inſtances of this are found in the articulation of the lower jaw ; in the connection of the clavicle with the ſternum, and in the knee-joint. Theſe are called interarticular cartilages.

The articular ſurfaces of bones are in every inſtance covered by a thin cruſt of cartilage, having its ſurface moſt exquiſitely poliſhed, by which all friction in the motions of the joint is avoided, and the ends of the bones glide over each other with the moſt perfect facility.

Theſe permanent cartilages become not unfrequently more or leſs oſſified in old perſons. The cartilages of the larynx, particularly the thyroid and cricoid, and thoſe of the ribs, are generally affected in this way in an advanced age : yet ſome inſtances have been obſerved, where this change had not taken place, even in very old ſubjects, as, e. g. in the caſe of Thomas Parr, who was examined by Harvey, (Sectio Thomæ Parre, Lond. 1669, 8vo.) and of another perſon of 130 years old by Keill. (Phil. Tranſ. No. 306.) The ſymphyſis of the pubis, and that of the ilium and ſacrum, are very rarely affected indeed ; and oſſific union of the bodies of the vertebræ is alſo very uncommon.

The reader may conſult on the ſubjects of this article, J. G. Haaſe Diſſert. de Fabricá Cartilaginum, Lipſiæ, 1767. 4to. and the firſt vol. of Soemmerring's work, De Corporis humani Fabricá.

CARTILAGINOUS *fiſhes*, *Piſces Cartilaginei*, and *Les Poiſſons Cartilagineux* of the French. The fiſhes of this tribe are diſtinguiſhed by having, as their name implies, a cartilaginous inſtead of bony ſkeleton.

The cartilaginous fiſhes are numerous, embracing the whole of the two laſt orders of Ichthyology, the *Branchioſtegi*, and *Chondropterygii*. in which the following genera are contained, Mormyrus, Oſtracion, Tetrodon, Diodon, Syngnathus, Pegaſus, Centriſcus, Baliſtes, Cyclopterus, Lophius, Acipenſer, Chimera, Squalus, Raja, Petromyzon, and Gaſtrobranchus (*myxine*, Linn.)

Linnæus ſeparated the cartilaginous from the other fiſhes, and placed them in the claſs Amphibia, where they conſtituted the order Nantes. This diſtribution was made under the ſuppoſition of the cartilaginous fiſhes being furniſhed both with lungs and gills, an idea apparently confirmed by the obſervations of Dr. Garden of South Carolina, who at the deſire of Linnæus examined the organs of the genus Diodon, and found, as he conceived, both external gills, and internal lungs. Theſe ſuppoſed lungs, however, have been ſince aſcertained by naturaliſts to be only a peculiar modification of the gills, and it therefore now appears that this cartilaginous tribe are, in reality, fiſhes, differing principally, if not entirely, from other fiſhes in having, as before mentioned, a cartilaginous ſkeleton. They differ from the generality of other fiſhes, in having the gills deſtitute of bony rays, or in the gills being cartilaginous ; and they are deficient, for the moſt part, at leaſt, of obvious ſcales, thoſe being either very deciduous, minute, or ſo deeply imbedded in the ſkin as to be ſcarcely viſible : in many of the cartilaginous fiſhes there is not even the ſlighteſt appearance of ſcales on the ſurface of the ſkin. See FISHES and ICHTHYOLOGY.

CARTILAGINOUS *leaf*, among *Botaniſts*. See LEAF.

CARTILI, in *Antient Geography*, a bay of Africa, where veſſels ſheltered themſelves from the eaſterly wind ; ſituate N.E. of the mouth of the river Chinalaph.

CARTILIS, a place of Africa, in Mauritania Cæſarienſis, between Cartennæ and the colony of Cæſarea, according to the Itinerary of Antonine.

CARTINAGA, a town of India, on this ſide of the Ganges. Ptolemy.

CARTISMANDUA, in *Biography*, queen of the Brigantes in Britain about the middle of the firſt century, juſtly incurred infamy by cauſing Caractacus, who had put himſelf under her protection with promiſes of ſafety, to be arreſted and delivered up to the Romans, A. D. 49. By this act of treachery, ſhe gained their favour and increaſed her own power and wealth. But afterwards, preferring to her huſband Venuſius, who was eſteemed the beſt warrior among the Britons (Caractacus excepted), his equerry Vellocatus, and advancing him to the partnerſhip of her throne and bed, ſhe occaſioned two contending parties ; one in favour of Venuſius, which maintained his right to the throne, and another which adhered to the intereſt of Cartiſmandua. When ſhe found herſelf likely to be overpowered, ſhe ſought the protection and aſſiſtance of the Romans, who ſecured her ſafety, and in the iſſue of the conteſt made themſelves maſters of the country. Tacitus, Annal. xii. Hiſt. iii.

CARTMEL, in *Geography*, is a market town of Lancaſhire, England, ſeated in a woody vale, near a tract of ſands which run out into the Iriſh Sea. Theſe ſands bear the reſpective names of three rivers, which here diſcharge themſelves into the ocean. To ſhorten the diſtance from one place to another many perſons travel acroſs theſe ſands, but from the danger that attends theſe pathleſs roads, it is found neceſſary for ſtrangers to employ guides, who are conſtantly waiting for that purpoſe. Theſe are employed, and paid, by the government. In the vicinity of the town are ſome high hills, known by the name of Cartmel Fells. Here was formerly a priory, which was founded by William Mareſchall, earl of Pembroke, in the year 1188, for canons regular of the order of St. Auſtin. The church, which originally belonged to this religious foundation, is appropriated to the pariſh, and is a large handſome ſtructure. Its tower is very peculiar, being ſquare for ſome diſtance from the ground, and the upper part ſet diagonally within the lower. The interior of the church is fitted up in a very neat ſtyle, and contains a number of fine, and ancient monuments. The pariſh has five chapels of eaſe, at ſmall places in the vicinity of the town. Here is a free grammar ſchool well endowed, and its buildings were re-erected in 1790. Though Cartmel has no particular manufactories, yet in its vicinity are three very large cotton-mills. Here are two weekly markets, Tueſdays and Saturdays ; and two annual fairs. Cartmel is 16 miles from Lancaſter, and 265 N.W. from London. It contains 140 houſes and 882 inhabitants.

About three miles ſouth of the town are *Cartmel-Wells*, which are reſorted to in the ſummer ſeaſon, and their waters are found ſerviceable in ſcorbutic complaints. A pleaſant walk through the woods of about a mile leads to *Holker-Hall*, the ſeat of lord George A. Cavendiſh. The manſion is ornamented with ſeveral fine pictures by Vandyke, and other maſters.

CARTON, or, as we pronounce it, CARTOON, in *Painting*, a deſign made on ſtrong paper, to be afterwards calqued through, and transferred on the freſh plaſter of a wall, to be painted in freſco.

CARTON is alſo uſed for a deſign coloured, for working in moſaic, tapeſtry, &c. The word, in the original French, ſignifies *thick paper* or *paſte-board*.

In Italian, whence the term ſeems to be derived, *cartone*, or *cartoni*, ſignifying *large paper*, denotes ſeveral ſheets of paper paſted on canvas, on which large deſigns are made, whether coloured or with chalks only. Of theſe cartoons there are many by Domenichino, Lionardo da Vinci, Andrea Mantegna, Michael Angelo, &c. ; but the moſt celebrated performances of this kind are the "cartoons of Raphael" or Raffaello Sanzio, Da Urbino, which are ſeven in number, and form only a ſmall part of the ſacred hiſtorical deſigns executed by this famous artiſt, while engaged in the chambers of the Vatican under the auſpices of pope Julius II. and Leo X. As ſoon as they were finiſhed, they were ſent to Flanders, to be copied in tapeſtry, for adorning the pontifical apartments ; but the tapeſtries were not conveyed to Rome till after the deceaſe of Raphael, and probably not before the dreadful ſack of that city in 1527 under the pontificate of Clement VII. ; when Raphael's ſcholars having fled from thence, none were left to inquire after the original cartoons, which lay neglected in the ſtorerooms of the manufactory. The revolution that happened ſoon after in the Low Countries prevented their being noticed during a period in which works of art were wholly neglected. Theſe ſeven, however, eſcaped the wreck of the others, which were torn in pieces, and of which ſome fragments remain in different collections. Theſe were purchaſed by Rubens for Charles I., but they had been much injured by the weavers. In this ſtate they alſo fortunately eſcaped being ſold in the royal collection, by the diſproportionate appraiſement of theſe ſeven at 300l. and the nine pieces, which were the triumph of Julius Cæſar by Andrea Mantegna, appraiſed at 1000l. The cartoons ſeem to have been little noticed till king William III. built a gallery for the purpoſe of receiving them at Hampton-Court. After having ſuffered much from the damps of the ſituation in which they were placed, they were removed by order of his preſent majeſty king George III. to the queen's palace at Buckingham-houſe, and from thence to the caſtle at Windſor, where they are open to public inſpection. Theſe cartoons are juſtly repreſented as "the glory of England, and the envy of all other polite nations;" and his majeſty is entitled to a tribute of reſpect and applauſe for his care in preſerving theſe precious treaſures. They have been long deſervedly held in high eſtimation throughout Europe by all authors of refined taſte, and by all the admirers of the art of deſign, for their various and matchleſs merit, particularly with regard to the invention, and to the noble expreſſion of ſuch a variety of characters, countenances, and attitudes, as they are differently affected and ſuitably engaged, in every compoſition. The Abbé du Bos, in his treatiſe on poetry and painting, has committed a very groſs error in his developement of one of the characters in this collection. Having deſcribed the carton of the miraculous draught of fiſhes, he points out with propriety the expreſſion of St. Peter, St. John, and other diſciples, and then proceeds to illuſtrate a ſingular character, which he ſeems particularly to admire, for the ſtrength and juſtneſs of the expreſſion; that figure, according to his opinion, being repreſented with a confuſed countenance, and melancholy complexion, and ſeeming to be devoured by black jealouſy, in which perſon (he ſays) it is eaſy to diſtinguiſh Judas. Whereas if this ingenious writer had maturely conſidered the time which Raphael choſe for his ſubject, and which was, as the evangeliſt informs us, the third time of our lord's appearing to his diſciples after his reſurrection, and conſequently ſome weeks after the death of Judas, who hanged himſelf when Chriſt was condemned; or if he had counted the number of figures in the compoſition, which is only eleven and our Lord himſelf, he could never have committed ſo unaccountable an error, as to imagine that Raphael deſerved commendation for being ſo abſurd as to introduce ſo infamous a wretch, at ſuch a point of time, when Chriſt was directing his diſciples to take care of his flock; or for grouping ſuch a perſon among the apoſtles, who, as he was dead before, could not aſſociate with them, and whom they would have avoided, if he had been alive, with abhorrence and deteſtation. The diſcernment and judgment of Raphael could not have allowed him to be guilty of ſo groſs an anachroniſm. "Perhaps the beſt apology, and the trueſt (ſays Pilkington), that can be made for this miſtake of Du Bos, is, that he was much more converſant and better acquainted with the works of Raffaello than with the works of the Evangeliſts. Mr. Fuſeli, however, remarks, that Mr. Pilkington has miſcalculated the number of the cartoons; as he mentions that which repreſents the miraculous draught of fiſhes, and the ſubſequent one of the donation of the keys, with regard to which Du Bos committed his error, as if they were the ſame. Pilkington's Dictionary of Painters by Fuſeli, art. *Raffaello* SANZIO, *Da Urbino.*

CARTOUCH, in *Architecture, Sculpture,* &c. denotes an ornament repreſenting a ſcroll of paper; being uſually in form of a table, or flat member, with wavings; whereon is ſome inſcription, or device, ornament of armory, cypher, or the like. It is nearly akin to a modillion; from which it only differs in this, that the latter is uſed under the cornice in the eaves of a houſe, and the former in wainſcotting within doors. Some workmen call the *cartoozes* DENTILS. The word is French, formed from the Italian *cartoccio*, which ſignifies the ſame. Cartouches are ſometimes drawn on paper, as in the titles of maps, &c. and are ſometimes made of ſtone, brick, plaſter, wood, &c. for buildings.

CARTOUCHES, in *Heraldry*, a name given to a ſort of oval ſhields, much uſed by the popes and ſecular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on. Many ſuppoſe this form derogatory to the honour of the perſon; but though the ſquare ſhield, with the rounded and pointed bottom, is more in uſe with us, as alſo with the French and Germans, yet this is ſuppoſed more truly the figure of the Roman ſhield worn by the ſoldiery, and therefore more ancient and honourable than either that or the indented ſhield of the Germans.

CARTOUCH, in the *Military Art*, a wooden caſe about three inches thick at bottom, and girt round with marline, holding two, three, or four hundred muſquet balls, with eight or ten iron balls weighing one pound each, to be fired from a mortar, gun, or howitzer, for the defence of a paſs, defile, ditch, breach, retrenchment, &c. It ought not to be confounded with the *gargouge, gargouche,* or *gargouſſe*, which is ſimply the caſe or roll of paper, paſte-board, parchment, or flannel, &c. filled with the charge of powder neceſſary for the caliber or bore of the piece or fire arm made uſe of; whereas the cartouch contains, beſides the powder, balls of lead, old nails, chains, pieces of iron, &c. &c., which are put into the piece inſtead of a bullet, whether on a breach or on a retrenchment, in defending a paſs, or againſt an enemy near to you in battle. Thoſe, who make uſe of this ſort of firing, are ſaid to fire with the cartouch, in French *tirer a cartouche.*

CARTOUCHES, in *Artillery*, are made of leather for flinging over the ſhoulders of the matroſſes; who carry in them the ammunition from the magazines or waggons for the uſe of the artillery, when they are either at exerciſe or on actual ſervice.

CARTOUCH *de congé abſolu*, known under the name of *congé d'ancienneté*, or leave of ſeniority, is a ſet form of abſolute, final, or unlimited leave of abſence from military ſervice, inſerted on a ſheet of paper called or known by the name of *cartouche,* on which are expreſſed the merits or deſerts of the military perſon, to whom the diſcharge or *congé abſolu* is granted, whether for having finiſhed the time or number of years he was engaged to ſerve by his contract of enrollment, or on account of the impoſſibility of his finiſhing the ſame through his wounds or infirmities, or for other reaſons, that exempt him definitively from ſervice.

CARTOUCH *de ſoldat, cartouchier,* a cartridge-box, pouch, cartouch. It is a caſe of light wood covered with leather, with a flap over it of the ſtouteſt blackened calf-ſkin, ſufficiently thick and ſubſtantial to bear the wetteſt and ſevereſt weather. The caſe is conſiderably longer than broad, and has two rows of holes in it for about 24 muſquet-cartridges. As it hangs from a buff croſs-belt over the left ſhoulder, and is worn in that manner by the infantry, before the body of the ſoldier a little below the right pocket-hole for the purpoſe of carrying his ammunition, it is made of a form ſomewhat rounded or circular in order to apply equally every where to his body. It is worn by him in this way upon a belt both on ordinary duty and in the time of action. The flap is generally ornamented with a braſs crown, &c.

for the battalion-men; a fuſe for the grenadiers; and a bugle-horn for the light infantry. The pouches or cartridge-boxes uſed by the cavalry are ſmaller than thoſe made uſe of by the infantry. Cartridge-boxes have often been made of iron, but ſeldom or ever are now.

CARTRIDGE, in French *gargouge*, *gargouche*, or *gargouſſe*, and ſometimes, but erroneouſly, *cartouche*, which ſignifies not merely the cartridge and charge of powder as the word *gargouſſe*, *gargouge*, or *gargouche* does, but the whole charge, conſiſting of the cartridge and charge of powder with the bullet, grape-ſhot, caſe-ſhot, chain-ſhot, double-headed ſhot, nails, pieces of braſs or iron, or whatever elſe is diſcharged from the piece by the inflammation of the powder. A cartridge, in the ordinary acceptation of the word, is a caſe or cover holding exactly the charge of powder allotted for any piece, and ſo fitting the bore of the ſame as to be rammed home without difficulty. Cartridges have been made of various ſubſtances, ſuch as paper, paſte-board, parchment, bladders, and flannel. The bottoms of paper-cartridges are apt to remain in the fire-arm or piece, and to accumulate to ſuch a degree as to prevent the priming from reaching the powder, beſides which inconvenience they are attended alſo with others. Paſte-board-cartridges are liable to nearly the ſame objections. The fire ſhrivels up thoſe made of parchment or bladders in ſuch a manner, that they enter into the vent and become ſo hard, that the priming iron cannot ſufficiently clear it. Nothing has as yet been found to anſwer better for cartridges than flannel, which is now generally made uſe of for artillery-ones of all ſorts, becauſe as it does not keep or retain fire it is not apt to occaſion accidents in loading, which the others frequently uſed to do. But as the duſt of powder paſſes through them, parchment covers are ſometimes made and put over them, which are taken off as they are uſed. Flannel cartridges, however, may be rendered much more commodious or manageable, and not only a great deal ſtiffer but alſo proof againſt the duſt of powder penetrating or paſſing through them, by boiling the flannel, of which they are made, in ſize. Without ſome ſuch precaution to ſtiffen them, they are ſo pliable, and when large contain ſo much powder, that it is with difficulty they are put into the pieces. The loading and firing of guns with cartridges are much quicker and leſs liable to accidents than with looſe powder.

The cartridge for a heavy braſs 42 pounder, or an iron 42 pounder for ſervice, uſed to contain, and does now, 14 lb. of powder; that for a heavy braſs 32 pounder uſed to contain, and does now, 10 lb. 11 oz. of powder; that for an iron 32 pounder uſed to contain 9 lb. 4 oz. but contains now 10 lb. 11 oz. of powder; that for a heavy braſs 24 pounder or iron 24 pounder uſed to contain, and does now, 8 lb. of powder; that for a heavy braſs 18 pounder uſed to contain, and does now, 6 lb. of powder; that for an iron 18 pounder uſed to contain 8 lb. but contains now 6 lb. of powder; that for a heavy braſs 12 pounder or an iron 12 pounder uſed to contain, and does now, 4 lb. of pounder; that for a heavy braſs 9 pounder uſed to contain 3 lb. of powder, and that for an iron 9 pounder now contains the ſame weight of powder; that for a heavy braſs 6 pounder uſed to contain 2 lb. 8 oz. of pounder, but now contains only 2 lb. of powder; that for an iron 6 pounder uſed to contain 2 lb. 8 oz. of powder, but now contains only 2 lb. of powder; that for a heavy braſs 3 pounder or for an iron 3 pounder uſed to contain, and does now, 1 lb. of powder; that for a medium braſs 24 pounder uſed to contain, and does now, 8 lb. of powder; that for a medium braſs 12 pounder uſed to contain, and does now, 3 lb. 8 oz. of powder; that for a medium braſs 6 pounder uſed to contain, and does now, 2 lb. of powder; that for a medium braſs 3 pounder uſed to contain the ſame weight of powder as one for a heavy braſs 3 pounder, viz. 1 lb. of powder; and one for a braſs 3 pounder, according to general Deſaguliers' conſtruction, contains the ſame charge of powder now; that for a light braſs 24 pounder uſed to contain, and does now, 5 lb. of pounder; that for a light braſs 12 pounder uſed to contain, and does now, 3 lb. of powder; that for a light braſs 6 pounder uſed to contain, and does now, 1 lb. 8 oz. of powder; and that for a light braſs 3 pounder uſed to contain 12 oz. of powder, but contains now only 8 oz.

There ought not, ſtrictly ſpeaking, to be fixed or determinate charges for guns of different calibres. But they ſhould vary as to the weights and quantities of the powder with the ſervices, to which the guns themſelves are to be applied. And it may with truth be aſſerted, that the charges of powder uſually allotted for cannon are generally greater than what are either proper or neceſſary for them on any ſervice whatſoever. The beſt charges even for one and the ſame piece, when applied to different uſes or ſervices, have never as yet been correctly aſcertained, or even nearly ſo.

*Ball-cartridges*, in French *cartouches*. For the convenience of quick firing, the ſhot is fixed to the cartridge by means of a wooden bottom ſo hollowed or cut into on one ſide as to receive nearly one half of the ſhot, which is faſtened to it by two ſmall ſlips of tin, which paſs or croſs over the ſhot and are faſtened to the bottom, to the other ſide of which the cartridge holding the charge of powder is tied.

The cartridges are likewiſe fixed in the ſame manner to the bottoms of grape ſhot, which are uſed with field pieces, and are called in French *cartouches a grappes de raiſin*.

Cartridge-*box*. See Cartouche *de ſoldat*.

CARTWRIGHT, Thomas, in *Biography*, a learned Puritan divine, was born in Hertfordſhire about the year 1535, and admitted into St. John's college in the univerſity of Cambridge in 1550. Such was the aſſiduity of his application, commenced at college and continued through life, that he allowed himſelf only five hours of ſleep. Upon the death of king Edward VI., he quitted the univerſity, and became clerk to a counſellor at law; but in this ſituation he proſecuted his former ſtudies with unremitting diligence, at every interval of leiſure which occurred. Being afterwards recommended by the gentleman who employed him to Dr. Pilkington, maſter of St. John's college in Cambridge, he was reſtored upon giving ſatisfactory evidence of his abilities and attainments, to that ſeminary of learning, and in 1560 was choſen fellow of his college. From hence he was removed to Trinity college, and on account of his peculiar merit, made one of the eight ſenior fellows. When queen Elizabeth viſited the univerſity in 1564, Mr. Cartwright was much diſtinguiſhed; and in 1570 he was choſen lady Margaret's divinity profeſſor. At this time his popularity as a preacher was ſo great, that when it was his turn to officiate at St. Mary's church, it was neceſſary to take down the windows for the accommodation of the multitude that attended him. The ſentiments concerning church diſcipline, which he delivered in his lectures, were unfavourable to the eſtabliſhed hierarchy, and complaints were preferred againſt him to ſir William Cecil, chancellor of the univerſity, both by archbiſhop Grindal and Dr. Whitgift, who deſired that he and his adherents might be ſilenced. The chancellor, to whom Cartwright wrote in his own defence, ſeemed diſpoſed to treat him with moderation; but his adverſaries renewed their accuſations; and he was cited before the vice chancellor, to give an account of the obnoxious ſentiments delivered in his lectures. Incapable of giving ſatiſfaction, he was ſuſpended from his office as a lecturer, and prevented from obtaining his doctor's degree. In 1571, Dr. Whitgift was appointed vice-chancellor; and by his influence Mr. Cartwright was firſt deprived of his Margaret-profeſſorſhip, and afterwards of his fellowſhip. As danger was apprehended from the diſſemination of his principles in the univerſity, he was reduced to the neceſſity of leaving it and of ſeeking ſubſiſtence in a foreign country. Whilſt he was abroad, he formed an acquaintance with the moſt celebrated divines in ſeveral Proteſtant univerſities, who treated him with great reſpect on account of his learning and character; and he was choſen miniſter to the Engliſh merchants firſt at Antwerp, and afterwards at Middleburg, where he continued two years. His friends in England, however, were anxious for his return to his own country, and he at length yielded to their importunity. Upon his return he found that the proſecution againſt the Puritans continued with unabated violence; and though the authors of a piece in their favour, entitled "An Admonition to the Parliament," had been committed to Newgate in 1572, Mr. Cartwright wrote "A ſecond Admonition to the Parliament," which involved him in a controverſy with Dr. Whitgift, that obliged him to leave the kingdom, whilſt it was the means of advancing his opponent to the biſhopric of Worceſter. During an abſence from his country of five years, he officiated in ſome of the Engliſh factories; and in 1580, James VI., king of Scotland, having an high opinion of his abilities, and learning, offered him a profeſſorſhip in the univerſity of St. Andrew's, which he thought proper to decline. Upon his return to England, he was arreſted as a promoter of ſedition, and thrown into priſon; but being liberated by the intereſt of the lord treaſurer Burleigh, and the earl of Leiceſter, the latter conferred upon him the poſt of maſter of the Hoſpital, which he had founded in Warwick. In compliance with the ſolicitations of ſeveral learned friends at home and abroad, he undertook to write againſt the Rhemiſh tranſlation of the New Teſtament; but ſome time after he had commenced the work, archbiſhop Whitgift, by an arbitrary and unjuſt mandate, prohibited his proſecution of it; the performance, however, was nearly completed; and was publiſhed ſome years after his death. In 1585 ſome new complaint was alleged againſt him, and he was committed to priſon by Dr. Aylmer, biſhop of London; and again in 1591, the ſame prelate ordered him to be lodged in the Fleet, where he was kept in a very cloſe and rigorous confinement. Many applications were made on his behalf, but they were ineffectual till about the middle of the year 1592, when he was releaſed, reſtored to his maſterſhip of the hoſpital at Warwick, and permitted to preach. Towards the cloſe of his life, the zeal with which he had, in the earlier period of it, oppoſed the church, was ſomewhat abated, and he ſeems to have lived on terms of friendſhip with archbiſhop Whitgift, who uſed him kindly and tolerated his preaching at Warwick. Long confinement and application to ſtudy had much impaired his health; and at length terminated his life in December, 1603, in his 68th year. In his private character, he was pious, diſintereſted, and charitable; and though the perſecution againſt him was harſh and ſevere, it originated with that conteſt for ſuperiority, which the intolerant principles of each party would lead them to abuſe, and therefore demands ſome kind of apology from the candour of more enlightened and liberal times. Beſides the works already mentioned, Cartwright wrote "Commentaria practica in totam Hiſtoriam evangelicam," 4to. 1630; reprinted at Amſterdam in 1647; "Commentarii ſuccincti et dilucidi in Proverbia Salomonis," 4to. Amſt. 1638; "Metaphraſis et Homiliæ in librum Salomonis, qui inſcribitur Eccleſiaſtes," 4to. Amſt. 1647; "A Directory of Church-government," 4to. 1644; and "A Body of Divinity," 4to. Lond. 1616. Biog. Brit

CARTWRIGHT, WILLIAM, a poet and divine of the 17th century, was born in 1611 at Northway, near Tewkſbury, in Glouceſterſhire, educated at Weſtminſter ſchool, and elected a ſtudent of Chriſt-church in Oxford, in 1628. Having gone through the uſual courſe of ſtudies, he took orders, and became, as Anthony Wood expreſſes it, "a moſt florid and ſeraphical preacher" in the univerſity; where he performed the office of junior proctor, and alſo that of metaphyſical reader. His poetical purſuits amuſed him in the courſe of theſe graver ſtudies, and procured for him unbounded applauſe. But a malignant fever cloſed his career in his 33d year, December 1643. The king and queen, being at this time in Oxford, teſtified their reſpect for him, by their inquiries during his illneſs, and his majeſty wore black on the day of his funeral. Mr. Cartwright was much diſtinguiſhed both by external and internal endowments, and few perſons ſhared a greater degree of attention and applauſe. Four plays, and ſome other poems, compriſed in one volume, and prefaced by about 50 copies of commendatory verſes, by the univerſity wits, are the principal production on which our author's fame was founded. But his popularity does not ſeem to have been very extenſive or durable; as only one edition of his works was publiſhed, and that is at preſent very little known. He is alſo ſaid to have written ſome Latin and Greek poems, a "Paſſion ſermon," and two or three occaſional poems. Biog. Brit.

CARVA, in *Botany*, a name given by the Indians to one of the kinds of cinnamon-tree. This is of all others the moſt eſteemed amongſt them, and ſerves for the greateſt number of purpoſes. They extract camphor and liquid oil from the roots; they extract oil of cinnamon from the bark, and from the leaves they make another oil, which is called oil of cloves, and ſold as ſuch. The fruits yield them an oil reſembling that of juniper, and afterwards they extract from them a thick, fat ſubſtance, like wax, ſerving them for the making of unguents and plaſters, and alſo for the making of their candles.

CARVAGE, *carvagium*, the ſame with CARRUCAGE.

Henry III. is ſaid to have taken carvage, that is, two marks of ſilver of every knight's fee, towards the marriage of his ſiſter Iſabella to the emperor.

Carvage could only be impoſed on the tenants *in capite*.

CARVAGE alſo denotes a privilege whereby a man is exempted from the ſervice of *carrucage*.

CARVALHAL, in *Geography*, a town of Portugal, in the province of Beira; five leagues S.E. of Porto.

CARVALHO, a town of Portugal, in the province of Beira; four leagues S.E. of Coimbra.

CARVALHO D' ACOSTA, ANTONY, in *Biography*, was born at Liſbon in 1650; and having devoted his life to the ſtudy of the mathematics, aſtronomy, and hydrography, undertook to give a topographical deſcription of his country: with this view he traverſed the whole country, following the courſe of its rivers and croſſing its mountains. The reſult of his inveſtigation is the beſt work on the ſubject, contained in three volumes fol. which appeared between the years 1706 and 1712. It compriſes alſo the hiſtory of the principal places, the illuſtrious men to which they have given birth, their natural curioſities, &c. He alſo wrote an abridgment of geography, and a method of aſtronomy. He died in 1715 in ſuch a ſtate of indigence, that he did not leave enough to pay the charges of his funeral. Nouv. Dict. Hiſt.

CARVANCAS, in *Ancient Geography*, a mountain mentioned by Ptolemy, which terminated Norica, and alſo Pannonia to the weſt.

CARVANIS, a town of Cappadocia, placed by Ptolemy in the Pontus Polemoniacus; probably the *Carbanis* of Steph. Byz. and Cedrenus.

CARUCATARIUS, in *Ancient Law Books*, he that held land in SOCCAGE, or by plough tenure.

CARUCATE. See CARRUCATE.

CARUE, in *Rural Economy*, a term ſignifying the ſouring of any ſort of fluid: thus, to *carue* implies to grow ſour, and is generally applied to cream.

CARVEL, in *Ship-building*. When the edges of the planks are towards each other, the veſſel is ſaid to be *carvel-built*, in contradiſtinction to *clinker* or *clinker-built*, where the edges of the planks over lap each other.

CARVEL of *St. Thomas*, in *Geography*, a rock ſituate between the Virgin iſles E and Porto Rico on the W. At a ſmall diſtance it appears like a ſail, as it is white, and has two points. Between it and St. Thomas, paſſes ſir Francis Drake's channel.

CARVENDONCK, a town of Germany, in the circle of Weſtphalia, and duchy of Cleves; eight miles S.S.E. of Cleves.

CARVENTUS, in *Ancient Geography*, a town of Italy, in Latium. Steph. Byz. Livy, lib. IV. c. 53.

CARVER, a cutter of figures or other devices in wood. See CARVING.

Carvers anſwer to what the Romans called *ſculptores*, who were different from *cælatores*, or engravers, as theſe laſt wrought in metal.

CARVER is alſo an officer of the table, whoſe buſineſs is to cut up the meat, and diſtribute it to the gueſts. The word is formed from the Latin *carptor*, which ſignifies the ſame. The Romans alſo called him *carpus*, ſometimes *ſciſſor*, *ſcindendi magiſter*, and *ſtructor*.

In the great families at Rome, the carver was an office of ſome figure. There were maſters to teach them the art regularly, by means of figures of animals cut in wood. The Greeks alſo had their carvers, called δαιτροι, q. d. *deribitores*, or *diſtributores*. In the primitive times, the maſter of the feaſt carved for all his gueſts. Thus in Homer, when Agamemnon's embaſſadors were entertained at Achilles's table, the hero himſelf carved the meat. Of later times, the ſame office on ſolemn occaſions was executed by ſome of the chief men of Sparta. Some derive the cuſtom of diſtributing to every gueſt his portion, from thoſe early ages when the Greeks firſt left off feeding on acorns, and learned the uſe of corn. The new diet was ſo great a delicacy, that to prevent the gueſts from quarrelling about it, it was found neceſſary to make a fair diſtribution. Athen. Deipn. lib. i. cap. 10. Potter. Arch. lib. iv. cap. 10.

In Scotland the king has an hereditary carver in the family of Anſtruther.

CARVER, in *Geography*, a townſhip of America, in the ſtate of Maſſachuſetts and county of Plymouth. Here is a pond containing ſuch quantities of iron-ore, that 500 tons have been taken out of the clear water in a year. Upon the ſtream which runs from the pond is a furnace; and the iron made of this ore is better than that made of bog ore, and ſome of it is as good as refined iron.

CARVER'S *river*, a branch of St. Peter's river, which diſcharges itſelf into the Miſſiſſippi. See *St.* PIERRE.

CARUGNA, in *Geography*, a town of Piedmont, in the marquiſate of Ivrea; 8 miles S.W. of Jurea.

CARUI, in *Botany*, pratenſe officinarum. Bauh. pin. 158. (Tourneſ. Cl. 7. gen. 4.) See CARUM *Carui*.

CARUI, *foliis tenuiſſimis;* Tourn. See SISON *verticillatum*.

CARUI *alpina*; Bauh. pin. See SESELI *Pyrenæum*.

CARUIFOLIA, Bauh. pin. Villars. See SELINUM *caruifolia*.

CARVILLAN, in *Geography*, a ſmall iſland near the W. coaſt of Scotland, a little to the N. of the iſland of Gigo.

CARVIN-ESPINOY, a town of France, in the department of the ſtraits of Calais, and chief place of a canton, in the diſtrict of Bethune; 4 leagues E. of Bethune. The place contains 4920, and the canton 14,807 inhabitants; the territory includes 90 kiliometers and 11 communes.

CARVING, in a general ſenſe, the art or act of cutting or faſhioning a hard body by means of ſome ſharp inſtrument, eſpecially a chiſſel. In which ſenſe, carving includes ſtatuary and engraving, as well as cutting in wood.

CARVING, in a more particular ſenſe, is the art of engraving or cutting figures in wood. In this ſenſe, carving, according to Pliny, is prior both to ſtatuary and painting. See CUTTING *in wood*.

CARVIST, in *Falconry*. See FALCON.

CARULA, in *Ancient Geography*, a town of Spain, in Bætica, between Baſilippo and Ilipa, according to the Antonine Itinerary, ſuppoſed to be the preſent *Villa-Nuevo-del-Rio*.

CARUM, in *Botany*. (Said to derive its name from Caria, in Aſia Minor, where the original ſpecies grows abundantly.) Linn. gen. 365. Schreb. 497. Willd. 561. Juſſ. 219. Gært. 125. Claſs and order, *pentandria digynia*. Nat. ord. *Umbellatæ*, Linn. *Umbelliferæ*, Juſſ.

Gen. Ch. Cal. *Umbel univerſal*, long; rays ten or more, often unequal; *umbel partial*, crowded; *involucre univerſal*, often monophyllous; perianth ſcarcely manifeſt. *Cor. univerſal*, uniform; florets of the diſk frequently abortive. *Cor. proper* unequal; petals five, unequal, obtuſe, keeled, inflex-emarginate. *Stam.* Filaments five, capillary, length of the corolla, caducous; anthers roundiſh, very ſmall. *Piſt.* germ inferior; ſtyles two, very ſmall; ſtigmas ſimple. *Peric.* none; fruit ovate-oblong, ſtriated, diviſible into two. *Seeds* two, convex on one ſide, flat on the other.

Eſſ. Ch. *Fruit* ovate-oblong, ſtriated, general involucre moſt commonly monophyllous. *Petals* keeled, inflexed, emarginate.

Sp. 1. C. *carui*, caraway. Linn. Sp. Pl. Mart. Willd. 1. Woodville. Med. bot. pl. 45. Eng Bot. 1503. (Seſeli Carum. Scop. Lam. Villars. Apium. Crantz. Liguſticum carui; Roth Germ.) "Stem branched; ſheaths of the leaves diſtended; partial involucre, moſt commonly none. Willd. *Root* ſpindle-ſhaped, biennial. *Stem* about two feet high, angular, furrowed, ſmooth. *Leaves* ſmooth, doubly pinnate; cut into linear narrow ſegments, the lowermoſt of which croſs each other. *Umbels* numerous, terminal, upright. *General involucre* of one, two, or three ſmall, narrow, entire leaves; *partial one* almoſt always none. *Petals* nearly uniform, white or very pale fleſh-coloured, inflexed ſo as to become heart-ſhaped; calyx entire. The central flowers only fertile, according to Dr. Smith; but Linnæus deſcribes the flowers of the diſc as being ſometimes abortive, and Dr. Withering aſſerts that they are all fertile. *Fruit* ſmall, oblong, ſtriated, each ſeed almoſt cylindrical. Dr. Smith. The ſeeds are well known to have a pleaſant ſpicy ſmell, and a warm aromatic taſte; and on that account they are a common ingredient in cakes, and are encruſted in ſugar for comfits; they are alſo diſtilled with ſpiritous liquors to improve their flavour. The tender leaves in the ſpring are boiled in ſoups; and the roots are ſaid by Parkinſon to be better eating than parſnips. The ſeeds are eſteemed to be carminative, cordial and ſtomachic, and recommended in dyſpepſia, flatulencies, and other ſymptoms attending hyſterical and hypochondriacal diſorders; they are alſo reported to be diuretic and to promote the ſecretion of milk.

An eſſential oil and a diſtilled ſpirit are directed to be prepared from them by the London college. They give out the whole of their virtues by moderate digeſtion, to rectified ſpirit. Watery infuſions are ſtronger in ſmell than the vinous tincture, but weaker in taſte. In diſtillation or evaporation, water elevates all their aromatic part; the remaining extract is almoſt inſipid, and thus diſcovers that there is in them leſs of a bitteriſh or ungrateful matter joined to the aromatic than in moſt of the other warm European ſeeds. Along with the aqueous fluid there ariſes in diſtillation an eſſential oil in the proportion of about one ounce from thirty, which is hotter in taſte and more pungent than that obtained from moſt of our other warm ſeeds. Woodville. A native of many countries in the northern part of Europe. In England it is found apparently wild, but, as Dr. Smith thinks, only accidentally naturalized, in Bedfordſhire, Cambridgeſhire, Suffolk, Norfolk, Lincolnſhire and Yorkſhire. On the banks of the Humber, near Hull, it is ſo abundant, that great quantities of the ſeeds are collected every year by the poor people and ſold to the apothecaries and confectioners. It is cultivated in ſeveral counties, particularly in Eſſex; and in others, intermingled with coriander and teaſels. Twelve pounds of caraway, ten of coriander, and twelve of teaſels, are a proper quantity for one acre. They require freſh land which has lain long in paſture, and a ſoil conſiſting of a ſtrong clayey loam. The paſture ſhould be ploughed, ſowed, and harrowed about the beginning of March. In about ten weeks the plants will be ſtrong enough to bear hoeing, which ſhould be repeated three times in the courſe of the ſummer. The coriander being annual will be fit to cut about the beginning of July, and is threſhed in the field on a cloth in the manner of rape ſeed. The ground ſhould be hoed again in the ſucceeding April and June, and needs no other culture; the caraway will be ready in the beginning of July, and the teaſels about the middle of September. Mart. Miller. 2. C. *ſimplex*, Willd. 2. "Stem quite ſimple; ſheaths of the leaves preſſed cloſe to the ſtem; partial involucre of many leaves." *Stem* half a foot high, erect, terminated by a ſolitary umbel. *Leaves* reſembling thoſe of the preceding ſpecies, but ſmaller and narrower; ſheaths ſtriated, not dilated, only ſlightly membranous at their edges. *Umbel* conſiſting of from thirteen to fifteen unequal rays; partial umbels capitate. *Leaflets* of the partial involucre briſtle-ſhaped, unequal, numerous. *Flowers* white, ſmall. A native of Siberia.

Carum *foliolis ſetaceis verticillatis*; Sauv. mons. See Siſon *verticillatum*.

Carum *bunias*, Syſt. nat. 12. Jacq. tab. 198. Gouan. illuſ. 20. See Æthusa *Bunias*.

CARUNCULA, Caruncle, a term in *Anatomy*, properly ſignifying a little piece of fleſh, being a diminutive of the Latin *caro*, fleſh.

The name *caruncula* is applied to ſeveral parts of the body.

Caruncula, or Caruncle, in *Surgery*, a kind of warty excreſcence, or fleſhy ſubſtance; which the older ſurgeons ſuppoſed to be a very frequent cauſe of obſtruction in the urinary canal, and particularly in thoſe caſes uſually denominated *Strictures* of the urethra. See Bougies and Stricture. Mr. Hunter, and ſeveral other practitioners, have of late aſcertained, by actual diſſections after death, that patients who have ſuch ſtrictures are very rarely affected with caruncles; and, indeed, that they are ſcarcely ever found, except a ſhort way within the urethra.

Caruncula *lacrymalis*, in *Anatomy*, a ſmall prominence in the inner angle of the eye, between the two eyelids. See Eye.

Carunculæ *myrtiformes*, ſome ſmall fleſhy excreſcences, varying in ſize and number, which are found at the orifice of the vagina, after the rupture of the hymen. See Generation, *organs of*.

CARVO, or Carvonis, in *Ancient Geography*, a place of Belgic Gaul, between Mannaricium and Harenatium, according to the Itinerary of Antonine; placed by M. d'Anville on the left of the Rhine, N.E. of Noviomagus.

CARURA, a town of India, placed by Ptolemy on this ſide of the Ganges.

Carura, a village of Aſia Minor, near the Meander, where they had lodging-houſes for the accommodation of ſtrangers, and a number of hot ſprings. It ſerved as a boundary between Phrygia and Caria. Strabo.

Carura, *Kauri*, a royal town of India, in the interior of the country called Limyrica, according to Ptolemy; ſituated about 15 leagues from the ſea, S.S.E. of Tyndis and N.E. of Muziris.

Carura, or Ortospana, a place of Arachoſia, at the foot of mount Paropamiſus; from which place Alexander ſet out on his entrance into India. It was ſituated below the ſource of a ſmall river, which flowed into the lake Arachotus.

CARUS, in *Biography*, a Roman emperor, was born at Narbonne in Illyricum, confounded by Eutropius with the more famous city of that name in Gaul, his father probably being an African, and his mother a noble Roman; and thus the different opinions with reſpect to his origin have been conciliated. He was educated in the capital, and gloried in the title of Roman citizen. His merit advanced him through a gradation of civil and military honours to the rank of pretorian prefect under the emperor Probus, by whom he was ſo much eſteemed that he wrote to the ſenate to order an equeſtrian ſtatue to be erected to him, and a houſe to be built for him at the expence of the ſtate. Upon the murder of that prince by his mutinous ſoldiers, A. D. 282, Carus, being about 60 years of age, was unanimouſly elected by the ſoldiers, or publicly acknowledged, if, as ſome have ſuppoſed, he was named emperor before the death of Probus. Having notified his election to the ſenate, without ſoliciting their confirmation of it, he began his reign by puniſhing the aſſaſſins of his predeceſſor, though he could not eſcape the ſuſpicion of being acceſſory to a deed from which he derived the principal advantage. The next meaſure of his government was the inveſtiture of his two ſons with a ſhare of the imperial power, with the title of Cæſar. See Carinus. He then proceeded againſt the Sarmatians, who had made an incurſion into Illyricum, and defeated them with a great ſlaughter; 16,000 of them remaining dead on the field of battle, and 20,000 being taken captives. In the beginning of the year 283 he purſued his march, accompanied by his ſon Numerian, in the midſt of winter, through the countries of Thrace and Aſia Minor to the confines of the Perſian monarchy. Here, without aſſuming any enſigns of imperial dignity, except a coarſe woollen garment of purple, but ſeating himſelf on the graſs, with a piece of ſtale bacon and a few hard peas for his ſupper, he gave audience to the Perſian ambaſſadors. In the interview he took off a cap which covered his baldneſs, and aſſured the ambaſſadors, that unleſs their maſter acknowledged the ſuperiority of Rome, he would ſpeedily render Perſia as naked of trees as his own head was deſtitute of hair. Theſe declarations were not impotent menaces; for he ravaged Meſopotamia, made himſelf maſter of the great cities of Seleucia and Cteſiphon, and carried his victorious arms beyond the Tigris. His career, however, was ſuddenly interrupted by a premature death, attended with circumſtances which rendered it extraordinary. When he was confined by ſickneſs to his bed, a furious tempeſt aroſe in the camp, accompanied with ſingular darkneſs, and inceſſant flaſhes of lightning, and a loud clap of thunder was ſucceeded by a ſudden cry that the emperor was dead. It ſoon appeared that his chamberlains, in the paroxyſm of their grief, had ſet fire to the royal pavilion, and hence a report originated that Carus was killed by lightning; when in truth he died of the diſorder with which he had been ſeized. Such is the account given by his own ſecretary to the prefect of the city. Arrius Aper, the pretorian prefect, is accuſed by Vopiſcus with having occaſioned this cataſtrophe, and as he afterwards contrived the murder of Numerian, and the emperor's tent was ſet on fire, the ſuſpicion againſt him is confirmed. The death of Carus happened in the cloſe of the year 283 after a reign of 16 or 17 months. His temper was haughty, and his manners harſh and intractable; however he was flattered by an eclogue on his acceſſion to the throne, and after his death ranked among the gods. Carus and his two ſons bore the names of Marcus Aurelius. Crevier's Hiſt. of the Emperors, vol. ix. Gibbon's Hiſt. vol. ii.

CARUS, in *Medicine*, a diſeaſe which, according to the definitions of Sauvages, and ſome other noſologiſts, differs from apoplexy only in the abſence of the ſtertorous noiſe in breathing, and in the ſopor (or morbid ſleep) being ſomewhat leſs profound. It is properly conſidered by Dr. Cullen as a minor degree of apoplexy. (Synopſ. Noſol. Meth. p. 184.) See APOPLEXY.

CARUSA, in *Ancient Geography*, a town of Aſia Minor, in Paphlagonia, ſeated on the Euxine ſea. Scylax calls it *Caruſſa*, and ſays that it was a Greek city, between the river Halys and the town of Sinope. Ptolemy calls it *Cariſſa*.

CARWAITEN, or GRAWATTEN, in *Geography*, a town or rather village of Pruſſia, in the country of Samland, belonging to the government of Memel, the inhabitants of which ſubſiſt by fiſhing; 44 miles N. of Konigſberg.

CARWAR, a maritime town of Hindooſtan, ſituate on the coaſt of Malabar, between Meerzaw, or Merſhee, and cape Ramas in the neighbourhood of Goa, where the Eaſt India company have a factory; but better known to the Engliſh in the early period of their India trade, and before they were in poſſeſſion of Bombay. The valleys about it ſupply plenty of corn and pepper of an excellent kind. The woods on the mountains abound with quadrupeds, ſuch as wolves, monkeys, wild hogs, deer, elks, and beeves of a prodigious ſize. It is diſtant about 40 miles S.E. from Goa. N. lat. 15° E. long. 74° 10′.

CARY, LUCIUS, in *Biography*, viſcount Falkland, was the ſon of Henry viſcount Falkland, and lord deputy of Ireland in the reign of king James I.; and born, probably at Burford in Oxfordſhire, about the year 1610. Being removed at an early period to Ireland, he received part of his education at Trinity college in Dublin, and completed it at St. John's college in Cambridge. In his youth he was chargeable with ſome irregularities; but before he had attained the age of 20 years, he came into poſſeſſion of a large and independent fortune, that had deſcended to him in conſequence of the gift of a grandfather, and he terminated his career of diſſipation by marrying a young lady of diſtinguiſhed accompliſhments but ſmall fortune, whom he paſſionately loved. In forming this connexion he gave great offence to his father, who had entertained hopes of amending his own circumſtances by his ſon's marriage; and though he made ample conceſſions, and even offered to ſurrender his whole eſtate to the diſpoſal of his father, and to depend wholly on his kindneſs for a ſubſiſtence, his father remained unrelenting and irreconcileable. Diſtreſſed by this circumſtance, he determined to leave England; and accordingly he removed, with his wife, to Holland, where it was his intention to purchaſe ſome military command; but failing to accompliſh this object, he returned to his own country, where he lived in retirement and proſecuted his ſtudies, with uncommon aſſiduity and ardour, maintaining at the ſame time an intercourſe with ſome of the beſt ſcholars of that age. In a very ſhort time he is ſaid to have made himſelf perfect maſter of the Greek tongue, and to have read with an accurate attention all the Greek hiſtorians. Before he was 23 years of age, he had peruſed all the Greek and Latin fathers; he alſo made himſelf acquainted with all books, which he procured at a great expence from different countries; he likewiſe diligently ſtudied eccleſiaſtical and theological controverſies; and his memory is ſaid to have been ſo retentive, that he remembered, on all occaſions, whatſoever he read. In ſome of his poetical attempts he was ſo ſucceſsful as to have gained the eſteem and admiration of the moſt eminent poets of his time. About the time of his father's death, in 1633, he was made one of the gentlemen of his majeſty's privy chamber; but he ſtill indulged his paſſion for a rural and ſtudious life, and frequently retired to his ſeat near Burford, which by the viſits of literary men from the neighbouring univerſity was a kind of academy. Here Chillingworth wrote his admirable work againſt popery, deriving aſſiſtance in the compoſition of it from the ſuggeſtions of his lordſhip. In this retreat various queſtions of literature, morals, and theology were freely diſcuſſed; and here lord Falkland himſelf, whilſt he was entitled to pre-eminence on account of his extenſive literature, blended with it that modeſty and candour, and ſweetneſs of temper, which commanded the admiration and eſteem of his learned viſitants, no leſs than his diſtinguiſhed abilities and attainments. His habits, however, were not formed in this literary retreat for thoſe public ſcenes in which he afterwards engaged. In 1639 lord Falkland joined the expedition againſt the Scots; and in 1640 he was choſen member of the Houſe of Commons for Newport in the Iſle of Wight; his peerage, being Scotch, not entitling him to a ſeat in the Houſe of Lords. By his attendance on the debates of the houſe, he acquired a high degree of veneration for the authority of parliament; and he was ſo rigid an obſerver of eſtabliſhed laws and rules, that he thought no miſchief ſo intolerable, as the preſumption of miniſters of ſtate in breaking poſitive rules for reaſons of ſtate, or of judges in tranſgreſſing known laws, upon the plea of convenience or neceſſity. Accordingly he was more ſevere than his natural gentleneſs of temper allowed in other caſes, againſt lord Finch and the earl of Strafford; and he had conceived ſuch a diſlike to archbiſhop Laud, and ſome other biſhops, that he concurred in the firſt bill for depriving them of the right of voting in the Houſe of Lords. Hence ſome perſons were led erroneouſly to conclude that he was no friend to the eſtabliſhed government of the church; whereas on ſubſequent occaſions, when he began to ſuſpect the deſigns of the parliamentary leaders, he oppoſed the ſame meaſure to the utmoſt of his power. For ſome time he continued averſe from the court, and manifeſted even a moroſeneſs to courtiers; but at length he was prevailed upon to accept a ſeat in the privy-council, and the office of ſecretary of ſtate. But he was unfit for ſtations of this kind, as he was totally unacquainted with the forms of buſineſs, and as he was actuated by ſcruples which impeded the proſecution of it. He would not agree either to the employment of ſpies, or to the opening of ſuſpected letters. When the breach between the king and parliament came to a criſis, lord Falkland took a decided, firm, and active part with his maſter; and attended him, with conſiderable danger to himſelf, at Edge-hill fight, at Oxford, and at the ſiege of Glouceſter. During his reſidence at Oxford, a circumſtance occurred which we ſhall here recite. When his majeſty viſited the library, he was ſhewn, among other books, a Virgil elegantly printed and bound; and lord Falkland, deſirous of amuſing him, beſought him to try his fortune by that mode of divination which was called *Sortes Virgilianæ.* When the king opened the book, the paſſage which preſented itſelf was part of Dido's imprecation againſt Æneas (l. iv. v. 615, &c.), thus tranſlated by Dryden:

> " Oppreſs'd with numbers in th' unequal field,
> His men diſcourag'd, and himſelf expell'd,
> Let him for ſuccour ſue from place to place,
> Torn from his ſubjects, and his ſon's embrace, &c."

The king's mind ſeemed to be impreſſed by this accident; and, therefore, lord Falkland, hoping for a more favourable occurrence, determined to try his own fortune in the ſame way; but the paſſage which chance preſented him was more ſuited to his own deſtiny than the other had been to the king's. It was the following exclamation of Evander upon the untimely death of his ſon Pallas (Æneid, lib. xi. v. 152, &c.), thus rendered by Dryden:

> " O Pallas! thou haſt fail'd thy plighted word,
> To fight with caution, not to tempt the ſword:
> I warn'd thee, but in vain; for well I knew,
> What perils youthful ardour would purſue;
> That boiling blood would carry thee too far,
> Young as thou wert in dangers, raw to war!
> O curſt eſſay of arms, diſaſtrous doom,
> Prelude of bloody fields, and fights to come."

When lord Falkland perceived the calamities that were impending over his country, his ſpirits ſunk; he loſt the gaiety and ſociableneſs of his temper, became negligent of his dreſs and appearance, reſerved and moroſe, and indicated a mind diſſatiſfied with itſelf and the world. While ſitting among his friends he would frequently, after long ſilence and deep ſighs, with a ſhrill voice repeat the words "peace," "peace," and declare himſelf incapable of living in ſuch a ſtate of perpetual grief and anxiety. The cloſing ſcene proves almoſt a determination to throw away that life which was become a burden. Although poſſeſſing no military command, he reſolved to be preſent at the firſt battle of Newbury, fought September 20th, 1643; and in the morning called for clean linen, that if he were ſlain his body might appear with decorum. Having put himſelf in the firſt rank of lord Byron's regiment, he received a muſket ſhot in his belly, and fell from his horſe. His body was not found till the next day. Such was the fate of lord Falkland, in the 34th year of his age; generally eſteemed as the moſt virtuous public character, in a period fertile of virtue. His praiſes have been reſounded by poets, hiſtorians, and moraliſts, and are, as it were, interwoven with Engliſh literature. His fame perhaps owes moſt to his intimate friend lord Clarendon, who has drawn an elaborate character of him, and in ſome reſpects makes him the moral hero of his hiſtory. Lord Falkland left behind him ſome poems, and various ſpeeches and pamphlets on political and theological topics. Biog. Brit. Gen. Biog.

Cary, Robert, a learned chronologer, was born at Cochinton, in Devonſhire, about the year 1615. He finiſhed his education at Oxford, whither he went in 1631, and where he took his degrees, and was created doctor of laws in 1644. He travelled into foreign parts, and on his return was preſented with the rectory of Portlemouth, near Kingſbridge, in Devonſhire. During the troubles he joined the Preſbyterian party, but upon the reſtoration of Charles II. he was one of the firſt who congratulated him on his return, and was ſoon after preferred to the arch deaconry of Exeter. But after about two years he was ejected, in 1664, and retired to his rectory, where he paſſed the remainder of his life with reputation, and died in September 1688. He publiſhed his "Palæologia Chronica, or a chronological Account of ancient Times, in three parts, 1. Didactical, 2. Apodeictical, 3. Canonical," Lond. 1677, fol. Of this book we have an account in the Philoſophical Tranſactions, N° cxxxii. p. 808. He was, in his younger years, ſkilled in poetry, both Latin and Engliſh; but his only publication of this kind was thoſe hymns of our church which are appointed to be read after the leſſons, together with the creed, &c. They were tranſlated by him into Latin verſe. Biog. Brit.

Cary, in *Geography*, the name of a ſmall river in the county of Antrim, Ireland, which uniting with ſome other mountain ſtreams falls into the North Channel, at Ballycaſtle.

Cary, the northern barony of the county of Antrim, Ireland, oppoſite to the Iſland of Rachlin, and remarkable for the Baſaltic region, of which the Giant's Cauſeway is a part. It was anciently called the *Route*, or *Root*, and was taken poſſeſſion of by the clan of M'Donalds from the Hebrides, ſome time previous to what has been called the *plantation of Ulſter*, in the reign of James I. The barony received its preſent name from a caſtle now in ruins. Some old maps have alſo a cape marked Cas-Cary, which muſt be what is now called Tor-point. Hamilton's Antrim.

Cary *Bay*, a large bay on the ſouth coaſt of Cornwall, round the point of the Deadman to the weſtward, and extending almoſt to the eaſtern point of the entrance into Falmouth haven.

CARYA, in *Ancient Geography*, a country of the Peloponneſus, in Laconia, the capital of which was of the ſame name. Vitruvius mentions the deſtruction of this city, becauſe it united with the Perſians, who were enemies to the Greeks. The male inhabitants were put to the ſword, and its females were made captives. Pauſanias ſays, (Lacon. l. iii. c. 10. p. 230.) that it had a temple of Diana Caryatis, and a ſtatue of that goddeſs in the open air. It was ſituated on the banks of the river Œnus, a little to the weſt of Glympes. See Caryates and Caryatides.

Carya. See Caria.

CARYANDA, an iſland of Aſia Minor, in the Mediterranean, on the coaſt of Caria. Pliny.—Alſo, a town of Aſia Minor, in Caria. Steph. Byz. ſays, that it was a ſeaport, near Mindus and Cos. Scylax, who was of this city, ſays, that Caryanda was an iſland, town, and port. It has ſince been called *Caracoion*.

CARYATES, in *Antiquity*, a feſtival in honour of Diana, ſurnamed Caryatis, held at Caryum, or Carya, a city of Laconia. The chief ceremony was a certain dance, ſaid to have been invented by Caſtor and Pollux, and performed by the virgins of the place.

During Xerxes's invaſion, the Laconians not daring to appear and celebrate the cuſtomary ſolemnity, to prevent incurring the anger of the goddeſs by ſuch an intermiſſion, the neighbouring ſwains are ſaid to have aſſembled and ſung paſtorals, or *bucoliſmi*, which are ſaid to have been the origin of bucolic poetry.

CARYATIDES, in *Architecture*. Beſides columns and pillars, ſtatues of various kinds have been employed by architects for the ſame purpoſes. Female figures of this nature clothed in long garments were called by the Greeks Caryatides, the reaſon of which is thus explained by Vitruvius, lib. i. The inhabitants of Carya, a city of the Peloponneſus, having joined with the Perſians againſt the Grecian ſtates, and the Greeks having terminated the war by a glorious victory, with one conſent commenced hoſtilities againſt the Caryates. They took the city, deſtroyed it, put all the males to the ſword, and carried the females into captivity; and to treat them with ſtill greater ignominy, forbad them to diveſt themſelves of their robes, or any of their ornaments, that ſo they might not only be once led in triumph, but in a manner ſuffer the ſame mortification all their lives by conſtantly appearing in the ſame dreſs as on the triumphal day. And further, as an everlaſting teſtimony of the crime of the Caryates, the architects of that time employed the repreſentations of theſe women to ſupport the entablatures of their public buildings.

Vitruvius proceeds to inform us, that the Lacædemonians, after the battle of Platea, erected with the ſpoils and plunder the Perſian portico, as a trophy, to tranſmit to poſterity the valour and honour of the citizens; introducing therein the ſtatues of the captives, adorned with habits in the barbarian manner, ſupporting the roof. Thus, with merited infamy they puniſhed pride, terrified their enemies with the idea of their power, and the citizens beholding this monument of their courage, were inſpired with a love of glory, and became more animated in the defence of their liberty. Hence it is, that many introduce Perſian ſtatues ſuſtaining the entablature, and thus make an excellent variety in their works.

The Greeks and Romans had alſo two other denominations for theſe figures, derived from their action of carrying or ſupporting, *Atlantes* and *Telamones*. Caryatides, however, has become by modern uſage a generic term for theſe ſtatue-columns, and we ſhall accordingly under this article take a general view of the ſubject.

From the hiſtory related by Vitruvius we might be led to ſuppoſe that the Greeks were the inventors of this order, if it may be ſo called: they were not, however, the firſt, though it is not improbable that in different countries, without communication with each other, the love of allegory, religious or political motives, or the mere caprice of ornament, may have transformed columns into ſtatues.

That the Egyptians had adopted this manner appears from ſome remains, from the teſtimony of authors, and from the nature of their ſculpture. Among the ruins of the Memnonium, at Thebes, there is a portico with figures engaged in the pilaſters ſupporting the entablature: theſe ſtatues have the lituus in one hand and the flagellum or ſcourge in the other, as commonly ſeen in the ſtatues of Oſiris. Among the figures given by Denon there is a curious kind of frieze compoſed of truncated human figures, which, with their heads and one elbow lifted up, ſupport the cornice. Diodorus Siculus in deſcribing the ſepulchre of Oſymanduas, gives an account of a periſtyle four hundred feet ſquare, which inſtead of pillars was adorned with animals, each of a ſingle ſtone, and four and twenty feet high, executed after the ancient manner, and it was covered with ſtones twelve feet long, the ceiling being painted azure, and ornamented with ſtars. We are not informed what kind of animals theſe were, or what was their attitude; perhaps they were ſphinxes, which inſtead of being in the uſual crouched poſture of thoſe commonly ſeen, which were placed at the entrance of the temples, were in a ſitting attitude in the manner of the Athenian lions preſerved at Venice. At leaſt this ſeems the only poſition in which ſimilar ſupports could be placed to have the required height and neceſſary ſolidity. The ſame hiſtorian relates that Pſammeticus erected a periſtyle at Memphis, to which coloſſal ſtatues of eighteen feet high ſerved for pillars.

Sculpture appears to have been in Egypt entirely ſubordinate and ſubſervient to architecture, an art which had no motive but religion, no object but the decoration of its edifices; whether it led up to the temple gate the long avenue of ſphinxes, emblems of the myſtery which overſhadowed its walls or ſeated in ſublime tranquillity, the coloſſal effigies of its gods; or inſcribed in countleſs hieroglyphics its ſecret doctrines and excluſive knowledge.

When we conſider the nature of the Egyptian ſtatues and the timidity of the artiſts who never ſeparated the legs, and generally attached the figure behind to a ſquare ſlab or pilaſter reſerved out of the block, we ſhall not be ſurpriſed that independently of any religious motives which might lead to the uſe of Caryatides, the idea ſhould originate of employing for the ſupport of buildings ſtatues which did not yield in real ſolidity and apparent ſtrength to any ſpecies of columns. If alſo we conſider the ſtyle of ſculpture, its rigid ſymmetry of attitude and motionleſs inflexibility of appearance, we muſt allow that no ſtatues were better adapted to take the place of columns, and no where were the objections which may be urged againſt the uſe of Caryatides leſs founded. Accordingly, it ſeems probable that no where was this cuſtom more prevalent than in Egypt.

We may perhaps form the beſt idea of the Egyptian Caryatides from thoſe which at preſent ſupport the entablature of the great door of the Muſeum Vaticanum. Theſe ſtatues were found in the villa of Adrian, and were probably among thoſe which that emperor, ſo deſirous of imitating Egyptian cuſtoms, cauſed to be made in the manner of thoſe which exiſted in Egypt. They are eleven feet in height, including the plinth. The capitals which riſe above their heads are of the bell ſhape ſo commonly obſerved in the Egyptian remains. The appearance of theſe Caryatides is ſingularly grand, in ſpite of all the incongruities of their ſituation and of the details of the architecture which accompanies them.

The Hindoo excavations in the mountains of Ellora near Aurungabad in the Decan; works of whoſe origin hiſtory has preſerved no memorial, but whoſe ſtupendous execution ranks them among the wonders of human labour, may be cited among the inſtances of the uſe of Caryatides. In one of theſe the Kailaſa, or paradiſe of the gods, a monument which preſents the appearance of a vaſt and elaborate building, ſtanding in a conſiderable area, the whole of which is excavated in the granite rock; the baſement of this aſtoniſhing edifice is ſculptured with the figures of elephants and lions, giving the whole mighty maſs the appearance of mobility by theſe powerful animals. The excavated rocks of Mauveliporam offer ſingular pillars, each being compoſed of the figure of a lion ſitting on a double plinth, forming the lower part of the ſhaft, which riſing octagonally and tapering, terminates in a capital conſiſting of three horſemen, which ſupport the entablature. In one of the excavated temples on the iſland of Salſette, there are capitals well executed, and compoſed chiefly of elephants, to which, in ſome inſtances, are added horſes and human figures. In Jaganatha Sabha, another of the excavations of Ellora, the pillars reſt upon elephants. Daniell's Antiquities of India and Hindoo excavations.

The deſcription of the temple of Jeruſalem preſerves ſome traces of this cuſtom. Hiram's molten ſea was ſupported by twelve bulls, and on the walls of the oracle he placed alternate cherubim and palm trees, ſupporting wreaths of flowers, and probably the ceiling.

In the ruins of Perſepolis alſo, there remain ſome capitals conſiſting of horſes and camels. And in geographical, though not in chronological order, we may mention ſome inſtances at Palmyra. The coloſſal cornice of the great temple has modillions in the form of bulls and lions, ſupporting the corona, and in more than one example ſtatues of genii are uſed to ſuſtain a kind of projecting balcony in the ſingular tower-ſhaped mauſoleums which are found there.

Though however the idea of employing Caryatic figures is not original to Greece, the moſt complete and intereſting example of this practice is among the remains of ancient art at Athens. "To the north of the Parthenon, at the diſtance of about one hundred and fifty feet, are the remains of three contiguous temples. That towards the eaſt was called the Erectheum; to the weſtward of this, but under the ſame roof, was the temple of Minerva, with the title polias, as protectreſs of the city; adjoining to this, but under the ſame roof, is the Pandroſium, ſo named becauſe it was dedicated to the nymph Pandroſus, one of the daughters of Cecrops." This is an open portico, compoſed of ſix Caryatides, four being placed in front and two in the ſides; five of the ſtatues remain to the preſent time. Within the Pandroſium was the olive tree, ſaid to have been produced by Minerva in her conteſt with Neptune for the patronage of the city; it was called pankyphos, incurvated, from its branches having bent downwards after it had grown up to the roof; and under the tree ſtood the altar of Jupiter Herceus. (Stuart's Athens.) Theſe Caryatides agree perfectly with the deſcription of Vitruvius: they are deſigned in a grand and broad ſtyle, their drapery is ample and flowing, their hair arranged with art. The height of the figures is ſeven feet nine inches, including the capital and plinth: their attitudes are ſimple and ſymmetrical; their air ſerene and tranquil. The ſtatues are placed upon a continued pedeſtal, but with ſeparate plinths to each. Above the head riſes a capital, ſomewhat reſembling that of the Doric order, and upon the capitals is placed an entablature, very nearly three feet high, but conſiſting only of architrave and cornice, the frieze being ſuppreſſed. The cornice is dentilated and the mouldings enriched; the upper facia of the architrave is ſingularly ornamented with little rounds diſpoſed at equal diſtances. It is not eaſy to account for the ſingularities of the entablature and its extraordinary height compared to the figures; probably a Caryatic portico was not conſidered as ſubject to any of the common rules of architecture. The reader will find an elevation of this monument in *Plate* XIX. of *Architecture.*

The Caryatides of the Villa Albani are another beautiful example; they are female ſtatues clothed in long garments, the arms and necks ornamented with bracelets and necklaces, the head-dreſſes carefully arranged. A Greek inſcription on one of them informs us, that they were the work of two Athenian ſculptors, Crito and Nicolaus. Winckelmann is of opinion that theſe artiſts arrived at Rome about the time of Julius Cæſar; but whether theſe figures were executed at Rome, or tranſported there by ſome Roman plunderer, cannot be known. It ſeems probable, from a certain want of ſymmetry in their attitude and ornaments, that they are only part of a larger number and were not intended to be arranged contiguouſly. One of them has the head enveloped in a veil, which aſcends to the top of the capital. The capital of another is plain and without ornament, the others are decorated with as much elegance as richneſs.

Among the antiquities of Rome there are various fragments of ſtatues, which, from their attitudes and the capitals on their heads, may be ſuppoſed to have ſerved as ſupports to the entablatures of buildings. It appears, that the inſide of the Pantheon was ornamented in this manner by Diogenes the Athenian; they were probably executed in baſſo-relievo, and employed in the Attic over the columns.

In the tomb of the freed-man of Sextus Pompeius, on the Appian way, there is an example of Caryatides of both ſexes. They are in baſſo-relievo, and decorate rather than ſupport the different ſtories of the columbarium. The firſt order conſiſts of female figures draped, who, with extended arms, ſupport a great veil which entirely ſurrounds them. They have no capitals; but their feet are mounted on ſmall plinths. The Caryatides in the upper ſtory are of a particular kind, and of an invention ſufficiently capricious. They are naked figures, whoſe heads, ſurmounted with capitals, ſupport the cornice, and in their hands each holds a column perpendicularly, which ſupports nothing. This fancy ſeems to have given riſe to one ſtill more whimſical, which has been executed by Daniel de Volterra, in his chapel of La Trinita del Monte, where there are figures ſupporting in one hand a capital, and in the other the column adapted to it.

Theſe freaks of imagination, it is hardly neceſſary to obſerve, are only tolerable in the arabeſque, where may be found an ample collection of figures, which the caprice of decoration has adapted to the office of Caryatides.

It would be generalizing too far to include, among the ſubjects of this article, the compoſitions of winged genii, terms, griffins, and ſo many other fantaſtic animals which adorn and ſupport altars, tripods, vaſes, and other antique utenſils. Theſe objects, though confined by the realities of execution and the convenience of uſe to more connection and probability than the dreams of arabeſque, are not amenable to the grave laws of architecture. It is on account of not having perceived the limits of imagination in theſe different walks of arts that the Caryatides, which were originally a licence in architecture, have become, under the chiſel of the moderns, abuſes intolerable and unworthy of indulgence from the leaſt ſcrupulous reaſon.

This cenſure is not, however, applicable to the earlieſt revivers of this ſtyle of decoration; and we muſt do the juſtice to that diſtinguiſhed artiſt Jean Goujon, to allow, that in the beautiful Caryatides which ſupport the tribune of the former ſalle des gardes of the Louvre, he has conceived an idea juſt, grand, and ſuperior to every other modern inſtance. This monument conſiſts of four female figures, twelve feet in height, elegantly draped, with capitals on their heads, and ſtanding on circular pedeſtals; which ſupport an entablature of the Ionic order, richly ornamented, one quarter of the height of the ſtatues and pedeſtal. What is remarkable, the artiſt has repreſented the arms of the figures as truncated a little below the ſhoulder. It is certain, that this inſtance bears conſiderable reſemblance to the Caryatic portico at Athens, by the general idea of a gallery projecting from a larger maſs of building, by the number of figures being in both caſes four in front, their ſymmetrical arrangement, and particularly by the arms, which may be thought to be truncated in imitation of thoſe which time has mutilated. We cannot ſay, however, whether or not Jean Goujon had any knowledge of the Athenian Caryatides; if not, the merit of the invention and compoſition does the greateſt honour to his genius; and even if he were acquainted with them, ſuch an imitation ſhews conſummate taſte and judgmate; while the details remain intirely his own.

It is difficult to find a ſubject of approbation in any other modern inſtance of Caryatic figures. Thoſe of the celebrated Loggia de Lanzi, by Orcagna at Florence, and a multitude of other Atlantes in that town and elſewhere, which are ſeen bending under the weight of an architecture which cruſhes them, are but capricious inventions, where the ſculptors have rather conſidered their art than its harmony with the architecture.

Every one who is acquainted with the hiſtory of the fine arts after their revival in Italy, knows how much the ſtyle of ſculpture and architecture was influenced by that of painting. Painting was the favourite art, that which produced moſt genius, and was often exerciſed in common with the other arts by the ſame perſon. But it would not be difficult to ſhow, were this the proper place, that the principles of painting are very frequently in contradiction to thoſe of ſculpture, and ſtill more of architecture. Hence, aroſe a moſt abundant crop of abuſes, from which the immediate proximity of antique examples could not preſerve the building art, when the painters of decorations became its arbiters, and fictitious architecture its model. Among theſe muſt be reckoned the Caryatic figures, which became the common ornaments of ceilings and vaults under the Carraci, Domenichino, Lanfranco, and many inferior artiſts and imitators. The compoſition of theſe had no other rule than the caprice of the painter, who regarded them as a kind of academy figure, ſuſceptible of all the extravagancies of attitude and all the oſtentation of anatomy.

We now come to the theoretical and critical portion of this article; and, in the firſt place, it merits conſideration, whether the employment of Caryatides is not radically faulty as violating nature and the eſſential principles of imitation. It may be urged as an obvious impropriety to make the figures of men and women ſupport the enormous load of the entablatures and coverings of buildings. The ſight and imagination ſeem to be equally offended by the neceſſity of admitting the repreſentation of circumſtances of which the reality cannot for an inſtant be ſuppoſed poſſible.

If the example and authority of perhaps all nations who have been diſtinguiſhed in architecture were conſidered ſufficient, theſe objections would be anſwered by the preceding article: but as this cuſtom might have no other than religious and political motives, it is not impoſſible that taſte and rational criticiſm might be at variance with ſuch inſtitutions, and agree to baniſh from modern works a practice which, having no longer any connection with theſe motives, or any other object than the gratification of the ſight, offends gratuitouſly the principles or the appearance of ſolidity. We do not doubt, however, that Caryatides may be defended on the following conſiderations.

Sculpture, though it realizes in its imitations the external forms of objects, departs ſo widely from them in colour and texture, that no art is leſs capable of producing illuſion: the ſight is more affected by colour than figure. Zeuxis might deceive the birds with his bunch of grapes, and his competitor him with the curtain; but certainly a ſtatue was never taken for a man. Accordingly, every production of ſculpture may be conſidered both with regard to the object imitated, and the matter of which that imitation is compoſed. With regard to the firſt, nothing undoubtedly is more abſurd than to cauſe a man to perform the impoſſible function of a column; but with regard to the ſecond, nothing is leſs unreaſonable and more poſſible than to give that office to a ſtatue, whoſe ſolidity is equal, and material the ſame. Why not ſupport a ſtone entablature with a ſtatue equally of ſtone. When therefore figures are employed as Caryatides, it muſt be underſtood, that theſe figures are not the living and animated expreſſion, but the material and motionleſs image of the object repreſented. On this occaſion a kind of counter-illuſion is required of the ſpectator; and it is neceſſary that, overlooking every thing of deception, which might lead him to forget the material, he ſhould ſtop at the firſt impreſſion of the ſenſes, and inſtead of yielding fleſh, ſee only inflexible marble and bronze. This is not a difficult effort but the natural impreſſion, when the ſculpture in harmony with the architecture does not pretend to too much motion, action, and life. Nobody, in ſeeing the Egyptian ſtatues, can ſay, that nature and probability could be violated by ſuch allegorical ſupports.

On the other hand, when the deſcriber of Kailaſa obſerves, that the baſement, ſculptured with elephants and lions, gives the whole maſs the appearance of mobility on theſe mighty animals; he reports a ſevere cenſure, for this is exactly the air that a great edifice ought not to have.

From what has been advanced, it cannot be denied as a general propoſition, that Caryatides are admiſſible in the moſt regular and conſiſtent architecture. Reaſon demands real, and taſte apparent, ſolidity in ſupports; now the firſt exiſts inconteſtibly in the material of which theſe figures are formed, and the ſecond may be preſerved with attention to the rules of propriety, indicated by the nature of the objects, and which we ſhall proceed to diſcuſs.

Conſidering the preceding obſervations, good taſte will include in a general cenſure, all the figures ſo commonly ſeen bending under the maſſes which overwhelm them, thoſe ſymbols of ſlavery whoſe laborious attitudes affect the ſpectator with ideas of oppreſſion and miſery. The more the ſculptor diſplays of anatomy, the more forcibly he expreſſes the contraction of the muſcles; in ſhort, the more he gives of truth, in the action and movement, the more he will incur of blame from ſound criticiſm. His figures appear weaker as they make the more effort; and though good ſtatues, they will be bad Caryatides.

Let the figures intended for this purpoſe, broad and grand in their proportions, approaching the coloſſal in dimenſions, ſimple and upright in attitude, ſevere in expreſſion, preſent to the ſpectator an immoveable tranquillity in their appearance. Let ſymmetry prevail in their poſition and acceſſaries. Let the apparent weakneſs of the neck be corrected by treſſes of hair deſcending on their ſhoulders, and the drapery, agreeably defining the forms of the limbs, but tending to perpendicular folds, ſtrengthen the figure below, and give ſolidity to the whole. Thus we have almoſt deſcribed the Caryatides of Athens, or of Jean Goujon. This artiſt, a ſculptor and architect, had ſo well conceived the rules of taſte proper to the ſpecies of ſculpture in queſtion, that to take away all pretence of illuſion, he has repreſented the figures, as has been already mentioned, without arms, and under the appearance of mutilated effigies. However, without carrying our ſcruples ſo far on this point as Jean Goujon, it will be ſufficient to imitate him in the general character of gravity and auſterity which he has imprinted on this performance.

It ſeems neceſſary to give capitals to Caryatic figures to prevent the diſagreeable ſenſation produced by the architrave reſting immediately on the head, and to avoid the abrupt contact of the forms of ſculpture and architecture by an intermediate object partaking of both. The capitals in antique examples ſometimes approach the Doric form, as in the Athenian Caryatides, and ſometimes the Corinthian bell-ſhape, as in thoſe of the Villa Albani. The firſt is rich and well adapted to the ſhape of the head, the other has more lightneſs and elegance. It is proper in theſe things to keep a medium between the rigour of architecture and the caprices of mere ornament. Some antique capitals have been found imitating a baſket, but theſe cannot be recommended.

Caryatides as ſtatues require to be raiſed on pedeſtals. In the Athenian inſtance a continued ſtylobata anſwers this purpoſe. Jean Goujon has uſed inſulated pedeſtals, which are circular, apparently to give more the air of a column to the whole.

The Pandroſium at Athens, though only one example, is of the higheſt importance as being complete in itſelf, giving not only the beſt model of the figures proper for the purpoſe, with their appropriate pedeſtal and entablature, but alſo the relative proportion of ſuch a portico to the adjoining building, and of Caryatides to columns. The entablature, as has been before obſerved, is very remarkable in ſeveral reſpects, and firſt, in height compared to the figures being 2 feet $11\frac{3}{4}$ inches to 7 feet 9 inches. We may perhaps find the motive of this extraordinary weight in conſidering that a human figure amply draped as theſe are, preſents a larger maſs than any column. However, it cannot be denied, that the proportion of the entablature is greatly exaggerated, and produces an unpleaſing effect. In the next place, the frieze is ſuppreſſed, a ſingularity which we believe is not to be found in any other antique monument of the ſmalleſt credit, neither is the effect very good, as the maſs is too much divided into equal parts. On the whole, though it would be abſurd to conclude from a ſingle example, that the ancients had adapted any one particular entablature to this kind of order, we may infer from ſuch remarkable deviations that theſe objects are not to be conſidered within the limits of regular architecture, but are at the diſcretion of the deſigner within the limits of reaſon and taſte.

The proportion of Caryatides to columns when ſeen together, is another point that will require attention in execution. That the firſt ſhould be leſs is evident, but it is impoſſible to ſay what dimenſions will in all caſes have the beſt relation. The figures ought to appear coloſſal without enfeebling the effect of the columns. The proportion obſerved in the Athenian example, where this effect has been very happily attained, are, 7 feet 9 inches, the figures, 18 feet 5 inches, the columns which are the neareſt in contact.

The proper application and allegory of Caryatides will come next under conſideration. Chambray, an able and eloquent author, whoſe opinions always merit attention, obſerves in the "Parallele de l'Architecture antique avec la moderne," that there are few occaſions in which Caryatides can be employed with propriety, though the generality of modern architects have introduced them indifferently in all kinds of buildings. For not only in the palaces of princes, within and without, but in private houſes, and in churches even, and ſepulchres, every place is filled with them without any regard to hiſtory or decorum; and often, by an inſupportable abſurdity, they ſubſtitute for theſe miſerable captives the venerable figures of virtues, muſes, graces, and even angels, where they ought rather to enſlave and confine the vices.

In reply to this, we muſt obſerve, that if the artiſt be confined ſtrictly to the origin and motive attributed to this practice by Vitruvius, he can never employ Caryatic figures. The memorial of an outrageous ſeverity inflicted on the fair and innocent, is unworthy to be perpetuated.

The Perſian gallery of Sparta, though not conſiſtent with the delicacy of modern feelings, was a noble trophy of valour and patriotiſm worthy of the occaſion, and worthy of the people; but the people were Greeks, and the occaſions Thermopylæ and Platea. Such deep injuries, and ſuch glorious revenge, may well juſtify a triumph, that in moderate war would be barbarous and unmanly. Thus did the bone-heap of Murten record and inſpire the patriotic valour of the Swiſs. But the modern artiſt is called upon by every feeling of propriety, to reject theſe emblems of vengeance, theſe miſerable captives, whoſe figures only excite contempt towards the inſulting conqueror.

Caryatic figures are in themſelves more pictureſque and intereſting than any columns, but the proper employment of them is on this account more difficult. They have too much character to enter indifferently into ordinary works. Of a ſtatue we demand an explanation, and the occupation of Caryatides ſeems to render it proper that they ſhould be the repreſentations of allegorical perſonifications rather than of human individuals. A juſt and conſiſtent allegory is then the firſt requiſite of Caryatides; for to repreſent them as mere ſtatues, without any meaning, as Jean Goujon has done, ſeems both an impropriety and a poverty of invention; and with deference to M. Chambray, we can conceive ſituations where the figures of virtues, muſes, and angels, would be both beautiful and proper. Pococke, Norden, Denon. Dict. Meth. Stuart, Daniell. Chambray.

CARYL, Joseph, in *Biography*, one of the miniſters ejected by the act of uniformity, was born in London in 1602, educated in Exeter college, Oxford, and afterwards became preacher to the ſociety of Lincoln's Inn. He was a member of the aſſembly of divines, and one of the tryers for approbation of miniſters; and in all the ſtations he occupied maintained a reſpectable character for learning, piety, and modeſty. By order of parliament he attended the king at Holmby houſe, and was one of the commiſſioners in the treaty of the Iſle of Wight. After his ejectment in 1662, he lived privately in London, and preached to his congregation whenever the times allowed. He was a moderate "Independent," and diſtinguiſhed himſelf by his learned and voluminous "Expoſition on the book of Job." He died in February, 1672-3, in the 71ſt year of his age. Neal's Hiſt. of the Puritans, vol. II. p. 689. 4to.

CARYLL, John, an Engliſh poet of the Roman Catholic perſuaſion, was ſecretary to queen Mary, the wife of James II.; and having ſhared the fallen fortunes of his maſter, was rewarded for his attachment, firſt with knighthood, and afterwards with the honorary titles of earl Caryll and baron Dartford. In the reign of queen Anne he was in England, and recommended to Mr. Pope the ſubject of the "Rape of the Lock," who at its publication addreſſed it to him. He was the author of two plays, viz. "the Engliſh Princeſs, &c." 1667, 4to.; and "Sir Solomon, or the Cautious Coxcomb," 1671, 4to.; and in 1700, he publiſhed the "Pſalms of David, tranſlated from the Vulgate," 12mo. He was living, at a very advanced age, in 1717; but the time of his death is not aſcertained.

CARYOCAR, in *Botany*, Linn. Mant. 247. Schreb. Juſſ. See Pekea.

CARYOCATACTES, in *Ornithology*, the nut-cracker of Engliſh writers, is ſo denominated by Geſner, Willughby, and Ray, whence its Linnæan ſpecific name. See Corvus Caryocatactes.

CARYOCOSTYNUM, in *Pharmacy*, a kind of purging electary, the two principal ingredients of which, that give the denomination to the whole, are cloves, and coſtus. It works briſkly, and fetches the humours from the moſt remote parts; whence, and by reaſon of its warmth, it is preſcribed againſt rheumatic, arthritic, hydropic, paralytic, &c. diſorders.

CARYOLOBIS, in *Botany*, a genus formed by Gærtner for the ſeed of an unknown Eaſt Indian plant, remarkable for its ſingular ſtructure, having within it a central pillar which perforates the axis of the embryo. It is ſaid by Boſc, to be nearly allied to Cocoloba.

CARYONES, in *Ancient Geography*, a people placed by Ptolemy in European Sarmatia, between the Alans and Amaxobians. M. Peyſſonel claſſes them among thoſe who bore the name of Vandals.

CARYOPHYLLATA *alpina, apii foliis*, Bauh. pin. C. alpina tenuifolia, Barrel. See GEUM *reptans*.

CARYOPHYLLATA *alpina quinquefolia*, Bauh. pin. See ANEMONE *narciſſiflora*.

CARYOPHYLLEI, in *Botany*, the forty ſecond natural order in the Philoſophia Botanica of Linnæus, and the twenty-ſecond in the Prælections publiſhed by Giſche; ſo called, not as including the caryophyllus of Linnæus, which actually belongs to a different natural order; but in reference to the caryophyllus of Tournefort taken up by him from the older botaniſts, which Linnæus called Dianthus without aſſigning a ſufficient reaſon for changing the name, and as he ſtill continued to call the natural order of which his dianthus may be conſidered as the prototype, by its ancient appellation, with a certainty of introducing a palpable confuſion into the nomenclature. He has been followed in both caſes by Juſſieu, without a comment; and by Ventenat, with a remark pointing out the inconſiſtence. Linnæus gives it the following character. *Root* fibrous. *Stem* herbaceous, ſeldom ſhrubby, jointed: branches generally alternate. *Leaves* ſimple, almoſt always inclining to lanceolate, undivided, ſeſſile, or narrowing into a petiole, oppoſite, obvolute, moſt commonly ſmooth. *Flower* rarely ſeſſile; ſtamens either equal or double the number of the petals; piſtils from one to five. *Fruit* a capſule, one-celled, or with as many cells as there are ſtyles.

The genera enumerated in Philoſophia Botanica are dianthus, ſaponaria, drypis, cucubalus, ſilene, lychnis, coronaria, agroſtemma, frankenia, alſine, ceraſtium, holoſteum, arenaria, pharnaceum, ſpergula, ſagina, moerhingia, ſcleranthus. In the poſthumous lectures they are divided into four ſections; α. dianthus, ſaponaria, gypſophila, velezia, drypis, ſilene, cucubalus, lychnis, agroſtemna, ſheffieldia? β. ſpergula, ceraſtium, arenaria, ſtellaria, alſine, holoſteum, cherleria, ſagina, mœhringia, buffonia. γ. pharnaceum, glinus, mollugo, polycarpon, minuartia, queria, ortega, lœflingia, rotala. δ. ſcleranthus, polypremum. The firſt ſection comprehends the proper caryophyllate flowers of Tournefort, which have a tubular calyx, and unguiculated petals with a flat border.

Juſſieu and Ventenat have given in moſt reſpects the ſame general character, and aſſigned nearly the ſame genera to their caryophylleæ. According to Ventenat the plants of this family are in general herbaceous and natives of Europe. Their *ſtems* are commonly cylindrical, and never more than three or four feet high; branches axillary, oppoſite and apparently articulated at each knot. *Leaves* oppoſite and connate at their baſe, very rarely whorled, always ſimple and entire, generally deſtitute of ſtipules. *Flowers* almoſt always hermaphrodite, ſubject to become full or double by cultivation, commonly axillary, ſometimes terminal. *Calyx* one-leafed or divided, almoſt always permanent. *Corolla* rarely none; petals generally unguiculate, equal in number and alternate with the ſegments of the calyx. *Stamens* in ſome genera leſs numerous than the petals; more frequently equal in number and alternate with them; or twice as many, half of them inſerted into the receptacle, and the other half alternately into the petals. *Germ* ſimple; ſtyle rarely ſingle; ſtigmas equal in number to the ſtyles. *Fruit* capſular, almoſt always many-ſeeded, one or many-celled. *Seeds* inſerted into a central placenta or receptacle, or each of them attached to the bottom of the capſule by a ſmall umbilical cord. Periſperm farinaceous, central, i. e. ſurrounded by the ſpiral embrio. Radicle inferior.

The whole order is divided by Juſſieu into ſeven ſections. 1. Calyx divided; ſtamens three; ſtyle ſingle or triple. ortegia, lœflingia, holoſteum, polycarpon, donatia, mollugo, minuartia, queria. 2. Calyx divided; ſtamens four; ſtyles two or four. Buffonia, ſagina. 3. Calyx divided; ſtamens five or eight; ſtyles two, three or four. Alſine, pharnaceum, mœhrhingia, elatine. 4. Calyx divided; ſtamens ten; ſtyles three or five. Bergia, ſpergula, ceraſtium, cherleria, arenaria, ſtellaria. 5. Calyx tubular; ſtamens ten, generally inſerted alternately into the receptacle, and petals; ſtyles two, three, or five. Gypſophila, ſaponaria, dianthus, ſilene, cucubalus, lychnis, agroſtemma. 6. Calyx tubular; ſtamens leſs than ten; ſtyles two or three. Velezia, drypis, ſarothra. 7. Genera allied to the caryophylleæ. Rotala, frankenia, linum, lechea. Ventenat has adopted the ſame diviſions, but has omitted donatia, bergia, and rotala; added hagæa, and githago; and removed ſarothra to the gentianæ.

CARYOPHYLLON *Plinii*, the fruit of the *caſſia caryophyllata*, or cloveberry tree, whoſe bark is uſed in medicine

CARYOPHYLLUS, in *Botany*. (Gr. καρυοφυλλον, nut-leaf. Paul. Æginetus). Clove-tree, Giroflier, Fr. Linn. gen. 669. Schreb. 843. Gært. 202. Juſſ. p. 324. Vent. vol. 3. p. 327. Claſs and Ord. *Polyandria monogynia*, Linn. *Icoſandria*, Schreb. Lam. Nat. Ord. *Heſperideæ*, Linn. *Myrti*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, ſmall, permanent; ſegments four, concave, ſpreading, *Cor.* petals four, roundiſh, larger than the calyx and alternate, with its ſegments caducous. *Stam.* numerous; filaments capillary, a little longer than the petals (but not ſo expreſſed, either in Sonnerat's, Woodville's, or La Marck's figures), attached to the outſide of a quadrangular, hollow elevation within the ſegments of the calyx; anthers ſmall. *Piſt.* germ inferior, oblong, two-celled; ſtyle ſimple, in the centre of the quadrangular elevation, but perfectly diſtinct from it; ſtigma ſimple. *Peric.* Berry oval-oblong, one or two-celled, crowned with the permanent calyx, and quadrangular elevation. *Seeds* one or two, large.

Eſſ. Ch. *Cor.* four petalled. *Cal.* four-cleft. *Berry* inferior, one or two-celled.

Sp. 1. C. *aromaticus*, Linn. Sp. Pl. Bauh. pin. p. 410. Tourn. app. p. 661. Pluk. Alm. tab. 155. fig. 1. Rumph. amb. tab. 1, 2. Sonnerat. guin. nov. tab. 119. Woodv. med. bot. tab. 135. Gært. tab. 33. Lam. Illuſt. tab. 417. (Eugenia caryophyllata, Willd. Garyophili,

phili, Lob. ic. 2. p. 147. Tſhinka, Piſon. arom. p. 177.) "Leaves lanceolate, acuminate." A ſmall tree. *Trunk* from fifteen to thirty feet high, a foot thick, dividing into branches four or five feet from the ground, and forming a denſe, pyramidal head; branches oppoſite, ſlender, generally horizontal, but ſo weak as to ſtand in need of ſupport when loaded with fruit. *Leaves* from two inches and a half to four inches long, near an inch and a half broad, with a ſtrong midrib, and parallel lateral nerves, oppoſite, tapering at both ends, quite entire, ſmooth on both ſides, reddiſh and rather ſhining above, bright green underneath, and beſprinkled with minute reſinous points, which placed under a magnifier in a ſtrong light, are generally tranſparent; petioles from ſix to nine lines long, red, and according to Sonnerat, the moſt aromatic part of the plant. In Sonnerat's and Woodville's figures, they are much ſhorter than in La Marck's, and ſoon begin to expand into the proper leaf. *Flowers* odorous, from nine to fifteen or more on a branch, growing often by threes on partial peduncles in terminal cymes, or rather corymbous panicles; filaments white; anthers yellow; peduncles ſmooth: bractes two under each diviſion of the panicle, and at the baſe of each flower very ſmall, caducous. There is a variety figured by Rumphius with four larger bractes, which Linnæus ſeems to have miſtaken for a ſecond calyx, or as he calls it a perianth of the fruit placed under the germ, in contradiſtinction to the ſuperior perianth of the flower. *Fruit* coriaceous, reddiſh brown, oval-oblong, not falling ſpontaneouſly from the tree till the enſuing year. The bark, fruit, roots, and leaves, are all more or leſs aromatic. A native of moiſt ſituations in the Molucca iſlands and New Guinea. 2. C. *obtuſifolius.* Sonnerat nov. guin. pl. 120. "Leaves ovate-wedge-ſhaped, obtuſe." All parts of the plant ſcentleſs. *Leaves* rounded at their ſummit, pale green, on long petioles; cloves bitter. Sonnerat's figure repreſents a branch with only two terminal flowers. A native of New Guinea.

Sonnerat mentions another ſcentleſs ſpecies or variety differing from the preceding, in having the ſegments of the calyx extremely long and acute. Loureiro found in Cochinchina what appears to be ſtill a different ſpecies with ſcarcely any ſmell or taſte, which he thus deſcribes. A middle-ſized tree with few branches. *Leaves* broad-lanceolate, quite entire, ſmooth, oppoſite, petioled. *Flowers* white; peduncles many-flowered, regular, upright, terminal; calyx tubular, oblong, four-cleft; ſegments acute, ſhort, ſomewhat upright; petals roundiſh, concave, ſmall. *Pericarp* a calycine berry, ovate oblong, corticoſe, pale brown, crowned with the ſegments of the calyx. *Seed* ſingle.

Obſ. The clove ſpice does not appear to have been known by the ancient Greeks and Romans. Diodonæus, indeed, has conjectured, and Bodæus a Stapel agrees with him in thinking, that the tender branches of this tree are the real cinnamon of the ancients; but as far as we are able to judge, the ſuppoſition is without probability. The firſt diſtinct mention of it is by Paulus Œgineta, a Greek phyſician of the ſeventh century, who obſerves that it does not correſpond with its name which ſeems to imply a leaf in the ſhape of a nut, and of which Mr. Ray long after acknowledged that he could not gueſs the meaning; but is properly a kind of rod-like flower, the produce of an Indian tree. He ſays it is of a dark colour, about the thickneſs of a finger in length, aromatic, acrid, ſomewhat bitter, warm and dry in the third degree, much uſed, both in food and as a medicine. It was probably firſt brought into Greece from Arabia, as it correſponds ſufficiently with the deſcription of the Carunſel of Serapion, an Arabian phyſician nearly contemporary with Paulus Œgineta, and of the Charunſel Iellum of Avicenna, another phyſician of the ſame country, who flouriſhed at the beginning of the eleventh century. When the Portugueſe began to navigate the Indian ſeas about the cloſe of the fifteenth century, they ſoon became ſenſible of the value of the clove as an article of commerce, and are ſaid to have ſown many thouſand ſeeds in the iſland of Amboyna, about four years before it was taken by the Dutch. To this iſland and the neighbouring ſmaller ones of Honimſa, Oma, and Nouſſa lant, commonly called the Ulaſſiers, its new maſters, with that narrow ſpirit of mercantile ſelfiſhneſs which is ſo generally attributed to them as a national characteriſtic, have long wiſhed to confine its cultivation, that they might monopolize the ſale of it to themſelves and have it in their power to fix upon it their own price. For this purpoſe, about the middle of the laſt century they compelled the kings of Ternate, Tidore, Machian and Bachian, and afterwards made a ſimilar contract with the king of Bouton, to accept an annual payment, as a recompence for ſuffering the clove-tree to be extirpated throughout their dominions, and for aſſiſting the Dutch agents in their periodical circuit of devaſtation. The king of Ternate is ſaid by Du Tour in Nouv. Dict. to have received annually about eighteen thouſand rix-dollars, near four thouſand pounds ſterling; but according to Stavorinus, the king of Bouton received lately only 150 rix-dollars, or 32l. 14s. 6d. which is repreſented as a conſiderable ſum in his treaſury. The Dutch Eaſt India company are alſo bound to take at a fixed price all the cloves raiſed by the inhabitants of Amboyna. Beſides theſe reſtrictions, they have ſometimes thought fit to reduce the number in the iſlands appropriated to their growth. In 1769 it was ordered by them that more than five hundred thouſand ſhould not be ſuffered to remain in the iſland of Amboyna; in 1773, fifty thouſand more were deſtroyed. But notwithſtanding all the efforts of their illiberal policy, the clove tree is now known to grow ſo abundantly in New Guinea, and many other iſlands over which they have never obtained any influence, that even if there were a probability of their riſing from their preſent degraded ſtate, and recovering their former rank in the ſcale of nations, it would not be poſſible for them to renew ſo odious a monopoly. So long ago as 1770 the patriotic M. Poivre, then intendant of the iſle of Bourbon, ſent two ſhips to the ſpice iſlands under the direction of M. Prevoſt, a confidential friend well acquainted with the navigation of their coaſts, for the expreſs purpoſe of obtaining living plants and ſeeds to be cultivated in the French colonies. After ſeveral unſucceſsful attempts, this able negotiator obtained from the kings of Gebi and Palam in the iſland of Ceram, ſovereigns entirely independent of the Dutch Eaſt India company, a great number of plants both of the clove and nutmeg tree, as well as of ripe berries and nuts. In the year 1771 M. Prevoſt made another voyage to Gebi and returned in 1772 with a ſtill more abundant cargo of trees and ſeeds. They were planted by M. Poivre in a magnificent garden prepared for them in the iſle of France, whence they were afterwards exported in conſiderable quantities to Cayenne and Martinico. In Cayenne 4400 clove trees were gradually raiſed between the years 1779 and 1784, excluſive of thoſe which had been diſtributed among private individuals. In 1785 the oldeſt of them, then of ſix years growth, produced a few ſmall flowers; and two pounds and a half of cloves were collected from them. In 1786 the crop amounted to 95 pounds; and in 1787 to 273 pounds, when Lavoiſier and the Count de la Luzerne were appointed to examine them and report their quality to the French government. The cloves of Cayenne proved equal to thoſe of the Eaſt Indies, and were even found to afford a larger proportion of eſſential oil. In 1792 the plantation contained 4500 fruit-bearing trees; and a merchant of Bourdeaux had ſold in the preceding year 700 pounds of Cayenne cloves at a lower price than was aſked for thoſe from the Moluccas. The ſucceſs of the plants ſent to Martinico was not known to Du Tour, from whom theſe details are taken, that iſland having ſoon afterwards ſurrendered to the Britiſh arms; but we learn from the tranſlator of Stavorinus's voyages to the Eaſt Indies, that in 1797, 305 pounds of cloves were imported into the port of London from Martinico, and in 1798, 200 pounds from the ſame iſland and 2981 from St. Kitts.

This ſpice, ſo much ſought for in commerce, and ſo much eſteemed by epicures, is not the ripe fruit of the plant, but the bud of the flower, which is found by experience to loſe much of its aromatic quality if ſuffered to remain on the tree till the anthers have diſcharged their pollen, and the germ has become impregnated. In Amboyna it makes its firſt appearance at the beginning of the rainy ſeaſon, and is of a dark green colour. In Auguſt and September it acquires its proper ſhape, and then gradually paſſes from green to yellow, and from yellow to red; but ſtill has its ſtamens completely ſhut up in the unopened petals, which form a kind of globular button at the top of the calyx and germ. In that ſtate it has a ſtrong reſemblance to a ſmall nail; of which the cloſed petals and expanded ſegments of the calyx compoſe the head, and the germ, gradually tapering to a bluntiſh point, the lower extremities. The reſemblance is ſo ſtriking, that it has given riſe to the vulgar name by which this article of commerce is known in moſt nations of Europe. The Dutch call it naghel, the Spaniards clavo, the Italians chiodo, and the French clou, from which the Engliſh word clove is evidently derived. When the cloves have thus arrived at what may be properly called their mercantile ſtate of maturity, thoſe within reach are gathered by the hand, and the reſt, as moſt authors aſſert, are beaten down by poles or reeds; but, according to Stavorinus, are cut off with long hooks. The latter is the more probable account; for, as Mr. Ray obſerves, it is not eaſy to conceive how unripe fruit which in a healthy ſtate is uſually ſtrongly attached to the tree, can be forcibly beaten off, without breaking or materially bruiſing the tender branches, which at the ſame time is expreſsly ſaid to be carefully avoided, as a certain detriment to the crop of the enſuing year. The ſeaſon of gathering continues from October to February. The cloves, as ſoon as they are gathered, are dried either in ſmoke over a fire, in the ſun, or in a kiln. Stavorinus aſſerts that thoſe which are dried in ſmoke are not good, and may be diſtinguiſhed by their blacker colour, and their bending between the fingers: whereas thoſe dried in the ſun are of a reddiſh caſt, and are not flexible, but brittle, ſnapping aſunder upon being fillipped by the finger. Du Tour obſerves, that the oily part of the clove is beſt preſerved when it is dried in a kiln. Thoſe are always preferred in the market which appear plump, and leave an oilineſs on the fingers when preſſed, which have moſt of the aromatic taſte and ſmell, and which retain the globular unexpanded corolla, a certain proof that they have not continued too long on the tree.

They are uſed in their native climate, and in almoſt every part of the civilized world, as an article of luxury, communicating a pleaſing flavour to preſerved fruit, ſauces, ragouts, and liqueurs. They are likewiſe employed by the perfumer. In medicine they are eſteemed tonic, cordial, and exhilarating, acting as a powerful ſtimulant to the muſcular fibres, and ſuperior to moſt of their claſs in caſes of atonic gout, paralyſis, &c. They have a ſtrong agreeable ſmell, and a bitteriſh, hot, but not very pungent taſte, qualities which are completely extracted by rectified ſpirit. To water they communicate more of their ſmell, but leſs of their taſte; and in diſtillation with water, they yield one-ſixth of their weight of eſſential oil, ſmelling ſtrongly of cloves, but leſs pungent than the ſpirituous extract. This oil is an article of the Pharmacopœias, and enters into ſeveral officinal compoſitions. It often gives inſtant eaſe in the tooth-ach; and is uſed with benefit as an external application in paralytic and lethargic affections. That which is commonly met with in the ſhops, and received from the Dutch, is much more acrimonious than the genuine diſtilled oil, and is probably ſophiſticated by an admixture with the reſinous part of the cloves, from which it receives its peculiar acrimony and high colour.

Valentyn deſcribes four ſorts of cloves; that which he calls the male is the ſort uſed for drying; the female is of a pale colour, and the beſt for extracting oil; the king's clove is a very ſcarce ſpecies, bearing larger and double fruit, and is perhaps that figured by Rumphius, which he calls regium; the fourth ſort, or rice-cloves, are very ſmall, and likewiſe very rare. Whether the trees which produce theſe different kinds are diſtinct ſpecies, or only varieties, we cannot determine.

The berries which ripen on the tree are emphatically called mother-cloves, as being chiefly deſtined to give birth to a future progeny. The Dutch, however, preſerve them in ſugar, and value them as an uſeful aſſiſtant to digeſtion, and a pleaſant antiſcorbutic ſea-ſtore. See Bodæus a Stapel's Notes to Theophraſtus, Raii Hiſtoria Plantarum, Stavorinus's Voyages to the Eaſt Indies, Sonnerat's Voyage to New Guinea, Woodville's Medical Botany, La Marck in Encyclopedie, and Du Tour in Nouveau Dictionaire, under Epice and Geroflier.

On re-conſidering the ſubject, ſince the article Caryophyllei was drawn up and ſent to the preſs, we are convinced that Linnæus was right in retaining for the Aſiatic ſpice the name of Caryophyllus, which had been originally formed for it by the Greek merchants of the middle ages, who ſeem to have miſtaken the dried cloves for the leaves of the plant; and that he had no alternative but to invent a new one for the European plants, which could not poſſibly be arranged under the ſame genus, although they had received the ſame appellation from the earlier modern botaniſts, on account, as Mr. Ray has obſerved, of ſome reſemblance to the ſmell of the original caryophyllus, or clove, in one of the ſpecies at leaſt which is ſtill called by gardeners the clove pink. (*Dianthus caryophyllus*, Linn.). He is to be cenſured only for diſtinguiſhing, by the name of Caryophyllei, a natural order which does not contain the true Caryophyllus, and which he might have been led by an obvious analogy to call Dianthei. It is ſurpriſing that he ſhould have been followed by Juſſieu in ſo groſs an impropriety.

CARYOTA, in *Botany,* (Καρυωτις, Dioſc. Καρυωτος φοινιξ, Ætius, a palm, bearing nuts.) Linn. gen. 1228. Schreb. 1701. Juſſ. 38. Vent. 2. 129. Gært. 25. Nat. Ord. *Palmæ* (*Monœcia polyandria*).

Gen. Ch. Male *Cal.* ſpathe univerſal; ſpadix branched; proper perianth three-leafed, Linn. (ſix-leafed, Gært.; ſix-cleft; the three outer ſegments ſhort, not deeply divided, Vent.; ſhort, membranous, entire, forming a little cup, Lam.) *Cor.* three-cleft, Linn. (of three oblong, concave, petals, Lam.; none, Gært. Vent.) *Stam.* numerous; anthers linear. Female. Perianth and corolla as in the male. *Piſt.* germ ſuperior, roundiſh; ſtyle acuminate, ſhort; ſtigma ſimple, (twin, Gært.) *Fruit* berry roundiſh, one-celled. *Seeds* one or two, large, flat on one ſide, convex on the other.

Eſſ. Ch. Male. *Calyx* common. *Cor.* three-cleft. *Stam.* numerous. Female. *Piſt.* one; berry two-ſeeded, Linn.

Sp. 1. C. *urens,* Linn. Sp. Pl. Gært. tab. 7. fig. 3. Lam. Illuſt. Pl. 897. (Schunda-panna, Rheed. Mal. 1. tab. 11. Seguaſter major, Rumph. Amb. 1. tab. 14.) "Fronds bipinnate; leaflets ſeſſile; berry two-ſeeded." *Trunk* frequently ſo large as to be ſcarcely embraced by two men; riſing to a conſiderable height, but not ſo high as the cocoa-palm; bark greyiſh; wood hard, ſolid, heavy; pith white. *Leaves* or fronds large, forming an ample head, twice winged; pinnules ſmall with reſpect to the ſize of the leaf, wedge-ſhaped, obliquely truncated, and gnawed on the upper edge, finely ſtriated lengthwiſe, browniſh-green, ſhining. *Spathe* many-leafed, axillary within the loweſt leaf. *Flowers* in pairs, on long, pendulous ſpikes, firſt green, then red or purple, finally yellow; filaments nearly as long as the petals. Berry about the ſize of a plum, globular, ſucculent, almoſt black when ripe; rind thin; pulp ſoft and red, very ſharp and acrid. *Seeds* generally two, ſometimes only one, wrinkled, hard. The farina of its pith reſembles that of ſago, but is leſs pleaſant. A native of the Eaſt Indies. 2. C. *mitis,* Mart. Mil. Loureiro Cochin. 569. "Fronds bipinnate; petioles of the pinnules nodding; berry one-ſeeded." *Trunk* fifteen feet high, two inches thick, very ſtraight and regular. *Leaves* four feet long; pinnules wedge-ſhaped, many-nerved, obliquely bitten, on long ſlender petioles. *Spathe* ſimple, oblong, rather acute. *Spadix* branched; ſpikes ſimple, long. *Flowers* regularly diſpoſed, with ſingle females between pairs of males; filaments none; perianth of the females five-leafed; ſtigma bifid. *Fruit* about the ſize of a muſket ſhot, round, coriaceous, ſmooth, black; pulp mild. *Seed* pale, ſoftiſh. A native of Cochinchina.

CARYSFORT, in *Geography,* a very ſmall village, if indeed it can be called more than a houſe, in the county of Wicklow, Ireland, 7 miles S.W. from Wicklow, and 31 from Dublin. Before the union it ſent two members to parliament, but it does not appear to have been ever a place of importance. Near it is Croaghan mountain, where gold was procured. See Croaghan.

CARYSIS, in *Ancient Geography,* an iſland of Aſia Minor, on the coaſt of Lycia, which belonged to the inhabitants of Caria, according to Steph. Byz. It was one of the three ſmall iſlands, Cryéon, ſituate at the bottom of the north-weſt part of the gulf of Glaucus.

CARYSTIUM *linum.* See Linum *caryſtium.*

Carystium *marmor.* See Marmor.

CARYSTUS, in *Ancient Geography,* a town of Greece, in the iſland of Eubœa, ſituated in the ſouthern part of the iſland, at the bottom of a ſmall gulf which opened to the ſouth-weſt. It was famous for the quarries of marble which were found in mount Ocha, at the foot of which it was ſituated. This marble was in high eſtimation among the Romans. Strabo ſays that this high mountain furniſhed the well known aſbeſtos or amianthus. Ptolemy calls this town Caryſte, and it is ſaid to have derived its name from Caryſtus, the ſon of Chiron; whence it was alſo called Chironia; and it was likewiſe denominated Ægea, from Ægon, who is ſaid to have reigned here, and is ſuppoſed by Stephanus to have given his name to the Ægean ſea. The inhabitants of Caryſtus worſhipped the god Briareus, who, according to Homer, was the ſame with Ægeon, adored by the Chalcidians; the name of Ægeon being given to him, as he tells us, by men, and that of Briareus by the immortal gods. Caryſtus has been ſince called Cariſto, and Caſtel Roſſo.

CARYUS, in the *Materia Medica,* a name given by Dioſcorides, and ſome other of the ancient Greeks, to the *eryngium,* or ſea-holly, called by us *eryngo.* It was thus named from its having a ſmall head or cluſter of flowers like a walnut. See Eryngium.

CAS, St. *Bay,* in *Geography,* a bay of the Engliſh channel, on the N.W. coaſt of France, where in 1758 the Engliſh made an unſucceſsful landing, with the loſs of about 1000 men. It derives its name from that of a village near it. It is 10 miles W. of St. Maloes, and 5 S.E. of cape Frehel.

CASA, John De La, in *Biography,* a celebrated Italian writer, was the deſcendant of a noble family at Florence, and born in 1503. Having been educated at Bologna, and afterwards having purſued his ſtudies for ſome time at Florence, under Ubaldino Bandinelli, he ſettled at Rome, and, in 1538, became clerk of the apoſtolical chamber. With the elegant and claſſical ſtudies to which he was devoted, he combined, as was too frequently the caſe, the licentious manners of the capital; and as the fruit of his amours, he had a natural ſon, whom he named Quirino. In 1540 he became a member of the newly inſtituted Florentine academy; and in 1544 he was made archbiſhop of Benevento, and alſo diſpatched as nuncio to Venice. Failing to engage the Venetians to join in a league with pope Paul III. and Henry II. king of France, for controuling the dreaded power of Charles V., which was one object of his miſſion; he ſucceeded in another, for the purpoſe of carrying on a proceſs againſt Vergerio, formerly the pope's nuncio in Germany, who had become a Lutheran. But although he drove him from Italy, Vergerio amply avenged himſelf by the injury which he did to Caſa's reputation in Europe. Under the pontificate of Julius III. he was involved in the diſgrace of cardinal Alexander Farneſe, and obliged to quit Rome, and to retire to Venice, in the vicinity of which he paſſed ſeveral years in the private proſecution of his ſtudies. Upon the election of Paul IV. he was recalled to Rome, and appointed ſecretary of ſtate; but he never advanced to the rank of cardinal, which ſome have aſcribed to the licentious writings of his youth. He died of the gout in 1556, at the age of 53 years.

John de la Caſa has been always regarded as one of the politeſt writers of the moſt flouriſhing age of Italian literature, and one of the principal models of the pure Tuſcan dialect. His verſes, though defective in ſtyle, excel in elevation of ſentiment and livelineſs of imagery. Deviating from the courſe purſued by Petrarch and his imitators, he aimed at ſubſtituting a ſublime and noble gravity to their perpetual ſoftneſs and tenderneſs. He alſo adopted in his youth the burleſque manner of Berni, and other writers; and in this ſtyle of compoſition he wrote his famous "Capitolo del Forno," which, by its extreme indecency, fixed an indelible reproach on his name and character. This piece, and ſome more of his performances, have been ſuppreſſed in all late editions of his works; but they are printed among other compoſitions of a ſimilar kind by Berni, Mauro, and others, at Venice in 1538. His Italian letters are elegant, but defective in point of eaſe and familiarity. His moſt celebrated work in Italian proſe is the "Galateo," or Art of living in the World, which is a kind of ſyſtem of politeneſs, that has been much eſteemed, and tranſlated into moſt of the languages of Europe. His orations have been much admired, as finiſhed pieces of artificial eloquence. As a writer of Latin in proſe and verſe, Caſa is one of the happieſt imitators of the ancients, and his lives of the cardinals, Contarini, and Bembo, are maſter-pieces of their kind. His knowledge of Greek was diſplayed by elegant tranſlations of the orations in Thucydides, and of that writer's deſcription of the peſtilence at Athens. Of the numerous editions of his works, that of Venice in 5 vols. 4to. 1728, is reckoned the moſt valuable, on account of its illuſtrations and biographical anecdotes. Gen. Dict. Gen. Biog.

CASA, in *Ancient* and *Middle Age Writers*, is uſed to denote a cottage or houſe.

CASA *Santa*, denotes the chapel of the Holy Virgin at Loretto. This is properly the houſe, or rather chamber, in which the Bleſſed Virgin is ſaid to have been born, where ſhe was betrothed to her ſpouſe Joſeph, where the angel ſaluted her, the Holy Ghoſt overſhadowed her, and, by conſequence, where the Son of God was conceived, or incarnated. It is pretended to have been carried in May, 1291, through the air from Galilee to Terſato, in Dalmatia, by angels; and 4½ years afterwards to have been removed to Italy, where about midnight, in December 1294, it was ſet down in a wood, in the diſtrict of Recanati, about a thouſand paces from the ſea. But it was nearly 200 years in Italy before any author of that country took any notice of it. Of this building the Catholics tell many other wonderful ſtories, too childiſh to tranſcribe.

The Santa Caſa, or holy chamber, conſiſts of one room, the length of which is 31¾ feet, the breadth 13 feet and nearly 3 inches, and the height 18¾ feet. Formerly it had only a timber ceiling; but, leſt by a great number of lights continually burning it ſhould happen to take fire, Clement VII. cauſed a vaulted roof to be made. It was alſo ſtrongly compacted with rafters, boards, and ropes, and ſupported by machines till the new foundation was carried up, ſo as to be joined with the old walls of the houſe. On the ceiling is painted the aſſumption of the Virgin Mary. On the weſt ſide of the window, through which the angel came into the houſe, and facing it, in a niche, ſtands the image called the great *Madona*, or lady, five feet high, made of cedar, and, as they ſay, wrought by St. Luke, who was a carver as well as a phyſician. The mantle or robe ſhe has on, is covered with innumerable jewels of ineſtimable value. She has a triple crown of gold, enriched with pearls and diamonds, given her by Lewis XIII. of France, and a little crown for the child Jeſus. The niche in which the image ſtands is adorned with 71 large Bohemian topazes; and on the right ſide of the image is an angel of caſt gold, profuſely enriched with diamonds and other gems, which is ſaid to have coſt 50,000 ducats, and which was offered by Maria Beatrix Eleonora, of the houſe of Eſte, queen of king James II. of England, that, by the interceſſion of the Virgin Mary, ſhe might conceive a ſon. Accordingly, ſoon after, as it is ſaid, ſhe had a ſon; who has ſince occaſioned ſo much noiſe in Europe, under the name of the pretender to the Britiſh crown. On the left ſide of the Virgin's image is a ſilver angel; and on the right hand another coſtly one, which was the gift of Lewis XIII. king of France for the birth of the dauphin, afterwards Lewis XIV. The robe which this famous image wore, when it was brought from Dalmatia into Italy, is of red camlet, and kept in a glaſs ſhrine. The diſh out of which ſhe and her divine infant are ſaid to have eaten is a ſhallow bowl, of glazed earthen ware, plated over with ſilver. This utenſil is not only kiſſed, but roſaries, medals, agnus dei's, crucifixes, and paper caps, painted with the image of the Madona of Loretto, are rubbed againſt it, from a firm perſuaſion that they thus become an infallible remedy againſt the head-ache, and other diſeaſes. Seven golden lamps are continually burning before the image; and other parts of the Caſa Santa are illuminated by 37 ſilver lamps, which are ſupplied with oil out of legacies bequeathed, and ample funds eſtabliſhed for this purpoſe. Notwithſtanding the mean appearance of the walls within the Caſa Santa, the outſide is elegantly adorned with the fineſt Carrara marble, which caſe of marble was begun in 1514, in the pontificate of Leo X and conſecrated in 1538 by Paul. III. The expence of this caſing was enormous, and the moſt celebrated ſculptors of the age were employed in adorning it. The edifice which encloſes the holy houſe was deſigned by Bramante, and the ſculpture was deſigned and executed by the moſt famous artiſts. It was completed in 1579, and Gregory XIII. had the honour of finiſhing this ſuperb work. On the top of the Caſa Santa is a little tower, in which are hung two ſmall bells, that are rung in violent tempeſts of thunder and lightning, under a notion that their ſound will diſperſe the ſtorm, and prevent any injurious effects. There is one part of the Caſa Santa which may be regarded as the holy of holies: for it is ſeparated from the other part by a ſilver baluſtrade, and a gate of the ſame metal. It is ſaid to be the ſpot where the Virgin was ſitting when the angel Gabriel appeared to her at the time of the annunciation. The large church in which the caſe of the Caſa Santa ſtands, as if it were under a tent, is built of Iſtrian ſtone, reſembling the Travertino ſtone uſed at Rome. The front is wholly of marble, and embelliſhed with very fine ſculpture, and over the portal is a ſtatue of the holy Virgin. The three doors on this ſide of the church are bronze, with beautiful baſſo-relievos, repreſenting different hiſtories of the Old Teſtament. Over the middle door are theſe words "Domus Deiparæ, in quâ verbum Caro factum eſt." Keyſler's Travels, vol. iii. See Loretto.

Casa *Calanda*, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Moliſe; 21 miles E.N.E. of Moliſe.

Casa *de la Contratacion*, or the houſe of trade, in *Commerce*, a tribunal of Spain eſtabliſhed at Seville, to the port of which the commerce of the New World was confined, as early as the year 1501, for the regulation of ſuch commercial affairs as required the immediate and perſonal inſpection of thoſe appointed to ſuperintend them. It may be conſidered both as a board of trade, and as a court of judicature. In the former capacity it takes cognizance of whatever relates to the intercourſe of Spain with America; regulates the commodities that ſhould be exported thither, and has the inſpection of thoſe that are received in return. It decides concerning the departure of the fleets for the Weſt Indies; the freight or burden of the ſhips, their equipment, and their deſtination. In the latter capacity it judges with reſpect to every queſtion, civil, commercial, and criminal, ariſing in conſequence of the tranſactions of Spain with America: and in both theſe departments, its deciſions are exempted from the review of any court but that of the *Council of the Indies*, which ſee.

Casa *Grand*, in *Geography*, a town of North America, in the country of New Mexico, and province of New Navarre, ſeated on a river N. of Buenaventura. N. lat. 29° 30′. W. long. 107° 20′.

Casa *Maſſima*, a town of Naples, in the country of Bari; 11 miles S.W. of Converſano.

Casa *Viíieri*, a town of Naples, in the country of Lavora; 7 miles S.E. of Sora.

CASAC, or Cazac, a country of Aſia, in the dominions of Perſia, on the frontiers of Armenia, governed by princes of its own, nominally ſubject to Perſia; about five leagues from north to ſouth, and ſomewhat more from eaſt to weſt. The inhabitants are deſcended from the Coſſacks, and are repreſented as a rude and barbarous people. Caſac, or Cazac Loré, is the name of the capital.

CASÆ, in *Ancient Geography*, a town of Aſia, ſituate on the mountains of Pamphylia. Ptolemy.

Casæ *Baſtalenſes*, or *Calanenſes*, an epiſcopal ſee of Africa, in Numidia.—C. *Calbinti*, a place of Africa, in Mauritania Cæſarienſis, between the colonies of Tipaſa and Icoſium, according to the Itinerary of Antonine.—C. *Favenſes*, an epiſcopal city of Africa; but the province in which it was ſituated is not aſcertained.—C. *Medianenſes*, an epiſcopal city of Africa, in Numidia.—C. *Nigræ*, an epiſcopal city of Numidia.—C. *Sylvanæ*, an epiſcopal city of Africa, in Byzacium.—C. *Villa Aniceorum*, a place of Africa, according to the Itinerary of Antonine, in the route from Carthage to Leptis, between Tacapæ and the colony of Sarbaras.

CASAL, in *Geography*, a town of Italy, and capital of Montferrat, ſeated on the Po, formerly well fortified, and defended by a citadel, which was much admired. It was taken from the Spaniards in 1640; ſold by the duke of Mantua to the king of France in 1681; taken in 1695 by the allies, who deſtroyed its fortifications; but retaken by the French and re fortified. The king of Sardinia became maſter of it in 1706; but it was taken by the French in 1745, retaken in 1746, and captured again by the French in 1796. The biſhop is ſuffragan to the archbiſhop of Milan. N. lat. 45° 7′. E. long. 8° 37′.

Casal-*Maggiora*, a town of Italy, in the duchy of Milan, and country of the Cremoneſe, ſeated near the Po, and made a town in 1754. N. lat. 45° 6′. E. long. 11° 5′.

CASALMACH. See Iris.

CASAL-NOVO, a conſiderable town of Naples, in the province of Terra di Otranto, containing about 4000 inhabitants, noted for nothing but their taſte for dog's fleſh. At this place, as well as at Lecce, the tanners kidnap dogs and tan their hides into an imitation of Turkey leather, with which they ſupply the gentlemen of the neighbouring cities, who are nice in their ſlippers. This demand for falſe Morocco occaſions the ſlaughter of many dogs, and, without doubt, the cuſtom of eating their fleſh commenced among the needy tanners. Hunger and experience have taught their countrymen to conſider the diſcovery as a very beneficial one. N. lat. 40° 42′. E. long. 17° 36′.—Alſo, a town of Naples, in the province of Principato Citra, N.E. of Policaſtro. N. lat. 40° 16′. E. long. 15° 34′.

CASALUS *Sinus*, in *Ancient Geography*, a gulf on the weſtern coaſt of the iſland of Corſica.

CASAMA, a town of Aſia, placed by Ptolemy in the Palmyrene territory, which was a country of Syria. The Notitia Imperii places it in Phœnicia. It was ſituated on a ſmall river to the eaſt of Carræ.

CASAMAN, a town of Aſia, probably towards Armenia.

CASAMARRI, a people placed by Pliny in Ethiopia, near Egypt.

CASAN, or Kazan, in *Geography*, a government of Ruſſia in Europe, ſeated on the river Volga; bounded on the north by that of Viatka, on the eaſt by the governments of Permia and Ufa, on the ſouth by that of Simbirſk, and on the weſt by that of Neſhnei Novogorod. It contains 13 diſtricts, of which one is Caſan, or Kazan, ſituate on the rivulet Caſanka, which falls into the Volga. Its capital bears the ſame name. The kingdom of Kazan was conquered from the Tartars by Joan Vaſſilievitch II. or Baſilowitz, after a conteſt of ſeven years; the capital of it ſurrendering to the victor in 1552; and at this time the empire of it was united to Ruſſia for ever. In the Turkiſh and Tartarian language, Kazan ſignifies a large cauldron, of ſufficient ſize to contain victuals for many perſons; and this name is given by the Crim or Budziah Murſes to the families of their ſubjects, or vaſſals, reckoning about 10 men to a kazan. The preſent Kazan Tartars are but a feeble remnant of what they once were, partly conſiſting of thoſe who remained in their old habitations, and partly of thoſe who ſettled as fugitives in other diſtricts of Ruſſia.

Casan, or Kazan, a city of Ruſſia, and the capital of the above government, ſituated near the Volga. This city was built in the year 1257, by a ſon of Baaty, a kinſman of the great Tchinghis; and its khanate aſſerted its independency about the year 1441, when the Krim disjoined itſelf from Kapiſchah, or Capſchac. Kazan conſiſts of a ſtrong fort, built with ſtone, the wooden town as it is called, and ſeveral adjoining ſuburbs, one of which is inhabited by Tartars. Here are ſeveral churches, moſt of which are conſtructed with ſtone, and alſo 11 convents in or near the town. The government chancery which is held in the fort, is under the direction of the governor and deputy governor. All the garriſons and regiments within the government of Kazan are under the command of the governor. The garriſon of the city conſiſts of three regiments, for the ſervice of which a good hoſpital is provided. Kazan is an archbiſhop's ſee. At one end of the town is a manufactory of cloth, which is purchaſed by government for the cloathing of the troops. In a convent, called Siliandowo, ſeated on the river Caſanka, about two werſts from the town, is a ſchool, where the children of Tartars are taught the Ruſſian and Latin languages, the principles of the Chriſtian religion, and the elements of philoſophy, in order to qualify them as preachers for the converſion of the nations to which they belong. In 1749, and again in 1752, this city was totally deſtroyed by fire. The adjoining country is fertile in all ſorts of fruits, corn, and pulſe. The commerce of this government conſiſts of furs, and of oak timber for the building of ſhips. For the preſervation of the large oak-trees that grow in this diſtrict czar Peter I. appointed foreſters, who had under them diſcharged ſoldiers; but theſe people committed every kind of exceſs among the inhabitants, and, therefore, they were aboliſhed in the year 1762. However, every land-owner is careful of his oaks, as they fetch at all times a good price. In Peterſburg every pood of oak timber, including the expence of tranſport, ſells for 15 to 25 kopeeks. Caſan or Kazan is diſtant 400 miles E. of Moſcow, and 660 S.E. of Peterſburg. N. lat. 55° 43′ 58″. E. long. 49° 8′ 15″.

CASANDRA, in *Ancient Geography*, an iſland placed by Pliny in the Perſian gulf over againſt Perſia Propria.

CASA-NOVA, Marc-Antonio, in *Biography*, called in his time, the prince of Latin epigrammatiſts, was born at Rome, where he flouriſhed in the beginning of the 16th century. Attaching himſelf to the imitation of Catullus and Martial, he affected the wit and ſeverity of the latter, but deviated from the nature and purity of the former. Whilſt he was engaged in the ſervice of the Colonna family, he exerciſed his ſatire againſt Clement VII. with ſo little moderation, that he was impriſoned and condemned to death, but pardoned by the pontiff. After the ſack of Rome he was reduced to ſuch extreme indigence, that he wandered about the ſtreets begging bread, and died either of want or of the plague in 1527. Beſides his epigrams, he wrote ſhort eulogies or inſcriptions on the principal characters of ancient Rome. A ſelection of his pieces may be found in the firſt volume of the "Deliciæ Poetar. Italor."

CASAPE, in *Ancient Geography*, a town of Aſia, placed by Ptolemy in the interior of Hircania.

CASAQUE, an ancient military habit conſiderably larger than an ordinary coat. It was formerly the common veſtment or garment of all the French. And as this caſaque was of a different colour in each company of their troops, it was eaſily and immediately diſcovered by this diſtinguiſhing difference, to what company any ſoldier belonged, who had been guilty of any diſorder, outrage, or irregularity. When the caſaque was aboliſhed, it was ſucceeded by the echarpe or ſcarf, which was alſo of different colours in different companies.

CASAS, De Las, Bartholomew, in *Biography*, a prelate eminently diſtinguiſhed by his humanity, was born at Seville in 1474, and in his 19th year accompanied his father, who ſailed to the Weſt Indies with Columbus. On his return to Spain after an abſence of five years, he purſued his ſtudies, and entered into the eccleſiaſtical order. When Columbus made a ſecond voyage to Hiſpaniola, Las Caſas was one of the clergymen who attended him thither, with a view of ſettling in that iſland. On the reduction of Cuba, he was obliged to take the rectory of Zaguarama in this iſland. Adopting the opinion which was prevalent at this time among the eccleſiaſtics, and particularly among the Dominicans, that it was unlawful to reduce the natives to ſervitude, he concurred with them in exclaiming againſt the "repartimientos," or diſtributions which were made of them by the governor as ſlaves to their conquerors. In order to demonſtrate the ſincerity of his conviction, he relinquiſhed his ſhare in the diſtribution, declaring that he ſhould ever bewail his own misfortune and guilt, in having exerciſed for a moment this impious dominion over his fellow creatures. From that time he became the avowed patron of the Indians, and by his active interpoſition in their favour contributed to reſtrain the exceſſes of his countrymen. Actuated by a laudable zeal in their cauſe, he ſet out for Spain in 1516, for the purpoſe of ſtating their diſtreſſed ſituation to king Ferdinand and intreating his compaſſion in their favour. This monarch, being in a declining ſtate of health, was much impreſſed by the eloquence of Las Caſas, and promiſed to adopt means for redreſſing the evil of which he complained and the guilt of which he forcibly charged on Ferdinand himſelf. Death, however, prevented him from executing his reſolution. Las Caſas, with unabated ardour, determined to lay their caſe before Charles of Auſtria, who was then in the Low Countries, but whilſt he was preparing to ſet out for Flanders, the regent, Cardinal Ximenes, with the vigour peculiar to his character, adopted a plan for accompliſhing the object which the benevolent eccleſiaſtic had in view; and accordingly he reſolved to ſend out three reſpectable commiſſioners, with ample powers to examine all circumſtances upon the ſpot, and to decide finally with reſpect to the point in queſtion. As the Dominicans and Franciſcans had already eſpouſed oppoſite opinions in this controverſy, he excluded both theſe fraternities from the commiſſion, and reſtricted his choice to the monks of St. Jerome. Having ſelected three perſons, whom he deemed equal to the charge, and joined to them a private lawyer of diſtinguiſhed probity, Las Caſas was appointed to accompany them, with the title of "Protector of the Indians." Upon their arrival at St. Domingo, they began to execute their commiſſion by liberating all the Indians, who had been granted to the Spaniſh courtiers, or to any perſon not reſiding in America. This meaſure excited a general alarm; but the fathers of St. Jerome proceeded with prudence and caution; and finding it neceſſary to tolerate the "repartimientos," they uſed their utmoſt endeavours to prevent the injurious effects of this eſtabliſhment, and to ſecure to the Indians the beſt treatment that was compatible with their ſtate of ſervitude. For this purpoſe they enacted ſeveral uſeful regulations. Las Caſas, however, was diſſatisfied, and remonſtrated againſt that unhallowed timid policy, which led them to accommodate their conduct to the ſtate of the colony, and to tolerate what was unjuſt, becauſe it was beneficial. The commiſſioners adhered to their ſyſtem; and Las Caſas, in order to avoid the effects of the reſentment which he had excited among the Spaniſh planters, was under a neceſſity of ſeeking an aſylum in a convent. Perceiving that all his efforts in America were fruitleſs, he ſoon ſet out for Europe, with a fixed purpoſe not to abandon the protection of a people whom he deemed to be cruelly oppreſſed. Upon his arrival, he found Ximenes dying; and ſoon after Charles V. took poſſeſſion of the Spaniſh government, which he chiefly committed to his Flemiſh miniſters. Las Caſas intereſted them in his cauſe, and induced them to recal the fathers of St. Jerome, and to appoint a chief judge to re-examine the points of controverſy between the friends of Indian liberty, and the coloniſts. Whilſt Las Caſas was thus zealouſly promoting a ſcheme, ſuggeſted by humanity and a liberal policy, for the emancipation of Indian ſlaves, he was betrayed by the ardour with which he proſecuted his purpoſes into the inconſiſtency of extending the miſeries of ſervitude to the inhabitants of Africa. Accordingly,

cordingly, in order to furniſh the Spaniſh planters with labourers, inſtead of thoſe Indians whom he wiſhed to emancipate, he propoſed to purchaſe a ſufficient number of negroes from the Portugueſe ſettlements on the coaſt of Africa, and to tranſport them to America, that they might be employed as ſlaves in working the mines, and cultivating the ground. Thus, while he contended earneſtly for the liberty of the people born in one quarter of the globe, he laboured to enſlave the inhabitants of another region; and in the warmth of his zeal to ſave the Americans from the yoke, pronounced it to be lawful and expedient to impoſe one ſtill heavier upon the Africans. Unfortunately for the latter, Las Caſas's plan was adopted. Charles V. granted a patent to one of his Flemiſh favourites, containing an excluſive right of importing 4000 negroes into America. He ſold his patent to ſome Genoeſe merchants for 25,000 ducats, and they were the firſt who brought into a regular form that execrable commerce for ſlaves between Africa and America, which has ſince been carried to ſuch an amazing extent. Las Caſas, however, connected with his very cenſurable plan of enſlaving Africans the much leſs exceptionable project of ſupplying the new ſettlements in Hiſpaniola and the other iſlands with a ſufficient number of labourers and huſbandmen, who ſhould be allowed by ſuitable premiums to remove thither. This ſcheme was countenanced by the Flemiſh miniſters, but defeated by the biſhop of Burgos, who thwarted all the projects of Las Caſas. Las Caſas, deſpairing of procuring any relief for the Indians in thoſe places where the Spaniards were already ſettled, formed an idea of eſtabliſhing a new colony; and with this view, he applied for a grant of the unoccupied country, ſtretching along the ſea-coaſt from the gulf of Paria to the weſtern frontier of that province now known by the name of Santa Martha. He propoſed to ſettle there with a colony compoſed of huſbandmen, labourers, and eccleſiaſtics. He engaged, in the ſpace of two years, to civilize 10,000 of the natives, and to inſtruct them ſo thoroughly in the arts of ſocial life, that, from the fruits of their induſtry, an annual revenue of 15,000 ducats ſhould ariſe to the king; and in 10 years he expected that his improvement would be ſo far advanced as to yield annually 60,000 ducats. In forming this ſcheme Las Caſas had evidently conceived ideas concerning the method of treating the Indians, ſimilar to thoſe by which the Jeſuits afterwards carried on their great operations in another part of the ſame continent. After encountering much oppoſition from the biſhop of Burgos and the council of the Indies, he at length obtained a territory of 300 miles along the coaſt of Cumana, with liberty to extend it as far as he pleaſed towards the interior part of the country. However, with all his efforts, he could not prevail on more than 200 perſons to accompany him, with whom he failed, in 1521. Several of theſe died or left him at Porto Rico, where he firſt landed; and with the few that adhered to him, he proceeded to Cumana, which he found much diſtreſſed on account of a recent invaſion of the Spaniards. He was therefore under a neceſſity of repairing to Hiſpaniola in order to ſolicit ſuccours; but during his abſence, the natives, exaſperated by the injuries they had ſuffered, attacked the enfeebled coloniſts, deſtroyed many of them, and obliged the reſt to take refuge in the iſland of Cubagua. Soon after this iſland was abandoned, and not a Spaniard remained in any part of the continent, or adjacent iſlands, from the gulf of Paria to the borders of Darien. Las Caſas, aſhamed to ſhew himſelf after ſuch a ſucceſſion of diſaſters, and after this fatal termination of all his ſplendid ſchemes, ſhut himſelf up in the convent of the Dominicans at St. Domingo, where he aſſumed the habit of the order and devoted himſelf to the performance of religious duties. Fruſtrated in all his projects for the benefit of the oppreſſed Indians, he nevertheleſs not only retained his former anxiety and zeal for their relief, but an increaſed knowledge of their ſufferings had augmented its ardour. In 1542, he was ſent by a chapter of his order at Chiapa to Madrid, and he took this occaſion of pleading their cauſe before Charles V. and inculcating his favourite maxims concerning the proper mode of treating them. Not confiding for ſucceſs in the powers of his oratory alone, he enforced them by compoſing his famous treatiſe entitled "Brieve Relation de la Deſtruction des Indes," in which he related, with many horrid circumſtances, probably exaggerated by his powers of deſcription, the devaſtation of every province, which had been viſited by the Spaniards. This treatiſe excited throughout Europe a deteſtation of the cruelties practiſed by the Spaniards in America; and Las Caſas ſo far ſucceeded with the Spaniſh court, as to induce them to adopt ſeveral new regulations which he propoſed, and which contributed in a conſiderable degree to alleviate the ſufferings of the oppreſſed natives. With a view to their further relief and protection he accepted the dignity of biſhop of Chiapa, and returned thither in 1544. Having continued in his ſee till the year 1551, he left it on account of his declining health, reſigned his biſhopric into the hands of the pope, and retired to Madrid, where he finiſhed his courſe of active and indefatigable benevolence in 1566, at the advanced age of 92 years. Beſides his work on the deſtruction of the Indians, he wrote a Latin treatiſe on the queſtion, "Whether ſovereigns may in conſcience, by virtue of any right, alienate their ſubjects from their crown, and transfer them to the dominion of any other lord?" Tubing. 1625, 4to. In this treatiſe he diſcuſſes, with ſingular freedom, many points of a delicate nature reſpecting the rights of ſovereigns and people. He alſo compoſed many other works, which have never been publiſhed, among which is "A General Hiſtory of the Indies," of which Antonio de Herrera is ſaid to have availed himſelf in the compilation of his hiſtory. Moreri. Robertſon's Hiſt. of America, vol. i. and vol. iii.

CASASA, or Caçaça, in *Geography*, a ſea-port town of Africa, in the kingdom of Fez, at the mouth of a large river in the Mediterranean; 18 miles S. of Melilla. N. lat. 35° 8′. E. long. 32° 41′.

CASATI, Paul, in *Biography*, a learned Jeſuit, was born at Placentia in 1617, and became a profeſſor of mathematics and theology at Rome. He was one of the two Jeſuits who attended Chriſtina queen of Sweden at her requeſt, and proſelyted her to the Roman Catholic religion. Upon his return to Italy, in 1652, he was ſuperior over ſeveral houſes of his order, and occupied the firſt dignity in the univerſity of Parma for two years; in which city he died in 1707. He compoſed the following works: "Vacuum proſcriptum;" "Terra machinis mota;" "Fabrica et uſo del compaſſo di proportione;" "Mechanicorum libri viii; "De Igne;" "Hydroſtaticæ diſſertationes;" "Opticæ diſputationes," written at 88 years of age, after he was blind: "Problemata ab anon. geom. Ludg. Batav. propoſita, a Paulo Caſato explicata."

CASAUBON, Isaac, an eminently learned critic and commentator, was born in 1559, at Geneva, whither his father retired to eſcape perſecution, and received his early education at Creſt in Dauphiné, under his father, where he was ſettled as miniſter, when the perſecution ceaſed. So rapid was his proficiency, that, at the age of nine years, he was able to ſpeak and write Latin with fluency and correctneſs. But, on account of his father's frequent abſence, he ſo far loſt the ground which he had gained, that, at the age of 12 years, he was obliged to recommence his ſtudies. In 1578, he was ſent to Geneva, where he made ſuch progreſs in the Greek tongue under Francis Portus of the iſle of Candy, the Greek profeſſor, that, in 1582, he was appointed to ſucceed him. At the age of 25 years he publiſhed his notes on "Diogenes Laertius," which were added, in 1594, to the 8vo. edition of Henry Stephens. His "Lectures on Theocritus," were publiſhed at Geneva in 1584, 12mo. and dedicated to H. Stephens, whoſe daughter he married in 1586, by whom he had 20 children. Theſe notes were likewiſe publiſhed under the aſſumed name of "Hortibonus," ſynonymous with Caſaubonus, becauſe *Caſau*, in Dauphiné, means a garden; which he preferred to his own as more ſuitable to a Latin book. In 1587, he publiſhed his "Strabo" at Geneva," fol.; and in the ſame year his edition of the New Teſtament with notes, afterwards inſerted in the "Critici Sacri." Having ſtudied philoſophy and civil law under Julius Pacius, he alſo applied to the oriental languages and Rabbins. His notes on "Dionyſius Halicarnaſſenſis," were publiſhed at Geneva, in 1588, fol.; and his "Polyænus's Stratagemata," at Lyons, in 1589, 16mo. His "Ariſtotle," in Greek and Latin, was printed at Lyons, in 1590, and reprinted at Geneva, in 1605, fol.; and in the following year he publiſhed an edition of "Pliny's Letters," with notes, and the ancient "Panegyrics," Genev. 12mo. His "Theophraſtus's Characters," 12mo. was publiſhed at Lyons, in 1592, with a Latin verſion and commentary, and a third more correct edition appeared at Lyons, in 1612, 12mo. His "Apuleius's Apology," appeared in 1594, 4to. dedicated to Joſeph Scaliger; and his "Commentary on Suetonius," was printed at Geneva, in 1596, 4to. and another enlarged and corrected edition was printed at Paris, in 1610, fol. Diſſatisfied with his ſituation at Geneva, he removed to Montpellier, in 1596, and accepted the office of profeſſor of the Greek and of polite literature; but here he was ſo much diſappointed in his expectations of encouragement and ſupport, that he thought of returning again to Geneva. However, in 1598, he removed to Lyons, with the view of printing his edition of "Athenæus's Deipnoſophiſtæ," which was publiſhed in 1600, and again in 1612, in 2 vols. fol.; and in the mean while he accompanied M. du Vicq to Paris, where he was introduced to king Henry IV. and whoſe invitation to the office of profeſſor of polite learning he accepted, in 1599. But jealouſy, on the part of the other profeſſors, and his own adherence to the Proteſtant religion, rendered this office untenable. In 1600, he was one of the judges on the ſide of the Proteſtants at the conference held at Fontainbleau, between Cardinal du Perron and du Pleſſis-Mornay, and by his conduct on this occaſion he led ſome perſons to expect that he would become a convert to popery; but though he was no zealot in religion, he invariably declined complying with the ſolicitations of his Roman Catholic friends, who wiſhed him to change his profeſſion. The king, who had conferred upon him a penſion, promiſed him alſo the reverſion of the poſt of his librarian, which office he obtained in 1603, together with an increaſe of his penſion. At this time he publiſhed ſeveral works of the ancients, viz. "Hiſtoriæ Auguſtæ Scriptores cum Commentario," Paris, 1603, 4to.; "Diatriba ad D. Chryſoſtomi Orationes," publiſhed in Morel's edition of that author at Paris, 1604, fol; "Perſii Satyræ ex recenſione et cum Commentariis I. Caſauboni," Paris, 1605, 8vo., and London, 1647, 8vo. of which Joſeph Scaliger ſays, that in this edition "the ſauce is worth more than the fiſh;" "De Satyricâ Græcorum Poeſi, et Romanorum Satyrâ, lib. ii." Paris, 1605, 8vo.; in which work he maintains that the ſatyrical poetry of the Latins was very different from that of the Greeks; an opinion which was attacked by Daniel Heinſius, and vindicated by Ezekiel Spanheim: and "G. Nyſſeni Epiſtola ad Euſtathiam, Ambroſiam, et Baſiliſſam, Gr. et Lat. cum notis I. Caſauboni," Paris, 1606, 8vo. and Hanaw, 1611, 8vo.; which letter was firſt publiſhed by him. In 1607, he compoſed his treatiſe "De Libertate Eccleſiaſticâ," 8vo.; which was occaſioned by the diſputes that had occurred between pope Paul V. and the republic of Venice, and contains a vindication of the rights of ſovereigns againſt the pretenſions of Rome; but theſe diſputes being adjuſted whilſt the work was printing, it was ſuppreſſed by order of king Henry IV. His edition of "Polybius," to which is annexed "Æneas Tacticus de tolerandâ obſidione, Gr. et Lat." was publiſhed at Paris in 1609, fol. His Latin verſion of both theſe authors was much approved; and the dedication to Henry IV. is reckoned among the maſterpieces of modern Latin compoſition. The beſt edition of his letters "If. Caſauboni Epiſtolæ, &c." containing alſo his prefaces, dedications, poems, &c. with thoſe of his ſon Meric, is that by Almeloveen, Rotterdam, 1709, fol. In conſequence of ſeveral conferences which he held with cardinal du Perron on the ſubject of religion, a report was ſpread that he had promiſed to abandon the Proteſtant faith, which he thought it neceſſary publicly to contradict: and his uniform adherence to his profeſſion ſufficiently refutes the charge of indifference to religious doctrines, which has been alleged againſt him. Although he was perſevering in his attachment to his own profeſſion, he avoided controverſy, and in his opinion, with regard to thoſe who differed from him, he was liberal and tolerant. When one of his ſons became a capuchin, and afterwards ſought his bleſſing, "I give it you," ſays he, "with all my heart; I do not condemn you, neither do you condemn me: we ſhall both appear at the tribunal of Chriſt." As a farther evidence of the liberality of his ſentiments, and love of peace, it is alleged, that he was one of thoſe who thought an union between the Papiſts and Proteſtants to be both practicable and deſirable; and in this opinion he concurred with the learned Grotius and many others of the age in which he lived. His attachment to his own profeſſion, notwithſtanding his liberality, was evinced by the uneaſineſs he felt on occaſion of his eldeſt ſon's becoming a proſelyte to the Catholic religion. After the death of Henry IV., an event which he much lamented, he determined to comply with the repeated invitation of James I. to viſit England; and, accordingly, in 1610, he accompanied ſir Henry Wotton hither, and was received with great civility by the king and many other perſons of learning and diſtinction. Upon his arrival, he was made a denizen, liberally penſioned, and preſented to a prebend at Weſtminſter and another at Canterbury. In return for theſe favours he was engaged by the king, much againſt his own inclination, in controverſial writings againſt the Papiſts. Accordingly, his confutation of Baronius's Annals, or "Exercitationes contra Baronium," was publiſhed at London, in 1614, fol. at Franckfort, in 1615, 4to., and at Geneva in 1655 and 1663, 4to. He did not live long after the completion of this work; for he died of a ſingular and painful diſeaſe of the bladder, of which ſir Theodore Mayerne has given a particular account in his medical writings, in 1614, in the 55th year of his age. He was interred in Weſtminſter Abbey, and a handſome monument was erected to his memory by Thomas Morton, biſhop of Durham. The laudatory epitaph, inſcribed upon it, cloſes with theſe lines:

"Qui noſſe vult Caſaubonum,
Non ſaxa, ſed chartas legat,
Superfuturas marmori,
Et profuturas poſteris."

Caſaubon's character was that of a modeſt, candid, upright man, though ſomewhat reſtleſs and querulous in his temper. As a critic, he is always ranked among the firſt, and his numerous publications, the principal of which we have recounted, afford ſufficient evidence of his indefatigable induſtry and extenſive erudition. Gen. Dict. Biog. Brit.

Casaubon, Meric, ſon of Iſaac, the ſubject of the preceding article, was born at Geneva in 1599, and, accompanying his father to England, in 1610, finiſhed his education at Chriſt-church college, Oxford, where he took the degree of M. A. in 1621, and acquired the reputation of extenſive learning. At the age of 22, he publiſhed a book, vindicating his father againſt the calumnies of the Roman Catholics, and entitled "Pietas contra maledicos Patrii Nominis et Religionis Hoſtes," 8vo. This was followed, three years after, viz. in 1624, by a ſecond vindication of his father, "Vindicatio Patris adverſus Impoſtores, &c." written by command of king James I. and occaſioned by a publication of the ſame year, entitled, "The Original of Idolatries, or the Birth of Hereſies, &c." falſely aſcribed to I. Caſaubon. About this time he was promoted to the rectory of Bledon in Somerſetſhire; and, in 1628, by the intereſt and recommendation of biſhop Laud, he was made prebendary of Canterbury. This prelate, upon his own advancement to the ſee of Canterbury, gave Caſaubon two vicarages in the iſle of Thanet, and, in 1636, he was created doctor in divinity by mandate of king Charles I.; but, during the heat of the civil wars, about the year 1644, he was deprived of his preferments, fined, impriſoned, and reduced to extreme indigence. In theſe circumſtances he declined accepting ſome advantageous offers that were made him in 1649, on condition of his undertaking to write the hiſtory of the late war; and he alſo rejected an invitation that was conveyed to him ſoon after by the Swediſh ambaſſador from queen Chriſtina, to ſuperintend the univerſities in her kingdom. On the reſtoration he recovered his preferments, and, in 1662, exchanged one of his vicarages for the rectory of Ickham near Canterbury. He died in 1671, and was buried in the cathedral of that city. His literary character was that of a general ſcholar, but by the aid of his father's rules and papers more ſkilled in criticiſm than in any other department of literature. In private life he was diſtinguiſhed by his piety and charity, and by the courteouſneſs of his diſpoſition and manners. Of his publications the principal are as follow: viz. "Optati Libri VII. de Schiſmate Donatiſtarum," 1632, 8vo.; "A Treatiſe of Uſe and Cuſtom," Lond. 1638, 8vo.; "The Uſe of Daily public Prayers in three Poſitions," Lond. 1641, 4to.; "Marci Antonini Imperat. de ſeipſo et ad ſeipſum, &c. with Xylander's Verſion, &c. Gr. & Lat." Lond. 1643, 8vo.; alſo, "An Engliſh Tranſlation of this Work, with Notes, &c." 1634; "De Verborum Uſu, et accuratæ eorum Cognitionis Utilitate Diatriba," Lond. 1647, 8vo.; "De quatuor Linguis Commentationis, Pars I." comprehending the Hebrew and Saxon, but left incomplete as to the Greek and Latin; Lond. 1650, 8vo.; "Terentius, cum Notis T. Farnabii in quatuor priores comœdias, et M. Caſaub. in Phormionem et Hecyram," Lond. 1651, 12mo.; "Some Annotations on the Pſalms and Proverbs," inſerted in one of the latter editions of the "Aſſembly's Annotations on the Bible;" "In Hieroclis Commentarium de Providentia et Fato, Notæ et Emendationes," Lond. 1655, 8vo. and 1673, 8vo.; "A Treatiſe concerning Enthuſiaſm, as it is an effect of Nature, but is miſtaken by many for either Divine Inſpiration, or Diabolical Poſſeſſion," Lond. 1655, 8vo.; a work highly commended by ſir William Temple, as a happy attempt to account for deluſions upon natural principles, though it has been obſerved, that the author was too much inclined to credulity and ſuperſtition to diſcuſs this ſubject philoſophically, which appears from his "True and faithful relation of what paſſed for many years between Dr. John Dee and ſome Spirits," in the preface to which he attempts to confirm what is ſaid in that relation concerning ſpirits, Lond. 1659, fol.; and alſo in his work "Of Credulity and Incredulity in Things Natural, Civil, and Divine; wherein the Sadduciſm of theſe Times in denying Spirits, Witches, and ſupernatural Operations, is fully confuted," &c. Lond. 1668, 8vo. 1670, 8vo. 1672; "De Nupera Homeri Editione Lugduno-Batavica Hackiana, &c." Lond. 1659, 8vo. reprinted in Almeloveen's edition of Caſaubon's letters; "Epicteti Enchiridion et Cebetis Tabula, Gr. & Lat." Lond. 1659, 8vo.; "An Engliſh Tranſlation of Lucius Florus's Hiſtory of the Romans, with Notes," Lond. 1659, 8vo.; "A Vindication of the Lord's Prayer, &c." Lond. 1660; "Notæ et Emendationes in Diogenem Laertium, &c." annexed to the editions of Laertius, printed in Lond. 1664, fol. and Amſt. 1692, 4to.; "Of the Neceſſity of Reformation in and before Luther's Time, &c." Lond. 1664, 4to.; "Notæ in Polybium," firſt printed in Gronovius's edition, Amſt. 1670, 8vo.; and "Epiſtolæ, Dedicationes, &c." annexed to I. Caſaubon's letters by Almeloveen. Beſides the works above recited, M. Caſaubon wrote ſeveral other pieces, learned, controverſial, &c. which it is needleſs to enumerate. He alſo left, by will, a great number of MSS. to the univerſity of Oxford. His Engliſh ſtyle is harſh and perplexed, and much intermixed, according to the cuſtom of the time, with Greek and Latin. Gen. Dict. Biog. Brit.

CASAVOLI, in *Geography*, a town of Naples, in the province of Bari; 14 miles S.W. of Monopoli.

CASBA, a town of Africa, in the kingdom of Tunis, which was once a Roman colony, is ſituated on a large, fertile plain, about 25 or 30 miles S. of Tunis. The walls of this town are ſtill ſtanding, though it has been almoſt deſtitute of inhabitants ever ſince it was deſtroyed by the Turks.

CASBIA, in *Ancient Geography*, a town of Aſia Minor, in Lycaonia. Ptolemy.

CASBIN, in *Geography*, a city of Perſia, in the province of Irak Agemi, is ſituated in an extenſive pleaſant plain, about 3 leagues from the noted mountains of Aluvend or Elwend. It was formerly a very conſiderable city, being about ſix miles in circumference, and containing 12,000 houſes, occupied by 100,000 inhabitants; but it has been ſo reduced by the civil wars of the country, that, in Hanway's time, its number of houſes did not exceed 1100. Its beautiful palaces are now in ruins, its walls are deſtroyed, and it has neither garriſon nor forts to defend it. The Hippodrome, or Royal Piazza, was 700 paces long, and 250 broad. Its ſituation for commerce is, in many reſpects, advantageous, as it lies open to Georgia, Adirbeitzan, and the Caſpian ſea. Its adjacent territory produces excellent grapes, ſome of which yield a ſtrong wine, and others are dried, and ſent with other fruits to all the provinces of the country. In its vicinity are found yellow orpiment and copper ore. In the 16th century Shah Tahmas, unable to defend Tauriz againſt the Turks, retired to Caſbin, which he eſtabliſhed as the capital city of his empire; but Abas the Great transferred this dignity to Iſpahan. The European geographers aſſert that Caſbin is the ancient Arſaria; but the Perſian hiſtorians will not allow it to be ſo ancient. N. lat. 36° 33′. E. long. 49° 33′.

CASBUONA, a town of Naples, in the province of Calabria Citra; 5 miles W. of Strongoli.

CASCABLE, the hindermoſt part of the breech of a cannon from the baſe-ring to the end or extremity of the knob or button. See Cannon.

CASCADE, a ſteep fall of water, from a higher into a lower place.

The word is French, formed of the Italian *caſcata*, which ſignifies the ſame; of *caſcare, to fall*; and that from the Latin *cadere*.

Caſcades are either natural, as that of Tivoli, &c. or artificial, as thoſe of Verſailles, &c. and either falling with a gentle deſcent, as thoſe of the Sceaux; in form of a buffet, as at Trianon; or down ſteps, in form of a perron, as at St. Clou; or from baſon to baſon, &c.

A natural caſcade, falling with a great noiſe, is more properly called a *cataract*, which ſee.

In a military ſenſe *caſcade* ſignifies, in hollowing out, or digging galleries or mines, a ſinking down into the earth by a ſort of ſtep below the common level, or a riſing above the ſame in like manner. When a miner rather ſinks deeper into the ground or riſes up higher by means of ſuch ſteps at different diſtances, or turns, he is ſaid to proceed by caſcades, or to *cheminer par caſcades*.

Cascade of *fire*. See Pyrotechny.

Cascade *point*, in *Geography*, a cape on the weſtern coaſt of New Zealand, in the South Pacific ocean. S. lat. 44° 5′. E. long. 189° 4′.

CASCAES, a ſea-port town of Portugal, on the N. ſide of the mouth of the Tagus, ſituate on a ſlip of land under which ſhips may lie; 5 leagues W. of Liſbon. N. lat. 38° 44′. W. long. 9° 33′. *Cape Caſcaes* lies 2½ miles S.W. of the town.

CASCANS, in French *caſcanes*, holes ſunk in the ground in the form of pits or wells, near the ramparts, from which galleries are carried under ground, either to mines of your own, or to give vent to thoſe of the enemy. Caſcans alſo denote a kind of cellars made under the capitals of a fortification.

CASCANTE, in *Geography*, a ſmall town of Spain in Navarre; 2 leagues from Tudella. Its ancient name was Caſcantum, and it was a municipal town. Ptolemy attributes it to the Vaſconi. It was ſituated near the Iberus; S.E. of Calaguris.

CASCARILLA, in *Botany*. See Croton *caſcarilla*.

Cascarilla, in the *Materia Medica*, is placed by Dr. Cullen in the claſs of tonics. It approaches, he ſays, to the aromatics by its eſſential oil; but its bitter, to be extracted either by water or ſpirit, is its moſt conſiderable part. It was introduced in the 17th century as a medicine of great value, both in continued and intermittent fevers; and the Italians, fond of any thing as a ſubſtitute for the Peruvian bark, againſt which they had declaimed, employed the caſcarilla in their practice and adduced many teſtimonies of its efficacy: but theſe teſtimonies have not been ſupported by ſucceeding practitioners, and in this country particularly it has been found a weak ſubſtitute for the Peruvian bark. In ſeveral trials it has entirely failed. Bergius, though he atteſts its inefficacy in fevers, recommends it in hæmoptyſis. But Dr. Cullen obſerves, that in hæmorrhages of all kinds it ſeems to be rather hurtful, as might be inferred from its aromatic and bitter qualities, while it does not in any inſtance manifeſt an aſtringent power. Its tonic and ſtomachic power may be allowed; but in theſe reſpects its virtues are not peculiar nor conſiderable: nor is there any juſt foundation for the prejudices which the German phyſicians have conceived in its favour. Cullen, Mat. Med. vol. II. p. 89. It has, however, maintained its place in our Pharmacopeias. The *extract of Caſcarilla*, prepared in the ſame manner with that of Cinchona (which ſee), has been lately introduced into the London Diſpenſatory, as a medicine of conſiderable uſe, and ſerving as a tonic in dyſpepſy, debility of bowels, and in ſome circumſtances of epidemic fevers. It may be given from 10 to 20 grains, two or three times a day. The *tincture* of caſcarilla, prepared by digeſting four ounces of powdered caſcarilla in two pints of proof ſpirit of wine with a gentle heat for eight days, and ſtraining it, is given in debility of the ſtomach and bowels, and may be ſubſtituted in ſome caſes for the tincture of cinchona.

CASCE, Casica, or Casice, in *Ancient Geography*, a town of Aſia in Aria. Ptolemy.

CASCHARA, a town of Aſia, in Meſopotamia, garriſoned by the Romans to guard their frontiers.

CASCHAU, Cassovia, Kassa, or Kossice, in *Geography*, the capital of Upper Hungary, a royal free town ſeated on the river Hernath, or Hundert, ſurrounded with a triple wall, a moat, and a bulwark, and furniſhed with a good arſenal. It is a well built place and the ſeat of a tribunal. The wine, beer, and ale of this town are very bad. In 1400 it was beſieged in vain by the Poles. In 1535, king John took it by ſtratagem, and in 1556, it was deſtroyed by fire. In 1604, its large and beautiful pariſh church was taken from the Lutherans, upon which, and in conſequence of other oppreſſive meaſures, the Caſchians were ſo incenſed that they took part with Stephen Botſkay, who died here in 1606. In 1616, it ſurrendered to Bethlem Gabor; in 1644, to George Rakotzy; in 1681 to Tokoly; and in 1685, to the Imperialiſts. Its univerſity was ſuppreſſed in 1782. It is diſtant 100 miles S. from Cracow, and 124 N.W. from Clauſenburg.

CASCHIVE, (Mormyrus Caſchive), in *Ichthyology*, the name under which Haſſelquiſt deſcribes the Linnæan Mormyrus *anguilloides*, which ſee.

CASCHOU, in *Botany*, Merian, Surin. See Anacardium *occidentale*.

CASCO-Bay, in *Geography*, a bay of North America, in the diſtrict of Maine, which ſpreads N.W. between Cape Elizabeth on the S.W. and Cape Small point on the N.E. Within theſe points, which are about 40 miles apart, are about 300 ſmall iſlands, ſome of which are inhabited, and almoſt all more or leſs cultivated. The land in theſe iſlands, and on the oppoſite coaſt on the main, is the beſt for agriculture on the ſea-coaſt of this country. Caſco includes ſeveral bays. *Maquoit* bay lies about 20 miles N. of Cape Elizabeth. On the E. ſide of this cape is the arm of the ſea called *Stroud-water*. Farther to the E. is *Preſumpſcot* river, formerly called Preſumpca, or Preſumpkeag, which riſes in Sebago pond. This river opens to the waters of Caſco-bay on the E. of Portland, and upon it are ſeveral valuable mills. *Rayal's* river, called by the natives Weſtecuſtego, falls into the bay ſix miles from Preſumpſcot river. It has a good harbour at its mouth for ſmall veſſels; and has upon it ſeveral mills; but two miles higher a fall obſtructs the navigation. Between it and Kennebeck there are no rivers: ſome creeks and harbours of Caſco-bay extend into the main land, affording harbours for ſmall veſſels, and interſecting the country in various forms. N. lat. 43° 40′. W. long. 70° 10′.

CASCUMPAC *Harbour* lies on the North coaſt of the iſland of St. John in North America. N. lat. 46° 45′. W. long. 63° 55′.

**CASE**, ſometimes denotes a veſſel or receptacle in form of a tomb, commonly decorated with gold and ſilver, wherein the body of a ſaint, or ſome relics of it, are preſerved.

In which ſenſe, the word is formed from the French *chaſſe*. Originally theſe caſes were made in the figure of little Gothic churches, purſuant to that ancient Chriſtian maxim, that the ſaints, having been the living temple of the Holy Ghoſt, are entitled, after their death, to have their bones encloſed in the figure of the viſible houſe of God.

The caſe of St. Genevieve is never brought down without great ceremony, nor except in time of extreme public dangers or calamities.

**Case, John**, M. D. in *Biography*, was born at Woodſtock, where he received the rudiments of his education. In 1564, he was elected ſcholar, and in ſucceſſion, maſter of arts, and one of the fellows of St. John's college, Oxford. Wood celebrates him for his ſkill in diſputation, in which he is ſaid to have excelled all his cotemporaries. Marrying ſome time after, he was permitted by the chancellor to read lectures to the ſtudents, in logic and philoſophy. He alſo wrote, for the uſe of his pupils, ſhort treatiſes on Ariſtotle's organon, ethics, politics, œconomics, and phyſics. One of them, "Sphæra Civitatis ſive de Politia," printed in 4to. in 1588 by Barnes, having been pirated on the continent, and copies coming over, Barnes obtained an order, obliging every ſcholar in the univerſity to take one of his books. In 1589, he was made doctor in medicine, and the ſame year, prebendary of North Aulton, in the church of Sarum. He was much reſpected, both as a phyſician, and teacher, and acquired, Wood ſays, a handſome fortune, the greater part of which he left at his death, (which happened on the 23d of January 1599), to charitable uſes. He was buried in the chapel of St. John's college, where a handſome monument was erected to his memory. Wood gives a catalogue of his productions, which are now little noticed. Athænæ Oxon.

**Case, John**, M. D. Granger gives an account of this man. He was a noted aſtrologer in the time of queen Anne, and ſucceeded Lilly, who left him poſſeſſed of his apparatus, particularly his darkened chamber, and pictures, with which he pretended to ſhew his cuſtomers their abſent friends. Caſe uſed to exhibit theſe to his intimates, in the hours of conviviality, laughing at the folly, and credulity of the people. Over his door was written,

Within this place
Lives Dr. Caſe;

by which diſtich he probably got more than Dryden did by all his works. Haller alſo mentions a doctor John Caſe who publiſhed in 1694, "Compendium Anatomicum, nova methodo inſtructum," 12mo. in which the writer ſtrenuouſly defends the opinion of De Graaf, that quadrupeds, and all other animals, as well as birds, proceed ab ovo.

**Case**, or *Caſos*, in *Ancient Geography*, a ſmall iſland ſituate S.W. of Carpathos, and N.E. of the iſle of Crete.

**Case**, in *Grammar*, is underſtood of the different inflexions or terminations of nouns; ſerving to expreſs the different ſtates or relations they bear to each other, and to the things they repreſent. For the reaſon of the name, ſee Declension.

There is a great diverſity among grammarians, with regard to the nature and number of caſes: they generally find ſix caſes even in moſt of the modern languages, which they call the *Nominative*, *Genitive*, *Dative*, *Accuſative*, *Vocative*, and *Ablative*: but this ſeems only in compliance with their own ideas, which are formed on the Greek or Latin, and which they transfer to other languages.

The truth is, if by caſe be only meant an occaſional change in the termination of the noun, or name, which ſeems to be the juſt idea of caſe; there will, in this ſenſe, be juſt as many caſes as there are different terminations of nouns in the ſame number, i. e. in ſome languages more, in others leſs, and in others none at all.

Indeed, the generality of authors either have not any preciſe notion of caſes at all, or they wander ſtrangely from that notion: for they always reckon five caſes of nouns in the Greek, and ſix in the Latin: though ſeveral of theſe caſes be frequently alike, as the genitive and dative ſingular of the firſt declenſion of the Latin; the dative and ablative plural of the ſecond, &c. the genitive and dative dual of the Greek, &c. So that with theſe authors the termination is not the ſole criterion of the caſe.

It ſeems, however, much more agreeable to the principles of grammar, which only conſiders words materially, to make as many different caſes, as there are changes in the terminations of a name; which would free the Engliſh, and other modern tongues, from the embarraſſment of caſes; moſt of them expreſſing the various relations, not by changes in termination, as the ancients; but by the ſituation of the ſubſtantive, as in the nominative and accuſative caſes, or by the appoſition of articles and prepoſitions. On this footing it is certainly wrong to ſay, v. g. that *of a father*, is the genitive caſe of father; and *to a father*, the dative; for *of* and *to* are no part of the noun *father*; they are no cloſes or terminations, but articles or modificatives, which ſhew the different relation of the word *father*. And the ſame may be ſaid of the caſes of nouns, in the French, Italian, Spaniſh, Portugueſe tongues, &c. Nevertheleſs, the relation of poſſeſſion, which anſwers to the genitive caſe, is often expreſſed by a different termination of the ſubſtantive: "as God's grace," or, as it was formerly written, "Godis grace," the grace of God. So that the Engliſh ſubſtantives may be conſidered as having two terminations for caſes; that of the nominative, and that of the genitive or poſſeſſive caſe. In this reſpect it bears ſome reſemblance to the German, which is probably derived from the ſame Teutonic original. In the Greek and Latin languages, the words πατρος and *patris* are real caſes of the words πατηρ, and *pater*, and different from thoſe words: and ſomewhat like this may be ſaid of the Hebrew, Arabic, Armenian, Poliſh, and German languages; which in the ſame number admit of changes in the terminations of words: and yet in theſe languages, caſes are different from what they are in the Greek and Latin. The Hebrew names, for inſtance, are not properly declined by caſes, and to be diſtinguiſhed by any peculiar terminations; but they are determined principally by the conſtruction and meaning of the ſentence or diſcourſe in which they occur, or by certain prepoſitions, or letters ſerving the purpoſe of prepoſitions, prefixed to the reſpective words, as in the following example:

| | | |
|---|---|---|
| Nom. | מלך | Rex. |
| Gen. | המלך | Regis. |
| Dat. | למלך | Regi. |
| Accuſ. | את מלך | Regem. |
| Vocat. | המלך | ô Rex. |
| Ablat. | ממלך | à Rege. |

Hebrew nouns very frequently occur in the oblique caſes, although they have no letter or particle denoting theſe caſes; and the letters or particles which make particular caſes are frequently connected with other caſes. The article ה, which grammarians commonly ſpecify as the mark of the genitive, is applied to all the other caſes, and chiefly to the vocative. The relation expreſſed by the genitive caſe of nouns ſometimes occaſions an alteration in them; but this alteration, inſtead of being in the noun governed, as in other languages, occurs in the Hebrew in that which governs, and this word ſometimes loſes one of its letters, and ſometimes has it changed into another; e. g. מלכי ארץ, reges terræ, inſtead of מלכים ארץ; and תורת יהוה, lex domini, inſtead of תורה יהוה. The Maſoretic points are changed in the ſame manner; as דְבַר שֶׁקֶר, verbum falſitatis, for דָבָר שֶׁקֶר. See Regimen.

The letter ל, which is an abridgment of the prepoſitions אל, על, or למען, generally denotes the dative, and not rarely the genitive, and it is alſo joined to the accuſative, ablative, and even the nominative. The particle or prepoſition את, or ואות is connected, not only with the accuſative, but with the dative, ablative, and nominative: and the letter מ, which is the prepoſition מן abridged, is almoſt always joined to the ablative, and very rarely to other caſes. For the changes that expreſs Hebrew pronouns, ſee Pronoun. The caſes in the Chaldee language are determined in the ſame manner with thoſe of the Hebrew; either by the ſenſe of the paſſage in which words occur, or by prefixing the particles ד or די to the genitive, ל to the dative, ית or ל to the accuſative, and מ or מן to the ablative. The Syriac differs from the Chaldee only in two points, viz. that the mark of the accuſative is ל, and not ית, and that the note of the ablative is מן, and not the abbreviature מ. The caſes in the Samaritan language are formed like thoſe of the Chaldee, by prefixing ד to the genitive, ל to the dative, ית, or עם to the accuſative, and מן or מ to the ablative. See Maſclef's Grammat. Heb.

An ingenious writer ſuggeſts that the Greek caſes are formed by certain ſyllables, which conſtitute no part of the primitive names of things, but were originally ſhort words, having an independent meaning of their own, and retaining that meaning when joined to theſe names: thus *σημα*, *θεος*, were originally *σημ*, *θε*; *α*, and *ος*, being annexed to mark them as ſubjects or agents. In aſcertaining the preciſe meaning of the prepoſitions *of*, *from*, *to*, which are the ſigns of the Greek caſes, he intimates, that though the termination called the genitive caſe be rendered by *of*, it means invariably *from*, *beginning*, *motive*; and this appears to be the true ſignification of the term *of*, if we regard its etymology, which this author derives from *αφ*, *απο*, *ab*, *from*; although cuſtom ſeems to have aſſigned it a different undefinable meaning, it is in all caſes reſolvable into the ſenſe of *from*; e. g. a table *of* wood is a table *from* wood, wood being the origin, or beginning of it. This is the reaſon, he ſays, why ſome prepoſitions which ſignify *origin* or *beginning* in Greek, Latin, and French, are rendered in our tongue by *of*. He adds, that as *of* ſignifies *beginning*, ſo *to* means *end*: for it is taken, as he ſuppoſes, from an oriental verb ſignifying *to aim*, *purſue*, or *ſtretch after a thing*, and hence denotes the thing or object aimed at. Into Greek the original verb has paſſed in the form of *τειω* or *τεω*; but in Perſian, Latin, German, and Welſh, as in Engliſh, it has with little variation in ſound, and none in ſenſe, migrated into a prepoſition. But *beginning* and *end*, or if the terms are applied to moral actions, *motive* and *deſign*, are often the ſame. Hence it is that the force of theſe two prepoſitions is expreſſed in Latin by the ſame termination, the dative or ablative caſe. Hence alſo, in all languages which admit of caſes, the dative, ablative, and genitive, have a near affinity to each other; and in Greek, the firſt language, as this writer imagines, in which the uſe of caſes was introduced, they were all three at firſt repreſented by one termination. Jones's Grammar of the Greek tongue, p. 194.

Some writers think, that the relations ſignified by the addition of articles and prepoſitions to the noun may properly be denominated caſes, in Engliſh; and that, admitting this principle, there are, in our language, as many caſes as in the Latin tongue. But Mr. Lindley Murray, in his "Engliſh Grammar," (p. 54. ed. 12.) obſerves, that to this mode of forming caſes for our ſubſtantives there are ſtrong objections. If an arrangement of this nature were to be conſidered as conſtituting caſes, the Engliſh language would have a much greater number of them than the Greek and Latin tongues: for, as every prepoſition has its diſtinct meaning and effect, every combination of a prepoſition and article with the noun would form a different relation, and would conſtitute a diſtinct caſe. Thus our language would be incumbered with many new terms, and a heavy, as well as uſeleſs, load of diſtinctions. Mr. Murray is of opinion, that although this variety of caſes does not at all correſpond with the idiom of our language, we may with great propriety admit a caſe in Engliſh ſubſtantives, which ſhall ſerve to denote the *objects* of active verbs or of prepoſitions; and which is, therefore, properly termed the *objective* caſe. He allows however, that the general idea of caſe has undoubtedly a reference to the termination of the noun; and yet there are many inſtances, both in Greek and Latin, in which the nominative and accuſative caſes have preciſely the ſame form, and are diſtinguiſhed only by the relation they bear to other words in the ſentence. Analogy, therefore, warrants our applying this principle to our own language, as far as utility, and the idiom of it, will admit. It is obvious that in Engliſh, a noun governed by an active verb, or a prepoſition, is very differently circumſtanced, from a noun in the nominative, or in the poſſeſſive caſe; and that a comprehenſive caſe, correſponding to that difference, muſt be uſeful and proper. The buſineſs of parſing, ſays this ingenious grammarian, and of ſhewing the connection and dependence of words, will be moſt conveniently accompliſhed by the adoption of ſuch a caſe; and the irregularity of having our nouns ſometimes placed in a ſituation, in which they cannot be ſaid to be in any caſe at all, will be avoided.

Although it ſhould be maintained, that many of the modern languages have not, ſtrictly ſpeaking, any caſes of nouns; yet moſt, if not all of them, have a kind of caſe in their pronouns, without which it would be hard to conceive the connection, or ſyntax of a diſcourſe; and which, therefore, make a neceſſary part of grammar: e. g. in Engliſh *I* and *me*; and in French, *je* and *moy*. See Pronoun. For the relations expreſſed by each caſe, and the mode of denoting them, ſee Nominative, Genitive, Dative, &c. &c.

Case, in *Printing*, a large flat, oblong frame, placed aſlope, divided into ſeveral compartments, or little ſquare cells; in each of which are lodged a number of types, or letters of the ſame kind; whence the compoſitor takes them out, each as he needs it, to compoſe, and make a page, or form.

A frame of caſes, in printing, uſually conſiſts of two pair, viz. an upper and lower, Roman and Italic. A ſhallow caſe ſhews the letter beſt, as being leaſt ſhadowed by the ſides of the boxes. A deep caſe has the advantage of holding a great number of letters, ſo that the compoſitor need not diſtribute ſo often.

They ſay, *a caſe*, or rather *pair of caſes*, of Greek, of Hebrew, of Pica, &c.

Case of a ſilk worm, is a lodge framed within its web, wherein to depoſit its *ova*.

Case is alſo uſed for a certain numerous quantity of divers things: a caſe of piſtols implies a brace; a caſe of glaſs, &c. ſee Glass.

Case is alſo uſed for a frame ſurrounding a door, window, or the like. In which ſenſe we ſay a door-*caſe*, window-*caſe*, &c.

Case, *action upon the*, in *Law*. See Action.

Case, *ſpecial*, relates to a kind of ſpecial verdict, in which the jury find a verdict generally for the plaintiff, but ſubject nevertheleſs to the opinion of the judge or the court above, on a *ſpecial caſe* ſtated by the counſel on both ſides with regard to a matter of law. This has the advantage over a ſpecial verdict, of being attended with much leſs expence, and of obtaining a much more ſpeedy deciſion; the *poſtea* (which ſee) being ſtayed in the hands of the officer of *niſi prius*, till the queſtion is determined, and the verdict is then entered for the plaintiff, or defendant, as the caſe may happen.

Case *ſtated out of Chancery*, reſpects a queſtion of law in the proceſs of any cauſe referred by this court to the opinion of the judges of the court of King's Bench or Common Pleas; before whom it is heard, and who certify their opinion to the chancellor in order to a decree.

Case-*hardening*, a method of preparing iron, ſo as to render its outer ſurface hard, and capable of reſiſting the file, or any edged tool. It is uſed by file-cutters for coarſe files; by gun-ſmiths, to harden the barrels of guns; and by others, on other occaſions.

The proceſs of caſe-hardening, which is no other than a ſuperficial converſion of iron into ſteel, depends on the cementation of it with vegetable or animal coals. This treatment converts the external part into a coating of ſteel, which is uſually very thin, becauſe the time allowed for the cementation is much ſhorter than when the whole is intended to be made into ſteel. Immerſion of the heated pieces into water hardens the ſurface, which is afterwards poliſhed by the uſual methods. Among the receipts given for this purpoſe are the following: cow's horn or hoof is to be baked, or thoroughly dried and pulverized: to this add an equal quantity of bay-ſalt; mix them with ſtale chamber ley, or white wine vinegar. Cover the iron with this mixture, and bed it in the ſame in loam, or incloſe it in an iron box: lay it then on the hearth of the forge to dry and harden: then put it in the fire, and blow till the lump have a red heat, and no higher, leſt the mixture be burned too much. Take the iron out, and immerſe it in water, to harden. See Iron and Steel.

Case-*ſhot*, are muſquet-balls, ſtones, old pieces of iron, or the like, put up into caſes, and ſo ſhot out of great guns.

Caſe-ſhot is chiefly uſed at ſea, to clear the enemies' decks when they are full of men.

CASEARIA, in *Botany*, Schreb. 756. Willd. 877. Jacq. Amer. 132. Claſs and order, *decandria monogynia*.

Gen. Ch. *Cal.* Perianth four or five-leafed, or four or five-cleft; leaves oblong, flat, coloured, widely ſpreading. *Cor.* none. *Nect.* four or five-leafed; leaflets oblong, obtuſe, hirſute, rather erect, half the length of the ſtamens, and alternating with them. *Stam.* Filaments eight or ten, awl-ſhaped, rather erect; anthers oblong, incumbent. *Piſt.* Germ roundiſh; ſtyle filiform, erect, the length of the ſtamens; ſtigma capitate, obtuſe. *Peric.* Capſule roundiſh, obtuſe, crowned with the permanent baſe of the ſtyle, one-celled, coriaceous, thick, three-valved. *Seeds* generally more than one, compreſſed, angular, fixed to the valves, immerſed in a ſoft pulp.

Eff. Ch. *Cal.* five-leafed. *Cor.* none. *Nect.* four or five-leafed. *Stamens* alternate, with the leaflets of the nectary. *Capſ.* berried, three-valved, one-celled; ſeeds in a ſoft pulp.

Sp. 1. C. *ſpinoſa*, Willd. 1. (C. aculeata; Jacq. Amer. 133. Samyda ſpinoſa; Linn. Sp. Pl. 2. Swartz. Obſ. p. 179. Poiret Encyc. 11.) "Flowers octandrous; leaves egg-ſhaped, ſerrated, ſmooth; peduncles axillary, one-flowered; branches ſpinous." A ſhrub about ſeven feet high. *Branches* numerous, diffuſe, furniſhed when young with a few diſtant and ſolitary ſpines. *Leaves* an inch and half long, crowded. *Flowers* axillary, cluſtered; peduncles ſhort, one-flowered; calyx white; leaves oblong, obtuſe; filaments awl-ſhaped; anthers oblong. *Fruit* greeniſh purple, mucronate at its ſummit. A native of St. Domingo. 2. C. *nitida*, Willd. 2. Jacq. Amer. 132. Act. Helv. 8. p. 58. fig. 1. (Samyda crenata; Poiret Encyc. 12.) "Flowers octandrous; leaves egg-ſhaped, crenate, ſmooth; cymes axillary, peduncled." A ſhrub about fifteen feet high. *Branches* numerous, ſpreading. *Leaves* from an inch and half to four inches long, alternate, petioled, very variable in ſize and form. *Flowers* ſmall, whitiſh; leaves of the calyx obtuſe. *Fruit* roundiſh; pulp ſcarlet or purple. *Seeds* two, ſometimes only one. A native of America in the neighbourhood of Carthagena. Perfectly diſtinct from Samyda nitida. 3. C. *hirta*, Willd. 4. Swartz. Fl. Ind. Occid. 2. p. 756. (Samyda tomentoſa; Swartz. Prod. 68. Poir. 12.) "Flowers octandrous; leaves egg-ſhaped, ſerrated, rough with hairs underneath." A ſhrub ſeven or eight feet high. *Branches* alternate, cylindrical, a little angular, pubeſcent. *Leaves* alternate, acute at the ſummit, a little narrowed at the baſe, nerved and veined, on very ſhort petioles. *Flowers* axillary and lateral, faſcicled, on ſhort peduncles, with membranous ſcales at their baſe; calyx four-cleft; ſegments deeply divided, linear, lanceolate, obtuſe, pubeſcent, whitiſh, green underneath, permanent; filaments ſtraight, awl-ſhaped; anthers heart-ſhaped, erect, yellowiſh; ſtyle trigonous; ſtigma capitate, a little trifid. *Fruit* oblong, ſomewhat acuminate. A native of Jamaica. 4. C. *parviflora*, Willd. 5. (Samyda parviflora; Linn. Sp. Pl. 1. Poir. 13. S. foliis ovatis cum acumine; Brown, Jam. 217. Arbor baccifera, &c. Sloane Jam. 137. hiſt. 108. tab. 211. fig. 2.) "Flowers decandrous; leaves oblong, acuminate, ſlightly crenate, ſmooth on both ſides, ſhining; peduncles crowded, axillary, one-flowered." A ſhrub. *Branches* diffuſe, cylindrical, rather crooked, ſmooth, blackiſh brown, ſometimes ſprinkled with very ſmall oval greyiſh or yellowiſh ſpots. *Leaves* about three inches long, an inch and half broad, alternate, thin, almoſt membranous, rather pale underneath; with a few lateral, ſimple, alternate nerves, and reticulated veins; on ſhort petioles. *Flowers* whitiſh, axillary, ſolitary, or in ſmall tufts; peduncles not leſs than half an inch long, ſimple, cylindrical, upright; calyx deeply five-cleft, ſmooth, caducous. *Fruit* ſmall, globular; pulp yellowiſh. A native of Cayenne. 5. C. *parvifolia*, Willd. 6. Jacq. Amer. tab. 85. (Anavinga; Lam. Illuſ. Pl. 355. fig. 2. Samyda parvifolia; Poir. 14.) "Flowers decandrous; leaves egg-ſhaped, acuminate, ſerrated, ſmooth; peduncles one-flowered, aggregate, lateral." A ſhrub about fifteen feet high. *Stems* erect. *Branches* diffuſe, ſlender, long. *Leaves* alternate, about an inch long. *Flowers* not axillary; peduncles ſimple; leaves of the calyx whitiſh, reflexed, egg-ſhaped, obtuſe; filaments unequal, nearly as long as the calyx. A native of Martinico. 6. C. *ſylveſtris*, Willd. 7. Swartz. Flor. Ind. Occid. 2. p. 752. (Samyda ſylveſtris, Poir. 15.) "Flowers decandrous: leaves egg-ſhaped, acuminate, quite entire; branches rod-like; peduncles axillary, crowded." A ſhrub. *Stems* ſmooth. *Branches* long, ſlender, looſe, cylindrical. *Leaves* alternate, acuminate to a great length, thin, ſmooth on both ſides, ſhining, veined, porous when held againſt the light, on ſhort ſmooth petioles. *Flowers* twenty or thirty together; peduncles about three lines long, ſimple ; furniſhed at their baſe with ſmall, dry, imbricated ſcales ; calyx very ſmall, whitiſh ; leaves oval, open, pubeſcent ; filaments the length of the calyx ; anthers whitiſh, heart-ſhaped ; germ ovate ; ſtyle trigonous. *Fruit* about the ſize of a pepper-corn, reddiſh. A native of Jamaica. 7. C. *macrophylla*, Willd. 8. Vahl. ecl. 2. p. 32. (Pitumba guianenſis ; Aubl. guian. vol. 2. tab. 385. Samyda pitumba ; Poir. 16.) "Flowers decandrous, ſomewhat tomentous ; leaves elliptical, acuminate, ſlightly crenate." A ſhrub. *Branches* cylindrical, ſmooth, ſpotted. *Leaves* from ſix to eight inches long, more than three broad, petioled, alternate, firm, thick, coriaceous, ſprinkled with pellucid dots, ſmooth on both ſides, deep green above, paler and ſomewhat ruſſet underneath ; marked with lateral, curved, deep brown nerves ; and with tranſverſe, ſcarcely reticulated veins. *Flowers* in ſmall axillary branches ; peduncles ſhort, ſimple ; calyx ſmall. *Fruit* about the ſize of a walnut. A native of Cayenne and many other parts of South America. 8. C. *ſerrulata*, Willd. 9. Swartz. Flor. Ind. Occid. ii. p. 754. (Samyda niviana : Poir. 17.) "Flowers decandrous ; leaves ovate-lanceolate, ſlightly ſerrated ; little branches zig-zag ; peduncles axillary, crowded." A ſhrub. *Branches* ſmooth, cylindrical, long, covered with a cinereous bark ; ramifications ſcattered, almoſt filiform, ſtriated. *Leaves* an inch and half long, alternate, a little acuminate, ſmooth on both ſides, bright green above, nerved and veined, on ſhort petioles. *Flowers* whitiſh, very ſmall, axillary, ten or twelve in a bunch ; peduncles about a line long, furniſhed at their baſe with ſmall membranous ſcales ; calyx-leaves oval, concave, ciliated ; filaments very ſhort ; anthers ovate-heart-ſhaped ; ſtyle awl-ſhaped ; ſtigma obtuſe. A native of the iſland of Nevis. 9. C. *hirſuta*, Willd 12. Swartz. Flor. Ind. Occid. ii. p. 755. (Samyda hirſuta ; Poir. 18.) "Flowers decandrous ; leaves egg-ſhaped, acuminate, tooth-ſerrated, hairy, villous underneath ; peduncles lateral, crowded." A ſhrub. *Stems* woody. *Branches* cylindrical, flexible, pubeſcent. *Leaves* large, alternate, petioled, ſoft. *Flowers* in ſmall lateral branches, not axillary ; calyx-leaves ovate-lanceolate, whitiſh, pubeſcent, a little villous ; filaments ſtraight, awl-ſhaped ; anthers oval ; ſtyle trigonous, the length of the filaments. *Fruit* oval, trigonous. A native of Jamaica and Hiſpaniola. 10. C. *viridiflora*. (Samyda viridiflora ; Poir. Encycl. 19.) "Leaves ovate-elliptical, ſmooth, ſomewhat coriaceous ; flowers nearly ſeſſile, axillary, faſciculated." A ſhrub. *Branches* ſmooth, cylindrical, long. *Leaves* from four to five inches long, two and a half broad, alternate, membranous, glaucous green, inclining to yellowiſh, nearly entire, with lateral nerves and reticulated veins, on ſhort petioles. *Flowers* pubeſcent, greeniſh, ſhort, with five ovate, rather obtuſe ſegments. A native of the Eaſt Indies, deſcribed from a dried ſpecimen in the herbarium of La Marck.

CASEARIA *ramiflora*, Willd. 3. See ATHENÆA *guianenſis*. Willdenow is right in his arrangement. This plant is properly a caſearia ; and the genus athenæa of Schreber, (Iroucana of Aublet,) ought to be aboliſhed. The number of ſtamens, it is now allowed, cannot determine a generic character. C. *elliptica* and *ovata*, Willd. 9, 10. See ANAVINGA *lanceolata* and *ovata*.

Profeſſor Martyn has omitted all our ſpecies, having inadvertently referred from caſearia to ſamyda, and from ſamyda back again to caſearia.

Poiret has united caſearia to ſamyda, and obſerves, that theſe two, anavinga and aquilaria, are all nearly allied, agreeing with each other in the inſertion of the ſtamens into a particular body, attached to the inner part of the calyx near its baſe ; and differing only in the manner of their inſertion, and in the number of the valves and cells of the capſule. The rim into which the ſtamens are inſerted, and which has been uſually called a nectary, he thinks is properly a monopetalous corolla, adnate with the calyx, and toothed or divided almoſt to its baſe. Into this corolla the filaments are inſerted, either looſe, as in anavinga, aquilaria, and the original caſearia, or adhering, through their whole length, to its teeth, as in the original ſamyda, and thence giving the anthers the appearance of being ſeſſile. Conſidered in this point of view, they would form one well-marked genus, having for its eſſential character "a very ſhort, monopetalous corolla, with the ſtamens inſerted into its tube." It is ſufficiently evident from the deſcription of the ſpecies of caſearia given above, that a monophyllous or polyphillous calyx can by no means be admitted as generic diſtinctions. Such an union would, in our judgment, be a real improvement to ſcience, as it would render our ideas of the ſubject more compact and not leſs diſtinct. Though the ſpecies at preſent known are not very numerous, they might be conveniently thrown into ſeparate ſections, nearly correſponding with the preſent genera. The ſolitary ſpecies now conſtituting the whole of the genus aquilaria would differ the moſt from its congeners on account of its two-celled, two-valved capſule. See Poiret in Encyc. Method. vol. vi. p. 487.

CASEI DI CAVALLO, the name of a peculiar cheeſe, famous in Italy, and many other places, and made of the milk of the female buffalo, that ſpecies being as commonly tamed and kept there as the ox and heifer with us.

CASEL, JOHN, in *Biography*, a learned German, was born at Gottingen in 1533 ; and having ſtudied in ſeveral univerſities, travelled to Italy, and was made doctor of laws at Piſa. In 1563 he became profeſſor of philoſophy and eloquence at Roſtock, and afterwards at Helmſtadt, where he died in 1613. He excelled in his knowledge of the Greek fathers ; and he warmly oppoſed Daniel Hoffman and others, who maintained that philoſophy is adverſe to theology, and that many things are true in the latter which are falſe in the former. He carried on a correſpondence with ſome of the moſt eminent ſcholars of his age ; and left many works, both Greek and Latin, in verſe and proſe. A collection of his letters was printed at Frankfort in 1687, 8vo. Moreri.

CASELLA. We uſed to imagine that this was only a poetical character in the *Purgatorio* of Dante ; but as his commentators call him an ancient Italian muſician and compoſer, he muſt not be paſſed without a ſalutation ; particularly as his exiſtence has been acknowledged by *Lemmo da Piſtoia*, who flouriſhed in 1300, and in a note to one of his madrigals, preſerved in the Vatican library, which ſays, *Caſella diede il ſuono*, "this madrigal was ſet to muſic by *Caſella*."

There is ſomething in the deſcription of this imaginary rencontre ſo ſimple and affectionate, that I cannot help wiſhing to convey an idea of it to my Engliſh reader. Dante, after viſiting the infernal regions with Virgil, is conducted by the ſame poet into purgatory ; where, ſoon after his arrival, he ſaw a veſſel approach the ſhore laden with departed ſouls, under the conduct of an angel, who brought them thither to be cleanſed from their ſins, and rendered fit for Paradiſe : as ſoon as they were diſembarked, ſays the poet, "they began like beings landed on a foreign ſhore, to look around them :

"On me when firſt theſe ſpirits fix their eyes,
They all regard me with a wild ſurpriſe,
Almoſt forgetting that their ſins require
The purging remedy of penal fire :

When one of theſe advanc'd with eager pace,
And open arms, as me he would embrace;
At ſight of which I found myſelf impell'd
To imitate each geſture I beheld.
But vain, alas! was ev'ry effort made,
My diſappointed arms embrace a ſhade:
Thrice did vacuity my graſp elude,
Yet ſtill the friendly phantom I purſued.
My wild aſtoniſhment with ſmiling grace
The ſpectre ſaw, and chid my fruitleſs chace.
The voice and form now known, my fear ſuſpend,
O ſtay, cried I, one moment with thy friend!
No ſuit of thine is vain, the viſion ſaid,
I lov'd thee living, and I love thee, dead.
But whence this haſte?—not long allow'd to ſtay,
Back to the world thy Dante takes his way—
Yet let this fleeting hour one boon obtain,
If no new laws thy tuneful pow'rs reſtrain,
Some ſong predominant o'er grief and woe,
As once thou ſung'ſt above, now ſing below;
So ſhall my ſoul, releas'd from dire diſmay,
O'ercome the horrors of this dreadful way.
Caſella kindly deign'd his voice to raiſe,
And ſung how *Love the human boſom ſways*,
In ſtrains ſo exquiſitely ſweet and clear,
The ſound ſtill vibrates on my raviſh'd ear;
The ſhadowy troops, extatic, liſt'ning round,
Forgot the paſt and future in the ſound."

CASELLA, *Ital.* a ſmall houſe, but in *Muſic* it implies a *bar*, a compartment, containing ſuch a portion of notes as the character or characters for time direct at the beginning of a movement. See TIME, BAR, MEASURE.

CASELLE, in *Geography*, a town of Italy, in the principality of Piedmont, on a ſmall river which runs into the Stura; 6 miles N. of Turin.

CASEMATE, or CASEMENT, in *Architecture*, the ſame with *cavetto*, denotes a hollow moulding, which ſome architects make one-ſixth of a circle, and others one-fourth.

CASEMATE, from the Spaniſh word *caſamata*, or from the Italian word *caſamatta*, in *Military Language*, a low, covered, or concealed houſe. A caſemate may in general be defined to be a ſubterraneous or covered arched work. Caſemates are made in garriſoned places, in order to place the troops of the garriſons, when off from duty, under, from ſhells, &c. They are alſo made ſometimes under different parts of the rampart of a place with embraſures, for cannon, or loop holes for muſquetry.

This name is alſo given to ſubterraneous or covered arched works, on that part of either flank of a baſtion, which is next to the adjoining curtain made there for placing ſome guns in, to defend the paſſage of the moat or ditch, the face of the oppoſite baſtion, and the approaches to any breach that may be made in it. That part of the flank is taken inwards towards the capital of the baſtion, that it may be covered from the enemy's or beſieger's fire, by the remaining part of it, which, when rounded, is called a round *orillon*, but when left without being rounded, is called a ſquare *orillon*. The part of the flank thus taken inwards is therefore called the retired or covered flank, as alſo *caſemate* and *place baſſe*; and the ſide of it next to the curtain is generally in the continuation of the line of defence, which part of the ſaid line is called the *retirade*, or retrenchment of the flank, or the platform of the caſemate. The vaults or caſemates in this retired flank have commonly the ſoles or bottoms of their embraſures a little above the terre plain or level of the place or country, in order that the guns in them may fire over the parapet of the fauſſe braye, in the ditch before it, if there be any.

Caſemated flanks are rarely made uſe of at preſent, becauſe the enemy's batteries can generally bury the cannon contained in them under the rubbiſh and ruins of their vaults, and becauſe the ſmoke, with which they are always in a ſhort time filled, renders them inſupportable to thoſe who ſerve the guns, notwithſtanding all the flues, vents, or air-holes that can be made in them. Beſides theſe inconveniences, muſquetry, if they be expoſed to its fire, will, within a certain diſtance, when properly made uſe of, always ſilence cannon, whether they be in caſemates or not. Engineers, therefore, at preſent commonly make their retired flanks open at top, and call them low flanks, or *flancs bas*.

A low flank ought to have a horizontal depth or thickneſs of at leaſt 16 yards; to wit, 3 for its parapet, and 5 for its terre-plain, or rampart behind the parapet, and if there be two of them, they ought together to have a breadth or thickneſs of at leaſt 32 yards.

Low flanks have ſeveral diſadvantages. If there be more than one of them in the ſame flank, they cannot well be made uſe of at once on account of the flame and flaſhing of the powder and the rubbiſh that is conſtantly tumbling down from one of them into another. They become almoſt uſeleſs when the ravelin is once taken, by reaſon of the command it has over them, unleſs they be remarkably well covered by the orillons. And the rubbiſh which falls down from the higher flanks upon the lower, forms a gentle ſlope for the enemy to mount on to the aſſault. The beſt low flanks, perhaps, are the tenailles, or thoſe parts of the fauſſe braie of the ditch, that are in front of or oppoſite to the flanks, and diſtant from them reſpectively from 20 to 24 yards.

The chevalier Antoine de Ville, in ſpeaking of the inconveniences and inutility of caſemated low flanks, expreſſes his ſentiments thereon in the following words: "Autrefois on faiſoit aux flancs des voutes où on mettoit le canon tout couvert, et par deſſus ils en faiſoient d'autres pour mettre d'autres canons; mais cela n'eſt plus en uſage, à cauſe des grandes incommoditez, qu'ont a veu arriver en ces places. Car apres qu'on avoit tiré, la fumée rempliſſoit de telle façon ces voutes, qu'il etoit impoſſible d'y demeurer dedans, ni rien voir pour recharger, quelques ſouſpiraux qu'on y peut faire, outre que l'etonnement du canon ebranloit tout; et l'ennemy tirant dans ces voutes baſſes, les eclats et debris bleſſoient et tuoient ceux, qui eloient dedans, et en peu de coups les melloient en ruine. C'eſt pourquoi on a laiſſé ces voutes et on fait les places baſſes decouvertes. Et pour avoir deux places on fait le premiere plus baſſe un peu par deſſus les parapets des fauſſe-brayes, s'il y en a. Les meſures quant a leur face ſont du tiers du flanc, ou de la mortié, comme nous avons dit. Leur profondeur en dedans et de quatrepas, qui ſont pour les merlons, ſix pas pour le dedans a mettre les canons, et trois pour les voutes lorſqu'on les met en ce lieu. La place baſſe doit aller en elargiſſant du cote de la courtine afin que le canon, qui eſt la, puiſſe etre pointe vers la contreeſcarpe.

Du cote de la courtine doit etre l'entrée ou voute, qui doit commencer au dedans de la ville, paſſant par deſſous le rampart de largeur et hauteur ſuffiſante pour pouvoir mener par là le canon et munitions."

CASEMENT, is uſed in building for a little moveable window, uſually within a larger, being made to open or turn on hinges. We ſay, a ſingle caſement, a folding caſement, a caſement with a lock, with a turn-about, or turn-buckle, a caſement with a cock-ſpur or pull-back at the hind-ſide, wherewith to draw it to.

CASENA, or Cassena, in *Geography*. See Kassina.

CASENDORF, a town of Germany, in the circle of Franconia, and principality of Culmbach; 7 miles S.W. of Culmbach.

CASENI, a town of Perſia, in the province of Irac; 160 miles E. of Iſpahan.

CASEOUS, ſomething that partakes of the nature or qualities of cheeſe, which ſee.

CASERNS, in French *caſernes*, in *Military Language*, are, ſtrictly ſpeaking, ſmall houſes built along by the rampart of a fortified place, for lodging the ſoldiers of the garriſon, in order to render them as little troubleſome as poſſible to the inhabitants. Each caſern for the infantry has generally two beds for ſix ſoldiers, three and three. One-half of theſe mount guard whilſt the others remain there to ſecure that quarter. And each caſern for the cavalry commonly holds four horſemen. But neither theſe nor any other caſernes that are erected, either adjoining the rampart or partly connected therewith, are carried along any other parts of it than thoſe that are behind the curtains, or lie between the baſtions, acroſs the gorges of which they ſeldom or ever extend.

Caſernes ſignify not only ſuch ſmall houſes as we have juſt been ſpeaking of, but alſo any buildings or edifice, however large or extenſive, erected, and deſtined for the reception and accommodation of troops. In a city of war, or fortified place, they are commonly conſtructed between the rampart and the houſes of the town or city, as being there moſt convenient for guarding againſt and preventing ſurpriſes. The caſernes or barracks for the infantry ſhould be kept ſeparate from thoſe of the cavalry and dragoons, as they are at Niſmes and ſeveral other places in France; and the laſt of theſe ought to be placed as near as poſſible to convenient or commodious watering-places for horſes. In France, and ſome other countries on the continent of Europe, theſe buildings have generally been erected in large towns and cities at the expence of the inhabitants, and in ſmall ones at that of the ſtate. But in this country the expenditure on all ſuch erections is defrayed by the public. They ſhould as much as is poſſible, when it can conveniently be done, be placed towards the eaſt, on account of the air. When there is ground enough for the purpoſe, it is of advantage to incloſe with them a ſquare or rectangular ſpace, ſufficiently large, not only for parading, but alſo for exerciſing the troops. The ſoldiers are then eaſily confined to their quarters, and kept out of the way of quarrels, riots, and miſchief. They are more obſervant of order and regularity, being immediately under the eyes of their officers, than they are when diſtributed among the houſes of the inhabitants. And as they then are, as it were, in one body, and the rooms they are lodged in are contiguous to one another, and not far from the apartments of their officers, orders can be executed with more diſpatch and privacy than when they are either lodged in ſeparate or detached places, or are billetted and diſperſed about among the citizens. In time of war, or during a ſiege, many inconveniences may ariſe from having the ſoldiers ſcattered about in the houſes of the inhabitants of a fortified town or city, inſtead of having them collected together in one body, or in a few ſeparate and diſtinct bodies, under the inſpection at all times of their officers. In caſe of any alarms happening, the governor or commandant of the place cannot aſſemble the garriſon without a good deal of trouble and a conſiderable loſs of time. Should he wiſh to ſend a party or corps out of it either on ſorties or other duty, he cannot do it without the knowledge of the whole town or city. Such a diſperſion of troops tends to render them diſorderly, diſſolute, and negligent of diſcipline; whereas the keeping of them together in barracks or caſernes, contributes much towards the obſervance and maintainance of it.

Caſernes or barracks are built and conſtructed differently, according to the ſituations on which they are placed. When the ground will admit of it, as we have already obſerved, it is advantageous to encloſe with the buildings a ſquare or rectangular ſpace, yard, court, or area ſufficiently large for not only parading the troops, but alſo for all the exerciſes of detail, and that too for either infantry or cavalry, who ought to be kept ſeparate. For a large court or area is neceſſary for the one as well as for the other. In ſuch buildings galleries ſhould be carried along their whole extent, to furniſh an eaſy communication between the different rooms or chambers. When they are erected for cavalry, the men ought to be lodged immediately over the ſtables for their horſes.

When barracks are built along by the rampart oppoſite to the curtains, as marſhal Vauban has practiſed in a good many places, they are generally compoſed of large bodies of buildings for the troops to lodge in, and at the ends or extremities of them are barracks or pavilions erected for the officers. Theſe barracks or caſernes are commonly two ſtories high, independent of the ground floor or ſtory; and ſometimes three.

In every body of double barracks, there are, for the moſt part, on each ſtory four rooms, each two of which anſwer to the ſtair-caſe next to it. Every room ought to be at leaſt 22 feet long and 18 feet wide, which is a ſize ſufficient for four beds. Thoſe on the ground floor ſhould be not leſs than 12 feet high, thoſe in the next ſtory 10, and thoſe in the upper ſtory ſhould be at leaſt 8 feet high. The doors ought to be 6 feet 4 inches high, and 3 feet at the leaſt wide. And whether they be built with bricks or ſtones, the walls ought to be two feet thick or upwards. A ſort of *cordon* is ſometimes made in the walls, at the upper part of each ſtory, which is uſeful in helping to preſerve the faces or outſides of them, by preventing water or moiſture from running or trickling down them. In the barracks at Woolwich the rooms are too ſmall, being each of them only 16 feet ſquare. There has been no general rule, indeed, either eſtabliſhed or obſerved in this country for ſuch buildings, and the ſizes of the rooms or apartments in them.

Though barracks or *caſernes* of any form or deſcription are ſeldom or ever erected along by thoſe parts of the rampart, where the flanks and faces of the baſtions are, as they are along by thoſe that lie between the baſtions, yet when theſe works are empty, inſtead of being as they generally are, eſpecially ſuch of them as are not likely to form part of any front, that may be attacked by a beſieging enemy, it may not only be adviſable, but extremely uſeful, to erect barracks, or caſernes, oppoſite to their gorges, and at ſome little diſtance from the ſame, converting the interior areas or parts of them into gardens to be cultivated by the troops inhabiting thoſe buildings. Theſe would furniſh them not only with a conſiderable proportion of their nouriſhment, but alſo with proper and uſeful exerciſe, and agreeable walks, without leſſening or diminiſhing in any way, or manner whatſoever, the ſtrength or defence of the place. In fortified towns or cities, however, with encloſures of conſiderable extent, and large garriſons, the barracks,

racks, or caſernes, are generally erected along by the works in different places ſeparate and diſtinct from one another, but with eaſy and ſpeedy communications, there being ſeldom more ſuch buildings in one of thoſe places than what are ſufficient for lodging two battalions. In conſequence of this precaution, arrangement, and diſtribution of their garriſons, thoſe entruſted with their defence are leſs apprehenſive of being ſurpriſed than they otherwiſe would be, as the different parts of the works are thereby equally guarded and defended. Such an arrangement, however, is not always made or obſerved in fortified places. For barracks, that have been formerly erected without any regard to ſuch a diſtribution, are commonly repaired as long as they are capable of receiving repairs, or being rendered uſeful. And in Roman Catholic countries old religious edifices and buildings originally erected for pious purpoſes, which for the moſt part are agreeably and eligibly ſituated, are frequently converted into barracks if they happen to be near the gates or principal works.

Whilſt the feudal ſyſtem exiſted, and chivalry was in repute, the militia, which it ſupplied in every ſtate or country where it prevailed, formed all the troops that either the barons made uſe of in their feuds and contentions, or ſovereigns employed in the forcible aſſertion of their claims and pretenſions. During the prevalence of that ſyſtem there was no ſtanding army or regular military eſtabliſhment either in this country or on the continent of Europe. And as ſuch forces were ſeldom aſſembled or brought together but on the ſpur of the occaſion, or at the moment, when they were going to attack, repulſe, or engage their enemies; as they very rarely took the field but in mild and ſeaſonable weather and were generally diſmiſſed, before the ſetting in of winter or the rainy ſeaſon to return to their reſpective homes and places of cuſtomary abode, it was not neceſſary to erect barracks for them to lodge in. As the ſtrength of that ſyſtem became ſomewhat broken, and the rigour of it began to decline in the time of Charles VII. of France and his contemporaries, he and ſome others of them, inſtructed by experience and influenced by mutual example, began the practice of keeping bodies of troops conſtantly on foot and in pay. From this originated the neceſſity of conſidering the beſt and moſt advantageous manner of providing habitations or lodgings for them. But as the military eſtabliſhments under theſe princes and their ſucceſſors were but ſmall, even in time of war, and very trifling during peace, the difficulty of procuring lodgings for them was not great. At preſent, however, when ſuch eſtabliſhments are much increaſed and augmented, the beſt manner of lodging them, either in garriſons and along the frontiers, or in the interior parts of a country, becomes a matter of ſerious concern to the prince or ſtate.

When troops are to remain for a conſiderable time in one place there are four different ways, in which they may be lodged or diſpoſed of, namely, in tents, in huts, in barracks, or in the houſes of the inhabitants. To make ſoldiers live conſtantly either in tents or huts would be prepoſterous and abſurd, as it would operate injuriouſly to their health and fitneſs for ſervice when neceſſary, ſubjecting them to unneceſſary hardſhips and inconveniences, without any ſaving or diminution of expence to the nation to which they belong. No queſtion then on this ſubject remains but between the propriety of keeping them in barracks or the diſtributing of them among the houſes of individuals.

As a ſoldier is a man, and ought to be regarded as a citizen or member of the community in every country, but more eſpecially in a free one like Great Britain; and is moreover entruſted with the defence of our perſons and property, ſome attention ſhould be paid to his comfort and convenience. To preſerve, however, public tranquillity during peace, particularly in a nation under an arbitrary or monarchical government, and enſure ſucceſs to its operations in time of war, ſoldiers ſhould be ſubjected to an exact and a rigorous diſcipline, for the due obſervance of which they ought to be ſo diſpoſed of as to be frequently viſited and looked at without much trouble or difficulty, to be eaſily aſſembled, to have their conduct liable to conſtant notice and inſpection, to have their mode of eating and living daily and properly attended to, and to be able to execute with promptitude and expedition the orders that may be given to them from time to time. But ſtrict attention to theſe eſſential circumſtances is in a great meaſure incompatible with their being ſcattered or diſperſed over the whole of a large town or city. For it muſt certainly be allowed that ſuch a diſperſion of them has a great tendency to weaken and deſtroy diſcipline, to render them riotous and diſſolute, and to create in them a diſlike of order and ſubordination, and a ſtrong inclination for indolence, ſoftneſs, and eaſe. In deſpotic countries, or where mercenaries are partly employed, it is not only deſtructive of diſcipline, but extremely dangerous. It is, therefore, a natural and invariable maxim of ſuch governments to keep their troops as ſeparate and diſtinct as poſſible from the reſt of their ſubjects, to inſpire them with views and ſentiments repugnant to theirs and incompatible with civil liberty, and to make them believe, that their intereſts are not only different from, but oppoſite to thoſe of the people; as their deſpotic mandates, oppreſſive impoſitions, and arbitrary regulations muſt be enforced when neceſſary by the ſoldiers, and the people muſt be rendered ſubmiſſive and obedient to them by the terrors of military execution. In this free country, however, things of this kind ought to be guarded againſt with the utmoſt caution and circumſpection. Eſpecial care ſhould be taken to prevent the ſoldiers from forgetting that they are citizens, or from ſuppoſing that their intereſts are in any way diſtinct from or inconſiſtent with thoſe of their fellow ſubjects. It ought to be inſtilled into their minds, that they are ſerving and are to fight, not only for their king, but alſo for themſelves, and for their country, her conſtitution, her liberties, and her laws. An intercourſe between them and the people, inſtead of being prevented or diſcountenanced, ſhould not only be permitted but countenanced. And they ought never to be confined to barracks to the prevention of ſuch an intercourſe, but in certain circumſtances, and on certain occaſions. Our learned commentator on the laws of England, in expreſſing his ſentiments on this ſubject, makes uſe of the following words. “ Nothing ought to be more guarded againſt in a free ſtate than making the military power, when ſuch a one is neceſſary to be kept on foot, a body too diſtinct from the people. Like ours, therefore, it ſhould wholly be compoſed of natural ſubjects; it ought to be enliſted for a ſhort and limited time; the ſoldiers alſo ſhould live intermixed with the people; no ſeparate camp, no barracks, no inland fortreſſes ſhould be allowed. And perhaps it might be ſtill better, if, by diſmiſſing a ſtated number, and enliſting others at every renewal of their term, a circulation could be kept up between the army and the people, and the citizen and the ſoldier be more intimately connected together.” Blackſtone's Commentaries, book i. page 413. See ARMY.

In attempting any reform or amelioration of our military eſtabliſhments we ought never to forget, that Great Britain is an iſland, and reſts not principally on her troops for her defence, that we have ſeldom or ever any neceſſary occaſion for employing them on the continent, and that it is therefore prepoſterous and abſurd to think of aſſimilating our military ſyſtem in every reſpect to thoſe of the other nations of Europe, which have no other ſecurity, protection, or defence. The maxims, that thoſe employed as the defenders of this iſland ſhould think of nothing but their muſquets, that they ſhould be rendered a ſort of mere machines at the riſk of undergoing even a degradation of intellect, and that they will not fight the better in defence of it for having ſtakes in it to loſe, are not only ridiculous, but truly abominable. Were not the nobleſt, the moſt glorious and moſt ſucceſsful ſtruggles in ſupport of freedom and independence, that are recorded in the annals of mankind, made by ſtates who did not even enjoy the immenſe advantages of our inſular ſituation, who had no ſeparate military eſtabliſhments, whoſe troops were their citizens, who after the emergencies that called for their ſervices and exertions were paſt, returned to their various occupations in ſociety, and to the peaceful purſuits of life? And were not the troops of that people who conquered the world, compoſed entirely of citizens, who after performing the ſervices they were employed on, returned to mix with the reſt of the community? As to the idea of theſe united iſlands having a regular ſtanding military force ſufficient for enabling us to reſtore the continent of Europe to an equilibrium, or to preſcribe to the different powers in it their relative degrees of ſtrength and territory, it is too extravagant to be entertained by any but the moſt viſionary and wildeſt of men, who, cheriſhing ſuch chimeras, loſe ſight, not only of the conſtitution of this country, but of every principle and conſideration that ought to govern their deliberations reſpecting her welfare, ſecurity and defence.

We will not, like the learned judge, go ſo far as to aſſert, that no barracks ought to be allowed. For within works and fortified places, ſuch as Portſmouth and Plymouth, if the latter, indeed, deſerves the appellation, they may be proper, allowable, and neceſſary. But out of ſuch places they ought not, on any account or pretext whatſoever, to be tolerated to any great extent.

In this country there never has been any certain or eſtabliſhed rule for the building of barracks, and the relative dimenſions of their ſeveral component parts. But in France, which has always been a kind of arbitrary government, and is at preſent a peculiar ſpecies of military deſpotiſm, ordinances for that purpoſe were made from time to time. Even in that country, however, ſuch regulations have not been at all times ſtrictly obſerved or attended to.

CASERTA, in *Geography*, a city of Naples, in the country of Lavora, about 16 miles from the capital, ſituated at the foot of a lofty ridge of hills and irregularly built. This place is famous for the magnificent palace cauſed to be erected by Charles III. of Spain, according to the deſigns of Vanvitelli, and ſurpaſſing in ſize and ſolidity almoſt every royal edifice in Europe. The vaſt dimenſions of its apartments, the bold ſpan of their ceilings, the excellence and beauty of the materials employed in building and decorating it, and the ſtrength of the maſonry, claim the admiration of all beholders, who muſt confeſs it to be a dwelling ſpacious and grand enough to have lodged the ancient maſters of the Roman world. The two principal fronts are 787 feet in length, and contain five ſtories of 37 windows each. The two other ſides are 616 feet long, and conſiſt alſo of five ſtories, in each of which are 27 windows. The interior is divided into four courts, and in the centre of the palace is a ſuperb ſtair-caſe, crowned by a circular hall which affords a communication to every ſet of apartments. The richeſt marbles are diſplayed with profuſion, moſt of them being dug out of quarries within the realm. The chapel is incruſted with pannels of yellow marble. The theatre is a maſter-piece of art; antique columns of alabaſter ſupport the roof and divide the houſe into 42 boxes richly decorated, and ſo arranged as to ſet off both actors and ſpectators to the beſt advantage. The gardens are very extenſive, but formed with wide ſultry alleys and crowded rows of ſtatues. A broad canal interſects the garden and paſſes to the hills at the diſtance of nine miles from the city, where it collects, for the ſupply of the palace, the ſtreams that in ancient times were conveyed to Capua; and theſe are conſigned to one regular channel, and conducted by an eaſy fall along the ſinuoſities of ſeveral vallies. The depth of one hollow, and the height of the oppoſite ridge of hills, made it neceſſary to build an aqueduct acroſs for their conveyance. This aqueduct, diſtant ſix miles from the city, about two miles in length, and proportionably broad, is an edifice of three ſtories of arcades, of which the upper one is divided into 43 arches; the two lower ones, on account of the declivity of the hills and contraction of the valley, conſiſt of fewer. From hence the waters are carried in a channel to the caſcade near the royal gardens, and paſs under the city. The pavement of this aqueduct is formed of calcareous ſtone, with which the neighbouring mountains abound; and the remainder of the edifice is conſtructed with volcanic tufa, in which are intermixed ſome pieces of enamel. Sir William Hamilton informs us, that in the environs of Caſerta, below a ſtratum of vegetable earth four or five feet in thickneſs, we meet with cinders, pumices, and fragments of lava; and that in digging near the foundation of the aqueduct volcanic earths are diſcovered. Spallanzani (ſee his Travels, vol. i.), on examining the adjacent country, found that it was wholly calcareous, not excepting the higheſt mountains, almoſt all of which were of the ſame contexture and colour with the chains of hills between Naples and Loretto. This place was at firſt a hamlet, built by ſome families that eſcaped from the ruins of Capua; and from the weakneſs of its ſituation it was called *Caſa erta*, dreary houſe. It now ſeems, ſays Swinburn (Travels in the Two Sicilies, vol. iii.), very likely to relapſe into its priſtine ſtate by the emigration of its inhabitants, drawn into the plain by the conveniences of the new city and the charms of its court. The monarchs of the country have lately expended large ſums in embelliſhing the environs of Caſerta, in planting groves, and building places of rendezvous for hunting. N. lat. 41° 5′. E. long. 15° 5′.

CASES *reſerved*, in the *Romiſh Policy*, are conſiderable ſins, the abſolution of which is *reſerved* by the ſuperiors to themſelves, or their vicars.

There are ſome caſes reſerved by the pope, and others by the biſhops: in convents ſome are reſerved by the chapter, &c. None but theſe, or their vicars, can abſolve in ſuch caſes; except at the article of death, when all reſerved caſes are abſolvable, by the ordinary.

CASH, in *Commerce*, the ſtock or ready money, which a merchant, or other perſon, has in his preſent diſpoſal, to negociate; ſo called from the French term, *caiſſe*, i. e. *cheſt*, or *coffer*, for the keeping of money. M. Savary ſhews, that the management of the caſh of a company is the moſt conſiderable article; and that whereon its good or ill ſucceſs chiefly depends.

Cash-*book*. See Book.

CASHAN, in *Geography*, a populous and wealthy city of Perſia, in the province of Irak-agemi; ſituate about 98 miles N. of Iſpahan, in a large plain near a high mountain, which being oppoſed to the ſouth is ſo much affected by the reverberation of the ſun's rays in ſummer as to be intolerably hot. The bazars and baths of this place are elegant ſtructures, and the royal inn founded by Abas the Great, in the ſuburbs, is the faireſt in all Perſia. Adjoining to it ſtands the royal palace, and oppoſite to it another, deſigned for lodging ambaſſadors. Cashan has various manufactures of all ſorts of ſilks, ſtuffs, and tiſſues of gold and ſilver. N. lat. 33° 40′. E. long. 51° 20′.

CASHEF, or Kiaschef, in the Turkiſh government, an officer who acts as lieutenant of the Bey, and who preſides over a town or village in Egypt, collecting the revenues and judging in ſmall cauſes; from whom an appeal lies to the bey. The authority of a caſhef is as arbitrary as that of a bey. See Bey.

CASHEL, in *Geography*, a mountain of the county of Galway, Ireland, in the barony of Ballinahinch, which is an important land-mark to thoſe wiſhing to enter Birterbui-bay.

Cashel, a city and poſt town of the county of Tipperary, Ireland, ſituated about three miles eaſt of the river Suire. It was anciently a place of great importance and the reſidence of the kings of Munſter, who are ſuppoſed to have had a houſe of ſtone on the rock in the fifth century. Cormac Mac Cullinan in particular, who was at the ſame time prince and biſhop of Caſhel, reſided here at the beginning of the 10th century. In 1172 Henry II. of England viſited this town, in which he received the homage of Donald O'Brien, king of Limerick, and held a ſynod by which the ſupreme lordſhip of Ireland was confirmed to him, and ſome eccleſiaſtical regulations were adopted. Caſhel was ſurrounded by a wall which, though now mouldering, ſeems, from two gates of tolerable workmanſhip yet remaining, to have been of better materials than the generality of ſuch encloſures. But its eccleſiaſtical ruins are thoſe for which Caſhel is chiefly diſtinguiſhed. The chief of theſe are on the celebrated rock of Caſhel, which is ſeen at a great diſtance and in many directions, and which of courſe has a very extenſive proſpect. The old cathedral appears to have been a large as well as handſome Gothic ſtructure, the dimenſion of the nave and choir from eaſt to weſt being about 200 feet. Some have ſuppoſed that it was the firſt ſtone building in Ireland, but this appears to be mere conjecture. Donald, brother of Morrough, king of Munſter, about 1086, is generally recorded as the founder of it, and his grant of lands was confirmed by king John, as appears from an old ſtatute. Sir James Ware, however, was of opinion that it was not built till about the time of the arrival of the Engliſh under Henry II. perhaps ſuppoſing with that prejudice which blinds many writers, that the Iriſh were incapable of raiſing ſuch a ſtructure. Cormac's chapel, the ruins of which join the cathedral, and which is 50 feet by 18, is a very curious ſtructure, of a ſtyle of architecture totally different from that of the cathedral, and ſuppoſed to have been built by Cormac, about 902, which would be near two centuries earlier. There is alſo on the rock near the eaſt angle of the north aiſle, a lofty round tower, which is 54 feet in circumference and is divided into 5 ſtories with holes for joiſts. This tower has a communication with the church by a ſubterraneous paſſage, which implies that it was uſed for ſome religious purpoſe. From its having been built of free ſtone, when the rock and all the other buildings upon it are limeſtone, Dr. Campbell infers its being of greater antiquity than the reſt. The whole rock was incloſed by a wall, within which was the reſidence of the archbiſhop; and it is ſuppoſed by Mr. Ledwich to have been a *Mandra*, or habitation of a great number of monks. The church being through age in a ruinous condition was repaired by Richard O'Hedian, archbiſhop, in 1420, and part of it was uſed as the metropolitan church till 1750, when it was prematurely unroofed by Alexander Price, and thus expoſed to the effects of the weather. In the unhappy civil war of 1641, the rock having been taken poſſeſſion of by lord Taaffe, was ſtormed by the earl of Inchiquin, and many perſons were put to death. Caſhel is a tolerably well built town, containing about 600 houſes, but without trade. There is a handſome market-houſe, a ſeſſions-houſe, the county infirmary, a charter-ſchool, and a barrack. The church is a new and neat ſtructure, and the archbiſhop's palace, though plain, is large and commodious. The city is governed by a mayor, recorder, and bailiffs, and it ſends a member to the imperial parliament. Diſtance S.W. from Dublin 77 Iriſh miles. N. lat. 52° 30′ 30″. W. long. 7° 5′. Dr. Beaufort. Campbell's Philoſophical Survey. Collectanea de Rebus Hibern. Ledwich's Antiquities, &c. &c.

Cashel, *Archbiſhoprick of*, in Ireland; chiefly confined to the county of Tipperary. It was founded or reſtored by Cormac Mac Cullinan at the beginning of the 10th century; was made an archbiſhoprick by cardinal Paparo, the pope's legate in 1152, and was united to Emly in 1568. The united ſees are very compact, extending 32 Iriſh miles in length, and 30 in breadth. There are in the union 155 pariſhes, which make 47 benefices, and have only 35 churches. The cathedral, which ſerves alſo for a pariſh church, is a large and handſome modern edifice, completed by archbiſhop Agar, who alſo eſtabliſhed a choir. The archbiſhop is primate of Munſter, and ranks next to the archbiſhop of Armagh and Dublin; his ſuffragans are the biſhops of Killaloe, Limerick, Cork, Cloyne, and Waterford. Beaufort's Memoir.

Cashel, *Pſalter of*, an hiſtorical poem, or rather a collection of poems in the Iriſh language, written by Cormac Mac Cullinan, prince and biſhop of Caſhel, about 902. This Cormac is mentioned by Caradocus Llancarvanenſis in his Chronicle of Wales; and was ſlain in battle in 908 either by the Leinſter forces, or by the Danes. He is repreſented to have been learned and well ſkilled in the Iriſh antiquities, and his pſalter is highly valued by many as an authentic record. It has not been publiſhed, but part of it, at leaſt, is ſaid to be in the Bodleian library, and has been ſeen by reſpectable writers. Extracts from it have been publiſhed, and it is often referred to for the events of ſome centuries preceding. Stillingfleet and Pinkerton have, however, perhaps too raſhly, affirmed it to be a collection of poetical fictions, compiled in the 13th century, an opinion adopted by Ledwich. Is it not probable that whilſt an unreaſonable ſtreſs has been laid upon its authority by the advocates of early Iriſh literature, the others have been influenced by a prejudice againſt this? Teſtimony is in favour of the authenticity of the work, and there does not ſeem to be any reaſon for calling it in queſtion on this occaſion, but an unwillingneſs to admit an Iriſh work of ſo early a period. As to the degree of credit ſuch a work is entitled to, admitting its authenticity, it ſeems to be ſuch as is uſually given to poetical records, in which the facts related are generally ſo mixed with fable, or ſo exaggerated, that it is very difficult to draw the line of diſtinction. Ware's and Ledwich's Antiquities of Ireland. Nicholſon's Hiſtorical Library, &c.

CASHENDAL Bay, called alſo the Red bay, and ſometimes confounded with Cuſhendon bay, which lies a little north of it; an inlet on the north-eaſt coaſt of Ireland, in the county of Antrim, where a ſhip may ſtop in moderate weather, above two cables length from the ſhore on from three to nine fathoms water. White limeſtone is found near this part of the coaſt. N. lat. 55° 4′. W. long. 5° 54′. Hamilton's Antrim. M'Kenzie.

CASHEW-nut, in *Botany*. See Anacardium.

CASHGAR, anciently Casia, in *Geography*, formerly a remarkable town of Little Bucharia, giving name to a conſiderable kingdom, the limits of which nearly correſponded with thoſe of Bucharia. This town, though fallen from its ancient ſplendour, ſtill retains ſome commerce. See *Little* Bucharia.

Mr. Rennell has taken great pains to inveſtigate and aſcertain the poſition of Caſhgar; and he obſerves, as the reſult of his inquiry, that Caſhgar, Koten, &c. by their known ſituation with regard to Samarcand, muſt bear to the weſt, rather than to the eaſt, of north from Caſhmere; and alſo that the ridge of mountains, (the Imaus of the ancient geographers,) on the weſt of Caſhgar, Koten, and Karia, can be no other than that which ſeparates thoſe countries from Little Thibet and Badakſhan, and that joins on the ſouth to Caſhmere. By a mean deduced from the tables of Abulfeda, Ulug Beig, and Naſereddin, Caſhgar is about 7° 30′ of longitude eaſt of Samarcand; and of courſe 2° W. of Caſhmere. The parallel of Caſhgar, given in the tables, is 44°, which would place it nearly N.E. from Samarcand. That it bears conſiderably to the north of eaſt from Samarcand is ſtrongly implied by the direction of the roads, which lead to it, from Samarcand and Bokhara; that of the former being through Cogend and Andegan, (or Ferganah,) both of which lie to the north-eaſt of Samarcand; the former at ſeven, and the latter at 11 days' journey from it. From Bokhara, the road to Caſhgar lies through Taſhkund, ſtill more northerly than Cogend. Hence, if the direction of the road be north-eaſt for 11 days out of 25, the diſtance of Caſhgar from Samarcand, and 14 out of 30 from Bokhara, nearly N.E. by N., it furniſhes a ſtrong preſumptive proof that the direction of the whole line is very far to the north of eaſt. The only line of diſtance that will aid us in aſcertaining the latitude of Caſhgar is that given by Bernier, (vol. ii. lett. 9.) in which it is ſtated, that the diſtance of Caſhgar from Caſhmere is 44 journies, through Little Thibet; but that a ſhorter road lay through Great Thibet; and theſe journies, though not ſo expreſſed, may be underſtood to be thoſe of a caravan. Such journies, ſays Mr. Rennell, on a diſtance that requires 44 days of travelling, cannot, *in any country*, be taken at more than 14 geographical miles of direct diſtance each day; and through ſuch countries as thoſe between Caſhmere and Caſhgar, perhaps at 11 or 12 only. The diſtance, according to this proportion, would reach to the parallel of 42° 45′; on a ſuppoſition that 7½ or 8 degrees of longitude were allowed between Samarcand and Caſhgar; but even if 9 or 10 were ſuppoſed, the bearing line from Caſhmere is ſo nearly meridional, that two degrees of longitude would make a difference of a few minutes only in the latitude aſſigned to Caſhgar. Hence it may be generally inferred, that Caſhgar cannot be in a lower parallel than 42¾°; and then, admitting either of the diſtances from Samarcand (between 7½ and 10 degrees of longitude,) the bearing would be from E.N.E. to E.N.E. ½ N. Strahlenberg places it in 42½° latitude, and at 2½° of longitude W. of Caſhmere; M. Petis de la Croix (in Timur, b. iii. c. 7.) in 43°; M. d'Anville went into extremes, and placed it in 40° only. Admitting then that the capital of Caſhgar is ſituated in or about the parallel of 42¾°, we ſhall find that its diſtance from Samarcand and Bokhara, according to the report of the Orientaliſts, is conſiſtent with the difference of longitude, given in their tables. From ſeveral eſtimates of the rate of travelling by Sherefeddin and Aſtley, the difference of longitude between Samarcand and Caſhgar is ſtated to be 7½°. Caſhgar, according to a paſſage cited by capt. Kirkpatrick from Shanawaz, is bounded on the north by the mountains of Moguliſtan, one extremity of which range reaches to Shâſh, (i. e. Taſhkund on the river Sihon, or Jaxartes,) and the other to Terfan, and from thence to the Calmuck country. On the weſt it is bounded by a long ridge of mountains, from which the Moguliſtan mountains branch out. To the eaſtward lie quickſand hills, foreſts, and deſerts. The ſouthern limit is not given. Hence it appears, that the northern frontier of Caſhgar is on a parallel, or nearly ſo, with the territory of Sháſh, which lies on the north of Cogend, and the capital of which is Taſhkund, ſituate in lat. 42½°, according to the tables of Abulfeda, Naſereddin, and Ulug Beig. The long ridge of mountains on the weſt is, of courſe, that which extends from the north of Caſhmere to a point beyond the heads of the Sihon, ſeparating, in that part, the countries of Caſhgar and Turkeſtan; which ridge, in Sherefeddin's Timur, is named "Karangoutac," and is reckoned, in a military point of view, inacceſſible. No doubt ought to remain, ſays Mr. Rennell, concerning the proximity of Caſhgar to Great Bucharia; when we have proved from the writings of Abul Fazil, and Abdul Humeed, that the S.W. extreme of Caſhgar joins to the N.E. quarter of Cabul; or, admitting that part to be no more than a nominal dependency of Caſhgar, the real territory itſelf is not likely to be very remote. Mr. Rennell is of opinion, that the capital of Caſhgar, as well as the mountains on the north of it, which, in d'Anville's map of Aſia, extend towards Acſou and Terfan, ought to be removed ſeveral degrees to the north-weſt, and to the neighbourhood of Al Shâſh; theſe being the mountains of Moguliſtan deſcribed by Shahnawaz. Thus a conſiderable change will be made in this part of our maps of Aſia. Strahlenberg's map of the Ruſſian empire is much more conſonant to the ideas of Shahnawaz; and includes alſo the Weſtern Tartary, and the courſes of the rivers Jihon and Sihon (*Oxus* and *Jaxartes.*) His mount "Muſart," which paſſes along the north of Caſhgar, and Moguliſtan in general, at the height of 43° and 44° of latitude, anſwers to the Moguliſtan mountains of Shahnawaz, and really joins to Shâſh on the weſt, having alſo the long ridge branching out, and forming the weſtern boundary of Caſhgar. On a general conſideration of Strahlenberg's map, Mr. Rennell obſerves, that Cabul, Caſhmere, and Caſhgar, although nearly right, in reſpect of each other, are from four to five degrees too far eaſt, in reſpect of the Caſpian Sea and Samarcand; and the head of the Irtiſh river is by ſeveral degrees too near to Caſhgar, even as the latter ſtands in the map. Hence it follows, that the ſpace between the Irtiſh and Caſhgar is, out of all proportion, contracted; whilſt Great Bucharia is too much extended. Rennell's Memoir, p. 197, &c. See Bucharia.

CASHIER, the *caſh-keeper*; he who is charged with the receiving and paying the debts of a ſociety.

In the generality of foundations, the *caſhier* is called *treaſurer.*

Cashiers *of the bank*, are officers who ſign the notes that are iſſued out, examine and mark them when returned for payment, &c.

CASHIN, in *Geography*, a river of the county of Kerry, Ireland, which having united the waters of the Brick, the Teal, and the Gale, falls into the mouth of the Shannon, about three leagues eaſt of Kerry-head. It has a very narrow channel between beds of ſand, and alſo a bar at its mouth, which can be croſſed only about high water, ſo that it is frequented by none but ſloops and ſmall veſſels. Smith's Kerry.

CASHLEH Bay, a tolerably large harbour in the county of Galway, Ireland, which has ſafe anchorage for veſſels, that draw not above nine or ten feet water. It is however viſited only by ſmugglers and fiſhermen. N. lat. 53° 13. W. long. 9° 32′. M'Kenzie.

CASHMERE, Cashmire, or Kashmir, a province of Aſia, ſituate at the northern extremity of Hindooſtan, northward of Lahore, and reſtricted to a valley of an oval form, ſurrounded by hills, which has its largeſt extent from S.E. to N.W., or more ſtrictly, from S.E. by E. to N.W. by W. Mr. Forſter reckons its dimenſions 80 Britiſh miles by 40. Mr. Rennell admits that the eſtimate of 80 miles for the length of the flat part of the valley, does not exceed the truth by more than a very few miles; for he ſays, that 74 or 75 can be clearly made out. But its breadth is ſuppoſed to be 50 miles, or more; for Heerapour, at the entrance of the valley from the ſide of Bember, or the ſouth ſide, is nearly 25 Britiſh miles acroſs from Sirinagur; and Lar, according to Bernier, is about as far from Sirinagur as Barehmooleh is, i. e. 27 Britiſh miles; but as Sirinagur does not lie directly between Heerapour and Lar, a conſiderable angle takes place, and may probably reduce the 52 miles to 50 in direct diſtance. In the Ayin Acbaree, Caſhmere is divided into two parts, viz. "Meraje" and "Kamraje," the former being the eaſtern part, and containing the diſtricts ſituated to the E., the S.E. and the N.E. of Sirinagur; and the latter, the weſtern part, containing the N.W. and S.W. diſtricts. On the ſouth-eaſt of Sirinagur, at ſome diſtance beyond the great circle of mountains that ſurrounds the valley of Caſhmere, is the diſtrict of Benhal. With regard to its general poſition, Caſhmere is bounded on the weſt by the diſtrict of Puckholi; on the S.W. by the territory of the Ghickers; on the S.E. and S. by that of Jummoo and Kiſhtewar; and on the E. by the river Chunaub. On the N.E. lies Great Thibet, ſeparated from it by the ſummit of mount Kantel; and on the N.W. is Little Thibet. Tradition reports, that the ſite of this valley was formerly a lake; nor is this at all improbable. It is ſuch an effect as might be expected, in every caſe where the waters of a river are incloſed in any part of their courſe by elevated lands: and with reſpect to the river Behut in the preſent inſtance, it appears that the lake exiſted long enough to depoſit a vaſt depth of ſoil before it diſperſed. The Caſhmerian hiſtory names the lake "Sutty-Sirr;" and adds, that Kuſhup led a colony of Bramins to inhabit the valley, after the waters had ſubſided. Caſhmere, previouſly to the Mahometan conqueſt of India, was celebrated for the learning of its Bramins, and the magnificent conſtruction of its temple. Although we are not able to aſcertain the period of its ſubjection to the Mahometans, yet it is reaſonable to ſuppoſe, that a country ſupplying articles of valuable commerce, and furniſhing a profuſion of natural beauties, would at an early date have attracted their notice, and invited their conqueſt. It was governed for a long ſeries of years by a race of Tartar princes of the Jagatay or Zagathay tribe, until the year 1586, when it was ſubdued by Acbar, more, as it is ſaid, by intrigue than the force of arms. After having been annexed to the houſe of Timur for 160 years, it was betrayed by the Mogul governor to Ahmed Shah Duranny, who formed it into a province of the Afghan empire. Caſhmere is tributary to the ſultan of Cabul, and at the period of Mr. Forſter's reſidence, (A.D. 1783,) it was governed, or rather deſolated, by his viceroy. See CANDAHAR.

The valley, or country of Caſhmere, is celebrated throughout Upper Aſia for its romantic beauties, the fertility of its ſoil, and the temperature of its atmoſphere. Nor is its excellence in theſe reſpects to be queſtioned, when we conſider that it is an elevated and extenſive valley, ſurrounded by ſteep mountains that tower above the regions of ſnow; and that its ſoil is compoſed of the mud depoſited by a capital river, which, as we have already ſaid, originally formed its waters into a lake, that covered the whole valley, until it opened itſelf a paſſage through the mountains, and left this fertilized valley an ample field to human induſtry, and to the accommodation of a happy race; for ſuch the ancient inhabitants of Caſhmere undoubtedly were. The author of the Ayin Acbaree dwells with rapture on the beauties of Caſhmere; and on this account it was viſited by Acbar and by other emperors of Hindooſtan, who during the ſummer heats uſed to retire thither for the ſake of enjoying a cool and refreſhing climate, and who ſeemed to forget the anxieties of government during their reſidence in this "happy valley," "this garden in perpetual ſpring," "this paradiſe of India," as it was denominated by the multitude of its admirers. It appears that the periodical rains which almoſt deluge the reſt of India, are ſhut out of Caſhmere by the height of the mountains, ſo that only light ſhowers fall there; and yet theſe are ſo abundant as to feed ſome thouſands of caſcades, which are precipitated into the valley from every part of the ſtupendous and romantic bulwark that encircles it. The ſoil is the richeſt that can be conceived; and its productions are thoſe of the temperate zone. As it has generally a flat ſurface, copiouſly watered, it yields abundant crops of rice, which is the common food of the inhabitants. At the baſe of the ſurrounding hills, where the land is higher, wheat, barley, and various other grains are cultivated. A ſuperior ſpecies of ſaffron is alſo produced in this province, and iron of an excellent quality is found in the adjacent mountains. But the wealth and fame of Caſhmere have been chiefly owing to its manufacture of ſhawls, which are unrivalled, and which are diſtributed all over the weſtern and ſouthern parts of Aſia. The delicate wool of which theſe ſhawls are made, is the produce of a ſpecies of goat, either of that country, or of the adjoining one of Thibet. It is originally of a dark grey colour, and is bleached in Caſhmere by the help of a certain preparation of rice flour. The yarn of the wool is ſtained with ſuch colours as may be judged the beſt ſuited for ſale, and after being woven the piece is once waſhed. The border, which uſually diſplays a variety of figures and colours, is attached to the ſhawl after fabrication; but in ſo nice a manner, that the junction is not viſible. The texture of the ſhawl reſembles that of the ſhaloon of Europe, to which it has probably communicated the name. The price of an ordinary ſhawl, at the loam, is eight rupees; and thence, in proportional quality, it produces from 15 to 20; and ſome have been ſold at 40 rupees the firſt coſt. But the value may be very much enhanced by the introduction of flowered work; and hence the weaver occaſionally receives for a ſingle ſhawl the ſum of 100 rupees. Theſe ſhawls uſually conſiſt of three ſizes, two of which, the long and the ſmall ſquare one, are in common uſe in India; the other, long and very narrow, with a large mixture of black colour in it, is worn as a girdle by the northern Aſiatics. A portion of the revenue of Caſhmere is tranſmitted to the Afghan capital in ſhawl goods. The manufacture, however, is declined to one-fourth of the former quantity; which may be aſcribed to the decline of the Perſian and Hindooſtanic empires. In this diſtrict are ſheep, called "hundoo," which, like thoſe of Peru, are employed in carrying burdens. A wine is made in Caſhmere reſembling that of Madeira; and a ſpirituous liquor is alſo diſtilled from the grape, in which, as well as the wine, people of all claſſes freely indulge. The Caſhmirians fabricate the beſt writing paper of the Eaſt, which was formerly an article of extenſive traffic; as were alſo its lacquer ware, cutlery, and ſugars; but the heavy oppreſſions of the government, and the rapacity of the bordering ſtates, which prey upon the foreign traders and often plunder whole cargoes, have reduced the commerce of Caſhmere to a declining and languid ſtate. In proof of this fact, the Caſhmirians ſay, that during their ſubjection to the Mogul dominion, the province contained 40,000 ſhawl looms, and that at this day there are not 16,000. In Caſhmere are ſeen merchants and commercial agents of moſt of the principal cities of northern India, alſo of Tartary, Perſia, and Turkey, who at the ſame time advance their fortunes, and enjoy the pleaſures of a fine climate and a country, over which are profuſely ſpread the various beauties of nature. The country is plentifully watered by a number of ſtreams and rivers, which bring their tribute to the *Behut*, (which ſee,) the parent of the ſoil; and many lakes are ſpread over the ſurface, ſome of which contain floating iſlands. The whole country indeed reſembles a garden interſperſed with towns and villages, varied with beautiful trees, green meadows, fields of rice, hemp, ſaffron, and different legumes, and interſected by canals winding through them in all forms. The ſcenery is in a high degree pictureſque; and a portion of the romantic circle of mountains forms a part of every landſcape. The pardonable ſuperſtition of the ſequeſtered inhabitants has multiplied the places of worſhip of Mahadeo, of Biſhen, and of Brama. Caſhmere is altogether holy land; and it abounds with miraculous fountains. However, they are obnoxious to one dreadful evil, which is the frequent recurrence of earthquakes; and in order to preſerve themſelves from their injurious fatal effects, all their houſes are built of wood, which the country ſupplies in great abundance. The annual public revenue of Caſhmere, in the time of Aurungzebe, appears to have been only about 35,000l.; in the time of Shah Ivan the actual and realized revenues were about 25,000l.; and only 20,000l. in the time of Mahomed Shah. A revenue, ſays Forſter, of between 20 and 30 lacs of rupees is collected from this province, of which a tribute of ſeven lacs is remitted to the treaſury of Timur Shah. The army of Caſhmere conſiſts of about 3000 horſe and foot, chiefly Afgans, who are poorly paid, and who for want of better ſubſiſtence were under a neceſſity of living on the kernel of the ſingerah, or water-nut, which is plentifully produced in the lakes of this country. The dreſs of the Caſhmirians conſiſts of a large turban, a great woollen veſt with wide ſleeves, and a ſaſh wrapped in many folds round the middle; under the veſt, which may be properly called a wrapper, people of the higher claſs wear a pirahun, or ſhirt, and drawers; but thoſe of the lower order have no under garment, nor do they even gird up their loins. The dreſs of the women is no leſs aukward than that of the men. Their external, and often only garment is of cotton, and ſhaped like a long looſe ſhirt; over the hair, which falls in a ſingle braid, they wear a cloſe cap, uſually of woollen cloth of a crimſon colour; and to the hinder part of it is attached a triangular piece of the ſame ſtuff, which falling on the back conceals much of the hair. Around the lower edge of the cap is rolled a ſmall turban, faſtened behind with a ſhort knot, which ſeems to be the only artificial ornament about them. The women of the higher claſs are never ſeen abroad. The Caſhmirians are ſtout, well-formed, and as the natives of a country lying in the 34th degree of latitude, may be termed a fair people; and their women in ſouthern France and Spain would be called brunettes; but their figure is coarſe, their features broad, and their legs often thick. They are generally gay and lively, and much addicted to pleaſure, although the Afghan government has ſomewhat depreſſed their ſpirit. Young and old have a taſte for muſic. Mr. Rennell ſays they have a language of their own, ſaid to be anterior to the Sanſcrit; but according to Mr. Forſter, it is evidently derived from the Sancrit, and reſembles in ſound that of the Mahrattas, though more harſh; on this account the inhabitants compoſe their ſongs in the Perſic, or adopt thoſe of the Perſian poets. They ſeem to have a religion of their own, different from that of the Hindoos. Abul Fazil ſays "the moſt reſpectable people of this country are the Reyſhees, who, although they do not ſuffer themſelves to be fettered by traditions, are doubtleſs true worſhippers of God." Mr. Forſter ſays, that he never knew a national body of men more impregnated with the principles of vice than the natives of Caſhmere. Eager in purſuit of wealth, ambitious in ſeeking aggrandizement, arrogant and rapacious, and yet ingenious in deviſing and multiplying modes of luxurious expence; deceitful and treacherous; fickle in friendſhip and implacable in enmity:—ſuch is the diſguſtful picture which Mr. Forſter has exhibited of the diſpoſition and manners of the Caſhmirians. Thus, the numerous train of deſpicable vices engendered and nouriſhed by ſlavery are here exhibited in frightful deformity; and a land, which nature formed for a terreſtrial paradiſe, is converted by man into a region of ſorrow, of penury, and of carnage. Forſter's Travels, vol. i. and ii. Rennell's Memoir.

CASHMERE, CACHEMIRE, or CASHMIR, the capital of the above province, called alſo *Sirinagur*, is ſituated N. ¼ W. from Lahore, at the diſtance of 151 geographical miles, by the route of Bember. This city extends about three miles on each ſide of the river Behut, or Ihylium, which has a remarkably ſmooth current throughout the whole valley, the country being flat and the body of water very large; and it occupies in ſome parts of its breadth, which is irregular, about two miles. Over the river are four or five wooden bridges, connecting the ſeparate parts of the city. The houſes, many of which are two or three ſtories high, are ſlightly built of brick and mortar, with a large intermixture of timber. On a ſtanding roof of wood is laid a covering of fine earth, which ſhelters the building from the great quantity of ſnow that falls in the winter ſeaſon. This fence communicates an equal warmth in winter, and a refreſhing coolneſs in ſummer; when the tops of the houſes, which are planted with a variety of flowers, exhibit at a diſtance the ſpacious view of a beautifully chequered parterre. The ſtreets are narrow, and choaked with the filth of the inhabitants, who are proverbially unclean. No buildings are ſeen in this city that are worthy of remark; though the Caſhmirians boaſt much of a wooden moſque, called the "Jumah Muſſid," erected by one of the emperors of Hindooſtan; but its claim to diſtinction is very moderate. The lake of Caſhmere, long celebrated for its beauties, and for the pleaſure which it affords to the inhabitants of this country, extends from the N.E. quarter of the city, in an oval circumference of five or ſix miles, and joins the Ihylum by a narrow channel near the ſuburbs. Among the innumerable gardens which border the lake, the moſt conſpicuous is that which was conſtructed by Shah Iehan, called the "Shalimar," where nature and art ſeem to have vied which ſhould contribute moſt to its decoration. N. lat. 34° 20′ 30″. E. long. 73° 44′.

CASHNA. See KASSINA.

CASHOO, a medicinal and aromatic drug which is reckoned among perfumes. All that has yet been aſſerted about the origin and compoſition of this drug, is entirely fabulous. What follows will ſufficiently acquaint phyſicians, apothecaries, and druggiſts with what they ought to know of it. Caſhoo is extracted from a tree which is called *catee* in the country where it grows, which is a province of Hindooſtan, called Bahar, the capital of which is Patna. See BAHAR. Caſhoo is properly an extract made by a decoction and maceration of the ſeveral parts of this tree, and rendered ſolid by evaporation. There are two ſorts of ſimple caſhoo, the rough, and the purified or refined; the latter is a compoſition of purified caſhoo, mixed with aromatic drugs, and made into lozenges. This caſhoo is made for the uſe of the Indians, who chew it either alone, or mixed with pinang or areca. Rough caſhoo is a commodity which is brought down the Ganges as far as Bengal; whence it is diſtributed throughout the Indies, where there is a great conſumption of it; and to the Europeans, who ſend it into Europe. What is ſent into Europe, however, is moſtly purified; for caſhoo is not uſed rough any where.

Caſhoo is much valued in medicine: among other effects aſcribed to it, is the ſtopping a cough, and ſtrengthening the ſtomach; beſide which it ſweetens the breath, when, being reduced to an impalpable powder, mixed with ambergriſe, and mucilages of gum adragant, it is made into paſtils. Caſhoo muſt be choſen of a tanned red on the outſide, of a bright red within, very ſhining, and not burnt. Kœmpfer obſerves, that they prepare at Odowara perfumed caſhoo, of which they make pills, ſmall idols, flowers, and other figures, which they put into little boxes for ſale. The women are very fond of it, and uſe a great deal of it, becauſe it faſtens the teeth, &c. The thickened juice is carried to Japan, by the Dutch and Chineſe; and after it has been prepared at Macao, or at Odowara, they buy it again, and carry it to other places.

CASI, in the *Perſian Policy*, one of the two judges under the nadab, who decide all religious matters, grant all divorces, and are preſent at all public acts; having deputies in all cities of the kingdom.

CASIA, in *Botany*, *fructu nigro*, Amm. Ruth. See Nitraria *ſchoberi*.

Casia *poetica monſpelienſium*, Cam. Epit. Lob. Ic. 432. *Monſpelii dicta*, Geſn. Epit. 50. *Latinorum*, Alp. Exot. 41. See Osyris *alba*.

Casia, in *Ancient Geography*, a country which the ancients placed near mount Imaus in Scythia. M. D'Anville places it in the angle formed towards the weſt by the two chains of mountains, which he calls Imaus, one of which is to the north-eaſt, and the other declining to the ſouth-eaſt. This country correſponds to the preſent *Caſhgar*; which ſee.

Casia, a promontory on the coaſt of Carmania, at a ſmall diſtance from the mouth of the river Hydriacus.

CASIAR, or Cæsarea, in *Geography*, a town of Aſia, on the coaſt of the Mediterranean, in Paleſtine; anciently called Cæsarea-*Stratonis*, which ſee. In the year 635, it was taken by Omar, one of the ſucceſſors of Mahomet, and was alternately in the poſſeſſion of the Chriſtians and Mahometans during the religious wars, till it was finally left, with the loſs of its ancient ſplendour, in the power of the latter.

CASII, or Cassii *Montes*, in *Ancient Geography*, a chain of mountains in Aſia, ſituate in Serica, to the ſouth of Aſmiræa, and of Iſſedon Serica, according to Ptolemy.

CASILINUS, a river of Italy, in Campania. The town of Caſilinum was ſeated on the oppoſite banks of this river, and a bridge connected its two parts. Agathias ſays, that this river deſcended from the Apennines, and diſcharged itſelf into the Tyrrhenian ſea.

CASILINUM, a town of Italy, in Campania, N.W. of Capua, ſeated on the Vulturnus, at a conſiderable diſtance from the ſea. It once occupied both ſides of the river. During the ſecond Punic war it diſtinguiſhed itſelf by the reſiſtance which its garriſon made to Hannibal. Julius Cæſar eſtabliſhed a colony in this place. Modern Capua was built on its ruins. See Capua.

CASIMERSBURG, in *Geography*, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania; 14 miles E.N.E. of Colberg.

CASIMIR, in *Biography* and *Hiſtory*, the name of ſeveral kings of Poland.

Casimir I. was the ſon of Mieczlaus II. and at the death of his father, in 1034, was placed under the tutelage of his mother, Rixſa, who was appointed regent of the kingdom. The Poles, aggrieved by her oppreſſive adminiſtration, revolted, and expelled both her and her ſon. Caſimir took refuge in France, and, having a propenſity to literature, ſtudied in the univerſity of Paris; and, aſſuming deacon's orders, he became a monk, firſt in Italy, and afterwards in the abbey of Cluni, in France. Poland, having ſuffered much during the interregnum, the nobles of the country diſcovered the place of Caſimir's retreat, and recalled him from his exile; but it was neceſſary that he ſhould be releaſed from his clerical vows; for which purpoſe, a diſpenſation was obtained from the pope, on condition of the payment of Peter-pence by the Poles, and ſome other ſtipulations favourable to the holy ſee, and he was then crowned with unuſual ſolemnity, in 1040. By marrying the ſiſter of Jariſlaus, grand duke of Ruſſia, he ſecured peace from that quarter; and by the vigour of his government, he ſuppreſſed the banditti who had infeſted the country, and reſtored law, order, cultivation, and proſperity to Poland. He civilized his ſubjects by the eſtabliſhment of churches and monaſteries, and by encouraging the arts of peace he made his kingdom flouriſh to a degree before unknown. In 1044, he quelled the rebellion of Maſlaus, who had riſen from the rank of a private ſoldier to the higheſt offices of the ſtate, and who at laſt aſſumed the title of prince of Mazovia. He alſo expelled the Bohemians from Sileſia, and eſtabliſhed an epiſcopal ſee at Breſlaw. After an honourable and happy reign of 18 years, he died, in 1058, much regretted, and left the crown to his ſon Boleſlaus.

Casimir II. ſurnamed *the Juſt*, was the youngeſt ſon of Boleſlaus III. who, at the death of his father, in 1123, was left an infant in the cradle, without any proviſion. In mature age, he was advanced to the dignity of prince of Sandomir; and, as an evidence of the propriety with which the appellation of *Juſt* was beſtowed upon him, the following anecdote is recorded. Having won at play all the money of one of his nobility, the loſer, incenſed at his ill fortune, ſtruck the prince a blow on the ear. The offender inſtantly fled; but being purſued and taken, he was condemned to loſe his head. Caſimir interpoſed. "I am not ſurpriſed," ſaid the prince, "that, not having it in his power to revenge himſelf on Fortune, he ſhould attack her favourite." He revoked the ſentence, returned the nobleman his money, and declared that he alone was faulty, as he had encouraged, by his example, a pernicious practice, that might terminate in the ruin of his people. The Poles, diſſatiſfied with the conduct of his brother Mieczlaus III., depoſed him, and elevated Caſimir to the throne, in 1177. The new ſovereign proved himſelf worthy of the honour, by ſubduing the Lower Poland and Pomerania, aboliſhing all exorbitant impoſts, reforming the abuſes of his predeceſſor's adminiſtration, and reſtoring rights and privileges that had been alienated from their poſſeſſors. The brother of Caſimir, deprived of his crown, and reduced to a ſtate of extreme indigence, ſupplicated compaſſion; and ſo far ſucceeded, that the reigning prince determined to evacuate the throne in his favour, and pledged himſelf for his future good conduct; but the ſtates, to whom Caſimer applied for permiſſion to reſign, peremptorily refuſed it. He connived, however, at the irregularities of his brother, and particularly at his taking forcible poſſeſſion of Gneſna and Lower Poland, where he might have lived in ſplendour and in peace. But his reſtleſs ſpirit led him to extend his encroachments, and he perſiſted in his endeavours to wreſt the crown from his brother. It became neceſſary, at length, to reſtrain his uſurpations; and to compel him to evacuate all his conqueſts. The laſt enterpriſe of this prince was a kind of pious cruſade againſt the relapſed heathens of Pruſſia, whom he ſubdued rather by the reputation of his wiſdom and generoſity than by force of arms. Soon after his return to Cracow from this expedition, he died, in 1194, after a reign of 17 years, lamented as the moſt amiable prince that had ever filled the throne of Poland. With his diſtinguiſhed virtues, however, he blended culpable foibles. In his palace he was the ſlave of his miſtreſſes.

**Casimir III.** ſurnamed *the Great,* ſucceeded his father Uladiſlaus III. in 1333, and ſoon after his acceſſion engaged in a conteſt with the Teutonic knights, who obtained the ſupport of the kings of Bohemia and Hungary. His ſubjects wiſhed him to vindicate his claims and to puniſh the uſurpation, perfidy, and turbulence of theſe knights, by declaring war againſt them; but Caſimir, ſenſible of their power, thought it moſt prudent to wait for a more ſeaſonable opportunity, and acquieſced in the reſtitution of Culm and Cujavia. At this time he had another more important object in view than that of regaining Pomerania, which had been adjudged by the royal umpires to the knights; and this was the conqueſt of the province called Black Ruſſia, which, together with Volhinia and Mazovia, he completely ſubdued and annexed to his Poliſh dominions. Having accompliſhed this object, he directed his attention to the civilization and improvement of his country. Accordingly, he firſt gave the Poles a regular code of written laws, ſuch as had never before been ſeen in Poland, which he cauſed to be obſerved by all ranks of people, and he thus introduced juſtice and order in the room of arbitrary deciſion and undefined extortion. This written code he preſented to a general diet, where it was examined, approved, and enlarged. He alſo ſtrengthened the frontiers of the country by fortreſſes, incloſed the chief cities of his dominions with walls, built churches, founded monaſteries, and purſued every meaſure that was likely to conciliate the affection and attachment of his ſubjects, and to increaſe the wealth and proſperity of the kingdom. His incontinence caſt a cloud over his other virtues; and he incurred peculiar reproach by ſhutting up one of his wives in a monaſtery that ſhe might not interrupt his licentious intercourſe with a favourite concubine. His works of piety and charity recommended him to the favourable judgment of the clergy; and they not only extenuated the criminal indulgence of his ruling paſſion, but laviſhed upon him the higheſt encomiums. He was thrice married, but left no children; he was the laſt Poliſh king of the direct line of the Piaſti. His death, which happened in 1370, at the age of 60 years, and after a reign of 37, was occaſioned by a fall from his horſe in hunting.

**Casimir IV.** the ſecond ſon of Jagello, was grand duke of Lithuania, when, in 1445, his brother Uladiſlaus was killed in the battle of Varna againſt the Turks, and was crowned as king of Poland, in 1447.

The firſt operations of his reign were directed againſt Bogdan, who uſurped the vaivodeſhip of Moldavia, whom he obliged to ſue for peace. He afterwards undertook the protection of the Pruſſians againſt the tyranny of the Teutonic knights, whom he expelled from many of their cities. But whilſt his army covered the ſiege of Mariemburg, the knights attacked his camp with great impetuoſity, and conſtrained him to ſecure himſelf by an ignominious flight, after 4000 of his troops had been ſlain or taken priſoners. In conſequence of this defeat, he returned to Poland, and, having recruited his forces, he reſumed the ſiege of Mariemburg and took it; and thus humbled the knights to ſuch a degree, that, by a treaty of peace concluded at Thorn, they ceded the territories of Culm, Michlow, and the whole duchy of Pomerania, together with the towns of Elbing, Mariemburg, Talkmith, Schut, and Chriſtburg, to the crown of Poland. The king, in return, reſtored to them all his other conqueſts in Pruſſia; granted a ſeat in the Poliſh ſenate to the grand-maſter; and indulged him with other privileges, on condition that ſix months after his acceſſion, he ſhould do homage for Pruſſia, and take an oath of fidelity to the king and republic. Such were the conditions on which Caſimir terminated the war, and humbled an order which had given perpetual diſturbance to the northern hemiſphere, for nearly the ſpace of two centuries. Moldavia was alſo made tributary to Poland; and when the crown of Bohemia became vacant, the barons beſtowed it upon Uladiſlaus, the eldeſt ſon of Caſimir, in oppoſition to the intrigues of Matthias Corvinus, the king of Hungary, whom Uladiſlaus purſued into his own country, and defeated. Thus the three crowns of Poland, Hungary, and Bohemia, were united in the ſame family, and Caſimir's power was greatly augmented, though the felicity of his people, oppreſſed with grievous taxes, and diminiſhed in number by a variety of bloody engagements, did by no means increaſe in the ſame proportion. Caſimir wiſhed to retrieve his domeſtic affairs by the arts of peace; but before he could accompliſh his purpoſe, he died, at the age of 64, in the year 1492, more admired than beloved or regretted. In this reign the deputies of the provinces firſt appeared at the diet, and aſſumed to themſelves the legiſlative power; all laws before this period having been framed by the king, in conjunction with the ſenate. Caſimir is alſo ſaid to have publiſhed an edict, enjoining the ſtudy of the Latin tongue, in which both he and his ſubjects were before groſsly ignorant, and thus he rendered this language ever ſince almoſt vernacular among the gentry of Poland.

**Casimir, John,** ſecond ſon of Sigiſmund III. king of Poland, was originally deſtined for the church, and entered the ſociety of the Jeſuits, after having viſited moſt of the courts of Europe. From pope Innocent X. he had obtained a cardinal's hat: but upon the death of his brother Uladiſlaus VII. in 1648, the Poles elected him to the crown. Upon his acceſſion he expreſſed his diſapprobation of the meaſures which had irritated the Coſſacks and excited them to rebel; and, after ſome actions with them, he concluded a treaty of peace which was much in their favour. Afterwards the war was renewed; the Coſſacks were defeated, and again obtained a peace, which occaſioned diſſatisfaction to the nobility. In 1653, the Ruſſians availed themſelves of the hoſtile diſpoſition of the Coſſacks, and of the diviſions that ſubſiſted between Caſimir and the Poliſh nobility, to commence hoſtilities againſt Poland; and, uniting with the Coſſacks and Tartars, entered Lithuania, ravaged the country, and treated the inhabitants with great barbarity. At the ſame time Charles Guſtavus, king of Sweden, invaded Poland by the way of Pomerania, and, reducing the whole country as he advanced, with Cracow its capital, obliged the unfortunate Caſimir to ſeek an aſylum in Sileſia. Caſimir's flight being interpreted by the Poles as an abdication of the crown, they took an oath of allegiance to the conqueror; and Guſtavus became maſter of all Poland and Pruſſia, the city of Dantzic excepted. The impoſitions of the Swedes, aided by the exhortations and example of the clergy, rouzed again a ſpirit of reſiſtance. Caſimir was privately invited to return to his dominions; and he immediately put himſelf at the head of a conſiderable army, aſſembled by the nobility. The Tartars formed an alliance with the Poles, and, attacking a body of Swedes, totally defeated them. The Lithuanians alſo revolted from the Swediſh monarch, and taking advantage of the diſperſed condition of his ſoldiers, attacked and maſſacred them before they could unite and form themſelves into a body for their own defence. Guſtavus, however, proſecuted the war, and took Warſaw by ſtorm; but at length he was obliged, in 1657, to withdraw his army from the Poliſh territories, and to employ it in the defence of his own country, which was attacked by the Danes. Soon afterwards the Swedes were under a neceſſity of wholly evacuating Poland. After the death of Guſtavus, Caſimir made a peace at Oliva, in 1660, with Charles XI. his ſucceſſor, upon condition that he ſhould renounce all claim to the Swediſh crown, and that the Swedes ſhould reſtore all their conqueſts in Poland, Pruſſia, and Livonia, Riga and a few other places excepted. Peace being thus eſtabliſhed between the Poles and the Swedes, Caſimir determined to commence a war with the Ruſſians, who had made divers incurſions into his dominions; and having ſucceeded in two deciſive engagements, he laid ſiege to Wilna, the capital of Lithuania, which had been taken by the enemy during the late war with Sweden. The ſiege was protracted till diſſenſions occurred between the king and ſome of the nobility, who inſiſted that he ſhould diſmiſs his German mercenaries, under a plea that they were introduced to deſtroy the liberties of the republic, and not to recover her territories. The animoſity produced an open variance; forces were raiſed on both ſides; a battle enſued; the royal party was defeated; and the conteſt terminated with the diſmiſſal of the German levies. Upon this compliance on the part of Caſimir, the diſcontented party threw off the maſk, loſt all reſpect for the perſon of the king, and occaſioned to him ſo much vexation, aggravated at the ſame time by the loſs of his wife, who had been his brother's widow, that he reſigned the crown in diſguſt, A. D. 1668, and retired to France, where he was honourably received and hoſpitably treated by Lewis XIV. He died at Nevers, in December, 1672, and a magnificent monument was erected for him at the church of the abbey of St. Germain des Prez, of which he was abbot. The turbulent reign of John Caſimir gave riſe to the privilege aſſumed by each ſingle nuncio at the diet, of putting a ſtop to any public affair by his negative, called the "liberum veto:" a fruitful ſource of anarchy and violence. Mod. Un. Hiſt. vol. xxx. Moreri.

**Casimir, Matthias Sarbievski**, a Poliſh Jeſuit, and an excellent Latin poet, was born in 1597; and, in the judgment of M. Baillet, he is an exception to a general maxim of Ariſtotle and others among the ancients, which teaches us to expect nothing ingenious and delicate from the northern climates. His odes, epodes, and epigrams, have been thought not inferior to ſome productions of the fineſt wits of Greece and Rome. Grotius, D. Heinſius, and others, have not ſcrupled to affirm, that he is not only equal, but ſometimes ſuperior, even to Horace himſelf. Such was the reſpect which he entertained for Virgil, that he had begun to imitate him in an epic poem, called the "Leſciade," which he had divided into 12 books. But his death, which happened at Warſaw in 1640, put a ſtop to his progreſs in this work. His epigrams, however, are allowed to be much inferior to his odes. We have a tranſlation of one or two of his ſmall pieces in Dr. Watts's lyric poems. There have been many editions of his poems, the beſt of which is that of Paris in 1759.

**Casimir**, in *Geography*, a town of Poland, on the Viſtula, on the ſide oppoſite to that of Cracow, from which it is only ſeparated by a bridge, built by king Caſimir the Great, for an univerſity, which contains 11 colleges and 14 ſchools.

**CASINATES**, in *Ancient Geography*, the inhabitants of the town of Caſinum, which ſee.

**CASING**, among *Hunters*, denotes the ſtripping off the ſkin of a hare, fox, or badger. They ſay, *flay* a deer, *caſe* a hare, and all ſorts of vermin. This is done by beginning at the ſnout or noſe of the beaſt, and ſo turning his ſkin over his ears down to the body, and the very tail.

**Casing** *of Timber-work*, is the plaſtering of a wooden houſe all over on the outſide with mortar, and ſtriking it, yet wet, by a ruler, with the corner of a trowel, or the like inſtrument, to make it reſemble the joints of free-ſtone; by which means, the whole houſe appears as if built thereof. It is beſt done on heart-laths, becauſe the mortar is apt to decay the ſap-laths in a ſhort time. It is commonly laid on at two thickneſſes, the ſecond before the firſt is dry.

**CASINGS**, a provincial term applied to dried cow's dung, which is uſed in ſeveral parts for fuel.

**CASINO**, in *Geography*, a river of Italy, which runs into the ſea, 2 miles N.W. of cape Stilo.

**CASINUM**, in *Ancient Geography*, a conſiderable town of Italy, in Latium, upon the Latin way from Campania. Hannibal encamped two days under its walls. After the wars of the Samnites, under the conſulate of M. Valerius and Publius Decius, the Romans, having made themſelves maſters of Caſinum, ſent a colony thither in the year of Rome 442. Its ruins are viſible near San. Germano.

**CASINUS**, a river of Italy, which, according to Strabo, joined the Liris at the place where was ſituated the town of "Interamna." It is ſuppoſed to have been the preſent *Sacco*.

**CASIORUM Insulæ**, ſmall iſlands ſituate near the ſmall iſland of Caſus, to the ſouth of the iſland of Carpathus.

**CASIROTÆ**, a people of Aſia, who inhabited the territory N. of Aria, on the ſide of Drangiana, according to Ptolemy.

**CASIUS**, the name of two mountains of Phœnicia, one to the ſouth, on the frontiers of Egypt, the other to the north, near "Seleucia Pieriæ," to the right of the mouth of the Orontes. The term "Caſius," in the Eaſtern language, denotes limit or boundary, and the ſituation of theſe mountains, in their relation to Phœnicia, juſtifies this etymology. The mount Caſius of Syria (ſee Pliny, N. H. l. v. c. 22.) was ſituated to the ſouth of the mouth of the Orontes, near Seleucia to the ſouth-weſt. The preſent mount Caſius riſes above Antioch to a prodigious height; but Pliny ſurpaſſes hyperbole when he ſays that from its ſummit we may diſcover at once both the morning's dawn and the evening twilight. The mount Caſius that lay on the frontiers of Syria and Egypt is ſituated on the northern coaſt of the iſthmus of Suez, and was diſtant, according to Strabo, 300 ſtadia from Peluſium. According to this geographer (l. xvi. vol. ii. p. 1102.) it reſembled heaps of ſand, and projected into the ſea. On this mountain the body of Pompey the Great was depoſited, and it had a temple of Jupiter, named *Caſius*. Jupiter has alſo a temple, under this appellation, on mount Caſius in Syria, near Seleucia, as is evident from the reſort of the inhabitants thither every year to celebrate a feaſt in honour of Triptolemus. He was alſo worſhipped under this title at Caſſiope, a city in the iſland of Corcyra, ſituate on the weſternmoſt cape of the iſland, and neareſt the main land. Suetonius repreſents Nero as landing on this point, and ſinging before the altar of Jupiter Caſius. There are medals ſtill extant, which exhibit Jupiter with theſe inſcriptions, "ZEYC KACIOC," and "ΖΕΥΣ ΚΑΣΙΟΣ," expreſſive of this title.

Casius, a river of Aſia in Albania, mentioned by Pliny and Ptolemy; and the mouth of which is placed by the latter between thoſe of Gherius and Albanus.

CASK, in French *Caſque*, a head-piece or helmet, a defenſive armour for covering the head and neck. Formerly all the gens d'armes of France wore *caſques*. The king had one gilt with gold, the dukes and counts had theirs with ſilver, gentlemen of extraction wore them of poliſhed ſteel, and the reſt of plain iron. The word is commonly ſuppoſed to come from *caſſis*, the Latin term for a helmet.

The Romans had their caſques of braſs or iron, which were proof againſt the ſtrokes of any ſword or ſabre, and were ornamented to the height of two feet with plumes of feathers, or tufts of horſe hair, of different colours, which made them look grander and taller, and ſtruck more terror into their enemies. The chiefs and principal officers wore caſques gilded and enriched with precious ſtones, with the tops of them ornamented with plumes and aigrettes of value, which ſerved to diſtinguiſh them from others. The Scandinavians, and other people of the north, uſed to wear them, and the invention of them is aſcribed by ſome to the Scythians and the Celts. It is ſuppoſed, however, to have been one of the moſt ancient of all coverings for the head, and it is frequently ſeen on ancient medals in a variety of forms or faſhions, as the Grecian, the Roman, &c. Kings and emperors wore it; and even the gods themſelves are figured as wearing it. That which covers the head of Rome, has generally two wings, like thoſe of Mercury. Thoſe of ſome kings are furniſhed with horns, like thoſe of Jupiter Ammon, whilſt thoſe of ſome others have only bulls' or rams' horns, to denote their uncommon ſtrength.

Cask, in *Heraldry*, the ſame with helmet.

Cask is alſo uſed as a common name for veſſels of divers kinds; in contradiſtinction from the liquor, or other matter contained therein. Thus a hogſhead of ſpirits, &c. is ſaid to weigh 4 Cwt. ½ and 22lb. caſk and liquor; a puncheon, 6 Cwt. ¼ and 2lb. caſk and liquor. See Tun, &c.

Cask *of Sugar*, is a barrel of that commodity, containing from eight to eleven hundred weight.—A caſk of almonds is about three hundred weight. No one ſhall tranſport any wine caſk, &c. except for victualling ſhips, under a certain penalty, by 35 Eliz.

For the method of eſtimating the ſolidity or content of a caſk, ſee Frustum *of a Pyramid*, and Gauging.

CASKET, in a general ſenſe, a little coffer, or cabinet. See Cabinet.

CASKETS, in *Geography*, two high rocks at W. by N. and W.N.W. from the W. end of Alderney, beſides many ſmaller ones, ſeveral of which are covered by the flood-tide. On the weſternmoſt of the Caſkets there are three light-houſes, diſpoſed in a triangular form. N. lat. 49° 45′ 30″. W. long. 2° 24′ 40″. High water at ſpring-tides at 9 o'clock. See Alderney.

Caskets, in *Sea-Language*, are ſmall ropes made of ſinnet, and faſtened to gromets, or little rings upon the yards; their uſe is to make faſt the ſail to the yard when it is to be furled.

Caskets, *breaſt*, are the longeſt and higheſt of theſe, or thoſe in the midſt of the yard, betwixt the ties.

CASLEU, in the *Hebrew Chronology*. See Cisleu.

CASLON, William, in *Biography*, an eminent letter-founder, was born at Hales Owen in Shropſhire, in 1692; and having ſerved an apprenticeſhip to an engraver of ornaments on gun-barrels, he embarked for himſelf in this buſineſs in London, connecting with it the manufacture of tools for the book-binders, and for the chaſing of ſilver plate. Whilſt he was thus engaged, he became acquainted with the elder Mr. Bowyer, who introduced him to a foundery; and being ſatisfied of his abilities for undertaking the buſineſs of cutting types, though he had never before ſeen it performed, he concurred with two other eminent printers (Mr. Bettenham and Mr. Watts) in advancing the ſum of 500l. towards enabling him to commence the undertaking. Accordingly he immediately applied to it with ſingular aſſiduity and ſucceſs. In 1720, the ſociety for promoting Chriſtian knowledge propoſing to print, for the uſe of the Eaſtern churches, in Paleſtine, Syria, Meſopotamia, Arabia, and Egypt, where printing was not allowed, the New Teſtament and Pſalter in the Arabic language, engaged Mr. Caſlon to cut the fount of letter; in his ſpecimens of which he diſtinguiſhed it by the name of "Engliſh Arabic." Having finiſhed this fount, he cut the letters of his own name in "Pica Roman," and placed them at the bottom of one of the Arabic ſpecimens. When Mr. Palmer, the reputed author of the "Hiſtory of Printing" (which was in fact written by Pſalmanazar), ſaw the name, he adviſed the artiſt to cut the whole fount of Pica; in the execution of which he ſurpaſſed the other founders of the time. Mr. Palmer afterwards repented of the advice he had given him, and dreading the competition of ſuch a formidable rival, endeavoured to diſcourage his farther progreſs. Mr. Caſlon, diſguſted by this treatment, applied to Mr. Bowyer, and under his inſpection he cut, in 1722, the beautiful fount of "Engliſh" which was uſed in 1726, in printing Selden's works, and the Coptic types that were made uſe of for Dr. Wilkins's edition of the Pentateuch. Under the farther encouragement of his three firſt patrons, he proceeded with vigour in his employment, acknowledging his particular obligation to Mr. Watts as his maſter, from whom he had learned his art. Such was the perfection to which he attained, that it was no longer neceſſary to import types from Holland; and his own were ſo beautiful and elegant, and ſo far exceeded the productions of the beſt artificers, that they were frequently exported to the continent. A more beautiful ſpecimen than his, it has been juſtly ſaid, is not to be found in any part of the world. After ſome previous changes of habitation, he at length, viz. in 1735, eſtabliſhed his foundery in Chiſwell-ſtreet, where in proceſs of time it became the moſt capital of any exiſting in this or in any foreign countries. Having acquired opulence in the courſe of his employment, he was introduced into the commiſſion of the peace for the county of Middleſex; and towards the cloſe of his life, devolving the active part of his buſineſs on his eldeſt ſon, he retired to Bethnal green in the vicinity of London, where he died in January 1766 at the age of 74 years. Mr. Caſlon was univerſally eſteemed as a firſt-rate artiſt, a tender maſter, and an honeſt, friendly, and benevolent man; and ſir John Hawkins (Hiſt. of Muſic, vol. v.) has particularly celebrated his hoſpitality, ſocial qualities, and his love of muſic. Biog. Brit.

CASLUHIM, in *Scripture Geography*, one of the nations deſcended from Mizraim, who are ſuppoſed to have ſettled ſomewhere towards the entrance of Egypt, about mount Caſius, in that part of the Lower Egypt called Caſiotis by Ptolemy and others, which places, it is thought, retain ſome likeneſs of the name; but, without relying on that argument, they appear to have been planted near the Caphtorim, becauſe the Philiſtines ſeem to have been deſcended from both theſe people, and conſequently to have been ſettled in Egypt. Bochart, miſled by following the Jewiſh notion about Caphtor, fancies them to be the inhabitants of Colchis, at preſent called Mingrelia.

CASMA, in *Ancient Geography*, a town mentioned by Ptolemy, and placed in the eaſtern part of Mauritania Cæſarienſis between Aquæ Calidæ and Bida.

Casma La Barca, in *Geography*, a town of South America, in the country of Peru, and juriſdiction of Santa. *Caſma*, or *Cazma* port is 4 leagues N. from Morgon, and 11 S.E. from Ferrol, on the coaſt of Peru, in the South Pacific Ocean. S. lat. about 9° 40′. This is a good harbour, though ſubject to hard gales.

CASMENA, a town of Sicily, placed by ſome near the ſource of the Hippatis, and by others between Acræ and Camarina. This city, according to Thucydides (l. vi. c. 25.) was built by the Syracuſans 90 years after Syracuſe, or about the year 668 B C.

CASMONATES, a people of Italy, who inhabited the mountains of Liguria. Pliny.

CASOAR, in *Ornithology*, the French name of the caſſowary (Buff.) See Struthio Casuarius.

CASOLI, in *Geography*, a town of Naples, in the province of Abruzzo Citra; 15 miles S.S.E, of Civita di Chieta.

CASOS, or Casus, Casso, an iſland of the Mediterranean, one of the Cyclades, is ſaid to have received its name from Caſo, the father of Cleomachus. This little iſland ſent a colony to mount Caſius, dependent on Syria. According to Strabo, it is diſtant from Carpathus, now called Scarpanto, 70 ſtadia or 2½ leagues, and 250 ſtadia, or 9 leagues, from Samonium, a promontory of Crete. It is 80 ſtadia, or 3 leagues, in circumference; on it was formerly a town of the ſame name, which no longer exiſts, and round it are ſeveral ſmaller iſlands. The population of this iſland at the preſent time is not conſiderable; and entirely compoſed of Greeks, though ſubject to the Turks. It is little frequented by ſhipping, its road being difficult of entrance, and its ſhore dangerous of acceſs. The inhabitants, however, are on that account more happy and more free; as the Turks ſeldom venture to go thither to exerciſe the deſpotiſm with which they oppreſs the countries ſubject to their dominion. The Greeks of Caſſo, being more independent and more ſecure in their property, are more laborious than others; their toil and induſtry have introduced fertility on a ſoil of which the ſtratum even of vegetable earth, which covers the rocks, appeared not to render it ſuſceptible; the vines which grow on this ſtony ground, furniſh them with very good wine; and the honey, which they gather, is ſtill, as in ancient times, abundant, and of an excellent quality. The Caſſiots, like all the inhabitants of the ſmall iſlands which cannot ſupply the wants of their population, are navigators and traders; but their induſtry in that way does not extend beyond the limits of the Archipelago. The women of the iſland wear a jacket, ſaſh, and long robe of cotton; the only difference conſiſting in the embroidery, which varies according to their different taſtes, and in the manner of wearing their hair, which ſome ſuffer to flow upon their ſhoulders, in one or more treſſes, and others faſten to the crown of the head, letting it fall down again upon the neck. Their employment is that of ſpinning cotton and embroidering, and making the fine linens which they wear. Several of them are handſome, and their amuſements are dancing and muſic. The men, during the ſpring, ſummer, and part of autumn, are out at ſea, ſo that the iſland ſeems to have few males. Theſe trade to different iſlands of the Archipelago, and return from time to time with proviſions for their families, and only paſs the winter with them. They ſow the land with barley and wheat at the commencement of the rainy ſeaſon, which laſts from October to February; collect the harveſt in March, and then return to ſea, ſupplying from other countries the deficiency of the produce of their own iſland. The cultivated part of the iſland is divided into compartments, and ſhared among the Caſſiots. The rain is not continual in the above-mentioned months, but none falls in any other; during the remainder of the year the air is pure and ſerene, and both days and nights fine and clear. The heats are moderated by the ſea-breezes, and beneath a beautiful ſky, the inhabitants enjoy a delightful temperature, and are almoſt ſtrangers to every kind of diſeaſe. The men enjoy their repaſts, conſiſting of poultry, eggs and rice, and good wine, dining together ſeated in a circle on the carpet, and the women in a ſeparate apartment. Savary expreſſes his admiration of the regularity and wiſdom of this little republic, the peace and harmony that prevailed among its members, and, above all, that cheerfulneſs and content which was ſo viſible in their countenances. "In the midſt of ſlaves crouching beneath the Ottoman yoke, I have found," ſays this writer, "a rock only 3 leagues in circumference, on which the Turk dares not ſet his foot, and inhabited by a free and happy people. There each father of a family is a ſovereign within his own houſe; he decides every difference, and his decrees are laws, which cannot but be equitable, ſince they are only dictated by paternal tenderneſs. When any diſputes ariſe, the prieſt and the old men aſſemble, and decide them; but diſputes cannot be frequent among citizens, who are all equal and alike unacquainted with poverty or riches. All the members of this little ſociety are employed; and I have ſeen the handſomeſt of their women go down into the valley, to waſh their linen at the fountain, as in the days of Homer. They cheer their labours with a ſong; nor do they imagine themſelves diſgraced by their humble employment." Several iſlets or ſhoals lie near the northern coaſt of the iſland of Caſſo, called by the ancients the Caſſian iſlands; they are barren, and ſcarcely covered with a few buſhes; but they ſhelter the road of Caſſo from the winds and the ſea to the north.

CASPARGUS, in *Ichthyology*, a name given by Salvian, from Ælian, to a fiſh ſuppoſed to be of the Sparus genus, and probably the *Sparus annularis* of modern naturaliſts; it is deſcribed as being of a plain yellowiſh colour, with a large annular (ocellated) ſpot near the tail, which perfectly agrees with Sparus annularis.

CASPASIUS, or Caspasium *flumen*, in *Ancient Geography*, a river placed by Pliny in Aſiatic Scythia.

CASPATYRUS, or Caspapyrus, a town of Aſia, placed by Herodotus (l. iii. c. 52.) in Pactya, upon the Indus; but by Hecatæus, cited by Steph. Byz. in Ganderia, in the vicinity of the Sogdians and Bactrians, and ſouth of theſe people. The modern name of this town, according to M. d'Anville, is Tchupareh.

CASPE, in *Geography*, a town of Spain, in Arragon, ſituate at the conflux of the Guadaloupe and the Ebro. The adjacent country produces corn, wine, oil, and ſaffron. Here Ferdinand IV. was elected king of Arragon; 44 miles S.E. of Saragoſſa, and 35 S. of Balbaſtro.

CASPEAN, or Beautiful, a ſmall lake of North America, in Greenſborough, Vermont. On its weſtern ſide is Hazen blockhouſe. It is a head-water of La Moille river.

CASPERIA, in *Ancient Geography*, a town of the Sabines, mentioned by Virgil; towards the ſouth-eaſt of Reate. It is called *Caſparula* by Silius Italicus, l. viii. v. 416.—Alſo, a country of India, on this ſide of the Ganges, below the ſources of the Bidaſpe, Rhoas, and Sandubal, according to Ptolemy.

CASPHIN, or Casphis, a ſmall but well fortified town of Paleſtine, in the tribe of Dan, ſeated on a ſmall lake about 6 miles E. of Jamnia. It was fenced with high walls, and ſo well provided within, at the time of the Maccabitiſh wars, that the inhabitants, truſting to their own ſtrength, threw out many ſcornful ſarcaſms on the Jewiſh army; but Judas Maccabæus aſſaulted it with ſuch unexpected bravery, that he made himſelf maſter of it, and put all the inhabitants to the ſword, inſomuch that a neighbouring lake, about 2 furlongs broad, was ſeen running with blood. 2 Maccab. xii. 12—16.

CASPIÆ Pylæ, or Portæ, an important defile between the mountains and the Caſpian ſea. See Caspian *Gates*.

CASPIAN Sea, in *Geography*, a detached ſea of Aſia, which has no viſible connection with any of the great oceans, nor apparent outlet, and which, on this account, ſome writers have claſſed among the larger lakes, not thinking that it properly deſerves the appellation of a ſea. It is bounded on the north by the province of Aſtrachan and the Caucaſus, and on the ſouth, eaſt, and weſt, by different provinces of Perſia. The governments of Uſimſk and Caucaſus border on the Caſpian. It was anciently called by the Greeks the Hyrcanian, i. e. the Perſian, Sea; by the Tartars it is denominated Akdinghis, or the White Sea; by the Georgians it is termed the Kurtſhenſkian Sea; and the Perſians denominate it Gurſen, from the old Perſian capital, Gurgan, which is ſaid to have ſtood in the province of Aſtrabad, only ſeven verſts from the ſea. It reaches in length about 10 degrees, from about the 37th to the 47th degree of north latitude, or about 680 miles from Gurief to Medſhetiſar, and in breadth from 100 to 260 miles, where it is the wideſt. Its ſuperficial contents amount to above 36,000 ſquare Engliſh miles.

The ancient geographers were very imperfectly acquainted with this ſea, and have given very unfounded and abſurd deſcriptions of it. According to Strabo, (lib. xi. p. 773.) the Caſpian is a bay, that communicates with the Great Northern Ocean, from which it iſſues at firſt by a narrow ſtrait, and then expands into a ſea, extending in breadth 500 ſtadia. With him Pomponius Mela (lib. iii. c. 5.) agrees, and deſcribes the ſtrait by which the Caſpian is connected with the ocean as conſiderable in length, and in breadth ſo narrow, that it had the appearance of a river. Pliny (N. H. l. vi. c. 13.) gives a ſimilar deſcription of it. In the age of Juſtinian, this opinion concerning the communication of the Caſpian Sea with the ocean was ſtill prevalent. Some early writers, by a miſtake ſtill more ſingular, have ſuppoſed the Caſpian Sea to be connected with the Euxine. Quintus Curtius (l. vii. c. 7.) has adopted this error. Arrian, (l. v. c. 26.) though a more judicious writer, and who by reſiding for ſome time in the province of Cappadocia, as governor, might have obtained more accurate information, declares in one place, that the origin of the Caſpian Sea was ſtill unknown, and expreſſes a doubt whether it was connected with the Euxine, or with the Great Eaſtern Ocean which ſurrounds India. Theſe errors appear more extraordinary, as Herodotus, near 500 years before the age of Strabo, had given a juſt deſcription of this ſea. "The Caſpian," he ſays (lib. i. c. 203.) "is a ſea by itſelf, unconnected with any other. Its length is as much as a veſſel can ſail with oars in 15 days, and its greateſt breadth as much as it can ſail in eight days." Ariſtotle (Meteorol. l. ii.) deſcribes it in the ſame manner, and with his uſual preciſion contends, that it ought to be called a great lake, not a ſea. Diodorus Siculus (vol. ii. l. xviii. p. 261.) concurs with them in opinion. Ptolemy, however, maintained its communication with the Euxine, affirming that the waters of both had a ſubterraneous connection; as, otherwiſe, it was not to be explained how ſo many large rivers ſhould flow into the Caſpian; for, which there was not one channel out of it. What, it might be ſaid, becomes of the waters of the Volga, the Yaik, the Yemba, the Kur or Cyrus, the Araxes, the Byſtrai, the Akſa, the Koiſa, the Terek, and the numberleſs others that flow into it? By the ſun alone they cannot be evaporated; there is no viſible outlet for them; and yet the ſea is never perceptibly ſwollen, except merely in the Spring on the melting of the ſnows. See this ſubject diſcuſſed by captain Perry in his ſtate of Ruſſia, p. 100, &c. printed at London in 1716. Thoſe who have recourſe to ſubterraneous paſſages, by which its water muſt flow into the Perſian ſea, or more probably into the Euxine, allege two arguments in ſupport of their opinion. In the firſt place they ſay, that the Caſpian riſes very high with a weſterly wind; whereas the Euxine, on the contrary, rages moſt when the wind is at eaſt: conſequently, the eaſt wind favours the exit of the waters of the Caſpian, and the weſt wind impedes it. But this is one of thoſe fallacies, denominated by logicians, "Cauſa pro non cauſa:" all the winds that bring humid vapours with them are more ſtormy than thoſe which proceed from arid regions. But the weſt wind comes hither from the Euxine and the Palus Mœotis; and conſequently the Caſpian muſt neceſſarily be put into more vehement agitation by it. Secondly, it is pretended, that this ſea has a whirlpool, which, with a horrid noiſe, ſwallows up all the ſuperfluous water, and diſcharges it into the Euxine. In proof of this, it is farther urged, that a ſpecies of ſea-weed, growing only on the ſhores of the Caſpian, is found at the mouth of this tremendous vortex. To which they add, that near to this vortex is a ſort of fiſh, which is only caught in the Euxine; and laſtly, that in former days, a fiſh was taken in the Caſpian ſea, with a golden ring about its tail, on which was this inſcription; "Mithridates mihi dabat in urbe Sinope libertatem et hoc donum." See Kircher's Mundus Subterraneus, lib, ii. c. 13. But later accounts are ſilent with regard to a whirlpool; the fiſhes ſaid to be found only there and in the Euxine are yet to be more accurately deſcribed; and the ſtory from Kircher has very much the air of a fiction. Sea-weed grows every where on the ſhores of this ſea, from Aſtrachan to Sulak, and thence again to the Muganian Steppe. Upon the whole, therefore, we may conclude, that the eſcape of the waters of the Caſpian into the Euxine is an ungrounded hypotheſis. Seleucus Nicator, indeed, the firſt and moſt ſagacious of the Syrian kings, at the time when he was aſſaſſinated, entertained thoughts of forming a junction between the Caſpian and Euxine ſeas by a canal, and of thus extending the trade of his ſubjects in Europe and ſupplying all the countries in the north of Aſia, on the coaſt of the Euxine Sea, as well as many of thoſe which ſtretch eaſtward from the Caſpian, with the productions of India; but his ſcheme failed. See Canal. None of the ancient authors above cited have determined whether the greateſt length of the Caſpian was from north to ſouth, or from eaſt to weſt. In the ancient maps that illuſtrate the geography of Ptolemy, it is delineated, as if its greateſt length extended from eaſt to weſt. In modern times, the firſt information concerning the true form of the Caſpian, which the people of Europe received, was given by Anthony Jenkinſon, an Engliſh merchant, who with a caravan from Ruſſia travelled along a conſiderable part of its coaſt in the year 1588. The accuracy of Jenkinſon's deſcription was confirmed by an actual ſurvey of that ſea made by order of Peter the Great, A.D. 1718; when it was found to be in length about 1100 verſts from the mouth of the Ural to the coaſt of the Moſanderan; its greateſt width from the mouth of the Terek to the extremity of the bay of Mertvoï

Kultyuk being 8°, rather more than 700 verſts. At its ſouthern extremity, from the point of Lenkeron to the peninſula, ſituate at the mouth of the bay of Balkan, it is 6°, ſomewhat more than 525 verſts, and at its greateſt width 2° 35′, or 225 verſts. Its circumference, comprehending the great gulfs, but excluding the little ſinuoſities, is 4180 verſts.

The Caſpian is ſuppoſed at a former period to have extended further to the north, where the deſerts are ſtill ſandy and ſaline, and preſent the ſame ſhells that are found in the Caſpian; but the chain of mountains which branches from the weſt of the Ural to the north of Orenburg, and reaches to the Volga, muſt, in all ages, have reſtricted the northern bounds of the Caſpian. In the eaſt this ſea is generally ſuppoſed to have extended at no very remote period to the lake of Aral; the deſerts on that ſide preſenting the ſame features as thoſe to the north, though now an elevated level lies between the ſea of Aral and the Caſpian, occaſioned perhaps by the quantity of ſand rolled down by the Gihon, the Sirr, and other rivers which now flow into the ſea of Aral. The coaſts of the Caſpian northward, from the Terek towards the weſt, as far as the eaſtern extremity of the bay of Mertvoï Kultyuk, are low, flat, ſwampy, and overgrown with reeds; the water too is ſhallow. On the other ſhores from the Terek to the deſert of Korgan near Aſtrabad, and from the northern part of the bay of Balkan to that of Mertvoï Kultyuk, the country is mountainous, the ſhores bold, and the water very deep. The ground in many places, not far from the ſhore, is ſo deep that a line of 450 fathoms will not reach it. This ſea is the receptacle of many large rivers, as the Emba, or Yemba, the Ural or Yaik, and the Volga from the north; the Kuma, Terek, Kur, and Kizil Ozen from the weſt; thoſe from the ſouth are inconſiderable: but from the eaſt it is ſuppoſed ſtill to receive the Tedjen; and of the rivers that were formerly ſuppoſed to diſembogue into it, ſeveral do not exiſt, ſuch are the Jaxartes and the Oxus (Gihon), which were pretended to flow hither from the eaſt; the latter, in particular, is ſaid to have flowed into it by one or two branches, till it bent northward and joined the ſea of Aral. Some writers have reported, as a ſtriking peculiarity of the Caſpian, that during 30 or 35 years, its waters are conſtantly increaſing, and then for the ſame term continually decreaſe; but this report is not confirmed by any ſtated obſervations. This ſea has no regular flux or reflux; and, on account of ſhoals, it is navigable only by veſſels drawing from 9 to 10 feet of water: it has ſtrong currents, and, like all inland ſeas, is ſubject to violent and dangerous ſtorms, which the Ruſſian veſſels, badly conſtructed, weather with difficulty. The water is in general ſalt, though not in all places, particularly in thoſe where the large rivers empty themſelves into it.

The Caſpian has been obſerved to remain equally full; the true reaſon of which is perhaps to be ſought in the quality of its bottom; which conſiſts, not of a thick ſlime, but of a ſhell-ſand, the particles of which, touching only in few points, render it very porous. Of the ſame ſubſtance the whole ſhore is likewiſe formed. Layer upon layer it lies three fathoms deep. This indeed lets the freſh water through, but it becomes immediately ſalt again by means of the ſalt water that preſſes upon it. Through this ſand the water is filtered, and falls into the abyſs beneath in the ſame quantity which flows into the ſea. In the bay of Emba, above the river Yaik, the reverſe is ſeen. The water there is not let through; it therefore ſtagnates, and even the fiſhes putrefy. Its exhalations are extremely noxious. The wind that blows over this bay has been known to come on with ſuch ſurpriſing force as to throw down the ſentinels of the Ruſſian forts, erected here, with ſo much violence as to kill them. In this ſea there is a conſiderable number of iſlands, which are moſtly ſandy. The Caſpian abounds with a great variety of fiſh. The ſalmon is as good as that of Riga and Archangel, and even more fleſhy and fat. The herrings too are remarkably large, and plumper than the Engliſh and Dutch, but not ſo tender. To theſe we may add the ſterlet, two kinds of ſturgeon, ſeals and porpoiſes. The birds moſt generally ſeen in the vicinity of this ſea are ſtorks, herons, bitterns, ſpoonbills, red geeſe, red ducks, and many others. The moſt beautiful of theſe is the red gooſe, which, though ſo called, is white, with the tips of the wings, the orbits of the eyes, the beak and feet, ſcarlet. It is about the ſize of a ſtork, has a long neck and high legs, is very ſavoury to the taſte, and lives on fiſh. It may be denominated "Ciconia, vel Ardea, roſtro adunco lato brevi." A ſpecies of red wild ducks is alſo frequent, which fly in the evening to the tops of the trees or the roofs of houſes, where they perform a noiſy concert. Their fleſh is well-taſted, not oily, though, like other water-fowl, they feed on fiſh. The leeches here are of two kinds, the hog-leech and the dog-leech. Their holes have two apertures, one towards the ſouth and the other facing the north, which they open and ſhut according to the change of the wind. On the ſhore, between Terki and Derbent, grows a graſs on which all the quadrupeds feed with avidity: to the horſe alone the eating of it is fatal. They die upon the ſpot. Peter the Great is ſaid to have cauſed an experiment to be made in his preſence, and the common report was found to be true.

The ports of the Caſpian may be divided into Ruſſian, Perſian, and Tartar. The Ruſſian ports and trading places are Aſtrakhan, Gierief, and Kiſlar. The Perſian havens are Derbent, Niezabad, Baku, Einzellee, Farabat, Medſhetiſar, and Aſtrabad. The Tartar havens are the bay of Balkan and Mangufhiak. See each of theſe reſpectively.

The commerce of the Caſpian is of a very ancient date; though at preſent it is not ſo conſiderable as it might be made. The exports amount in value to about 1,200,000, and the imports to about 1,000,000 of rubles. The articles of exportation are nearly the ſame with thoſe that find purchaſers on the Euxine, (which ſee); and in return ſcarcely any thing is taken but ſilk.

In ancient times Egypt long enjoyed a monopoly of the commerce by ſea between the eaſt and weſt, and hence it derived that extraordinary degree of opulence and power for which it was conſpicuous. The kings of Egypt, by their attention to maritime affairs, had formed a powerful fleet, which gave them ſuch decided command of the ſea, that they could eaſily have cruſhed any rival in this kind of trade. The Perſians, however, though they carried on no commercial intercourſe at ſea with India, were no leſs deſirous than the people around them to poſſeſs its valuable productions and elegant manufactures; and accordingly theſe were conveyed to all the parts of their extenſive dominions by land-carriage. The commodities, deſtined for the ſupply of the northern provinces, were tranſported on camels from the banks of the Indus to thoſe of the Oxus, down the ſtream of which they were carried to the Caſpian Sea, and diſtributed, partly by land-carriage, and partly by navigable rivers, through the different countries, bounded on one hand by the Caſpian, and on the other by the Euxine Sea. The commodities, intended for the ſouthern and interior provinces, proceeded by land from the Caſpian gates to ſome of the great rivers, by which they were circulated through every part of the country. This was the ancient mode of intercourſe with India, while the Perſian empire was governed by its native princes. In the mean while the monarchs of Egypt were allowed to continue in the unmoleſted poſſeſſion of the trade with India by ſea: but though the ſovereigns both of Egypt and of Syria laboured with emulation and ardour to ſecure to their ſubjects all the advantages of the Indian trade, the power of the Romans, by a ſeries of revolutions, proved fatal to both. Having extended their dominion over Syria, they directed their victorious arms againſt Egypt, which was annexed to the Roman empire and reduced into the form of a Roman province by Auguſtus. As early as the 14th century the Venetians and Genoeſe, by means of the Caſpian, brought the Indian, Perſian, and Arabian commodities, with which they ſupplied the ſouthern parts of Europe, through Aſtrachan to their magazines at Azof and Caffa. From Aſtrachan the goods were conveyed up the Volga, then by land to the Don, and afterwards forwarded down that river to the Azof. The northern part of this continent was likewiſe ſupplied, through Aſtrachan, with Aſiatic goods, by the Ruſſian traders, who ſent them to their principal magazine at Wiſby, a Hanſeatic town in the iſle of Gothland. The devaſtations occaſioned by the wars of Timur or Tamerlane, towards the end of the 14th century, cauſed a transfer of this trade from Aſtrachan to Smyrna and Aleppo; and the Arabian commerce, more commodious for theſe parts, never returned to Aſtrachan; but part of the Perſian traffic was afterwards reſtored to its old channel. While the provinces of Caſan and Aſtrachan remained under the government of the Tartars, the camp of the khan was a mart for the Ruſſian and Perſian merchants. But as, agreeably to the cuſtoms of the Tartars, this was frequently changed, Aſtrachan and Terki became at length two principal places of reſort. This commerce, frequently obſtructed and interrupted by numerous banditti, was precarious; until the conqueſt of Caſan and Aſtrachan opened a ready communication between Moſcow and the Caſpian Sea; Ivan Vaſſilievitch II. having garriſoned Aſtrachan with troops, rendered it the chief emporium of the eaſtern trade. See ASTRAKHAN. This conqueſt being completed in 1554, ſoon after the diſcovery of Archangel, the Engliſh obtained the czar's permiſſion to paſs through his dominions into Perſia, and to carry on an excluſive trade over the Caſpian. In 1558, Jenkinſon, the firſt Engliſhman who navigated that ſea, landed at Manguſhlak upon the eaſtern ſhore, paſſed by land through the country of the Turcoman Tartars to Bokhara, capital of Great Bucharia, and returned to Moſcow in the following year. In 1561 he again ſailed over the Caſpian, and, proceeding to the coaſt of Shirvan, went by land to Caſbin, and obtained from the Sophy permiſſion to trade into Perſia. Several merchants followed his example. In 1597, Chriſtopher Burroughs conducted an expedition, which was attended with many dangers, and at length arrived at Aſtrachan. During theſe expeditions, the traffic was chiefly confined to the ports of Tumen, Derbent, Baku, and the coaſt of Ghilan. This infant commerce was much impeded by the banditti that frequent the ſhores of the Caſpian, and by the wars between the Turks and Perſians; and therefore during above a century and a half no Engliſh veſſel appeared upon this ſea. At length, in 1741, the Britiſh merchants of St. Peterſburgh, at the perſuaſion of captain Elton, an Engliſhman in the Ruſſian ſervice, renewed the commerce, and eſtabliſhed a factory at Reſhd in the province of Ghilan. In conſequence of ſome diſputes with the Ruſſians, he entered into the ſervice of Nadir Shah, and aſſiſted in conſtructing ſome veſſels on the Caſpian. This circumſtance gave umbrage to the court of St. Peterſburg; and Elizabeth, in 1746, withdrew her permiſſion to the Engliſh merchants of paſſing through her dominions for the Caſpian commerce. On the death of Nadir Shah, who, by Elton's influence, had permitted the Engliſh to trade to Perſia, their factory was pillaged by one of the pretenders to the throne, and their commerce annihilated.

The Ruſſians purſued, with perſeverance, the track opened by our merchants, and under Alexey Michaelovitch, Aſtrachan became the centre of the Perſian trade; to which place merchants from Bucharia, Crim Tartary, Armenia, Perſia, and even India, reſorted. By the rebellion of the Coſſacks of the Don, under Stenko Razin, and the devaſtations occaſioned by it, the trade of Ruſſia was annihilated. When this revolt was quelled, the greater part of the commerce fell into the hands of the Armenian merchants eſtabliſhed in Aſtrachan, who ſettled factories in both the Ruſſian and Perſian territories. During this whole period the Ruſſian and Armenian traders penetrated no further than Niezabad, a port between Derbent and Baku; and their chief ſettlement was at Shamakee, capital of Shirvan, until the year 1711, when that town was taken by the Leſgees, and the factory deſtroyed. In 1721, this commerce was renewed by Peter I. who obtained the ceſſion of the provinces of Dageſtan, Shirvan, Ghilan, and Maſanderan, on the eaſtern and ſouthern coaſts of the Caſpian. Soon afterwards he eſtabliſhed a Ruſſian mercantile company trading to the Caſpian; the whole capital of which conſiſted only of 400 achins or ſhares, of the value of 150 rubles or 30l. each. The chief ſettlements were formed at Aſtrachan and Kiſlar. As the poſſeſſion of theſe diſtant provinces was very expenſive, Anne reſtored them to the Sophy, on condition that the Ruſſian merchants ſhould enjoy liberty of trade to all the havens of the Caſpian without paying duty, be allowed to build houſes and magazines, and be ſubject to the laws of the country. The privileges of this company were confirmed by Anne and Elizabeth; but in 1762, Catharine II. aboliſhed the excluſive right of this company, and permitted all her ſubjects to trade with Perſia; prohibiting, on account of the numerous banditti that infeſt the roads, the inland traffic from Kiſlar, and the other Caſpian ports to Shamakee. Two Ruſſian conſuls reſide at Baku and Einzellee. The Armenian merchants, however, carry on a contraband trade, and from their knowledge of the country and language, underſell the Ruſſians. See ASTRAKHAN. In the year 1760, the exports and imports of the whole commerce, both by ſea and land, to and from the Caſpian Sea, amounted only to about 400,000 rubles; in 1768, to upwards of 800,000; and in 1775, to more than a million of rubles; without reckoning the contraband trade. At preſent it may be eſtimated at the ſame amount.

The fiſhery on the Caſpian is the moſt important branch of this buſineſs in Ruſſia. This is owing in a great meaſure to the excellent kinds of fiſh with which it abounds, to its commodious ſituation in the centre of the empire, facilitated by water communications, and the advantageous method in which this trade is proſecuted. Pallas obſerves, that the fiſhery on the Caſpian is in ſome reſpects as important to Ruſſia as the herring, the cod, and the whale fiſhery are to other maritime powers of Europe. The fiſhery on the northern or Ruſſian ſhores of the Caſpian is partly let out to merchants of Aſtrachan, whoſe great opulence is founded on it; and it partly belongs, in virtue of ancient privileges, to the Uralian Kozaks or Coſſacks. See ASTRAKHAN and URAL.

As the Caſpian is uſually free from ice towards the latter end of March, the fiſhery commences about the middle of March or beginning of April; and it is carried on by ſeveral contractors, each of whom has his particular ſtation or "vataga," commonly bearing the name of the proprietor. Every vataga is occupied by from 50 or 80 to 120 men, moſt of whom carry on a ſeparate trade; and here are alſo pilots, fiſhermen, ſalters, preparers of iſinglaſs and cavear, &c. The vatagas have alſo their own veſſels of various dimenſions and conſtructions; and near the habitations of the people that are employed are ſeveral ſheds, where the roes are prepared, the iſinglaſs dried, and the ſtock of fiſh kept in order. For preſerving the ſalted fiſh, deep and well-ſecured ice-cellars of conſiderable magnitude are dug under ground, and they are furniſhed with large reſervoirs, in which the freſh fiſh are pickled in a ſtrong brine. There are various other conveniences adapted to the neceſſary operations. The taxes paid by the vatagas to the crown are rated according to the quantity of prepared roes and iſinglaſs; and for every pood of iſinglaſs five rubles, but for a pood of roes two rubles 80 kopeeks are paid into the caiſſe. In autumn and winter only the beluga is caught, which then collect into the bays, either for paſſing the winter or to ſpawn. About the middle of March, when the ſea begins to be free from ice, myriads of little fiſh drive towards the ſhore; and of theſe the "obla," a ſort of ſcale-fiſh, is caught and kept alive in wells, in order to furniſh a ſupply for baiting the hooks while the ſeaſon laſts. This fry is followed by prodigious ſwarms of ravenous belugas; and whilſt this ſwarming laſts, a veſſel may bring up within 24 hours 50 of them and more. The beluga is caught by means of a machine conſiſting of a rope 70 ells in length, to which 125 lines of the length of $1\frac{1}{2}$ fathom each, with as many large angling-hooks, are tied. This rope with its hooks is technically termed a neſt, and 30 of theſe neſts tied together commonly belong to a machine, which is therefore ſeveral hundred fathoms in length. Between every two neſts a ſtone is tied of ſome pounds in weight, and the two ends of a whole machine are furniſhed with wooden anchors. The machine, when laid, is viſited twice a day, and the hooks cautiouſly taken up along the rope. Paſſing a rope through the gills of the fiſh brought up, they let them down again into the water in order to bring them on ſhore alive. Here they are dragged with hooks to the beach, which is laid with planks, and cut up in the following order: the lower part of the ſtomach, with the guts, is thrown away; the fleſhy gullet is ſalted for eating; the roe lies through the whole body adjoining to the entrails; this is taken out with the hands and caſt into tubs, in which it is carried away by the cavear-makers; then follows the ſloat or ſounds, which runs along the whole back, and is given to the iſinglaſs-makers. Laſtly, they cut off the cartilage of the back, in order to extract the dorſal ſinews, which are waſhed, hung upon poles, and dried in the air. The fiſh, being cleared of its entrails, the fat adhering about the melt and to the ſides is ſcraped away with knives, collected into tubs, boiled down, and cleanſed. This freſh fat, being of a good taſte, is uſed during the faſts inſtead of butter or oil. The cleanſed fiſh are at laſt brought into the cellar above deſcribed, pickled in brine, and then ſtrewed with ſalt, and laid up in courſes on each other. When the ſhoaling of the beluga has ceaſed, the train of ſevrugas comes on, which happens only once a year and laſts not much above two weeks. At one vataga, it is uſual, with a favourable ſea-breeze, to catch 16 and ſometimes 20 thouſand of theſe fiſh. The nets made uſe of for this purpoſe are ſo thick that the machines are only a ſpan wide. Twenty-five of them are tied together and laid at the depth of one fathom on ſunk poſts, as the ſevrugas go to ſhallow places. The largeſt of theſe fiſh are never above $4\frac{1}{2}$ arſhines (each arſhine 28 Engliſh inches); but their roes, as well as their ſounds, are much more eſteemed than thoſe of the beluga, and conſequently bear a greater price. The fleſh is partly ſalted down, and partly dried in the ſun. In May, when the ſpring-capture on the ſea-coaſt is over, the fiſhermen repair with their goods to Aſtrachan, where they are laid up in the ſtore-cellars, and thence diſpoſed of wholeſale to the merchants of that city. The autumn-capture begins in the middle of September, and continues through the whole of October. The winter-capture begins as ſoon as the ice is ſet in on the ſea, and laſts the whole winter. For taking the beluga in this ſeaſon, the machine with the angling-hooks already deſcribed is ſet under the ice; through which apertures are cut at the diſtance of eight paces aſunder, and through theſe the rope is introduced, by means of long poles. When two neſts are tied together, the machine is faſtened to a croſs-pole, which reſts on the brink of the aperture. The fiſh, when taken, are conveyed over the ice on ſledges to the vataga, and thence carried to Aſtrachan. Beſides the great vatagas, the proprietors of them have fiſhing-huts in different places on the ſea-coaſt, where there is no capture of ſturgeons, at which, moſtly in ſummer, ſhad and barbels are taken with drag-nets. The ſhads here uſually weigh eight pood (of 40 pounds each), and the barbel a pood and a half: the former are extremely fat in ſummer. The roes of this fiſh are thrown away, but of its ſounds an ordinary ſort of fiſh glue is made. For an account of other fiſheries in the rivers that run into the Caſpian Sea, ſee VOLGA and URAL. See alſo ASTRAKHAN. The ſeal-capture, which is carried on by the more opulent part of the Aſtrachan merchants on the Caſpian, is likewiſe very profitable. The ſeals are killed in ſpring and autumn on the iſlands, where they are immediately gutted and powdered with ſalt, and then brought to Aſtrachan, where they are flayed, and the tallow of them is melted. The Aſtrakanes by ſalting their ſeals immediately on the ſpot gain this advantage, that the tallow is much cleaner and better than that of the ſeals taken at Archangel. The fiſhermen affirm, that the Caſpian is incomparably richer in ſeals than any other ſea on the Ruſſian coaſts. Robertſon's India. Coxe's Travels in Ruſſia, vol. iii. Tooke's View of the Ruſſian Empire, vol. i. and iii.

**CASPIAN** *Gates*, *Caſpiæ Pylæ*, or *Caſpiæ Portæ*, in *Ancient Geography*, denote paſſes that lie between the mountains of Caucaſus and the Caſpian Sea. The name of Caſpian or Albanian gates is properly applied to Derbend, which occupies a ſhort declivity between the mountains and the ſea: the city, if we give credit to local tradition, had been founded by the Greeks; and this dangerous entrance was fortified by the kings of Perſia with a mole, double walls, and doors of iron. The *Iberian* gates, ſometimes confounded by geographers with the *Caſpian*, are formed by a narrow paſſage of ſix miles in mount Caucaſus, which opens from the northern ſide of Iberia or Georgia, into the plain that reaches to the Tanais and the Volga. A fortreſs, deſigned by Alexander, perhaps, or one of his ſucceſſors, commanded that important paſs. Procopius, with ſome confuſion, always denominates them Caſpian. This paſs is now ſtyled "Tatar-topa," the Tartar-gates.

**CASPII**, a people who inhabited the environs of the Caſpian Sea, called "Caſpiana regio," to the weſt and the eaſt of the river Cambyſes, between the Sopyrii and the Caſpian Sea. They occupied alſo the country towards the north of this ſea; and to the eaſt of the Tigris, between Parthia and Media.

CASPIRA, now *Caſhmere*, a town of India on this ſide of the Ganges, near mount Emodus, and towards the north of the ſource of the Hydaſpes. See Cashmere.

CASPIRÆI, a people of India on this ſide the Ganges, to whom Ptolemy has aſſigned 16 cities, of which Cragauſa was the capital.

CASPIRIA, a name given by Ptolemy to the Fortunate Iſlands, ſituate in the Atlantic ocean.

CASPIRUS, a town of Aſia on the frontiers of India, in the country of the Parthians, according to Herodotus, (cited by Steph. Byz.), who calls it Caſpatyrus.

CASPIUS mons, the Caſpian mountain, a name given by Ptolemy to a mountain which bounded the Greater Armenia. The ancients gave this name to two mountains; one, juſt mentioned, bounding Armenia; the other in Parthia.

CASQUE, in *Conchology*, a term among the French, ſynonymous with the Latin *Caſſidea*, a genus of the univalve ſhells eſtabliſhed in the new ſyſtem of Bruguière for the reception of a particular family of the Linnæan Buccina. See Buccinum in article Conchology.

Casque, in *Military Language*, &c. See Cask.

CASQUIPIBIAC, in *Geography*, a river of America, on the northern ſide of Chaleur bay, about a league from Black Cape, N.W. by N. in the bottom of Caſquipibiac cove, at the diſtance of about one league from which is the great river Caſquipibiac, lying weſt from the former, and affording a ſmall cod and ſalmon fiſhery.

CASR. See Kasr.

Casr *band*, a town of Perſia, in the province of Mecran; 185 miles W. of Mecran.

CASSACONI, a canton of Golo, the department of the iſland of Corſica, according to the French arrangement, including 1,112 inhabitants.

CASSADA, or Cassava, in *Botany*. See Iatropha Manihot.

CASSADGATH, in *Geography*, a lake of North America; N. lat. 62° 32′. W. long. 106° 15′.

CASSAGNAS, a town of France in the department of the Lozere, and diſtrict of Florac; eight miles S.E. of Florac.

CASSAGNE, La, a town of France in the department of the Dordogne, ſeven miles S.E. of Montignac.

CASSAGNES,-Begonez, a town of France, in the department of Aveyron, and chief place of a canton in the diſtrict of Rodès or Rhodez; 10 miles S. of Rhodez. The place contains 1432, and the canton 7208 inhabitants: the territory comprehends 217½ kiliometers and 22 communes.

CASSALAGAS, a town of Spain, in Old Caſtile; four leagues from Talavera.

CASSAMUNAIR, or Cassumuniar, in the *Materia Medica*, an aromatic vegetable drug, brought from the Eaſt Indies, highly valued as a nervine and ſtomachic, and reputed a ſpecific in epileptic and convulſive diſeaſes. It is ſuppoſed by ſome to be a ſpecies of galangal, by others of zedoary: its true name is not known, that of caſſamunair being apparently feigned to hide it: of late it has been imported by the name of *bengalle*.

CASSANA, Nicolo, called *Nicoletto*, in *Biography*, a painter of hiſtory and portrait, diſtinguiſhed by the beauty of his colouring, and the gracefulneſs of his figures, was born at Venice in 1659, and received inſtructions from his father Giovanni Franciſco Caſſana, a Genoeſe, who had been taught the art of painting by Bernardino Strozzi. At the court of the grand duke of Tuſcany, whither he was invited, he diſtinguiſhed himſelf by the portraits of that prince and his conſort; and during his reſidence at Florence, he painted ſeveral hiſtorical ſubjects, of which the moſt conſiderable ſeems to have been the conſpiracy of Catiline, conſiſting of nine figures as large as life, drawn to the knees; the two principal figures being repreſented as with one hand joined in the preſence of their companions, and holding in the other a cup of blood. Nicoletto was alſo invited to England with flattering promiſes of encouragement: and on his arrival was introduced to queen Anne, whoſe portrait he painted, and who diſtinguiſhed him by many tokens of favour: but his good fortune was of no long duration, as he died in London in 1713, univerſally regretted. Pilkington.

Cassana, Giovanni Agostino, called *L'Abate Caſſana*, the younger brother of the preceding, was born in 1664, and after receiving the rudiments of his education from his father, finiſhed his ſtudies at Venice, where his brother Nicolo reſided for ſome time. Although he was a good portrait or hiſtorical painter, he declined interfering with his brother in theſe departments of his art, and reſtricted himſelf to the repreſentation of animals and various fruits, in which he excelled. His pictures of this claſs are frequent in the collections of Italy, and ſometimes aſcribed to Caſtiglione. He cloſed his life at Genoa, after having indulged a liberality and profuſion, which his circumſtances did not warrant, in neglect, indigence and wretchedneſs. He had a ſiſter, Maria Vittoria Caſſana, who painted images of devotion for private amateurs, and died at Venice in the beginning of the 17th century. Pilkington.

CASSANDER, a king of Macedon, was ſon of Antipater, and one of Alexander's chief captains. Upon the death of Alexander, and the ſubſequent diviſion of his empire, the province of Caria was aſſigned to Caſſander, and he was alſo appointed by his father general of the horſe. When Antipater died, in the year B. C. 319, he bequeathed his high offices of protector and governor of Macedon to Polyſperchon; by which preference the reſentment of the ambitious Caſſander was rouſed, ſo that he ſoon began to form a party for the ſubverſion of the new protector's power. Accordingly he withdrew to the court of Antigonus, and having obtained ſome ſuccours from him, failed for Athens, and ſecured it. He afterwards marched to Macedon, for the purpoſe of oppoſing the tyranny of Olympias, widow of Philip, and mother of Alexander; and having beſieged her in Pydna, he took poſſeſſion of the place, and ordered her to be put to death. After her deceaſe, he ſent Roxana and her ſon Alexander to Amphipolis, where they were made priſoners; and thus ſet aſide the line of Alexander, in Macedon, his own country. Caſſander having provided for his own ſafety, aſſumed the government: built a new city in Pallene, which he called Caſſandria, repaired many others, and by various meaſures manifeſted his inclination to reſtore peace and plenty to his native country. Having eſtabliſhed tranquillity in Macedon, he returned into Greece in order to drive from thence Polyſperchon, his ſon Alexander, who was protected by Antigonus, and his other enemies. In the mean while he rebuilt Bœotian Thebes, which had lain in ruins about 20 years, and cauſed it to be re-inhabited. After various military conteſts, the captains of Alexander became weary of the wars in which they had engaged with each other, and therefore unanimouſly deſiring peace, it was eaſily concluded on the following conditions, viz. that each of them ſhould retain poſſeſſion of the provinces which then belonged to them; that the Greek cities ſhould be free, and that they ſhould be friends, and allies of each other. Caſſander, in order the more effectually to ſecure himſelf in the poſſeſſion of Macedon, put to death Roxana and her ſon Alexander, whom he had kept in a ſtate of confinement;

finement; and he alſo engaged Polyſperchon by liberal offers to murder Hercules, the ſon of Alexander by Barſine, whom he had ſet up as king of Macedon. In this ſtate of imagined ſecurity, the Grecians formed a league againſt him, and with the ſupport of Demetrius, the ſon of Antigonus, reduced him to great extremities. He ſucceeded, however, in forming a powerful alliance againſt Antigonus, who loſt his life at the battle of Ipſus, B. C. 301. On the death of Antigonus, the princes confederated againſt him, divided his dominions among them, and Caſſander recovered all that he had lately loſt. Jealous of the power of Pyrrhus, king of Epirus, whom he had hated and perſecuted from his infancy, he ſtrengthened the frontiers of his own territories, repaired cities that were falling into decay, and built new ones in the moſt eligible ſituations, and particularly the famous city of Theſſalonica, which was ſo named in honour of his wife. He endeavoured, alſo, by all the methods which policy ſuggeſted, to fix the attachment of his ſubjects to himſelf and his family. Whilſt he was thus employed, a dropſical complaint terminated his life, B. C. 298, after he had held the government of Macedon 19 years, during three of which the title of king had been appropriated to him by others, though he never himſelf aſſumed it. The political and military talents of Caſſander have been univerſally allowed; but his ambition had no bounds, and rendered his character peculiarly odious. Alexander, whom he had offended in his youth, and who had treated him with ſeverity, was the object of his invincible hatred and terror; and his enmity againſt him was indulged to ſuch a degree, that he concerted meaſures for the utter extirpation of his family. Anc. Un. Hiſt. vol. viii.

Cassander, George, a learned divine, was born in 1515, in the iſle of Cadſand, near Bruges, whence was formed his Latin name. He acquired a profound knowledge in the languages, polite literature, civil law, and divinity; and taught the belles lettres at Ghent, Bruges, and other places with great reputation. He afterwards directed almoſt his ſole attention to theological ſtudies, and retiring to Cologne, proſecuted his favourite idea of forming an union and reconciliation between thoſe religious parties which at this period ſo much divided Europe. On this ſubject he publiſhed without his name, in 1562, a ſmall work, entitled "De Officio Viri pii, &c." or, "On the Duty of a pious Man, and a ſincere Lover of Peace, in religious Differences;" which, favouring the Roman Catholic church, on the general ground of authority, was attacked by Calvin, with his uſual acrimony of ſtyle, on a ſuppoſition that it was written by Baudouin, a celebrated lawyer. When the true author was diſcovered, it was attacked a ſecond time, by Calvin, and a temperate reply was written by Caſſander. The ſentiments diſplayed in this anſwer induced the German princes to fix upon Caſſander as a mediator in the religious diſputes. Under this character he compoſed his famous piece entitled "Conſultatio Caſſandri," in which he diſcuſſes the ſeveral articles of the Augſburg confeſſion, ſtating their difference from the doctrines of the Catholic church, and the conceſſions that might be ſafely made with reſpect to them. This work, which was written with great liberality, was much applauded by thoſe who were deſirous of a coalition. Caſſander cloſed his life in 1566, in his 53d year. M. De Thou repreſents him as modeſt, void of arrogance, and acrimony; and he was as ardent in his wiſhes for a religious union, and made as many conceſſions for the accompliſhment of this object, as could be expected from a perſon who continued in the Catholic communion; but *authority* was an inſuperable barrier. Caſſander wrote ſeveral other works, which were firſt printed ſeparately, and afterwards collected into one volume, fol. Paris, 1616. Of theſe are "Liturgica," or "On the Rite and Order of the Celebration of the Lord's Supper;" "A Collection of Hymns," and of "Collects;" the "Decalogues of Vigilius, biſhop of Trent, and his Books againſt Eutyches;" the "Treatiſe of Honorius on Predeſtination and Grace;" "On Infant Baptiſm, and on the Origin of the Anabaptiſt Sect;" "Letters to ſeveral Men of Eminence," chiefly on religious topics; "Rules and Precepts of Rhetoric and Logic;" "A Reduction of Greek and Roman Money to Flemiſh;" and ſome other ſmall pieces. Du Pin. Hiſt. Eccleſ. Thuani Hiſt. Moreri.

CASSANDRA, in *Entomology*, one of the Fabrician ſpecies of Phalæna, (*Bombyx*), deſcribed from the Hunterian muſeum. The wings are ferruginous, with darker ſtreaks; anterior part of the thorax cheſnut.

Obſ. Cramer deſcribes a variety of the Fabrician *bombyx erythrinæ* as a diſtinct ſpecies under the name of *caſſandra.*

Cassandra, *Gulf of*, in *Geography*, a bay on the coaſt of European Turkey, in the north-weſt part of the Archipelago, eaſt of the gulf of Saloniki. It is ſo called on account of a ſmall iſland of the ſame name that lies at its extremity; and it was formerly called "Toronaicus Sinus." N. lat. 40°. E. long. 23° 44′.

Cassandra *Nova*, a town of European Turkey, in the province of Macedonia, ſituate on the north coaſt of the entrance into the gulf of Saloniki; 15 miles E. of Saloniki.

Cassandra, in *Fabulous Hiſtory*, daughter of Priam, king of Troy, and Hecuba, who is ſaid to have received the gift of prophecy from Apollo, on condition of gratifying his paſſion. Having obtained the gift, ſhe violated her engagement; and Apollo, being thus deceived, inſtead of revoking the grant, cauſed her to be conſidered as mad, and her predictions to be diſregarded. Many of the predictions, which ſhe delivered, during the impending calamities of Troy, were afterwards verified in the event. During the ſack of that city, ſhe fled for ſafety into the temple of Minerva, where ſhe was barbarouſly violated by Ajax, the ſon of Oileus. See Ajax *Oiliades.* In the diſtribution of the plunder of Troy, Caſſandra fell to the lot of Agamemnon, who took her home, where ſhe excited the jealouſy of Clytemneſtra; ſo that ſhe fell a victim, on occaſion of the aſſaſſination of that prince. Caſſandra was ſingularly beautiful, and had many ſuitors of diſtinguiſhed rank in the flouriſhing time of Troy. She had a temple at Leuctra, in which a ſtatue was erected to her honour, under the name of Alexandra, by which appellation ſhe was as well known as by that of Caſſandra. This appears from Lycophron's poem, ſtill extant, entitled Alexandra, becauſe it is a prophecy made, as the poet ſuppoſes, by Caſſandra. This poet alſo ſpeaks of a temple of Caſſandra built by the Daunians, and by the inhabitants of the city of Dardanus; where her ſtatue was recurred to as an aſylum by young women who rejected their ſuitors on account of their uncomelineſs or mean extraction. Plutarch ſays, that there was in Thalamæ, a city of Peloponneſus, an oracle of Paſiphæ; and that, as ſome writers reported, Caſſandra died in that place, and was called Paſiphæ, becauſe ſhe delivered oracles to all who conſulted her. Gen. Dict.

CASSANDRIA, in *Ancient Geography*, a maritime town of Macedonia, more anciently called *Potidæa*, and rebuilt by Caſſander, whence it derived its name. See Cassandra.

Cassandria, in *Geography*, a town of Dutch Flanders, in the iſland of Cadſand; one league N. of Sluys.

CASSANITÆ, in *Ancient Geography*, a people of Arabia Felix, on the banks of the Red Sea.

CASSANO, in *Geography*, a town of Naples, in the province of Principatro Ultra; 12 miles W. of Conza.—Alſo, a town of Naples, in the country of Bari; 15 miles S. of Bari.—Alſo, a town of Naples, in the province of Calabria Citra, the ſee of a biſhop, ſuffragan of Coſenza; 21 miles N.W. of Roſſano. N. lat. 39° 55′. E. long. 16° 30′.—Alſo, a town of the duchy of Milan, ſeated on the Adda; 16 miles N.E. of Milan. N. lat. 45° 20′. E. long. 10°.

CASSARANO, a town of Naples, in the province of Otranto; 8 miles W.N.W. of Aleſſano.

CASSAREEN, the ancient *Colonia Scillitana*, memorable for the martyrdom of its citizens, a town of Africa, in the inland country of the ancient Bizacium, and preſent kingdom of Tunis, ſeated on an eminence, 6 leagues W.S.W. of Spaitla. The river Derb runs winding below it; and upon a precipice that hangs over this river is a triumphal arch, with an attic ſtructure above it, with ſome rude Corinthian-like ornaments upon the entablature, though the pilaſters are Gothic. In the plains below Caſſareen are ſeveral Mauſolea, from which the town is ſaid to derive its name; theſe appearing at a diſtance like ſo many Caſſareen, i. e. towers or fortreſſes.

CASSATION, derived from the Latin *quaſſare*, to quaſh, or ſhake down, in the *Civil Law*, the act of abrogating, or annulling any act of procedure.

The occaſions of caſſation are, 1ſt, when a decree is directly contrary to another decree; and both againſt the ſame party. 2dly, When decrees are directly contrary to the expreſs deciſion of ſtatutes or cuſtoms. 3ly, When the formalities preſcribed by the laws have not been obſerved.

CASSE, in *Military Language*, a breaking or caſhiering, is a diſgraceful or an ignominious deprivation of, or diſmiſſion from, any military office, rank, ſituation, or employment.

This puniſhment has been and may be extended to an entire corps, to a company, to an officer, to a non-commiſſioned officer, or to a ſoldier of a choſen or ſelect company.

To break or caſhier a body of troops, as a regiment or a company, for example, is to degrade and depoſe or diſmiſs it after having adjudged it guilty of an offence that renders it unworthy of ſerving its country.

To break or caſhier an officer, is to deprive him of, or diſmiſs him from, his employment, becauſe his conduct and behaviour have been unworthy of, or unbecoming the rank he holds, or becauſe he has been guilty of ſome great offence againſt military diſcipline.

To break or caſhier a non-commiſſioned officer is, to withdraw from him the authority he was entruſted with, to deprive him of the employment he filled, and to reduce him to the condition of a common ſoldier.

And to break or caſhier a ſoldier or member of a choſen, particular, or ſelect company, as a grenadier, for inſtance, is to ſend him back to the company from which he was taken or ſelected, after ſhewing him to be undeſerving or unworthy of the diſtinguiſhed ſituation he was placed in.

The practice of breaking or caſhiering whole regiments or companies ignominiouſly, for miſconduct or miſbehaviour, is now, however, and perhaps, with reaſon, altogether laid aſide. For, let a regiment or company behave ever ſo ill, it rarely, or rather never happens, that every individual in it is in fault. Some other military puniſhment ſhould, therefore, be adopted, that has a tendency to make thoſe in a company or other body of troops, who are naturally diſpoſed to behave well, feel intereſted in the good behaviour of the reſt, and act as a check on them. The Romans had a practice which was admirably calculated to produce this effect. When a maniple, cohort, or other body of their troops behaved ill in the face of an enemy, or were guilty of any thing diſgraceful to the military character; they, in the moſt public manner, drew out from the body, by lot, every tenth man for puniſhment, which was inflicted without mercy. The others that remained, or on whom the lot did not fall, were fed on barley inſtead of wheat, and were lodged without the entrenchment expoſed to the inſults of the enemy. Such an inſtitution was well contrived both for impreſſing terror and for preventing military offences and miſconduct.

Casse-*noiſette*, Buff. in *Ornithology*, the *blue-capped manakin* of Engliſh writers, and *pipra manacus*, which ſee.

Casse *noix*, the name given by Buffon to the *nut-cracker*, *corvus caryocatactes*, which ſee.

CASSEBOHM, Frederic, in *Biography*, profeſſor of anatomy at Hall in Saxony, was one of the pupils to Winſlow, and approved himſelf a diligent and expert anatomiſt. He laboured, in a particular manner, to acquire a knowledge of the ſtructure of the human ear, at different periods of life, from the embryo of three months, to its perfection in the adult. In 1734, he publiſhed, as the reſult of his experiments to that time, "Tractatus quatuor Anatomici de Aure Humana, Tribus Figurarum Tabulis illuſtrati," 4to. They contain more complete and exact deſcriptions of all the parts of the ear, the bony ſtructure, muſcles, nerves, and veſſels, than were before extant. The following year he added two other diſſertations on the ſame ſubject, completing his deſign. He had before, viz. in 1730, publiſhed "De Differentia Fœtus et Adulti," Hall, 4to. in which, among other things, he notices the deſcent of the teſticles from the cavity of the abdomen into the ſcrotum. "Methodus ſecandi Muſculos, et Methodus ſecandi Viſcera," both publiſhed in 1740, in 8vo. contain uſeful rules for the aſſiſtance of the young anatomiſt. They were only parts, however, of a larger work intended to contain the anatomy of the whole body, which, by an early death, he was prevented completing. Haller was in poſſeſſion of his manuſcript, which he deſcribes as containing much valuable matter. See his Bib. Anatom.

CASSEDE, in *Geography*, a town of Spain, in Navarre; 2 leagues from Sangueſa.

CASSEELAS, a town of America, in the ſtate of Georgia; 165 miles W.S.W. of Auguſtine.

CASSEL, a city of Germany, the capital of the landgravate of Heſſe-Caſſel, in the circle of the Upper Rhine. It is divided by the river Fulda into the Old and New Towns, which are united by a bridge: the former is the largeſt, but ill built; the ſtreets are narrow and winding, and the houſes irregular, old, and moſtly conſtructed with timber. The New town is divided into Upper and Lower, the latter being ſmall and as ill built as the Old town. The Upper New town, called alſo the French town, from its having been firſt inhabited by French Proteſtants, who ſought a refuge here after the revocation of the edict of Nantz, is reckoned beautiful. The ſtreets are wide and ſtraight; the houſes uniformly built in a good ſtyle, with many magnificent palaces and public edifices. The manege is light and elegant; the pavilion exhibits a good ſtyle of architecture, and is pleaſantly ſituated in gardens richly decorated and perfumed with orange trees, and enlivened by the cheerful notes of Canary birds, which fly wild and unconfined about them; the muſeum, built by the landgrave, Frederic II., to whom the town owes many of its public ornaments, is a noble building, and contains a valuable collection of antique gems and ornaments, ſtuffed beaſts, ſtatues, buſts, and cork models of Rome, and a curious burning-glaſs, &c.; the library is a magnificent room, about 500 feet long and

40 broad; and contains, among other valuable books and MSS., a MS. of Thucydides, an Hebrew MS. collated for Dr. Kennicott, and a Latin Bible, printed at Mentz, in 1562, by John Fuſt and Peter Schaeffer. It has alſo a theatre, an anatomical theatre, and ſeveral churches. Romiſh and Calviniſtical churches are allowed, but they are not ſuffered to have any bells. At Caſſel there are ſeveral manufactures of cloth and woollen ſtuffs, fine hats, gold and ſilver lace, ſtockings of worſted and ſilk, tobacco, earthenware in imitation of China, &c. The town, which has been often injured by war, contains about 22,000 inhabitants. It is 84 miles N.E. of Coblentz, and 34 N.N.E. of Mentz. N. lat. 51° 19′ 4″. E. long. 9° 29′.

Cassel, a town or village of Germany, in the circle of the Lower Rhine, ſituate on the Maine, oppoſite to Mentz, with which it communicates by a bridge of boats. It was taken by the French in 1792, and fortified by them; but in the next year it was ſet on fire in the ſiege of Metz, when it was retaken by the Pruſſians.

Cassel, a town of France, in the department of the North, and chief place of a canton, in the diſtrict of Hazebrouch, ſeated on a hill which commands an extenſive view of the country, including 32 cities and towns, and the caſtle of Dover; 7½ poſts E.S.E. of Calais, and 6 poſts W.N.W. of Lille. N. lat. 50° 48′. E. long. 2° 27′. The place contains 3,601, and the canton 13,200 inhabitants: the territory includes 120 kiliometres and 13 communes.

CASSENIEU, a town of France, in the department of the Charente, and diſtrict of La Rochefoucault, 6 miles N.E. of La Rochefoucault.

CASSENTINO, Jacopo Di, in *Biography*, a painter of hiſtory and portrait, was born at Caſſentino in 1276, and learned the art of painting from Taddeo Gaddi. He was regarded, in his time, as an artiſt of conſiderable merit, both in freſco and diſtemper; and executed many works in his native city, in Arezzo, and in Florence; and in 1350, became the founder of the Florentine academy. He died in 1356. His moſt memorable work was that which he painted in the chapel of his academy, repreſenting St. Luke drawing the portrait of the Virgin, on one ſide of which were all the academicians, 10 in number, and on the oppoſite ſide all their wives. Pilkington.

CASSER, in *Geography*, a town of Aſia, in the Arabian Irak, on the Tigris; 120 miles S.E. of Bagdad.

CASSERES, a river of Africa, which runs into the ſea, to the north of the river Sierra Leona.

CASSERIUS, Julius, in *Biography*, a diſtinguiſhed anatomiſt of humble parentage, but of great talents, was born at Placentia in 1545. His genius leading him to the ſtudy of anatomy, he went to Padua, and became a ſervant to Fabricius, who, diſcovering his propenſity, made him his pupil, and, in ſucceſſion, his aſſiſtant, and, at length, coadjutor in the profeſſorſhip of anatomy. To this honour he was preferred in the year 1609, and he continued to fill the office with credit until the year 1616, when he died. As his diligence and induſtry equalled his genius, he became, in a few years, more knowing and ſkilful in his profeſſion than his preceptor. Fabricius, in the opinion of Douglaſs, excelled in philoſophy, Caſſerius in anatomy. This excited, however, no jealouſy. Fabricius, who was far advanced in years, was well pleaſed with the proſpect of leaving a ſucceſſor, ſo well qualified to advance the knowledge of the art; but in this he was diſappointed, as he ſurvived his pupil by more than three years. He was ſucceeded by Spigelius, who had been their common pupil. Of Caſſerius's anxious deſire to leave behind him a name, we have numerous proofs. Almoſt the whole of the revenue he obtained by teaching anatomy was expended in procuring ſubjects for diſſection, and in paying draughtſmen and engravers to delineate figures of ſuch parts of the body as he either diſcovered, or thought he had juſter conceptions of than his predeceſſors. In the prefaces to his anatomical works he is not backward in affirming that he has furniſhed future anatomiſts with delineations of the parts of human and animal bodies, exceeding in elegance, perſpicuity, and correctneſs, all that had preceded them. It will be obſerved he made uſe of animals, not as ſuccedanea, but only to enable him to diſcover minute parts which were not eaſily diſtinguiſhable in the human body. In giving this account, principally from Douglaſs's Specimen and the Dict. Hiſtor. of Med. Eloy. we cannot help obſerving in how many points, in genius, in induſtry, and zeal for the advancement of the art, a late celebrated anatomiſt, Mr. John Hunter, reſembled the character we are here depicting. The title of his firſt work, publiſhed in 1600, is, "De Vocis Auditusque Organis Hiſtoria Anatomica, &c. Tractatibus duobus explicata, Ferrara, fol. Figuræ partium tam in homine, quam in multis aliis animantibus, tabulis 33 comprehenſæ ſunt." He here lays claim to the diſcovery of a muſcle, moving the malleus, one of the oſſiculæ auditus. He alſo improved, Haller ſays, the anatomy of the larynx. "Pentæſtheſejon, id eſt, de quinque Senſibus Liber, Organorum Fabricam, Actionem, et Uſum continens, Venet. 1609, fol. Iconibus fideliter ære inciſis illuſtratum." This is an extenſion of the former work to the reſt of the ſenſes, executed with equal ſkill. They have both been ſeveral times reprinted. It was not until ſome years after the death of Spigelius, which happened in 1622, that the remainder of Caſſerius's works, conſiſting of 78 anatomical plates, with the explanations, was publiſhed. Bucretius, to whom Spigelius had left the care of his productions, incorporated the works of Caſſerius with them, and publiſhed them together in royal folio, in 1627, at Venice. Two of the plates by Caſſerius, viz. one repreſenting the placenta, and another the hymen, are printed with Spigelius's work, "De Formato Fœtu," fol. 1627. Douglaſs, Bib. Anat. Spec. Haller Bib. Anat. Eloy. Dict. Hiſt.

CASSETTES, or Coffins, in the *Manufacture of China Wares*, are utenſils made of Stourbridge or other good potter's clay with a third of ſand, in which the China ware is baked. They are generally made of a round form, with a flat bottom. They are either turned or formed in a mould. See Porcelain.

CASSI-*aſcher*, a name given to the grand provoſt of the Turkiſh armies.

Cassia, in *Botany*, (κασσια, Dioſc.; κασια, Theophraſt.) in its original acceptation, is the name of an oriental ſhrub, the bark of which has been held in high eſtimation, from the earlieſt antiquity, on account of its aromatic qualities, which reſemble thoſe of cinnamon. The grammarians who for the moſt part think it better to invent a bad etymology than go entirely without one, tell us, that it is called παρα το κασαι, ab ornando, quaſi κοσμεισθαι δια της ευοσμιας τας αισθησεις, quod ſuâ fragrantiâ ſenſus ornat. But the word is indiſputably of Aſiatic origin, and was brought into Greece, along with the commercial article which it denoted, by the Phœnician merchants. It is no other than the קְצִיעָה, ketſieh, of the Hebrews and other orientals. In the books of the Old Teſtament it occurs, indeed, only once, and that in the plural number. "Thou loveſt righteouſneſs and hateſt wickedneſs: therefore God, thy God, hath anointed thee with the oil of gladneſs above thy fellows. All thy garments ſmell of myrrh and aloes, and caſſia." Pſ. xlv. 7, 8. This pſalm, we apprehend, may be referred without heſitation to the reign of Solomon. The plural termination was probably adopted by the Hebrews, on account of the ſmall detached pieces into which the bark was uſually divided when it came into the hands of the merchants; but the ſeventy in conformity with the general uſage of Greek writers, give it in the ſingular number and with a ſingle σ, which appears to be the original orthography. But though the Phœnicians communicated the name to the Greeks, they did not themſelves adopt that by which this precious commodity was known in its native climate. In the Hebrew language, of which the Syro-Phœnician is only a different dialect, the verb קצע ſignifies to ſtrip any thing of its covering; and thence was naturally applied in a ſubſtantive form to denote the bark of a tree ſeparated from the trunk: and the high value which was ſet on the aromatic bark brought from the remoteſt regions of the then known earth, might as naturally cauſe it to be called bark by way of eminence; in the ſame manner as another kind of bark is thus diſtinguiſhed in modern times. The word caſſia occurs in two other paſſages of our common tranſlation of the Old Teſtament: Exod. xxx. 24. Ezek. xxvii. 19.; but in theſe the original קִדָּה, which the ſeptuagint in Exodus render ιρις, in Ezekiel appear not to have had in their copies. It was probably ſomewhat different from Caſſia; but from its connection in the book of Exodus with myrrh, cinnamon, and ſweet calamus, appears to have come from the ſame countries, and to have poſſeſſed ſimilar properties.

This oriental aromatic is the caſſia of modern cookery, but not of modern botany. We muſt, therefore, refer for its character and hiſtory to the article *laurus*, under which genus it is now placed.

The naturaliſt has often reaſon to lament that travellers and merchants have given the name of one thing long known to another recently diſcovered, on account of a real or fancied reſemblance in a ſingle particular, although in every other reſpect it is entirely different. Such has been the fate of caſſia. The Romans uſed the word with conſiderable latitude. When Virgil, extolling the ſimple fare of the happy huſbandman, ſays,

> "Nec caſia liquidi corrumpitur uſus olivi,"

he cannot be ſuppoſed to ſpeak of the caſia which he mentions in his ſecond eclogue, as interwoven with the flowers of the violet, poppy, narciſſus, and ſweet ſmelling aniſe in the garland made for Alexis by the naiad. In the former paſſage he undoubtedly alludes to the aromatic bark which the luxurious citizens of Rome infuſed in their table and culinary oil to give it a grateful ſmell and flavour. In the latter he muſt have intended ſome odoriferous herb, or ſhrub, which is a native of Italy; but by what name it is now known cannot eaſily be determined.

In the middle ages, the Arabian and Greek phyſicians, as appears from the writings of Avicenna and Myrepſus, acknowledged two kinds of caſſia; one, caſſia aromatica, a native of India, the caſſia of the ancients; the other, caſſia ſolutiva, a native of Egypt, totally different in its general appearance, botanical characters, and medical qualities; and which appears to have been honoured with the ſame name as that which from time immemorial had diſtinguiſhed the precious oriental ſpice, merely on account of its pleaſant ſmell; for we are informed by Alpinus, that when he was in Egypt in the latter part of the ſixteenth century, the natives took great delight in walking early in the morning in the ſpring ſeaſon near plantations of this kind of caſſia, and regaling themſelves with the fragrance of its flowers. To this ſpecies, and its numerous congeners, the term caſſia, as a generic appellation, is confined by modern botaniſts.

Linn. gen. 514. Schreb. 700. Juſſ. p. 348. Vent. vol. iii. p. 371. Gært. 755, 756. Tourn. Cl. 21. § 5. gen. 1. 3. Claſs and order, *decandria monogynia*. Nat. ord. *Lomentaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth five-leaved, (five-cleft, Gært. Juſſ.) lax, concave, coloured, deciduous. *Cor.* Petals five, roundiſh, concave; lower ones more diſtant, more ſpreading, larger. *Stam.* Filaments ten, declined; the three inferior ones longer; three inferior anthers very large, arcuate, beaked, opening at the tip; three lateral ones without a beak; three upper ones very ſmall, barren. *Piſt.* Germ ſomewhat cylindrical, long, pedicelled; ſtyle very ſhort; ſtigma obtuſe, aſcending. *Peric.* Legume oblong, with tranſverſe partitions. *Seeds* ſeveral, roundiſh, affixed to the upper ſuture.

Eſſ. Ch. *Calyx* five-leafed. *Petals* five; three upper anthers barren; three lower ones beaked. *Fruit* a legume.

Obſ. Tournefort divided the genus into two; caſſia with oblong legumes, entire partitions, and generally pulpy cells; and ſenna, with gibbous, inflexed partitions, and very thin partitions. Gærtner has adopted his two genera with the following eſſential characters.

Senna. *Calyx* five-cleft, deciduous. *Cor.* Petals five, lower ones larger. *Stamens* ten, ſeparate; three upper anthers barren, the reſt fertile: three lower ones arcuate. *Legume* membranous, many-celled. *Seeds* albuminous. *Embrio* ſtraight.

Caſſia. *Flower* as in ſenna. *Legume* long, cylindrical, woody, not opening by valves, many-celled; cells filled with pulp. *Seeds* albuminous; albumen with a chink on each ſide. *Embrio* ſtraight.

Sp. 1. C. *diphylla*, Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. (Niella-warei Indorum, Burm. Fl. Ind. 94.) "Leaves conjugate; ſtipules cordate-lanceolate." A ſhrub. *Stem* cylindrical. *Leaves* on a ſhort petiole; leaflets two, ſemi-orbicular, obtuſe, ſtriated. *Stipules* covering the branches. A native of the Eaſt Indies. La Marck obſerves that it muſt have been marked as an annual in the Species Plantarum by miſtake; for no ſhrub can be an annual. 2. C. *Abſus*, Linn. Sp. Pl. 2. Mart. 3. Lam. 2. Willd. 2. (Senna quadrifolia, Burm. Zeyl. 212. tab. 97. Senna exigua, &c. Pluk. alm. 341. tab. 60. fig. 1. Loto affinis Ægyptiaca, Bauh. pin. 332. Abſus, Alp. Ægypt. 97.) "Leaflets in two pairs, inverſely egg-ſhaped; with two awl-ſhaped glands between the loweſt." *Root* annual. *Stem* herbaceous, ſcarcely a foot high, weak, villous, branched. *Leaves* alternate. *Flowers* reddiſh, marked with purple veins, axillary, two or three together; peduncles ſhorter than the leaves. *Legumes* about an inch long, compreſſed, hiſpid. *Seeds* from four to ſix, blackiſh, ſhining. 3. C. *viminea*, Linn. Sp. Pl. 2. Mart. 4. Lam. 3. Willd. 3. Brown, Jam. 223. Sloane Jam. 2. 49. tab. 189. fig. 6, 7. Swartz obſ. 156. "Leaflets in two pairs, ovate-oblong, acuminate; with an oblong gland between the loweſt; and an obſolete, three-toothed ſpine, or callous ſcale under each petiole." A ſhrub. *Stem* forty or fifty feet high, ſtriated, ſtiff; branches divaricated, looſe, ſtiffiſh, round, ſtriated, ſmooth, ſpinous when old. *Leaflets* petioled, entire, nerved, veined, very ſmooth; lower pair bent down, ſpreading; upper pair bent down perpendicularly, approximating; general petioles thickened at the baſe, round, uſually directed one way. *Flowers* numerous, large, in axillary racemes, on long peduncles; calyx-leaves egg-ſhaped, reflexed, ſpreading, ſmall, pale green; four upper petals ſmaller, egg-ſhaped, with claws; the fifth largiſh, concave; germ linear, longer than the corolla, curved back. *Legume* ſhort, compreſſed. Swartz. A native of Jamaica in the woods of the higher mountains, in the anterior of the iſland. 4. C. *bacillaris*, Linn. jun. Supp. p. 231. Mart. 2. Lam. 4. Willd. 4. (C. fruticoſa, Mill. dict. 10. Mart. 39. C. americana tetraphylla, Houſt.

Reliq. tab. 17.) "Leaflets egg-ſhaped, oblique, in two pairs, with an obtuſe gland between the loweſt; racemes axillary, peduncled; legumes cylindrical, long." A ſhrub, twelve feet high, very ſmooth. *Leaves* alternate, petioled; leaflets ſmooth on both ſides; lower ones exactly egg-ſhaped; upper ones more elongated. *Stipules* none. *Flowers* orange, of a middling ſize; racemes ſolitary, few-flowered, erect; pedicels dependent, angular. *Legume* ſo like that of C. fiſtula as not to be diſtinguiſhed from it. A native of Surinam and Vera Cruz. Miller attributes terminal racemes to his C. fruticoſa, but as La Marck refers Houſtoun's figure to bacillaris, and as Miller's deſcription agrees ſufficiently with that of the younger Linnæus, we have ventured to conſider them as one and the ſame ſpecies. 5. C. *arborea*, (C. arboreſcens, Mart. 40. Mill. dict. 15. Houſt. MSS.) "Leaflets in two pairs, oblong-egg-ſhaped, villous underneath; flowers in corymbs; ſtem erect, arboreous." *Trunk* twenty-five or thirty feet high, much branched. *Leaves* on long petioles; leaflets four inches long, near two broad. *Flowers* deep yellow, inclining to orange, lateral and terminal; lateral ones few, ſcattered; terminal in large round branches, proceeding from one centre. *Legumes* near nine inches long, compreſſed, with a border on each ſide. *Seeds* oval, ſmooth, compreſſed. A native of Vera Cruz. 6. C. *tetraphylla*, Mart. 44. (C. procumbens, Mill. dict. 20. Houſt. MSS.) "Leaflets in two pairs, egg-ſhaped; flowers ſolitary, axillary; legumes hirſute; ſtems procumbent." *Root* annual. *Stems* about two feet long, herbaceous. *Leaves* on long petioles, at a conſiderable diſtance from each other. *Flowers* pale yellow. *Legumes* ſhort, flat. *Seeds* flat. A native of Vera Cruz. 7. C. *Tagera*, Linn. Sp. Pl. 5. Mill. 5. Lam. 6. Willd. 5. (Tagera, Rheed. Mal. 2. p. 103. tab. 52? Rai. hiſt. p. 1743. Caſſia 6. Senna ſpuria, &c. Amm. herb. 603. 33?) "Leaflets in three (two) pairs; gland petiolar; ſtipules ciliated, heart ſhaped, acuminate." Linn. "Leaflets in two pairs, inverſely egg-ſhaped; peduncles one-flowered, very ſhort; legumes narrow, linear." Lam. A ſhrub. *Stem* procumbent; branches filiform. *Leaflets* four, ſemi-orbicular, veined, the two outer ones larger; petioles very ſhort. Linn. *Stem* three or four feet high, hard, cylindrical, greeniſh. *Leaves* alternate; leaflets thickiſh, flat, with parallel nerves, the two upper ones largeſt. *Flowers* yellow, axillary. A native of Malabar. La Marck queſtions whether his plant be the tagera of Linnæus, and obſerves that it is diſtinguiſhed from the next ſpecies by the number of its leaflets. We are perſuaded that *trijugis* in Linnæus's ſpecific character is merely an error of the preſs. 8. C. *Tora*, Linn. Sp. Pl. 5. Mart. 6. Lam. 7. Willd. 6. (Senna orientalis, tala Zeylanenſium Herm. Lugd. 557. Rai. hiſt. 1743. Galega indica, Rai. hiſt. 911. Gallinaria rotundifolia, Rumph. Amb. 5. p. 283. tab. 97. fig. 2. Caſſia ſiliquis fœni Græci, Plum. ſpec. 18. tab. 76. fig. 2. Caſſia ſiliqua quadrang., Dill. Elth. 72. tab. 73. fig. 73.) "Leaflets in three pairs, inverſely egg-ſhaped; outer ones larger; an awl-ſhaped gland between the four lower ones." Linn. "Leaflets in three pairs, inverſely egg-ſhaped; peduncles ſhort, generally one-flowered; legumes linear, long, very narrow." Lam. *Root* annual. *Stem* from one to two feet high, herbaceous, upright, cylindrical, ſometimes ſimple, more frequently branched, ſmooth. *Leaves* alternate; leaflets ſmooth, ſomewhat glaucous, with a pointed gland between each of the lower ones; ſtipules linear, briſtle-ſhaped, a little villous. *Flowers* yellowiſh, axillary. *Legumes* from four to ſix inches long, with a ſmall border on each ſide, more or leſs curved, ſmooth. A native of the Eaſt Indies. 9. C. *limenſis*, Lam. 8. Miller Dict. tab. 82? "Leaflets in three or four pairs, inverſely egg-ſhaped, very obtuſe; ſmooth; racemes peduncled, elongated, axillary." Nearly allied to the preceding, but eaſily diſtinguiſhed from it by the infloreſcence. *Root* annual. *Stem* a foot and a half high, ſmooth, ſlightly angular towards the ſummit, ſomewhat branched. *Leaves* becoming larger as they increaſe in diſtance from the root; loweſt ones with only one pair of leaflets, thoſe above with two, thoſe ſtill higher with three, and thoſe near the ſummit ſometimes four; ſtipules awl-ſhaped. *Flowers* yellowiſh; from ſeven to ten together in peduncled axillary racemes. Found by Dombey about Lima. 10. C. *bicapſularis*, Linn. Sp. Pl. 6. Mart. 7. Lam. 9. Willd. 7. (C. hexaphylla; ſiliqua bicapſulari, Plum. Spec. 18. Burm. Amer. tab. 76. fig. 1.) "Leaflets in three pairs, inverſely egg-ſhaped, ſmooth; inner ones rounder, with a globular gland between them." A ſhrub. *Stem* ſix or eight feet high, ſingle, branched near the ſummit; branches cylindrical, greeniſh. *Leaves* alternate. *Flowers* bright yellow, veined; from three to five together in axillary, peduncled racemes, ſeldom longer than the leaves. *Legumes*, according to Plumier, long, cylindrical, divided in their whole length into two cells, forming contiguous tubes. La Marck, from a living plant in flower, but not perfecting its fruit. A native of South America. The bicapſularis of Miller is an annual plant, a foot and half high; with an erect, herbaceous ſtem, three pair of oval leaflets to each leaf; the flowers yellow, ſmall, axillary, ſolitary; pods taper; a native of the Weſt Indies and Madeira. It muſt therefore, as profeſſor Martyn obſerves, be a different ſpecies. 11. C. *emarginata*, Linn. Sp. Pl. 7. Mart. 8. Lam. 10. Willd. 8. (C. minor hexaphylla, ſennæ foliis; Sloane Jam. 2. p. 44. tab. 180. fig. 1, 2, 3, 4. Brown Jam. 223. 3. Swartz. Obſ. 157. C. racemoſa; Mil. Dict. 19.) "Leaflets in three pairs, egg-ſhaped, rounded, emarginate, equal." Linn. "Leaflets in three or four pairs, egg-ſhaped, almoſt entire; flowers in irregular racemes; ſtem arboreous." Swartz. A ſmall tree. *Trunk* ten or twelve feet high; branches round, aſh-coloured, pubeſcent. *Leaves* ſcattered, ſpreading; on round pubeſcent petioles, two inches long; leaflets petioled, blunt, nerved, thickiſh, tomentous, hoary underneath. *Flowers* yellow; racemes axillary, ſolitary, ſpreading, ſhorter than the leaves, many-flowered; three leaflets of the calyx larger, ovate-oblong, ſpreading, concave-arched, pubeſcent on the outſide; petals unequal; upper one larger, in ſhape of the letter S placed obliquely, concave, waved at the edge; filaments very ſhort, equal, awl-ſhaped; anthers thick, curved in, fertile. *Legume* flat, broad. Swartz. A native of Jamaica, where it is called the ſenna tree. Its leaves are purgative, and are ſometimes uſed inſtead of the true ſenna. The pulp of the legumes has the ſame flavour and the ſame medicinal qualities as caſſia fiſtula. 12. C. *obtuſifolia*, Linn. Sp. Pl. 8. Mart. 9. Lam. 11. Willd. 9. Swartz. Ob. 158. (C. americana foliis ſubrotundis; Tourn. 6. 9. C. fœtida; Dill. Elth. 71. tab. 62. fig. 72. Senna minor, Sloan. Jam. 2. p. 47. tab. 180. fig. 5.) "Leaflets in three pairs, egg-ſhaped, rather obtuſe." *Root* annual. *Stem* two feet high, cylindrical, ſmooth, greeniſh, herbaceous but ſtrong, branched. *Leaflets* a little narrowed towards the baſe, obtuſe, with a ſmall point at the ſummit, green, ſoft; upper ones larger; petioles a little villous; a conical gland between the lower pair. *Flowers* in ſhort axillary racemes near the top of the ſtem and branches. Lam. A native of the Weſt Indies. 13. C. *ſennoides*, Willd. 10. Ic. rar. 1. p. 70. Collect. 1. p. 74. "Leaflets in three pairs, elliptical, obtuſe, with a gland between the loweſt pair." A tree. *Stipules* awl-ſhaped. A native of the Eaſt Indies. 14. C. *acuminata*, Willd. 11. (C. apoucouira; Lam. 5. Aubl. guian. 1. p. 379. tab. 146.) "Leaflets in three pairs, egg-ſhaped, acuminate, with a ſeſſile gland between each pair." A tree. *Trunk* ſeven or eight inches in diameter, branches ſpreading. *Leaves* alternate; leaflets ſeſſile, ſmooth, the upper ones the largeſt; petiole winged, ending in a ſhort point. *Flowers* yellow, with red veins, in ſmall racemes which are either axillary or on the naked part of the ſtem and branches. A native of Guiana. 15. C. *corymboſa*, Lam. 12. Willd. 12. Bot. Mag. 633. "Leaflets in three pairs, lanceolate, ſomewhat falcate, ſmooth; a gland between the loweſt; corymbs peduncled, axillary, legumes cylindrical." A ſhrub. *Stem* about ſix feet high, brown, dotted, rough, about the thickneſs of a finger, branching near the top into a looſe but tolerably regular head. *Branches* ſmooth, cylindrical, greeniſh, ſmall. *Leaflets* green, quite ſmooth; upper ones longer, narrower, and moſt falcate. *Flowers* bright yellow, from five to ſeven in a corymb. *Legumes* inflated, cylindrical, an inch and half long, four lines thick, ſtraight, quite ſmooth. A native of South America about Buenos Ayres, deſcribed by La Marck from a living plant, and a dried ſpecimen of the legume gathered by Commerſon. 16. C. *villoſa*, Mart. 41. Miller Dict. 4. Houſt. MSS. "Leaflets in three pairs, oblong-ovate, equal, villous; pods jointed; ſtem erect, arboreous." A tree. *Trunk* fourteen or ſixteen feet high; branches numerous. *Flowers* pale ſtraw-colour, ſmall, in looſe terminal branches. *Legumes* long, narrow, jointed. *Seeds* oval, brown, each lodged in a ſort of iſthmus. A native of Campeachy. 17. C. *uniflora*, Mart. 42. Mil. Dict. 5. Houſt. MSS. "Leaflets in three pairs, ovate-acuminate, villous; flowers ſolitary, axillary; legumes erect." *Root* annual. *Stem* ſingle, ſeldom more than a foot high, herbaceous. *Flowers* pale yellow, ſmall. *Legumes* two inches long, narrow, taper. A native of Campeachy. 18. C. *longiſiliqua*, Linn. jun. Supp. p. 230. Mart. 11. Lam. 13. Willd. 13. (C. arboreſcens diffuſa; Brown Jam. p. 223.) "Leaflets in four pairs; upper ones lanceolate; an awl-ſhaped gland below the lower ones and between the upper ones." *Root* perennial. *Stem* erect, ſomewhat cylindrical, obtuſely furrowed; branches ſcarcely pubeſcent. *Leaflets* green, paler underneath, obovate-oblong, quite ſmooth; upper ones rather linear than lanceolate; an oblong-awl-ſhaped gland between or below the loweſt pair, a more acute one between the uppermoſt, ſeldom any between the intermediate ones; petiole erect, roundiſh. *Stipules* linear, acute, ſhort. *Legume* tetragonous, hairy, ſhort. It ſleeps during the night with its petioles cloſely erected, and its leaflets pendulous near the ſtem. A native of America. 19. C. *minima*, Mart. 45. (C. biflora; Mill. Dict. 14. Houſt. MSS.) "Leaflets in four pairs, oblong-ovate; ſtems procumbent; flowers axillary; peduncles two-flowered." *Root* annual. *Stems* two or three, ſlender, pubeſcent. *Leaflets* pale green, roundiſh. *Flowers* ſmall, yellow; peduncles jointed. 20. C. *falcata*, Linn. Sp. Pl. 10. Mart. 10. Lam. 14. Willd. 14. "Leaflets in four pairs, ovate-lanceolate, retrofalcate; a gland at the baſe of the petioles." *Root* annual. *Leaflets* tapering to the baſe, almoſt ſeſſile; the inner ſide broadeſt; outer ſide moſt narrowed near the baſe, ſo that they appear curved backwards. A native of America. 21. C. *ſericea*, Mart. 49. Willd. 15. Swartz. prod. 66. Flor. Ind. Occid. 2. p. 724. (C. ſenſitiva; Jacq. ic. rar. 3. tab. 459. Collect. 2. p. 362. Paiomirioba 2. Piſ. Braſ. 185.) "Leaflets in about four pairs, egg-ſhaped, hairy, with an awl-ſhaped gland between each pair; peduncles four-flowered; legumes tetragonal." *Root* annual. *Leaflets* ciliated. A native of Jamaica in open ſpots on the leſs elevated mountains. 22. C. *grandiflora*, (C. Chinenſis; Lam. 15. Vandzian-nam ſeu Telo-dzin-zan Sinenſium. Conf. Flos flavus.; Rumph. Amb. 4. p. 63. tab. 23.) "Leaflets in five pairs, egg-ſhaped, pubeſcent at the edges; peduncles axillary, ſhort, generally three-flowered; flowers large." *Stem* ſhrub-like, two or three feet high, herbaceous, erect, angular, a little villous at its ſummit. *Leaflets* green, ſoft, with a ſeſſile globular gland between the lower pair. *Flowers* bright yellow, remarkably large. Deſcribed by La Marck from a living plant, ſaid to come originally from China. As the Chinenſis of Willdenow appears to be a different ſpecies (ſee n. 37.), we have found it neceſſary to give a new trivial name to the preſent. 23. C. *ornithopoides*, Lam. 16. "Leaflets in four pairs, ovate-wedge-ſhaped, pointed; legumes linear, jointed, erect, tomentous, terminating in a recurved point." *Stem* a little angular, ſcarcely ligneous, covered near its ſummit with a ruſt-coloured down. *Leaves* alternate, ſhort; leaflets tomentous on both ſides; their edges, nerves, and petioles ruſt-coloured; a conical, awl-ſhaped gland between each pair; ſtipules long, awl-ſhaped, villous. *Flowers* in axillary racemes, ſhorter than the leaves. A native of South America, communicated to La Marck by Thouin. 24. C. *occidentalis*, Linn. Spec. Pl. 11. Mart. 12. Lam. 17. Willd. 16. (C. americana fœtida, foliis oblongis, glabris; Tourn. 619. Paiomirioba 1. Piſon. p. 185. Senna occidentalis; Comm. Hort. 1. p. 51. tab. 26. Sloan. Jam. hiſt. 2. p. 48. tab. 175. fig. 3, 4.) "Leaflets in five pairs, ovate-lanceolate, ſcabrous at the edges; outer ones larger, a gland at the baſe of the petioles." *Root* perennial, woody, fibrous, blackiſh, ſtriking deep into the earth. *Stem* herbaceous, two or three feet high, greeniſh, rough with irregularly ſcattered dots, ſcored downwards from each petiole with two grooves. *Leaflets* acuminate, ſmooth, fœtid, growing gradually larger to the upper ones; in old plants only three pairs. *Flowers* yellow, in looſe terminal racemes. *Legumes* from four to ſix inches long, three lines broad, a little compreſſed, ſlightly curved in the ſame manner as that of C. *falcata*. A native of Jamaica, where it is called ſtinking weed. It is eſteemed a powerful reſolvent, and uſeful ingredient in baths and fomentations for inflammations of the limbs. 25. C. *planiſiliqua*, Linn. Sp. Pl. 13. Mart. 13. Lam. 18. Willd. 17. (C. ſiliquis planis; Plum. Spec. 18. Burm. Amer. tab. 77.) "Leaflets in five pairs, ovate-lanceolate, ſmooth; a gland at the baſe of the petioles." A tree about the ſize of the common walnut tree. *Wood* firm, whitiſh; bark ſlightly wrinkled, dark brown. *Flowers* yellow, in terminal racemes. *Legumes* about a foot long, ſix or ſeven lines broad, compreſſed, a little curved, jointed. A native of Guadaloupe. 26. C. *fiſtula*, Linn. Sp. 14. Mart. 14. Lam. 19. Willd. 18. Rumph. Amb. 2. p. 83. tab. 21. Woodv. Med. Bot. tab. 163. Gært. tab. 147. fig. 1. (C. fiſtula alexandrina; Bauh. pin. 403. Tourn. 6, 9. Rai. hiſt. 1746. Caſſia nigra; Dod. pempt. 787. Conna, Rheed. Mal. 1. p. 37. tab. 22.) "Leaflets in five pairs, egg-ſhaped, acuminate, ſmooth; petioles without glands." A tree forty or fifty feet high. *Trunk* large, much branched. *Leaves* from three to five inches long, near two broad, equal at the baſe, lower ones largeſt, finely nerved, with a prominent midrib underneath, alternate, petioled; ſtipules ſcarcely apparent. *Flowers* large, yellow, veined, growing about five and twenty together in axillary racemes; partial peduncles two inches long, calyx ſmooth, three times ſhorter than the corolla; anthers oval, divided into two lobes at their baſe; germ ſlender, cylindrical, curved into a ſemicircle. *Legumes* about two feet long, cylindrical, dark brown, woody, with a longitudinal ſeam on one ſide, divided by tranſverſe partitions into numerous cells, each containing one ſeed lodged in a ſweetiſh black pulp. A native of Egypt, and almoſt all the warmer parts of the Eaſt Indies; and now naturalized in the Weſt Indies and South America. It is the caſſia ſolutiva of the Arab and Greek phyſicians of the middle ages, and its pulp has been very generally employed as a mild laxative, ſeldom producing uneaſineſs in the bowels, and therefore peculiarly proper for children and delicate or pregnant women. Dr. Cullen is of opinion that it does not differ from other ſweetiſh acid fruits, and that the pulp of prunes may be employed with equal effect. The pods of the Eaſt India caſſia are of leſs diameter, ſmoother, and afford a blacker, ſweeter, and more grateful pulp, than thoſe which are brought from the Weſt Indies, South America, or Egypt. The beſt pulp is of a bright ſhining black colour; and of a ſweet taſte, with a ſlight degree of acidity. It diſſolves both in water and rectified ſpirit; readily in the former, ſlowly in the latter, and not totally in either: the reſiduum has little or no activity. See Woodv. Med. Bot. p. 449. The officinal electuary of caſſia is directed to be prepared in the following manner: take of the freſh extracted pulp of caſſia, half a pound; manna, two ounces by weight; tamarind, one ounce by weight; roſe-ſyrup, half a pound. Beat the manna, and diſſolve it, in a water-bath ſaturated with ſea-ſalt, in the roſe-ſyrup; then add the pulps; and with the ſame degree of heat, evaporate the whole to an electuary of proper conſiſtence. The doſe of caſſia is from ℥ſs. to ℥i. Lond. Pharmac. 1796. 27. C *patula*, Mart. 46. Willd. 19. Hort. Kew. 2. p. 51. "Leaflets in five pairs, oblong, ſomewhat acute, ſmooth; a gland at the baſe of the petioles; branches with an even ſurface." *Root* perennial. *Leaflets* ſometimes in ſix pairs. It differs from C. occidentalis and planiſiliqua in the leaflets not tapering to the extremity. A native of the Weſt Indies, introduced into England in 1778. 28. C. *piloſa*, Linn. 12. Mart. 16. Lam. 21. Willd. 22. Swartz. Ob. 160. (C. ſuffruticoſa erecta hirſuta; Brown Jam. 224.) "Leaflets in five pairs, without glands; ſtipules ſemicordate, acuminate; ſtem ſtiff, hairy." *Stem* ſomewhat ſhrubby, from one to two feet high, upright, reddiſh; branches ſhort, nearly upright. *Leaflets* nearly ſeſſile, oblong, rounded at the tip, ſharp, with a very ſmall briſtle fixed obliquely to the petiole, veined, a little hirſute at the edges; common petioles thicker at the baſe, round, hirſute; glands extremely minute, concealed in the hairs under the loweſt pair of leaflets. *Flowers* yellow, axillary, two or three together, ſmall; peduncles one-flowered; petals nearly equal, with claws, concave. *Bractes* two, whitiſh. *Legumes* nearly cylindrical, linear, pubeſcent. A native of Jamaica. 29. C. *lineata*, Mart. 50. Willd. 20. Swartz. Prod. 66. Fl. Ind. Occ. 2. p. 726. "Leaflets in five pairs, ſomewhat oblong, pubeſcent underneath, nearly equal; an obſolete gland under the lower pair; peduncles one-flowered." *Root* perennial. *Stem* more ſhrubby and rigid, with leſs hairy branches, than the preceding ſpecies. *Peduncles* and *ſtipules* ſhort. *Legumes* linear. 30. C. *atomaria*, Linn. Mant. 68. Mart. 15. Lam. 20. Willd. 21. "Leaflets in five pairs, egg-ſhaped, ſomewhat tomentous; petioles round, without glands." *Stem* the height of a man, woody, aſh-coloured, much branched: little branches and petioles ſcarcely ſenſibly pubeſcent; petioles cylindrical, not channelled, beſprinkled with ſmall ruſt-coloured points. *Leaflets* green on both ſides, pubeſcent to the touch; lower ones not ſmaller, more obtuſe, ſomewhat emarginate, equal at the baſe; ſtipules awl-ſhaped, often permanent. 31. C. *fruteſcens*, Mart. 43. Mill. Dict. 2. Houſt. MSS. "Leaflets in five pairs, egg-ſhaped, ſmooth; outer ones longer; ſtem ſhrubby." *Stem* five or ſix feet high, much branched towards the top. *Flowers* yellow, in looſe racemes, lateral and terminal. *Legumes* long, taper. *Seeds* in a double row. 32. C. *arboreſcens*, Willd. 40. not of Miller. See n. 5. Vahl. Symb. 3. p. 56. (C. Glauca, Lam. Wellia Tagera Rheed. Mal. 6. p. 17. tab. 9, 10. "Leaflets in about five pairs, elliptical, ſmooth; an oblong gland between the loweſt; ſtipules awl-ſhaped, curved; racemes axillary." "Leaflets in ſix pairs, egg-ſhaped, glaucous and veined underneath; glands oblong, ſeveral; legumes linear, ſtraight, compreſſed, mucronate." Lam. A ſhrub five or ſix feet high. *Branches* pubeſcent at their ſummit. *Leaflets* two inches and a half long, more than one broad, a gland between each pair. *Flowers* yellow in axillary racemes at the ſummits of the branches. *Legumes* four or five inches long. Lam. A native of the Eaſt Indies. As both Willdenow and La Marck refer to Wellia-tagera of Rheed, we have put their ſpecies together; although we do not ſee how a ſhrub only ſix feet high can with any propriety be called arboreſcens. La Marck's deſcription was formed from ſpecimens in flower and young fruit ſent by Sonnerat. 33. C. *Senna*, Linn. Sp. Pl. 9. Mart. 17. Willd. 24. (C. lanceolata, Lam. 22. Forſkal Egypt. 85. n. 58. Senna officinalis; Gært. Senna alexandrina; Bauh. pin. 397. Tourn. 6, 8. Rai. hiſt. 1742. Moriſ. § 2. tab. 24. fig. 1. Sena orientalis; Tabern. ic. 517.) "Leaflets in five pairs, lanceolate, equal; a gland above the baſe of the petioles." Lam. from Forſkal. *Stems* from two to three feet high, ſomewhat woody; branches ſlender. *Leaves* alternate; leaflets an inch long, lively green, ſmooth, on ſhort petioles. *Flowers* pale yellow, in terminal racemes, on long peduncles. *Legumes* oblong, recurved, compreſſed. Lam. *Legumes* ovate-kidney-ſhaped, membranous, compreſſed, with foliaceous appendages, protuberant at the ſeat of the ſeeds; marked by capillary, tranſverſe, parallel ſtriæ; from ſix to nine-celled, two-valved; partitions tranſverſe, very thin. Gært. A native of Arabia and Upper Egypt, whence the leaves are brought to Grand Cairo; and as Alexandria is the port from which it is ſhipped for Europe, it has obtained the name of Alexandrian ſenna or ſena. The leaves of ſenna, as they are imported for medicinal uſe, have a rather diſagreeable ſmell and a ſomewhat acrid, bitteriſh, nauſeous taſte; they give out their virtue both to watery and ſpirituous menſtrua, communicating to water and proof ſpirit a browniſh colour, more or leſs deep according to the proportions, to rectified ſpirit a fine green. As far as is now known, it was firſt introduced as a purgative by the Arabian phyſicians Serapion and Meſue, who flouriſhed about the beginning of the ninth century. The firſt of the Greeks by whom it is noticed is Actuarius in the thirteenth. Actuarius, however, ſpeaks not of the leaves but the fruit. Meſue likewiſe ſeems to prefer the pod, as more efficacious than the leaf. In fact the pod purges leſs powerfully than the leaves, but has the advantage of not griping the bowels, like the leaves, and of being without their nauſeous bitterneſs. For covering the taſte of ſenna, Dr. Cullen recommends coriander ſeeds; and for preventing its griping, the warmer aromatics, as cardamoms or ginger. The formulæ of ſenna given by the colleges, are thoſe of an infuſion, a powder, a tincture, and an electuary. See Woodville's Medical Botany.

The London Pharmacopœia, 1796, directs the ſimple infuſion of ſenna to be prepared by macerating 1½ oz. by weight of ſenna, 1 dram of powdered ginger by weight, and one pint of boiling diſtilled water, for one hour, in a covered veſſel, and ſtraining the liquor, when cold. For the tartariſed infuſion of ſenna, take of ſenna 1½ oz. by weight, bruiſed coriander ½ an ounce by weight, cryſtals of tartar 2 drams by weight, and one pint of diſtilled water. Boil the cryſtals of tartar in the water, until they are diſſolved; then pour the water, yet boiling, upon the ſenna and ſeeds; macerate for an hour in a covered veſſel,

ſel, and ſtrain when cold. Both the preceding infuſions are mildly purgative to adults in the doſe of an ounce and an half, or two ounces; the nauſeous flavour of the ſenna is more covered in the latter; and perhaps would be ſtill more ſo by the addition of ſugar.

For the compound powder of ſenna, take ſenna and cryſtals of tartar of each 2 ounces by weight, ſcammony, $\frac{1}{2}$ an ounce by weight, and ginger 2 drams by weight; rub the ſcammony ſeparately, and the reſt together, into powder, and then mix them.

For the tincture, take of ſenna 1lb., carraway bruiſed $1\frac{1}{2}$ oz. by weight, leſſer cardamoms bruiſed $\frac{1}{2}$ an oz. by weight, raiſins ſtoned, 16 oz. by weight, and proof-ſpirit of wine, one gallon. Digeſt for 14 days, and ſtrain.

For the extract, take of ſenna 1lb., and diſtilled water, one gallon. Boil the ſenna in the diſtilled water, adding, after its decoction, a little rectified ſpirit of wine. Evaporate the ſtrained liquor to a proper conſiſtence. The ſpirit may be added when the decoction is reduced to one half, or to 3 pints. The extract is given as a gentle purgative, from 10 grains to a ſcruple; or, in leſs quantity, as an aſſiſtant to the milder laxatives.

34. C. *Italica*, (c. ſenna, Lam. 23. c. ſenna β. Linn. Senna Italica, Bauh. pin. p. 397. Tourn. p. 618. Rai. hiſt. 1742. Senna Dod. pempt. 361. Lob. ic. 2. p. 88. Burm. Ind. tab. 33. fig. 2.) "Leaflets in ſix pairs, inverſely egg-ſhaped; petioles without glands." *Root* annual. *Stem* a foot and half high, but little branched. *Leaves* alternate; leaflets green above, rather glaucous and ſlightly pubeſcent underneath, unequal at their baſe, larger than thoſe of the preceding ſpecies, from which they are alſo deciſively diſtinguiſhed by the obtuſeneſs of their ſummit. *Flowers* pale yellow, with purple veins, in terminal and axillary racemes; peduncles long; calyx-leaves reflexed. *Legumes* oval-oblong, compreſſed, curved upwards. Suppoſed to be a native of the northern part of Africa, and the Levant. It is cultivated on a large ſcale in Italy for medical purpoſes, and has been naturalized in the Weſt Indies, where it is applied to the ſame uſe. It poſſeſſes the ſame qualities as C. lanceolata, but is leſs powerful, and requires to be taken in larger doſes. La Marck has followed Forſkal in conſidering the two kinds as ſpecifically diſtinct, but has perverſely given ſenna as a trivial name, to the variety β. of Linnæus, at the ſame time that he maintains, the other plant to be the real ſenna of Alexandria. 35. C. *ruſcifolia*, Mart. 19. Willd. 25. Jac. ic. rar. 1. tab. 71. Collect. 1. p. 43. "Leaflets in ſix pairs, lanceolate, acute, ſmooth; a gland above the baſe of the rib; peduncles many-flowered." A ſhrub about the height of a man. *Stem* erect, round. *Leaflets* on ſhort petioles, upper ones gradually larger. *Flowers* yellow, in ſolitary axillary racemes near the ends of the branches. *Legume* ſtraight, a little compreſſed, ſmooth, ending in a blunt roundiſh beak, about four inches long. *Seeds* ovate, ſhining, black, a little compreſſed, with ſcarcely any pulp. A native of the Iſland of Madeira. 36. C. *biflora*, Linn. Sp. Pl. 15. Mart. 18. Lam. 24. Willd. 26. Bot. mag. 810. (not of Miller, ſee n. 19.) C. fruticoſa foliis minoribus, floribus geminis, &c. Brown. Jam. 223. C. minor fruteſcens; Plum. ſpec. 18. ic. 78. fig. 1. Burm. Am. 78. fig. 1.) "Leaflets in ſix pairs, rather oblong, ſmooth; lower ones ſmaller; an awl-ſhaped gland between the loweſt; pedicels generally two-flowered." A ſmall ſhrub. *Branches* numerous, ſlender, quite ſmooth, growing near together. *Leaflets* obtuſe, with a very ſmall briſtle-ſhaped point, the largeſt not more than an inch long. *Flowers* yellow, in looſe axillary racemes. *Legumes* ſtraight, linear, compreſſed, blackiſh, three or four inches long. A native of the Weſt Indies. 37. C. *Chinenſis*, Willd. 27. (not of La Marck, ſee n. 22.) Jacq. ic. rar. 1. tab. 73. Collect. 1. p. 64. "Leaflets in about ſix pairs, egg-ſhaped, acute, ſmooth; a gland at the baſe of the petiole; legume cylindrical, uncinate, tranſverſely ribbed. A native of China about Pekin. 38. C. *multiglanduloſa*, Mart. 21. Willd. 28. Jacq. ic. rar. 1. tab. 72. Collect. 1. p. 42. "Leaflets in about ſix pairs, oval-oblong, obtuſe, hairy, outer ones larger; an awl-ſhaped gland between each pair; legumes linear." A ſhrub about the height of a man. Young branches, petioles, peduncles, under ſurface and edges of the leaves villous. *Leaflets* on very ſhort peduncles, blunt, with a ſmall point. *Flowers* yellow, in terminal racemes; calyx-leaves villous, concave, yellow, very blunt, ſpreading, unequal; petals blunt, almoſt twice as large as the calyx; three upper ones very large. *Legume* linear, browniſh aſh-colour, ſlightly villous and ſoft to the touch, blunt, ſwoln with the ſeeds, about three inches long. *Seeds* ſomewhat egg-ſhaped, blunt, ſcarcely compreſſed, black, ſhining, without pulp. Hort. Kew. Found by Maſſon in the gardens of Teneriffe and introduced by him into England in 1779. 39. C. *hirſuta*, Linn. Sp. Pl. 16. Mart. 20. Lam. 25. Willd. 29. (C. americana fœtida, foliis amplioribus villoſis, Tourn. Inſt. 619.) "Leaves in ſix pairs, broadly egg-ſhaped, acuminate, woolly." Nearly allied to C. occidentalis, and differing from it chiefly in its woollyneſs. 40. C. *tomentoſa*, Linn. jun. ſupp. 231. Mart. 22. Willd. 30. Lam. 29? "Leaflets in ſix to eight pairs, obliquely rounded at the baſe, hairy above; panicles axillary; legumes villous." Linn. jun. "Leaflets in ſix to eight pairs, oblong-egg-ſhaped, mucronate, tomentous underneath; awl-ſhaped glands ſeveral; racemes axillary; legumes tomentous." Lam. A tree. *Branches* woody, round, zigzag; cloathed with a denſe, ſoft, white down, which becomes yellow when dry. *Leaflets* linear-lanceolate, acute, quite entire, green above, white or yellow underneath, tomentous. *Stipules* ſemilunar or lanceolate, tomentous, deciduous. *Flowers* yellow. *Legumes* ſtraight, compreſſed, very tomentous. A native of South America. Mutis. La Marck's plant was found in Brazil by Commerſon, and deſcribed by him from a living one in the royal garden at Paris. It appears to differ from that of Mutis only in the form of the leaflets. 41. C. *ſerpens*. Linn. Sp. Pl. 17. Mart. 23. Lam. 26. Willd. 31. Swartz obſ. 161. Brown Jam. 225. n. 15. Sloane Jam. 2. 5. "Leaflets in ſeven pairs; flowers pentandrous; ſtems filiform, proſtrate, herbaceous." *Root* annual. *Stems* three or four inches long, generally ſimple, ſtiff, round, villous. *Leaflets* ſomewhat ſickle-ſhaped, ſeſſile, approximating, flat, oblique, terminated by a ſhort briſtle, ſomewhat villous; common petioles ſhort, hirſute; glands two, red, flat, ſeſſile, roundiſh, perforated, ſituated beneath the loweſt pair of leaflets. *Stipules* two, oppoſite, oblique, lanceolate, acuminate. *Flowers* yellow, not axillary, but crowded above the petioles, on very ſhort peduncles; calyx-leaves lanceolate, ſpreading; petals unequal, egg-ſhaped, obtuſe, concave, ſpreading; filaments ſhort; anthers linear, fertile; the three anterior ones bent down and ſomewhat larger, germ compreſſed, oblong; ſtyle thickiſh; ſtigma blunt, pubeſcent. *Legume* flat, compreſſed, of a broad linear ſhape, margined, blunt, villous, many-ſeeded. A native of Jamaica, in paſtures, creeping among the graſs. Swartz. 42. C. *mexicana*, Willd. 32. Jacq. hort. Schœn. 2. p. 41. tab. 23. "Leaflets in ſeven pairs, rather obtuſe, pubeſcent, ciliated; a cylindrical gland between the loweſt." A native of Mexico.

43. C. *anguſtifolia*, Willd. 33. Vahl. Symb. 1. p. 29. "Leaflets in ſeven pairs, lanceolate; outer ones larger; petioles without glands; ſtem ſhrubby." It differs from C. ſenna in the number and form of the leaflets, and in the mature legumes not being curved inward; from C. liguſtrina in its larger outer leaflets, and petioles without glands. Vahl. 44. C. *liguſtrina*, Linn. Sp. Pl. 18. Mart. 24. Lam. 27. Willd. 34. (Senna liguſtri folio, Plum. ſpec. 18. Tourn. 619. Dill. Elth. 350. tab. 259. fig. 338. Caſſia Bahamenſis Mart. Cent. tab. 21.) "Leaflets in ſeven pairs, lanceolate; outer ones ſmaller; a gland at the baſe of the petioles." A ſhrub ſix or ſeven feet high, the thickneſs of the little finger, ſlightly angular; branches numerous, deeply ſtriated axills, upper part of the ſtem, edges, and back of the leaves finely pubeſcent. *Flowers* yellow, in axillary racemes near the top of the ſtem, peduncled. *Legumes* two inches long or more, one inch broad, oblong, compreſſed, a little curved upwards. A native of Martinico, the Bahama iſles and Virginia. 45. C. *florida*, Willd. 35. Vahl. Symb. 3. p. 57. "Leaflets in ſeven pairs, oval-oblong, ſmooth, emarginate, without glands; flowers in racemes; bractes ſpatula-ſhaped, mucronate. A native of the Eaſt Indies. 46. C. *ſtipulacea*, Willd. 36. Mart. 47. Hort. Kew. 2. p. 52. Feuill. peruv. 3. p. 56. tab. 42. "Leaves in about eight pairs, ovate-lanceolate; a gland between the loweſt pair; ſtipules ovate, very large." A native of Chili introduced by Thouin in 1786. 47. C. *alata*, Linn. Sp. Pl. 19. Mart. 25. Lam. 30. Willd. 37. Swartz obſerv. 162. (Herpetica, Rumph. amb. 7. p. 35. tab. 58. C. herpetica, Jacq. obſ. 2. p. 24. tab. 45. fig. 2. Plum. ſpec. 18. Sloane Jam. hiſt. 2. p. 59. tab. 175. fig. 2. C. bracteata, Linn. jun. Sup.?) "Leaflets in eight pairs, oval-oblong; inner ones ſmaller; petioles without glands; ſtipules ſpreading." Linn. "Leaflets in eight pairs, oval-oblong, obtuſe, mucronate; petioles without glands; legumes with two wings." Lam. Stems ſeveral, ſomewhat woody, from ſix to nine feet high, about the thickneſs of a finger, cylindrical, ſmooth, a little twiſted, and branched towards the top. *Leaves* alternate, from a foot to a foot and a half long; leaflets near two inches and a half long, one inch broad, near together, quite ſmooth. *Flowers* yellow, in terminal racemes; bractes roundiſh-ovate, concave, entire, the colour of the flowers, looſely imbricate, reſembling ſcales; calyx-leaves oblong, concave, coloured, tender; petals unequal, roundiſh, with claws, concave, entire; the fifth a little larger, waved with a fringed border. *Legumes* five or ſix inches long, quadrangular; oppoſite angles winged; margin crenate. *Seeds* ſeparated by alternate, membranous partitions, rhomboidal, compreſſed. Mill. and Lam. The juice of the leaves or buds is ſaid to cure the ringworm. A native of the Eaſt and Weſt Indies. 48. C. *marilandica*, Linn. Sp. Pl. 20. Mart. 26. Lam. 31. Willd. 38. Dill. Elth. 351. tab. 260. fig. 339. Mart. Cent. tab. 23. "Leaflets in eight pairs, ovate-oblong, equal; a gland at the baſe of the petioles." *Root* perennial. Stems ſeveral, three or four feet high, often ſimple, herbaceous, cylindrical, either entirely ſmooth, or furniſhed with a few hairs. *Leaves* alternate, rather long, green above, and pale underneath. *Flowers* bright yellow, in ſhort axillary racemes on the upper part of the ſtem. *Legumes* three or four inches long, a little curved, mucronate, bordered with conſpicuous joints, and a few ſcattered reddiſh hairs. A native of Maryland and Virginia. 49. C. *ſuratenſis*, Lam. 32. Burm. Fl. Ind. 97. "Leaflets in eight pairs, ovate-oblong, obtuſe, emarginate; lower ones ſmaller; a pedicelled gland at the baſe of the loweſt pair." *Stem* herbaceous. *Stipules* two, linear-lanceolate, at the baſe of each petiole. *Flowers* large, orange; peduncles axillary; bractes heart-ſhaped, acute. A native of the neighbourhood of Surat. 50. C. *faſtigiata*, Willd. 39. Vahl Symb. 3. p. 57. "Leaves in nine pairs, oblong, ſmooth; a pedicelled gland between every pair of leaflets; flowers in racemes." *Root* perennial. A native of the Eaſt Indies. 51. C. *frondoſa*, Mart. 48. Willd. 40. Hort. Kew. 2. p. 35. (C. [illegible], Jacq. Ic. Rar. 1. tab. 74. Collect. 1. p. 82.) "Leaflets in nine pairs, oval-oblong, ſmooth, rather obtuſe, a cylindrical gland between the loweſt; petiole without any gland at the baſe." *Root* perennial. 52. C. *tenuiſſima*, Linn. Sp. Pl. 21. Mart. 27. Lam. 33. Willd. 41. Roy. Lugd. 478. "Leaflets in nine pairs, oblong; an awl-ſhaped gland between the loweſt." *Root* perennial. A native of the Havanna. La Marck obſerves that he has ſeen in the Herbarium of Juſſieu a plant under this name, reſembling C. chamæcriſta, but with only nine pairs of leaflets. The peduncles are axillary, one-flowered, ſhorter than the leaves; the calyx-leaves very acute, and as long as the petals. 53. C. *ſiamea*, Lam. 34. "Leaflets in eight or nine pairs, ovate-oblong, obtuſe, ſmooth; petioles without glands; corymbs peduncled, axillary, and terminal. A tree. *Leaflets* almoſt emarginate, coriaceous, on ſhort petioles. *Legumes* ſix or ſeven inches long, flat, bordered. According to Commerſon, it is cultivated in the iſland of Ceylon for the beauty of its flowers. 54. C. *virgata*, Mart. 51. Willd. 42. Swartz Prod. 66. Fl. Ind. Occid. 2. p. 728. "Leaflets in ten pairs, ovate-lanceolate, villous; a petiolar pedicelled gland; peduncles one-flowered, longer than the leaflets." A native of Jamaica and Hiſpaniola. Nearly allied to C. chamæcriſta, but differs in having a ſhrubby branched ſtem; rigid, ſomewhat zigzag, erect branches; and narrower, more acute leaflets. 54. C. *ſophera*, Linn. Sp. Pl. 22. Mart. 28. Lam. 35. Willd. 43. Lour. Cochinc. 264. (Senna, Burm. Zeyl. 213. tab. 98. Galegæ affinis, Bauh. Pin. 352. Gallinaria acutifolia, Rumph. Amb. 5. p. 283. tab. 97. fig. 1. Ponnam-Tagera, Rheed. Mal. 2. p. 101. tab. 52. "Leaflets in ten pairs, lanceolate; an oblong gland at the baſe." A ſhrub, from three to five feet high; branches cylindrical, ſmooth. *Leaves* an inch and half long; leaflets ſlightly villous at their edges. *Flowers* pale yellow, veined, in ſhort axillary racemes or corymbs. *Legumes* three inches and a half long, two lines broad, compreſſed, linear, mucronate, nearly ſmooth, ſomewhat reſembling thoſe of C. occidentalis. A native of the Eaſt Indies, China, and the iſland of Tongatabu in the South Seas. 56. C. *anguſtiſiliqua*, Lam. 36. Plum. Spec. 18. Burm. Amer. tab. 78. fig. 2. "Leaflets in ten pairs, ovate-oblong, acute, awned; a pedicelled gland between the loweſt; legumes narrow, compreſſed." A ſhrub. *Leaflets* ſmooth above, a little villous underneath. *Flowers* yellow, large, in compound, terminal, and axillary racemes. *Legumes* from three to five inches long, blackiſh, ſtraight. A native of the iſland of St. Domingo. 57. C. *auriculata*, Linn. Sp. Pl. 23. Mart. 30. Lam. 37. Willd. 45. (Senna ſpuria, Pluk. Alm. 341. tab. 314. fig. 4.) "Leaflets in twelve pairs, obtuſe, mucronate; glands ſeveral, awl-ſhaped; ſtipules kidney-ſhaped, bearded. A ſhrub. *Branches* ligneous, a little pubeſcent towards their ſummit. *Leaflets* oval-oblong, ſomewhat villous underneath; ſtipules large, embracing the ſtem, very obtuſe, with one particular briſtle on each ſide. *Flowers* orange, very large, growing from three to five together, in ſhort terminal bunches. *Legumes* compreſſed, ſlender, almoſt ſmooth, narrowed at the baſe, obtuſe, terminated by a thread ſhaped point. A native of the Eaſt Indies. 58. C. *brevifolia*, Lam. 48. Willd. 46. "Stem much branched, nearly ſmooth; leaflets in twelve pairs, inverſely egg-ſhaped; peduncles lateral, one-flowered, longer than the leaves." *Stem* woody, from three to five inches long; branches very

ſlender. *Leaves* five or ſix lines long; leaflets very ſmall, growing near together. *Legumes* an inch long, compreſſed, almoſt ſmooth. A native of the iſland of Madagaſcar. 59. C. *javanica*, Linn. Sp. Pl. 24. Mart. 31. Lam. 38. Willd. 48. Vahl. Symb. 3. p. 58. (C. fiſtula javanica, Comm. Hort. 1. p. 217. tab. 111. C. fiſtula ſylveſtris, Rumph. Amb. 2. p. 88. tab. 22.) "Leaflets in twelve pairs, oblong, obtuſe, ſmooth; gland none." Linn. "Leaflets from twelve to fifteen pairs, egg-ſhaped, obtuſe, ſmooth; legumes nearly cylindrical, very ſmooth." Lam. A lofty tree. *Flowers* red or yellowiſh, in ſhort racemes. *Legumes* longer and more ſlender than thoſe of C. fiſtula, divided into numerous cells by tranſverſe partitions, without any ſucculent pulp. A native of Java and the Molucca iſlands. 60. C. *braſiliana*, Lam. 39. (C. grandis, Linn. jun. and Willd. excluding the ſynonym. C. mollis, Vahl.? C. fiſtula flore incarnato, Breyn. Cent. 1. p. 58. tab. 21. C. fiſtula braſiliana, Bauh. Pin. 403. Tourn. 619. Rai. Hiſt. 1747.) "Leaflets from fifteen to twenty pairs; leaflets oblong, obtuſe, pubeſcent; legumes very large, thick, compreſſed, ſword-ſhaped." Lam. A large tree. *Branches* extending widely on every ſide; little branches covered with a fine down. *Leaves* large; leaflets near together; common petiole nine or ten inches long, without any gland. *Flowers* fleſh-coloured, in ſimple axillary racemes, ſhorter than the leaves. *Legumes* a foot and half or two feet long, at leaſt three inches broad; with one ſuture double, the other ſingle, in ſome degree reſembling a ſabre; many-celled, containing a brown or blackiſh pulp, ſimilar to that of C. fiſtula, but bitter and diſagreeable. A native of Braſil and Surinam. 61. C. *nigricans*, Willd. 50. Vahl. Symb. 1. p. 30. (C. procumbens, Forſk. Arab. p. 111.) "Leaflets in twelve pairs, linear-oblong, very obtuſe, mucronate; a ſeſſile gland at the baſe." Perennial. A native of Arabia Felix. 62. C. *polyphylla*, Willd. 51. Jacq. Ic. Rar. 3. tab. 460. Collect. 4. p. 104. "Leaflets in many pairs, elliptical, obtuſe, ciliated; an oblong, ſeſſile gland between the loweſt; peduncles often two-flowered." A native of the iſland of Porto Rico. Perennial. 63. C. *Chamæcriſta*, Linn. Sp. Pl. 25. Mart. 33. Lam. 40. Willd. 52. Bot. Mag. 107. (C. ſuffruticoſa erecta, &c. Brown Jam. 225. Chamæcriſta pavonis major, Commel. Hort. 1. p. 53. tab. 37.) "Leaflets in many pairs; a petiolar pedicelled gland; ſtipules ſword-ſhaped." *Root* annual. *Stem* a foot and half high, cylindrical, pubeſcent, branched from the bottom. *Flowers* yellowiſh; the two upper petals with a purple ſpot; peduncles axillary, ſolitary, or ſometimes two together, one-flowered, ſhorter than the leaves. A native of Jamaica, Barbadoes, and Virginia. 64. C. *glanduloſa*, Linn. Sp. Pl. 26. Mart. 34. Lam. 41. Willd. 53. (Chamæcriſta pavonis americana, Breyn. Cent. 66. tab. 24.?) "Leaflets in many pairs, with many glands; ſtipules awl-ſhaped." *Stems* a foot high, ſlender, ſomewhat ſhrubby. *Leaflets* lanceolate. *Flowers* hexandrous; two of the anthers very long; peduncles axillary, in pairs, one-flowered, ſhorter than the leaf. 65. C. *mimoſoides*, Linn. Sp. Pl. 42. Mart. 35. Lam. 42. Willd. 54. "Leaflets in many pairs, linear: an obſolete gland at the baſe of the petioles; ſtipules briſtle-ſhaped." Stem two feet high, erect, ſimple, cylindrical; peduncles axillary, as long as the leaves, in pairs, one-flowered, furniſhed a little below the flower with two ſmall, lanceolate, acute bractes. *Legumes* linear. A native of the iſland of Ceylon. 66. C. *microphylla*, Willd. 55. "Leaflets in many pairs, linear, mucronate; a gland between the loweſt; ſtipules lanceolate, mucronate; peduncles ſolitary, one-flowered; ſtem with rod-like branches. *Stem* pubeſcent. *Legume* compreſſed, linear, clothed with a fine down. Nearly allied to the preceding, but thought by Vahl to be diſtinct. A native of the iſland of St. Crux. 67. C. *flexuoſa*, Linn. Sp. Pl. 28. Mart. 36. Lam. 43. Willd. 56. (Chamæcriſta, Breyn. Cent. 64. tab. 23.) "Leaflets in many pairs; ſtipules half heart-ſhaped. *Root* annual. *Stem* ſlender, a little angular, zigzag. *Leaves* long, narrow; leaflets linear-lanceolate, three-nerved, pale green, crowded; ſtipules large, acute, nerved. *Peduncles* ſolitary, axillary, one-flowered. A native of Braſil. 68. C. *anguſtiſſima*, Lam. 44. "Leaflets in many pairs, very ſmall, awned; ſtipules lanceolate-briſtle-ſhaped; peduncles in pairs, or two-cleft; ſtem hairy." *Root* annual. *Stem* ſlender, cylindrical, villous, a little branched, not zigzag. *Leaves* long, very narrow, villous; leaflets linear, crowded. *Peduncles* lateral, a little above the axils of the leaves. *Legumes* linear, compreſſed. Obſerved in the iſland of Java by Commerſon. 69. C. *capenſis*, Willd. 57. Thunb. Prod. 79. "Leaflets in many pairs, linear; ſtem erect, zigzag, villous." A native of the Cape of Good Hope. 70. C. *nictitans*, Linn. Sp. Pl. 29. Mart. 37. Lam. 45. Willd. 58. Hort. Clif. 497. tab. 36. (Senna ſpuria virginica, Pluk. Alm. 341. tab. 314. fig. 5. Amæna mæſta, Rumph. Amb. 6. p. 147. tab. 161. fig. 1.) "Leaflets in many pairs; flowers pentandrous; ſtem rather erect." *Root* annual. *Stem* from eight to ten inches high, ſlender, ſlightly villous, a little branched. *Leaflets* in twelve to fifteen pairs, oblong, obtuſe, with a briſtle-ſhaped point, crowded; with a brown, pedicelled gland a little below the loweſt pair. *Flowers* pale yellow, ſmall, axillary, ſolitary, on very ſhort peduncles; the lower petal larger and more open than the others. A native of Virginia. 71. C. *procumbens*, Linn. Sp. Pl. 30. Mart. 38. Lam. 46. Willd. 59. (C. americana procumbens, Comm. Petrop. tab. 11.) "Leaflets in many pairs, without glands; ſtem procumbent." *Root* annual. *Stem* herbaceous. *Flowers* ſmall. *Legumes* narrow, compreſſed. A native of Virginia. 72. C. *pumila*, Lam. 47. (Mimoſa pumila, Pluk. 252. tab. 120. fig. 1.) "Stem hairy, much branched; leaflets in many pairs, ciliated at the baſe; a petiolar pedicelled gland; flowers very ſmall." *Stem* divided from its baſe into many ſlender branches, three or four inches long, ſpreading on the ground. *Leaflets* oblong, acute, villous underneath, crowded. *Flowers* axillary, generally in pairs, on very ſhort peduncles. *Legumes* near an inch long, ſomewhat villous. A native of China and the Eaſt Indies.

*Propagation and Culture.* Some ſpecies of Caſſia are cultivated for their beauty, and others for their rarity. They are all propagated by ſeeds, but as they are natives of warm climates, they muſt be raiſed in hot-beds. Such as grow naturally between the Tropics, require the protection of a ſtove; and few will endure the rigour of our winters in the open air. The ſeeds of Caſſia fiſtula may be procured from the druggiſts, who import the pods for officinal purpoſes.

Cassia *cinnamomea*, Herm. Lugd. See Laurus *cinnamomum.*

Cassia *malabarica*, Herm. Lugd.—*Lignea*, Black.—*cinnamomea*, Pluk. Alm. 88, 89. See Laurus *caſſia.*

Cassia *lignea jamaicenſis* & *cinnamomea barbadenſium*, Pluk. Alm. See Canella *alba.*

Cassia, in *Geography*, a country of Sumatra, the inhabitants of which live in villages, independent of one another, and are always at war. See Sumatra.

Cassia *flake*, in the *Glaſs Trade*, is that iron with a piece of wood placed on it, on which they lay the glaſs after they have taken it off the pipes, and on which they turn the glaſs, to faſten the pontee to it.

CASSIAN, John, in *Biography*, an eccleſiaſtical writer of the claſs of monks, was moſt probably born in Scythia, though others ſay that he was a native of France, and others of Africa. He was brought up in the monaſtery of Bethlehem, where he formed an intimacy with a monk named Germanus; and from whence they went together into Paleſtine and Egypt, and paſſed ſeven years with the ſolitaries of the Thebais. The theological diſputes that prevailed even in theſe deſerts, occaſioned their withdrawing to Conſtantinople, where Caſſian was ordained deacon by St. Chryſoſtom. Upon the expulſion of this prelate from his ſee, he was deputed, together with Germanus, in 403, to lay the complaints of the church before pope Innocent I., by whom he was ordained prieſt. When Rome was taken by Alaric, he removed to Provence, and in 410 fixed at Marſeilles. Here he founded two monaſteries, one for each ſex, and inculcated in Gaul, both by his diſcourſe and writings, the opinions of the Semipelagians on the doctrine of grace, together with the rules of diſcipline which were obſerved among the Syrian and Egyptian monks; and here he is ſuppoſed to have died, between the years 430 and 433. His works, ſome of which detailed the mode of living among the Egyptian monks, and the diſcourſes of their moſt famous abbots, were publiſhed in folio at Frankfort, in 1722, with a large commentary by Alardus Gazæus. Caſſian has been regarded as a ſaint by ſeveral popes; and though he was never canonized by the church, his memory has been ſo much revered in Provence, that a day was obſerved as his feſtival; and his works were held in very high eſtimation by the devotees of the church of Rome. Du Pin. Eccl. Hiſt. 5th century, vol. ii. Moſheim, E. H. vol. ii.

CASSIANI, a ſect in *Civil Law*, who adhered to the ſyſtem and interpretations of Caſſius, a celebrated lawyer, in oppoſition to thoſe of Pegaſus, a timid ſlave of Domitian, who derived his name from the galley which his father commanded, whoſe adherents were denominated Pegaſiani. Theſe parties were alſo denominated Sabinians and Proculians. See Capito. The popular cauſe was in the hands of Pegaſus, while the favourite of the Cæſars was repreſented by Caſſius, who gloried in his deſcent from the patriot aſſaſſin. Tacit. Annal. xvii. 7. Sueton. in Nerone, c. 37.

CASSIANISM, from *Caſſian*, a teacher in Gaul to thoſe who were called Semipelagians towards the cloſe of the fifth century, is ſometimes uſed for Semipelagianiſm. See Cassian.

CASSICAN, in *Ornithology*, caſſican de la nouvelle Guinée, Buffon: the pied roller of Latham, Coracias *varia*, which ſee.

CASSICUS. Briſſon calls the oriolus Perſicus by this name, caſſicus luteus. See Oriolus *Perſicus*.

CASSIDA, in *Botany*, Tourn. Hall. Ray. Petiv. See Scutellaria.

CASSIDA, in *Entomology*, a genus of coleopterous inſects, which, according to Linnæus, have moniliform antennæ that become rather thicker towards the end: thorax and wing-caſes with a broad margin, the former flat, and forming a kind of ſhield, beneath which the head is concealed. To this Mr. Marſham adds, that the body is oval, convex, and flat beneath. Marſh. Ent. Brit. The Fabrician character as uſual is taken principally from the parts and ſtructure of the mouth: he obſerves that the anterior feelers are clavated, and thoſe behind filiform; lip elongated and entire, and the antennæ moniliform.

The above are the eſſential characters of this genus, to which a few general particulars may be added. The rotundate figure of the body, gibbous back, and flattened ſurface beneath are a ſtrong criterion of this genus. The ſurface above is commonly ſmooth, and in ſome ſpecies gloſſy; eyes oval, and placed near each other; antennæ inſerted between the eyes; ſcutel triangular and ſmall; wing-caſes ſame length as the abdomen; legs ſhort, thighs compreſſed, ſhanks rounded, and the tarſi conſiſting of four joints. Many of the ſpecies are very beautiful when alive, ſome of which retain their brilliancy of colours in the height of perfection after death; in others, however, and thoſe eſpecially of a ſmall ſize, theſe are altogether evaneſcent, their rich metallic or golden hues fading as the inſect dies, and totally diſappearing in the dried ſpecimens. Caſſidæ immerſed in ſpirit of wine alive, are obſerved to retain the ſplendour of thoſe golden hues for years in as high perfection as they appear in the living inſect: but if taken out and allowed to dry, theſe change colour in the ſame manner as the inſect would in dying without being ſteeped in ſpirits. For immediate obſervation, the true colours of the living inſect may however be revived in the dried ſpecimens at any time by leaving them for the ſpace of fifteen or twenty minutes in warm water; the colours re-appearing while the inſect is kept moiſt, and fading again as the inſect dries.

The larvæ of the caſſidæ are commonly found concealed on the under ſurface of the leaves of the plants on which they feed, and often hide themſelves under a cover of their own excrements, which they ſupport in the air above their bodies by means of their lateral ſpines, and the briſtles at the extremity of their tail to ſhelter themſelves from the ſun and rain. The larvæ caſt their ſkins ſeveral times before they paſs into the pupa ſtate. The perfect female inſect depoſits the eggs in regular order on the leaves of plants, and covers them with excrements to conceal them. The common Engliſh name of the inſects of this tribe is the tortoiſe beetle. We have only an inconſiderable number of the ſpecies indigenous to this country, and thoſe only of a ſmall ſize; many of the larger kinds, and thoſe diſtinguiſhed for their vivid hues and colours are natives of South America. The following ſpecies are deſcribed by authors.

Viridis. Green ſprinkled with confluent dots. Marſh. Ent. Brit. Caſſida viridis. Linn. La caſſide verte of Geoffroy. Frequent on thiſtles in Europe. Length one third of an inch.

Cruentata. Green, with a ſanguineous dot near the baſe of the wing-caſes. Inhabits Europe. Donov. Brit. Inſ. Caſſida ſanguinolenta of Paykull.

Similis. Green; wing-caſes ſtriate with dots. Found on anthemide cotula. Marſh.

Obſ. Perhaps caſſida praſina of Herbſt. Inhabits Europe.

Spergulæ. Pale green; ſhield ſmooth; wing-caſes ſtriate with impreſſed dots. Diſcovered by Mr. Kirby. Marſh. Ent. Brit.

Murraea. Black; ſhield red; wing-caſes ſanguineous, ſprinkled with black dots; named by Fabricius after Murray. Size of caſſida viridis, and inhabits Europe.

Liriophora. Black, above green; thorax emarginate; ſuture and two dots on the ſhells black.

Equestris. Green; a ſilvery ſtreak at the top of the wing-caſes; abdomen black, with a pale border. Olivier. A native of Germany: found on the water mint.

Nebulosa. Pale clouded and dotted with brown. Linn. Found on thiſtles in Europe.

Maculata. Greeniſh, with numerous black ſpots on the dorſal ſuture of the wing-caſes. Donov. Brit. Inſ.

Nobilis. Greeniſh-grey, with a ſhining blue line on the wing-caſes. Found principally on thiſtles, and inhabits Europe. Donov. Inſ. &c.

Splendidula. Grey, with a coppery gold line, and ſtreak in the middle of the wing-caſes near the apex. A new Britiſh ſpecies allied to caſſida nobilis. Marſh. Ent. Brit.

ATRATA. Deep black; anterior part of the ſhield ſanguineous. Inhabits Germany. Fabr.

AFFINIS. Wing-caſes grey, dotted with black; thorax yellowiſh, and without ſpots. Inhabits Europe. Olivier.

AUSTRIACA. Thorax and wing-caſes duſky, dotted with black; margin rufous and immaculate. A native of Auſtria.

CRIBRARIA. Reddiſh; thorax with four black dots; thoſe on the wing-caſes numerous; ſhield emarginate. Inhabits America. Olivier.

DEUSTA. Reddiſh; numerous blue black dots on the wing-caſes, and two on the thorax; ſhield entire. A native of New Holland. Olivier.

OCTO-PUNCTATA. Reddiſh; thorax with two blue black dots; wing-caſes with four on each. Inhabits Siam. Fabr.

INTERRUPTA. Yellowiſh; thorax immaculate; wing-caſes with a broad black interrupted line. Inhabits New Holland. Fabr.

ST. CRUCIS. Teſtaceous; wing-caſes golden with three tubercles at the baſe; margin pale, with two black bands beneath.

SEX-PUNCTATA. Yellowiſh; diſk of the wing-caſes ferruginous, with ſix black dots. Inhabits Cayenne. Fabr.

ANNULUS. Yellowiſh; diſk of the wing caſes black, with two yellowiſh rings, and poſterior band. Inhabits Cayenne. Fabr.

JUDAICA. Ferruginous; diſk of the wing-caſes marked with impreſſed dots, and ſpots of black. Found in South America. Fabr.

HEBRAEA. Pale, with numerous ſmall black lines. Inhabits Cayenne.

CINCTA. Thorax and wing-caſes duſky, with yellowiſh margin; wing-caſes with a white hyaline ſpot before the edge. Inhabits Africa.

MARGINELLA. Green; margin of the thorax and wing-caſes yellow. A native of Brazil.

LIMBATA. Head, thorax, and wing-caſes duſky, with reddiſh margins. Found in Germany. Olivier.

FERRUGINEA. Black; thorax and wing-caſes ferruginous and immaculate. Fabr. Caſſida ſubferruginea of Schranck. Smaller than caſſida viridis, and inhabits Germany. Rarely found in England.

VIBEX. Greeniſh; dorſal ſuture ſanguineous. A native of Germany. Olivier.

AFFINIS. Wing-caſes greyiſh, with black dots; thorax yellowiſh, and without ſpots. An European ſpecies deſcribed by Fabricius.

TRUNCATA. Rufous; wing-caſes ſlightly reticulated, and ſpotted with black; back gibbous. Fabr. This is of a large ſize; native place unknown.

GIBBOSA. Black, with two villous golden ſpots; wing-caſes reticulated with greeniſh; an obtuſe ſpine on the ſuture. A large ſpecies, deſcribed by Fabricius as a Braſilian inſect.

BIDENS. Black; anterior part of the wing-caſes projecting, and an erect ſpine at the ſuture. Inhabits the ſame country as the preceding, and is of a large ſize.

SPINIFEX. Ferruginous; wing-caſes with a projecting ſpine at the anterior angle; thorax with a tranſverſe ſpine on each ſide. Inhabits India. Voet.

BICORNIS. Cyaneous; a truncated ſpine at the anterior angle of the wing-caſes. Inhabits South America.

PERFORATA. Teſtaceous; wing-caſes ſpinous at the anterior angle, and perforated at the baſe. Pallas.

JAMAICENSIS. Pale yellow, braſſy; wing-caſes immaculate with hollow dots. This kind inhabits Jamaica. Olivier.

MARGARITACEA. Greeniſh; wing-caſes poliſhed ſilvery green; head and breaſt black. Inhabits Saxony. Schaller.

FASTUOSA. Black; wing-caſes braſſy red, with black ſpots. Inhabits the ſame country as the preceding. Schaller.

FUSCA. Tawny, with two raiſed lines on the wing-caſes. Laichart.

CRUCIATA. Pale; diſk black, with four yellowiſh ſpots. Fabr. Spec. Inſ. Found on plants in Europe.

CRUX. Yellow; thorax with a ferruginous dorſal line; diſk of the wing-caſes ferruginous, with four yellow ſpots. Fabr. Inhabits Cayenne, and is ſtrongly allied to C. cruciata.

UNDECIM-PUNCTATA. Yellowiſh, ſingle dot in the middle of the thorax, and eleven on the wing-caſes black. A native of Cayenne. Fabr.

BIFASCIATA. Pale; body with two fuſcous bands. Inhabits South America. Gmelin.

FLAVA. Yellow, and without ſpots; body teſtaceous, with a black ſpot on the ſcutel. Fabr. Found in the ſouth of Europe.

PURPUREA. Yellow; body above purple. This is a ſmall ſpecies, and inhabits America.

LEUCOPHÆA. Teſtaceous; margin dotted with yellow. Found in America. Linn.

TUBERCULATA. Teſtaceous; margins yellow; three tubercles on the wing-caſes. Inhabits Sierra Leon.

BITUBERCULATA. Brown, with white margin; wing-caſes ſpotted with black; and a ſingle tubercle at the baſe. A native of Cayenne. This is greatly allied to *tuberculata*, but is only half the ſize.

SUTURALIS. Brown; wing-caſes yellow, with brown ſuture. An African ſpecies. Fabr.

BIGUTTATA. Thorax yellow; wing-caſes reddiſh; margin black, with two yellow ſpots.

MILIARIS. Yellow; thorax immaculate; wing-caſes dotted with black, and two marginal bands. Inhabits the iſland of St. Helena.

PUNCTATA. Black; ſhield brown; wing-caſes yellow, with black ſpots.

RETICULARIS. Yellow; wing-caſes variegated with azure, and a ſingle lateral band. Fabr. A ſpecies of large ſize found in South America.

VARIEGATA. Rufous; wing-caſes variegated with azure, and a ſingle lateral band. Inhabits America.

TRIFASCIATA. Rufous; wing-caſes with three lateral bands. Fabr. This kind inhabits India.

ANNULATA. Azure; two ſpots on the thorax, and ſix rings on the wing-caſes, rufous. Fabr. Is of a large ſize; inhabits South America and India. A variety of this inſect is deſcribed by Herbſt under the name of caſſida ornata.

GROSSA. Sanguineous; diſk of the wing-caſes ſprinkled with black dots, and ramoſe black lines on the margin. Inhabits South America.

CLATHRATA. Ferruginous; margin of the wing-caſes, longitudinal line, and one half tranſverſely black. Deſcribed by De Geer. This ſpecies is a native of India. The thorax is immaculate; wing-caſes very broad. The female is diſtinguiſhed by having three diſtinct lines acroſs.

SEPTEM-GUTTATA. Black, with ſeven white ſpots on the wing-caſes. Gmel. This is rather an ambiguous ſpecies.

EXCLAMATIONIS. Yellow, with three black lines, the middle one interrupted, and reſembling the note of exclamation, (!). This inhabits South America. Fabr.

LINEATA. Greyiſh, with four whitiſh lines on the wing-caſes. Fabr. Inhabits the Cape of Good Hope.

JAMAICENSIS. Pale braſſy yellow; wing-caſes immaculate, with hollow or excavated punctures. Fabr. Deſcribed by Sloane in his Natural Hiſtory of Jamaica.

DORSATA. Thorax and wing-caſes duſky, the laſt with a ſpine at the ſuture, and whitiſh at the margin; baſe duſky. Fabr. Inhabits Siam.

QUADRIPUSTULATA. Thorax duſky; wing-caſes ſanguineous; margin blue, with two red ſpots. Inhabits America.

CYANEA. Braſſy blue; wing-caſes immaculate, with excavated dots. A Linnæan ſpecies deſcribed by Petiver and Degeer. Inhabits America.

MARGINATA. Wing-caſes teſtaceous; body and wing-caſes edged with black; thorax braſſy. A native of South America.

INÆQUALIS. Braſſy ferruginous; wing-caſes with a ſubovate yellow ſpot in the diſk. Inhabits the ſame country as the preceding.

SUPPOSITA. Wing-caſes black, annulated anteriorly, with a fulvous dot in the middle. A ſmall American ſpecies. Lederm.

LATERALIS. Braſſy fuſcous, with a yellow lateral ſpot on the wing-caſes. De Geer, Subzer, &c. Inhabits South America.

DISCOIDES. Braſſy green, with two approximate yellow ſpots on the diſk of the wing-caſes. Fabr. Caſſida quadrimaculata. Degeer. Inhabits South America.

DECUSSATA. Bluiſh black; wing-caſes ſpotted with yellow; the dorſal ſpots reticulated, thoſe on the ſides diſtinct. Inhabits Jamaica. Fabr.

BIPUNCTATA. Yellowiſh, with two black dots on the wing caſes. Fabr. Inhabits India.

BIPUSTULATA. Green, with two lateral ſanguineous ſpots on the wing-caſes. Linn. Amœn. Acad. A native of Cayenne.

SEX-PUSTULATA. Azure, with three red ſpots on the wing-caſes. Inhabits Brazil. Fabr.

SEXDECIM-PUSTULATA. Black; two dots on the thorax, and ſeven on the wing-caſes red. Fabr. A native of South America.

ANGUSTATA. Yellowiſh; wing-caſes narrowed behind. Gmel. Inhabits India.

BITUBERCULATA. Brown, with a white margin; wing-caſes ſpotted with black, and a ſingle tubercle at the baſe of each. Fabr. Inhabits Cayenne. This ſpecies is allied to caſſida tuberculata, but is only half the ſize.

TAURUS. Black; wing-caſes with a truncated ſpine at the anterior angle. Inhabits Cayenne. Fabr. Reſembles C. bicornis, except in being rather ſmaller.

RETIFORMIS. Black; thorax with two yellowiſh ſpots; wings yellow, reticulated with black. A native of Cayenne. Fabr.

PALLIATA. Black; thorax villous greeniſh; wing-caſes greeniſh, with the margin and middle line ferruginous. Fabr. Inhabits Cayenne.

RUBIGINOSA. Ferruginous; thorax and wing-caſes fuſcous, dotted; outer margin ciliated. Linn. This ſpecies is found in Europe.

CUPREA. Above coppery; edge of the thorax, and two marginal ſpots on the wing-caſes rufous. A native of Cayenne.

NITENS. Black; thorax and wing-caſes grey, gloſſed with gold; legs livid. Linn. Native country unknown.

SUPERBA. Black; wing-caſes dotted, and with the ſhield golden green; antennæ, abdomen, and legs greeniſh. A Linnæan ſpecies. This is found in Europe; the golden hue mentioned by Linnæus vaniſhes at the time the inſect dies.

SANGUINOLENTA. Golden yellow; oval ring on the wing-caſes, and tubercle on the ſuture ſanguineous. Inhabits America.

ARCUATA. Whitiſh, with a common black diſk; the border, oval ring, and poſterior arched line fine yellow. Swederus. A native of Rio Janeiro. This is of the middle ſize, and has the breaſt and abdomen black.

CASSIDA, in *Ancient Geography*, a town of India, on this ſide of the Ganges. Ptolemy.

CASSIDARIUS, in the *Ancient Armories*, he who had the care and cuſtody of the *caſſides*, or helmets. Spon gives an ancient inſcription found at Rome, on a tomb erected to a caſſidarius of the emperor Domitian.

CASSIDONY, a name given by the Italians and Germans to a ſort of beads made of the yellow and red chalcedony, a very beautiful ſtone, or of an agate ſomething reſembling it in colour. They alſo call the ſtones themſelves by this name; but are by no means determinate in the meaning of the word, not reſtraining it to any one peculiar ſpecies.

CASSIDONY, in *Botany*. Raï. Hiſt. Plant. See LAVANDULA STÆCHAS.

CASSII, in *Ancient Geography*. See CATTIVELLAUNI.

CASSILIACUM, a town of Rhœtia Prima, now called Roma-Keſſel.

CASSIMBUZAR, in *Geography*. See CASSUMBAZAR.

CASSIMER, or CASIMER, in *Commerce*, a thin twilled woollen cloth, much in uſe for ſummer wear.

CASSIMIRE, or CASHMIRE, in *Geography*. See CASHMERE.

CASSINE, in *Botany*, (a name given by the Indians of Florida to a plant once placed under this genus, but now referred to Ilex) Linn. Gen. 371. Schreb. 504. Willd. 568. Lam. Ill. 360. Juſſ. p. 378. Vent. vol. iii. p. 467. Gært. 575. Claſs and Ord. *Pentandria trigynia*, Linn. (*monogynia*. Lam.) Nat. Ord. *Dumoſæ*, Linn. *Rhamni*, Juſſ. *Rhamnoideæ*, Vent.

Gen. Ch. *Cal.* perianth ſmall, five-cleft, permanent. *Cor.* deeply five-cleft, ſo as to be almoſt pentapetalous; ſegments ſomewhat egg-ſhaped, ſpreading, larger than the calyx. *Stam.* Filaments five, awl-ſhaped, alternate with the ſegments of the corolla; anthers roundiſh. *Piſt.* germ ſuperior, conical; ſtyle none, ſtigmas three. *Peric.* Berry dry, drupaceous, roundiſh, three-celled, umbilicated with the ſtigmas. *Seeds* ſolitary, ſomewhat egg-ſhaped.

Eſſ. Ch. *Calyx* five-cleft. *Corolla* deeply five-cleft; ſegments alternate with the ſtamens. Stigmas three. Berry dry, three-celled, three-ſeeded.

Sp. 1. C. *Capenſis*, Linn. Mant. 220. Willd. 1. Lam. 1. Mart. 1. Lam. Illuſ. Tab. 130. fig. 3. (Celaſtrus, Burm. Afr. Tab. 85. Phillyrea, Dill. Elth. 315. tab. 236. fig. 305.) "Leaves oppoſite, egg-ſhaped, obtuſe, ſerrated; little branches tetragonous." *β*. with looſer corymbs. Burm. Afr. Tab. 86. C. colpoon, Thunb. Willd. Evonymus Colpoon, Linn. Mant.? A ſhrub five or ſix feet high, with a brown or purpliſh bark. *Leaves* petioled, flat, veined, ſtiff, ſmooth. *Flowers* white, in axillary branched corymbs. A native of the Cape of Good Hope. 2. C. *maurocenia*, Linn. Sp. Pl. 2. Mart. 4. Lam. Enc. 7. Illuſ. 2. Tab. 130. fig. 1. Gært. tab. 92, fig. 4. (Frangula ſempervirens. Dill. Elth. 146. tab. 121. fig. 147.) "Leaves oppoſite, inverſely egg-ſhaped, coriaceous, quite entire; little branches round." A ſhrub, five or ſix feet high, as cultivated in Europe, but more lofty in its native climate, with a dark-coloured bark; branches ſtiff; young ſhoots deep purple, or dull red. *Leaves* generally oppoſite, ſmooth, convex above, particularly the upper ones, with the edges a little reflexed underneath. *Flowers* ſmall, whitiſh, in ſhort axillary bunches or corymbs, three or four together, on a ſlender common peduncle; ſtamens inſerted into a fleſhy diſk which ſurrounds the germ, and covers the baſe of the corolla. A native of South Africa. 3. *Magellanica*, Lam. Illuſ. 3. "Leaves alternate, ovate-lanceolate, acute, obtuſely ſerrated; flowers axillary, nearly ſeſſile." A native of Magellan found by Commerſon.

*Propagation and Culture.* The firſt two ſpecies have long found a place in European collections on account of the beauty of their leaves, which continue on the tree all the year. They require no artificial heat, but muſt be removed into a well ſheltered green-houſe in the winter. The beſt method of increaſing them is by laying down the ſhoots that are neareſt the ground, which ſhould be twiſted to facilitate their throwing out roots. Thoſe which are laid down in autumn will be fit to remove in the autumn ſucceeding. They may be propagated alſo by cuttings; but in this caſe they will ſeldom be rooted enough to tranſplant in leſs than two years. The firſt kind is the leaſt hardy, requires greater care in winter, and ſeldom ripens its ſeeds in England. The other produces plenty of fruit, and enlivens the greenhouſe throughout the winter.

Cassine *peragua*; Linn. Mant. and Mat. Med.—Caroliniana; Lam. Enc. See Ilex *Vomitoria*. There is much confuſion in authors concerning this plant. In the Species Plantarum, Linnæus, as appears from his ſynonyms, confounded C. capenſis of recent botaniſts with the plant in queſtion. Martyn aſſerts that the C. peragua of Miller, quoted by Linnæus in Mantiſſa, 2. and Mat. Med. as a ſynonym of his peragua, is ilex vomitoria, but that the peragua of thoſe works is viburnum lævigatum; and in this opinion he is ſupported by Willdenow. La Marck, in Encyc. ſuppoſes, but with a mark of doubt, that his caroliniana is the peragua of Linnæus; and in his Illuſtrations that his ilex floridanus is the ilex vomitorius of the Hortus Kewenſis, without any reference to caſſine peragua of Linnæus. In Martyn's Miller the leaves of ilex vomitoria are ſaid to be leſs bitter than thoſe of the caſſine, caſſioberry buſh, or viburnum lævigatum, but under the article Viburnum lævigatum, no mention is made of any medical qualities poſſeſſed by that plant. It appears from Boſc that the North Americans uſe an infuſion of the leaves both of ilex vomitoria and of viburnum lævigatum as a medicinal beverage.

Cassine *oleoides, concava & lævigata*, Lam. Encyc. See Celastrus *oleoides, concavus & lævigatus*.

Cassine, from the Italian word *Caſſina*, in the *Military Language*, a houſe ſurrounded with a ditch like thoſe of the nobleſſe in Flanders, or thoſe of the feudal lords or barons, favourable for the reception of a ſmall body of men, who are placed by it out of the reach of an attack or ſurpriſe, and can defend themſelves in it till detachments come to their relief.

CASSINI, John Dominic, in *Biography*, an eminent aſtronomer, was born of a noble family in Piedmont, in 1625. His diſtinguiſhed talents for literature were manifeſted at an early age, and after being aſſiduouſly encouraged and cultivated by domeſtic tutors, they were further exerciſed and improved at the college of Jeſuits in Genoa. Some of his poetical compoſitions in the Latin language were thought worthy of publication, when he had attained the age of 11 years. But being caſually led to the ſtudy of aſtronomy, his progreſs in this ſcience which ſuited the bent of his genius, and in which he afterwards ſo eminently excelled, was ſo rapid and ſo great that in 1650 he was invited by the ſenate of Bologna to accept the chair of mathematical profeſſor. When he firſt went to that city he was no more than 15 years of age; and here employed himſelf in teaching the mathematics and in various celeſtial obſervations. The comet which appeared in 1652, was obſerved by him with great accuracy; and afforded him an opportunity of aſcertaining that comets were not temporary phenomena in the atmoſphere, as had been generally ſuppoſed, but bodies of the ſame nature, and probably governed by the ſame laws as the planets. In the ſame year he alſo reſolved the aſtronomical problem, which Kepler and Bullialdus had deemed incapable of ſolution, for geometrically determining the apogee and eccentricity of a planet from its mean and true place. In the following year, 1653, when the church of Bologna was repaired and enlarged, he obtained leave from the ſenate to correct and ſettle a meridian line. See Bologna and Meridian. In 1657 he aſſiſted a nobleman at Rome in compoſing ſome differences that had taken place between Bologna and Ferrara, in conſequence of the inundations of the Po; and his conduct on this occaſion, as well as the talents he had manifeſted in other tranſactions, induced Marius Chigi, the pope's brother, to appoint him in 1663 inſpector general of the fortifications of the caſtle of Urbino; and he was afterwards entruſted for ſeveral years with the care of all the rivers in the eccleſiaſtical ſtate. But he was not diverted by any occupations of this kind from proſecuting his aſtronomical ſtudies and obſervations. He diſcovered many particulars relating to the planets Mars and Venus, and more eſpecially the revolution of the former round its axis; and he directed peculiar attention to the theory of Jupiter's ſatellites, which after much labour, and many obſervations, he ſettled with accuracy, and publiſhed at Rome, among other aſtronomical pieces, in 1666. When Picard, the famous French aſtronomer, had an opportunity of examining theſe tables, he found them ſo accurate that he conceived a high opinion of the ſkill and judgment of the author, and they contributed ſo much to extend his reputation that he was invited to become a member of the Academy of Sciences, eſtabliſhed about this time by Lewis XIV. As he could not leave his ſtation without the permiſſion of his ſuperiors, the French monarch applied to the pope and ſenate of Bologna for this purpoſe; and they granted him leave of abſence for 6 years, ſo that he came to Paris in 1669, and was immediately appointed royal aſtronomer. At the expiration of the ſtipulated term, the pope and ſenate of Bologna inſiſted on his return, under penalty of forfeiting his revenues and emoluments, which had been hitherto continued without interruption; but he was nevertheleſs prevailed upon by the miniſter to remain in France, where he was naturalized in 1673, and about the ſame time entered into the marriage ſtate.

The royal obſervatory having been completed in 1670, Caſſini took poſſeſſion of it in the following year, and aſſiduouſly proſecuted the duties of his profeſſion. In 1672, he determined the parallax of Mars and the ſun, by comparing ſome obſervations which he made at Paris with others that were made at the ſame time in America; in 1677, he demonſtrated that the diurnal rotation of Jupiter about its axis was performed in 9 hours 58 minutes, by means of the motion of a ſpot in one of his larger belts; and in 1684, he diſcovered four ſatellites of Saturn, in addition to that which Huygens had before obſerved. A new edition of his "Tables of Jupiter's Satellites," corrected by later obſervations, was publiſhed in 1693; and in 1695 he viſited Bologna for the purpoſe of examining the meridian line which he had fixed there in 1653, and there he ſhewed, in the preſence of ſeveral eminent mathematicians, that it had not for forty years undergone the leaſt variation. In 1700 he continued the meridian line, begun by Picard, to the moſt ſouthern limits of France. Caſſini was a reſident at the Royal obſervatory of Paris more than 40 years; and in that long period he did the greateſt honour to the eſtabliſhment by various obſervations and diſcoveries, which it would far exceed our bounds to recite in this article, but which will be duly noticed in their proper places. The titles of his publications occupy nearly five pages in the cloſely printed index of Rozier. He had the misfortune to be deprived of his ſight during the latter years of his life; and he died on the 14th of September, 1712, at the age of 87 years. Mem. of the Paris Acad. for 1712.

Cassini, James, the younger ſon of the former, was born at Paris in 1677; and having ſtudied mathematics and philoſophy, firſt at his father's houſe, and afterwards at the Mazarine college under Varignon, who was mathematical profeſſor, his proficiency was ſuch that at the age of 15 years he acquired great reputation in ſupporting a mathematical theſis. When he was 17 years old, he was admitted a member of the Academy of Sciences, and at this time accompanied his father to Bologna, and aſſiſted him in verifying the meridian, and other operations. On his return he took a journey to Holland, where he diſcovered ſome errors in the meaſurement of the earth by Snellius, the reſult of which was communicated to the Academy of Sciences in 1702. In 1696 he viſited England, and became a member of the Royal Society. In 1712 he ſucceeded his father as aſtronomer royal at the obſervatory. In 1717 he communicated to the academy his reſearches on the diſtance of the fixed ſtars, in which he ſhewed that the whole annual orbit is a mere point in compariſon with this diſtance; and in the ſame year he preſented his diſcoveries concerning the inclination of the orbits of the planets in general, and eſpecially of thoſe of Saturn's ſatellites and ring. In 1725, he undertook to inveſtigate the cauſe of the moon's libration. See Libration. His attention was directed in 1732 to an important queſtion relating to the planet Venus. The diurnal rotation of this planet had been determined by his father to be performed in 23 hours, and in a work publiſhed by Bianchini in 1729, it was ſettled at 24 days eight hours. Caſſini upon examining Bianchini's obſervations of the ſpots of Venus, found that he had intermitted his obſervations for three hours, and thus had probably been led to miſtake new ſpots for old ones, ſo as to deduce from the whole an erroneous concluſion. Soon afterwards Caſſini aſcertained the nature and quantity of the acceleration of Jupiter's motion, at half a ſecond in the year, and of the retardation of Saturn's at two minutes annually; and that theſe quantities would go on increaſing for 2000 years, and then would decreaſe again. In 1740 he publiſhed his "Aſtronomical Tables," and his "Elements of Aſtronomy;" both of which are very comprehenſive and accurate works. Caſſini, though he particularly excelled in the department of aſtronomy, extended his reſearches to other branches of ſcience. Accordingly he publiſhed ſome experiments on electricity, or the light produced by friction; the recoil of fire-arms; the aſcent of the mercury in the barometer at different heights above the level of the ſea; the improvement of burning glaſſes, &c. In 1700, he aſſiſted his father in the meaſurement of the meridian; and in 1718 he finiſhed the operation begun by M. de le Hire north of Paris, in concurrence with Maraldi and the younger de la Hire. Hence he was led to conclude, that the degrees of the meridian were not only of different lengths in different parts, but that they decreaſed more and more towards the pole; and that conſequently the figure of the earth was that of an oblong ſpheroid, having its axis longer than the equatorial diameter. He alſo meaſured the perpendicular to the ſame meridian, and compared the meaſured diſtance with the differences of longitude as before determined by the eclipſes of Jupiter's ſatellites; and he alſo inferred from this meaſurement, that the length of the degrees of longitude was ſmaller than it would be in a ſphere, and that therefore the figure of the earth was an oblong ſpheroid. Theſe concluſions induced the French government to appoint two claſſes of mathematicians, one for meaſuring a degree at the equator, and the other at the polar circle; and the reſult of the whole was a determination that Caſſini's concluſions were erroneous, and that the figure of the earth was an oblate ſpheroid, conformably to Newton's inference from the theory of gravity. Caſſini prolonged a life of meritorious labour to an advanced period, and at length loſt his life by a fall in April 1756, in the 80th year of his age. His publications were "A Treatiſe on the Magnitude and Figure of the Earth;" "The Elements or Theory of the Planets, with Tables;" and a great number of papers in the Memoirs of the Academy of Sciences from the year 1669 to 1755.

Cassini, De Thury, Cæsar-François, the ſecond ſon of the former, inherited his talents and ſupported the reputation of the family in ſcientific reſearches and diſcoveries. He ſucceeded his father as director of the obſervatory, and he had the honour of being a member of moſt of the learned ſocieties in Europe. He was born at Paris, June 17th, 1714, and received his firſt inſtructions in mathematics and aſtronomy from M. M. Maraldi and Camus; and his proficiency was ſuch, that he was ſcarcely 10 years of age when he calculated the phaſes of the total eclipſe of the ſun of 1727. At the age of 18 he aſſiſted his father in drawing the perpendicular to the obſervatory-meridian from Straſburg to Breſt; and the buſineſs of traverſing the country by ſeveral lines parallel and perpendicular to the meridian of Paris, with a view to the formation of a general chart of France, was entruſted to Caſſini. He alſo undertook to meaſure the meridian of Paris by a new ſeries of triangles, of a ſmaller number, and more advantageouſly diſpoſed than thoſe employed by his grandfather and father, for the purpoſe of obtaining a more accurate reſult. This great work was publiſhed in 1740, with a chart, ſhewing the new meridian of Paris, by two different ſeries of triangles, paſſing along the ſea-coaſts, to Bayonne, traverſing the frontiers of Spain to the Mediterranean and Antibes, and thence along the eaſtern limits of France to Dunkirk, with parallel and perpendicular lines deſcribed at the diſtance of 6000 toiſes from one another, from one ſide of the country to the other. In 1735, he was admitted into the academy as adjunct ſupernumerary. A particular chart of France, conſtructed at the ſpecial ſuggeſtion of the king, took its riſe from a tour made by Caſſini in Flanders, in company with his majeſty, about the year 1741. He alſo publiſhed various works relative to theſe charts, and a great number of the charts themſelves. In 1761, he undertook an expedition into Germany; for the purpoſe of continuing to Vienna the perpendicular of the Paris meridian; of uniting the triangles of the chart of France with the points taken in Germany; of preparing the means of extending into this country a plan ſimilar to that of France; and of thus eſtabliſhing ſucceſſively for the whole of Europe a very uſeful uniformity. His obſervations of the tranſit of Venus, on the 6th of June, 1761, made during his ſtay at Vienna, were publiſhed in his "Voyage en Allemagne." Availing himſelf of the peace which afterwards took place between England and France, with a view to the accompliſhment of his great object, he propoſed the joining of certain points taken upon the Engliſh coaſt with thoſe which had been determined on that of France, and thus connecting the general chart of the latter with that of the Britiſh iſles, in a manner ſimilar to that by which he had united it with thoſe of Flanders and Germany. This propoſal was favourably received by the Engliſh government, and carried into effect, under the direction of the Royal Society, by which the excution was committed to the late general Roy. After his death it was for ſome time ſuſpended; but the farther execution of it was committed, under the auſpices of the duke of Richmond, then maſter-general of the ordnance, to the care of col. Edward Williams and captain William Mudge, reſpectable officers of the artillery, aud Mr. Iſaac Dalby, who had before aſſiſted general Roy.

The volumes of the Memoirs of the French Academy, between the years 1735 and 1770, contain a prodigious number of papers communicated by M. Caſſini, and conſiſting of aſtronomical obſervations and queſtions; among which are "Reſearches concerning the Parallax of the Sun, the Moon, Mars, and Venus; "On Aſtronomical Refractions, and the Effect cauſed in their Quantity and Laws by the Weather;" and "Numerous Obſervations on the Obliquity of the Ecliptic, and on the Law of its Variations." In ſhort, Caſſini cultivated aſtronomy for 50 years, a period the moſt important, in relation to that ſcience, that ever elapſed, with regard to the magnitude and variety of objects in which he commonly ſuſtained a principal part. His conſtitution was ſtrong and vigorous, and enabled him to ſurmount the fatigue that attended thoſe laborious operations in aſtronomy and geography, which he had the merit of conducting. However, the laſt twelve years of his life were rendered painful and diſtreſſing by an habitual retention of urine; and it was at length terminated by the ſmall-pox on the 4th of September, 1784, in the 71ſt year of his age; being ſucceeded in the academy, and as director of the obſervatory by his only ſon, count John-Dominic Caſſini, the 4th in order by direct deſcent in that honourable ſtation. Hutton's Math. Dict.

CASSINIAN CURVE, or CASSINOID, in *Aſtronomy*, a curve of an elliptic form, propoſed by M. John-Dominic Caſſini, to be the orbit of a planet. The property of this curve is, that the product of two lines drawn from its foci to any point in the curve, ſhall be equal to a given quantity, viz. to the rectangle under the aphelion and perihelion diſtances of the planet; whereas, in the common ellipſis, the ſum of two lines from the foci to any point in the curve is equal to the ſum of the above diſtances, or tranſverſe diameter. M. Caſſini ſuppoſed that a planet would deſcribe this curve about the ſun, in one of its foci, in ſuch a manner that the angles at the other focus are proportional to the times, which he calls the *focus*, or *centre of mean motion*; and that in which the ſun is placed, he calls the centre of true motion. Whence, any two diſtances of a planet from the focus of the true motion are reciprocally as its diſtances from the focus of mean motion. In this figure, if the leſs axis exceeds the diſtance of the foci, the curve is every where concave towards the centre: if, while the principal axis remains the ſame, the diſtance of the foci is leſſened, the minor axis will be increaſed; and, when the foci meet in the centre, the figure will become a circle; but if, on the contrary, the diſtance of the foci be increaſed, the leſs axis will be leſſened, and will become equal to the ſaid diſtance, ſince the diſtance is to the principal axis as unity to a mean proportional between one and three. If the diſtance of the foci be farther increaſed, the minor axis will be leſſened, the curve will at length have a point of contrary flexure, and will, at the ends of the minor axis, be convex towards the centre; and when the diſtance of the foci is ſo far increaſed, as to be in the ſame proportion to the greater axis as the ſide of a ſquare to the diagonal, that is, as 1 to $\sqrt{2}$, the leſs axis will become nothing, and the curve extend to the centre on each ſide. If the diſtance of the foci be greater in proportion to the tranſverſe diameter, than in the above ratio, the leſs axis is impoſſible, and the figure turns into two conjugate ones, at a diſtance from each other; which, upon the increaſe of the diſtance of the foci, will be leſſened, till at length the figure runs into two conjugate points. The diſtance of the foci increaſing, the two conjugate figures do again emerge, and they increaſe after the ſame manner as they decreaſed before, differing from the former in the order of the foci, and of the vertices, and are increaſed till they become infinite. Afterwards, this ſyſtem will again approach to a circle by the ſame degrees as it receded from it. After tracing a few of the properties of this curve, it muſt be evident that it cannot poſſibly be the orbit of a planet; for it is certain, that in all thoſe caſes, where it paſſes into two conjugate figures, it deviates from what is eſſential to the nature of an orbit, namely, *continuity*; and in all thoſe caſes where it is, at the end of the minor axis, convex towards the centre, the planet would need a centrifugal force to deſcribe ſuch parts of its orbit; that is, it would require at equal diſtances from the ſun, ſometimes a *centrifugal*, and ſometimes a *centripetal* force to retain it in its orbit, which is totally incompatible with all the laws of nature. It may be fairly concluded, that when all the ſpecies of a figure beyond a certain limit are unfit for diſcharging any office of nature, the remaining ſpecies on the other ſide of the limit ſhould be rejected alſo: and when, in addition to this, it is conſidered that the celeſtial obſervations are not conſiſtent with this curve, it can by no means be admitted into aſtronomy.

CASSINOMAGUS, in *Ancient Geography*, *Chaſſenon*, a place of Gaul in Aquitania Prima, 30 French leagues from Sermanicomagus, and 17 from Auguſtorium or Limoges.

CASSIOBERRY-BUSH, in *Botany*. See VIBURNUM *lævigatum*, and ILEX *vomitoria?*

CASSIODORUS, MAGNUS AURELIUS, in *Biography*, a Roman ſenator, born at Brutium, on the confines of Calabria, who flouriſhed in the time of Theodoric the Goth, in the 6th century, who died in 562, at the great age of 93, and who has been enumerated among the few Roman writers on *muſic*; but to whom neither the art nor the ſcience has great obligations. Caſſiodorus, contemporary with Boethius, has given us even leſs information on the ſubject than the excellent author of the diſcourſe "De Conſolatione Philoſophiæ:" for, writing on the ſeven liberal arts (de ſeptem diſciplinis), all that he ſays concerning muſic is contained in one chapter only, conſiſting of but four 4to. pages, and theſe few pages, which hardly contain the ſkeleton of a treatiſe, give us nothing but repetitions of what his predeceſſors have ſaid more fully. And it may, indeed, be aſſerted, without exaggeration, that all the Gr. and Lat. tracts that are come down to us, are but bullets of the ſame calibre, which teach us no part of muſic but the alphabet, nor can any thing be acquired by the moſt intenſe ſtudy of them, except deſpair and the head-ache.

CASSIOPÆA, or CASSIOPE, in *Ancient Geography*, a port of the ſea of Epirus, in the ſouthern part of Chaonia, S.W. of the port of Panormus. Pliny, Strabo, and Ptolemy, mention this city; but M. D'Anville has not placed it in his map. Caſſiope, or Caſſope, was famous on account of the temple of Jupiter Caſſius, whence ſome derive its name.

CASSIOPÆI, a people of Greece, mentioned by Strabo, who inhabited Caſſiopæa, or Caſſiope. This author aſſigns to Caſſiopæa a town and port of the ſame name, and three other ſmall towns in the interior of the country. Pliny alſo mentions the Caſſiopæans, and places them in the vicinity of the Dryopes. M. D'Anville fixes their ſituation on the ſea-coaſt in Theſprotia, towards the upper extremity of the ſouthern part of the iſland of Corcyra.

CASSIOPÆUM *Promontorium*, a promontory of the iſland of Corcyra.

CASSIOPE, a town and ſea-port in the northern part of the iſland of Corcyra, according to Ptolemy and Strabo, who place alſo a promontory of the ſame name in this iſland. It is alſo mentioned by Cicero and Pliny.

Cassiope, a town of Greece, in Caſſiopæa, according to Ptolemy. He places this in the mountains, and more eaſterly than the other.

Cassiope, or Cassiopeia, in *Fabulous Hiſtory*, wife of Cepheus, king of Ethiopia, and mother of Andromeda. Boaſting that ſhe was more beautiful than the Nereids, theſe were ſo incenſed that they beſought Neptune to revenge the affront; upon which he ſent into the country of Cepheus a ſea-monſter, who committed dreadful ravages. In order to appeaſe the god, Andromeda was chained to a rock, and expoſed to the monſter; but was reſcued by Perſeus, who married her, and obtained of Jupiter, that Caſſiopeia might be placed, after her death, among the ſtars. This circumſtance is ſaid to have given occaſion to the conſtellation of that name.

CASSIOPEA, in *Entomology*, a name given by Cramer to an African butterfly deſcribed by Fabricius under the title of Papilio Argia. The wings are roundiſh, of a white colour; anterior pair white, black at the apex, and marked on the lower ſurface near the tip, with a large brown ſpot.

CASSIOPEIA, or Cassiopea, in *Aſtronomy*, one of the 48 conſtellations of the northern hemiſphere, ſituate next to Cepheus, not far from the north pole.

In 1572, there appeared a new ſtar in this conſtellation, which at firſt ſurpaſſed in magnitude and brightneſs Jupiter himſelf; but it diminiſhed by degrees, and at laſt diſappeared, at the end of eighteen months. It alarmed all the aſtronomers of that age, many of whom wrote diſſertations on it; among the reſt Tycho Brahe, Kepler, Maurolycus, Lycetus, Gramineus, &c. Beza, the landgrave of Heſſe, Roſa, &c. wrote to prove it a comet, and the ſame which appeared to the Magi, at the birth of Jeſus Chriſt, and that it came to declare his ſecond coming: they were anſwered on this ſubject by Tycho. Several aſtronomers are of opinion that this ſtar has a periodical return, which Keill and others have conjectured to happen every 150 years. Mr. Pigott adopts the ſame opinion; and he accounts for its not being noticed at the completion of every term by its variable luſtre at different periods, ſo that it may ſometimes increaſe only to the 9th magnitude: and if this be the caſe, its period is probably much ſhorter. Phil. Tranſ. vol. lxxvi. p. 193. Dr. Herſchell has given a ſtatement of the comparative luſtre of the ſtars of this conſtellation in the Phil. Tranſ. for 1796, vol. lxxxvi. p. 463.

The ſtars in the conſtellation *Caſſiopeia*, in Ptolemy's Catalogue, are thirteen; in Hevelius's, thirty-ſeven; in Tycho's, forty-ſix; but in the Britannic Catalogue, Mr. Flamſtead makes them fifty-five.

CASSIOTIS, in *Ancient Geography*, a name given by Ptolemy to a country of Egypt, in the vicinity of mount Caſius; bounded, on the eaſt by a part of Judæa and Arabia Petræa.—Alſo, a country of Aſia in Syria, in which Ptolemy has placed 12 towns. This country took its name from mount Caſius in Syria.

CASSIPOUNEA, in *Botany*, Aubl. Juſſ. See Legnotis.

CASSIR, q. d. *Caſtle*, in *Geography*, a town of Africa, in the northern part of the eaſtern province of Algiers, ſituate amongſt the Beni Grobbery, N. of mount Aphroune, and W. of Boujeiah or Bugia. Upon the mountains adjacent to this place the Algerines frequently dig up large pipes of lead, ſuppoſed to have formerly conveyed the excellent water of theſe parts to Saldæ.

Cassir *Aſeite*, a town of Africa, in the kingdom of Tunis, near the gulf of Hamamett; about 30 miles S.E. of Tunis. This lies upon the ruins of a city, called by the ancients "Civitas Siagitana."

Cassir *Attyre*, a place of Africa, in the eaſtern province of Algiers, lying a little to the ſouthward of Seteef, famous for its adjacent plains and paſture grounds, which are cultivated by the Raigah, a clan of Arabs, noted for the breeding of cattle, particularly of horſes, that are reckoned the beſt in this kingdom.

CASSIS, a town of France, in the department of the Rhone, on the coaſt of the Mediterranean, with a ſmall port; 8 miles S.E. of Marſeilles.

Cassis, in *Military Language*, the ſame as Cask; which ſee.

CASSITAH, in *Geography*, an Indian town of America, which, as well as the Coweta town, is 60 miles below the Horſe-ford or Chattahouſee river.

CASSITERIA, in *Natural Hiſtory*, the name of a genus of cryſtals. The word is derived from κασσιτερος, *tin*; and expreſſes cryſtals which are influenced in their figures by an admixture of the particles of that metal. Theſe are all pyramidals without columns, and compoſed only of four ſides or planes. Of this genus there are only two known ſpecies, the whitiſh and the brown; found in Devonſhire and Cornwall.

CASSITERIDES, in *Ancient Geography*, an appellation which formerly comprehended Great Britain and Ireland, and which was afterwards reſtricted to the iſles of Scilly, famous, as well as the neighbouring coaſt of Cornwall, for their tin, which, according to Pliny, (l. xxxiii. c. 16.) was white and the moſt valuable, and called by the Greeks *caſſiteron*. Strabo ſays (Geog. vol. i. p. 265. ed. Caſaub.) that they were 10 in number, ſituated near one another and toward the north from the port of the Artabri. One was a deſert iſland; the reſt were inhabited by a people wearing black garments, which hung down to their heels and were bound round their breaſts. They ſubſiſted on their herds and had no fixed habitations: but they ſupplied thoſe who traded with them with tin, lead, and ſkins, in exchange for which they received earthen veſſels, ſalt, and braſs. The Phœnicians, ſays this geographer, were in ancient times the only perſons who carried on this commerce with them, ſailing hither from Gades, but concealing their navigation from the reſt of the world. The Greeks ſucceeded the Phœnicians, and they were at length followed by the Romans. Caſſiterides, in the Greek language, denotes "the iſlands of tin;" but this name was probably derived from ſome Phœnician or Celtic term. The Chaldeans and Arabians uſed words very ſimilar to ſignify tin. Thus in Numb. xxxi. 22, for the Hebrew בדיל, and Greek κασσίτερος, Jonathan has קסטירא, *kaſtira*, and the Jeruſalem interpreter קיסטרא, *kiſtera*, and the Arabs קזדיר, *kaſdir*: and in the Talmudic tract of the Sanhedrin קסטיטרין, *kaſtiterion*, is tin. From theſe different modes of expreſſion, we may infer that the term was borrowed from other nations by the Greeks.

Bochart, Geog. Sacr. apud. Oper. vol. i. p. 650. Theſe iſlands were alſo denominated "Sorlings," which, in the language of the Britons, ſignifies "ſeparated from the height of the land;" and it has been ſuggeſted, that the term "Caſſiteride" may be compoſed of Briton or Celtic words, viz. "Kaz i ter i" ſignifying "they are almoſt ſeparated." According to this etymology, the name *κασσιτερος* ſucceeded that of "Caſſiteri;" and it has been inferred that the Phœnicians derived their tin from the iſlands denominated Sorlings, as well as from the country of Cornwall.

CASSITHA, in *Botany*, Tabern. See Cuscuta.

CASSIUM, in *Geography*, a town of Africa in the country called Caſſiotis. Ptolemy.

CASSIUS, Caius, in *Biography*, a celebrated Roman, was the deſcendant of an ancient and honourable family, ſo zealous for the public liberty, that one of his anceſtors, Sp. Caſſius, after a triumph and three conſulſhips, is ſaid to have been condemned, and put to death by his own father, for aiming at dominion. C. Caſſius himſelf manifeſted at an early age his hatred of tyranny; for hearing, when he was a boy at ſchool, Fauſtus, the ſon of Sylla, boaſting among his ſchool-fellows of his father's greatneſs and abſolute power, he gave him a box on the ear; and he afterwards declared, in the preſence of Pompey, who demanded an account of the quarrel, that if Fauſtus ſhould dare to repeat the words, he would repeat the blow. In the Parthian war he was quæſtor to Craſſus, and ſignalized himſelf both by his courage and ſkill, and if Craſſus had followed his advice, would have preſerved the whole army. After the defeat and death of this leader, B. C. 53, he made good his retreat with the remains of the broken legions into Syria; and when the Parthians who purſued him blocked him up in Antioch, he preſerved that city and province from falling into their hands; and, watching his opportunity, gained a conſiderable victory over them, with the deſtruction of their general. In the civil war between Cæſar and Pompey, he took part with the latter, and commanded his fleet. After the battle of Pharſalia, B. C. 48, he ſailed with 70 ſhips to the coaſt of Aſia, with a view of raiſing forces, and renewing the war againſt Cæſar; and as ſoon as he had obtained intelligence where Cæſar, who croſſed the Helleſpont with a ſmall force, deſigned to land, he lay in wait for him, in the bay of Cilicia, at the mouth of the river Cydnus, with a reſolution to deſtroy him; but Cæſar landing on the oppoſite ſhore before he was aware, and his project being thus blaſted, he thought it moſt prudent, whilſt all the people of the country were declaring for him, to make his own peace, by joining the conqueror with his fleet. He ſtill, however, retained his ſtrong diſlike of uſurped authority; and when Cæſar had been created perpetual dictator, and ſeemed to aſpire after royal honours which every true Roman deteſted, he formed a conſpiracy againſt his life, and urged his friend and brother-in-law, Brutus, to take a lead in the execution of his purpoſe. His reſolution to deſtroy Cæſar has been aſcribed to motives of private diſguſt and reſentment, and particularly to his being refuſed the conſulſhip and to Cæſar's having conferred on Brutus the more honourable prætorſhip in preference to him. Hence it has been ſaid, that he hated the tyrant rather than the tyranny, and that in the proſecution of the whole deſign he manifeſted a peculiar rancour. But we need not be at a loſs for the true motive of his conduct, if we advert to his temper and principles. He was ſingularly impetuous and violent, impatient of contradiction, and much more of ſubjection, and paſſionately fond of glory, virtue, and liberty. From theſe qualities Cæſar apprehended his danger; and when admoniſhed to beware of Antony and Dolabella, he uſed to ſay, that it was not the gay, the curled, and the jovial, whom he had cauſe to fear; but the thoughtful, the pale, and the lean; meaning Brutus and Caſſius. For the progreſs and termination of this conſpiracy; ſee M. J. Brutus and Cæsar. After Cæſar's aſſaſſination, the conſpirators withdrew from Rome. Caſſius proceeded to Greece and joined Brutus at Athens. Having raiſed a conſiderable body of troops in Leſſer Aſia, he marched into Syria, the government of which had been aſſigned him by Cæſar, and having made himſelf maſter of the country, he paſſed into Phœnice and Judæa, and then laid ſiege to Laodicea, whither Dolabella, who was endeavouring to take poſſeſſion of Syria, had been under a neceſſity of retreating. Caſſius, having taken the town, treated it with great ſeverity; plundering its temples, levying oppreſſive contributions, and putting to the ſword many of the chief inhabitants. Whilſt he was preparing to invade Egypt, Brutus urged him to oppoſe Antony and Octavianus, who were preparing to croſs over into Macedon. He joined Brutus at Smyrna, and at his recommendation, it was determined that Brutus ſhould reduce the Lycians, whilſt he undertook the expedition againſt the Rhodians. After ſome unſucceſsful engagements on their part, the city of Rhodes was inveſted by ſea and land, and compelled to ſurrender. Caſſius treated the vanquiſhed in the true ſpirit of a Roman general. Having placed his tribunal in the forum with a ſpear planted before it, he reſtrained his ſoldiers from all plunder or violence; and ſummoning 50 of the principal citizens before him, cauſed them immediately to be put to death. Having accumulated from the ſpoils of the city the ſum of 8000 talents, and ordering the commander of the garriſon, which he left behind him, to levy from the inhabitants 500 more, he returned to the continent, and proceeded to join Brutus, exacting from all the provinces of Aſia, as he paſſed, a payment of 10 years' taxes. His junction with Brutus at Sardis was followed by occurrences, of which a brief recital has been given under the article Brutus. On the plains of Philippi the combined army of theſe two commanders met that of the triumvirs; and in the engagement that enſued, the ardour of Brutus in purſuing the troops of Octavianus left him expoſed, and at length obliged him to retire with a ſmall band from the field of battle. Titinius in the mean while was diſpatched to gain intelligence; and when Caſſius, perceiving from the eminence on which he ſtood that he was ſurrounded by a body of cavalry, which he apprehended to be that of the enemy, and not a detachment of friends coming to their relief, as in fact it was, imagined that Titinius was taken priſoner, he reproached himſelf for expoſing a dear friend to ſuch an accident, and withdrew to his tent. He was accompanied by Pindarus, one of his freedmen, who had conſtantly attended him ever ſince the battle in which Craſſus was ſlain, for the purpoſe of performing the laſt office for him, if occaſion ſhould require it. The circumſtances of his death have not been aſcertained: ſome ſay that he diſpatched himſelf with the dagger with which he ſtabbed Cæſar; but the fact was, that his head was found ſevered from his body, and that Pindarus no more appeared. This event occurred on the birth-day of Caſſius, B. C. 42.

Caſſius was a prudent and valiant commander, and an ardent lover of his country; and though he was in many reſpects inferior to Brutus, and chargeable with extortion and cruelty, he has been honoured as an aſſerter of the liberties of Rome, when they were juſt expiring, and he has ſhared with Brutus in the diſtinguiſhing appellation of "laſt of the Romans." He was learned himſelf, and a patron of literature; ſeveral of his letters to Cicero are extant; and that great orator beſtows praiſes on him in various parts of his works. If we compare Caſſius with his friend Brutus, the latter was the more amiable friend, and the former the more dangerous enemy. Caſſius has been charged with violence and cruelty in his mode of exacting money and other neceſſaries from the cities of Aſia. But it has been urged in vindication of his conduct, that he was engaged in an inexpiable war, where he muſt either conquer or periſh with the republic itſelf, and in the proſecution of which his legions were not only to be ſupported, but rewarded; the revenues of the empire were exhauſted; contributions were ſcanty; neighbouring ſtates wiſhed to maintain their neutrality. In theſe difficult circumſtances, when money was neceſſary, and it could only be obtained by force, extortion, it is ſaid, became neceſſary; the neceſſity of the end juſtified the means; and when the ſafety of the empire, and the liberty of Rome were at ſtake, it was no time to liſten to ſcruples. This was Caſſius's mode of reaſoning, and the ground on which he acted; whilſt he applied all his thoughts to the ſupport of the cauſe which he had undertaken. Brutus, on the other hand, being of a temper more mild and ſcrupulous, contented himſelf generally with the regular methods of raiſing money; and from his love of philoſophy and the politer ſtudies, having contracted an affection for the cities of Greece, inſtead of levying contributions, uſed to divert himſelf, wherever he paſſed, with ſeeing their games and exerciſes, and preſiding at their philoſophical diſputations, as if travelling rather for curioſity than to provide materials for a bloody war. When he and Caſſius therefore met, the difference of their circumſtances ſhewed the different effects of their conduct. Caſſius, without receiving a penny from Rome, came rich and amply furniſhed with all the ſtores of war. Brutus, who had received large remittances from Italy, came empty and poor, and unable to ſupport himſelf without the help of Caſſius, who was obliged to give him a third part of that treaſure, which he had been collecting with ſo much envy to himſelf for the common ſervice. In his latter years Caſſius deſerted the Stoics, and became a convert to Epicurus, whoſe doctrine he thought more natural and more reaſonable; conſtantly maintaining, that the pleaſure, which their maſter recommended, was to be found only in the habitual practice of juſtice and virtue. Whilſt he profeſſed himſelf therefore an Epicurean, he lived like a Stoic; being moderate in pleaſures, temperate in diet, and through life a water-drinker. In the letters addreſſed to him by Cicero, though he rallies his Epicuriſm, and change of principles, yet he allows him to have always acted with the greateſt honour and integrity; and pleaſantly ſays, "that he ſhould begin to think that ſect to have more nerves, than he imagined, ſince Caſſius had embraced it." Plutarch, Vit. Brutus apud Opera, T. i. p. 984. Middleton's Life of Cicero, vol. ii. Anc. Un. Hiſt. vol. x & xi.

Cassius, Avidius, an eminent military commander in the reign of Marcus Aurelius and an uſurper of the empire, was, according to Dion Caſſius, a native of Syria, and a ſon of Heliodorus, the rhetorician; but the author of his life, Vulcatius Gallicanus, ſeems to make him the ſon of Avidius Severus, who was raiſed from the rank of a centurion to the higheſt dignities of the ſtate, and as a man of merit, much regarded by Aurelius. The ſame writer repreſents him as by his mother's ſide a deſcendant from the ancient Roman Caſſii. Crevier diſputes that genealogy, though, as he ſays, he poſſeſſed all their haughtineſs, inſolence, and antipathy againſt monarchical government; adding to theſe qualities great ſkill in the art of war, and talents that commanded the fear and obedience of the ſoldiers. The firſt account we have of him is that of his commanding an army againſt the Parthians under the emperor Verus, about the year 164, whom he entirely defeated near Europus, a city of Syria. Improving this victory over Vologeſes II. king of the Parthians, he paſſed the Euphrates, took Cteſiphon, and demoliſhed the royal palace. He likewiſe ſubdued Edeſſa, Babylon, and all Media; and though Seleucia on the Tigris opened its gates to him, he ordered the inhabitants, amounting in number to 400,000, to be inhumanly maſſacred, and the city to be utterly deſtroyed. On his return he loſt great numbers of his men by famine and diſeaſe; however, he put an end to the war, and obtained for the indolent Verus, who had never joined him at Antioch, the title of conqueror of the Parthians and Medes. Caſſius, having acquired the reputation of a rigid diſciplinarian, was inveſted by Aurelius with the command of the legions of Syria; nor did he diſappoint the hopes which the emperor had conceived of him. Whilſt he had this command, he marched againſt the Egyptians, who had revolted, and contrived to ſubdue them by policy rather than force, and he afterwards performed great exploits in Armenia and Arabia. In the war againſt the Sarmatian Jazyges, he puniſhed with an ignominious death ſome centurions who had croſſed the Danube without orders, though they had killed 3000 of them and returned to the camp with very conſiderable booty. This ſeverity occaſioned a mutiny in the army; but Caſſius, with invincible intrepidity, appeared unarmed in the midſt of the incenſed multitude, calling out aloud to them, "kill me; and to your neglect of duty, add the murder of your general;" and by this intrepid valour, he quelled their fury and recalled them to their duty. Whilſt he inſpired his ſoldiers with awe, he likewiſe engaged their attachment; and though, among the inconſiſtent accounts that occurred of his character he is generally repreſented as chargeable with atrocious vices, inſomuch that he has been denominated a ſecond Catiline, he ſeems to have poſſeſſed the qualities neceſſary for conſtituting a great commander. When he commanded in the Parthian war, Verus ſuſpected his ambitious deſigns, and communicated his apprehenſions to M. Aurelius, his partner in the empire. But the philoſophical emperor took no notice of the charge that was alleged againſt him; but continued to entruſt him with the command of the army in the Eaſt. In the 15th year of Aurelius's reign, A. D. 175, Caſſius threw off all diſguiſe, and ventured to declare himſelf his rival in the empire. With this view he availed himſelf of an illneſs, under which Aurelius laboured during his war againſt the Marcomanni, to circulate a report of his death, and to cauſe himſelf to be proclaimed emperor in his room. Having aſſumed this title, he ſoon reduced all the countries beyond mount Taurus, and the governor of Egypt declared in his favour; ſeveral foreign princes and nations reſpected his cauſe, and none with greater zeal than the Jews. Whilſt he was ſucceſsfully purſuing theſe meaſures for the eſtabliſhment of his power, he feigned great reſpect for the memory of Aurelius, and placed him among the gods. As ſoon as the news of this revolt reached Rome, the ſenate inſtantly declared Caſſius a traitor, and confiſcated his effects; but the emperor, with ſingular moderation, left Germany and purſued his march as far as Illyricum towards the eaſt; propoſing to reſign the empire to his competitor, if the gods ſhould judge it expedient for the public good, that Caſſius ſhould reign, and not Marcus Aurelius. He had not proceeded far before he received the news, that Caſſius had been killed in conſequence of a conſpiracy among his inferior officers. When the head of Caſſius was brought to the emperor, he expreſſed much ſorrow, turned away his eyes from it, and cauſed it to be honourably interred, complaining, that he had been deprived of an opportunity of ſhewing his mercy. The reign of Caſſius, or rather his dream, as Dion Caſſius calls it, laſted but three months and ſix days. M. Aurelius would neither try, impriſon, nor condemn any ſenator concerned in the conſpiracy; but referred the whole to the ſenate, appointing a day for the criminals to appear before their judges. His wife and children were treated with unexampled clemency by the emperor; but Commodus afterwards indulged his cruel diſpoſition by burning alive all who were in any degree related to him. Crevier's Rom. Emp. Vol. vii. Anc. Un. Hiſt. vol. xiii.

Cassius *Parmenſis*, a Latin poet, was one of the conſpirators againſt Cæſar, and after the event of his aſſaſſination, attached himſelf firſt to Pompey's ſon, and afterwards to Antony, holding commands under each of them. After the battle of Actium he retired to Athens, where he was put to death by Quintilius Varus, who executed the orders of Octavianus, while Caſſius was at his ſtudies. Horace in his epiſtle to Tibullus makes honourable mention of him:

> "Scribere quod Caſſi Parmenſis opuſcula vincat."
>
> Epiſt. iv. lib. i.

But in another place he ſeems to deſcribe him rather as a rapid and copious, than as an excellent poet. See Sat. x. lib. i.

His papers were carried off by Varus, whence it is probable that the tragedy of Thyeſtes, aſcribed to Varus, was written by Caſſius. The verſes on Orpheus, publiſhed by Achilles Tatius, under the name of Caſſius, are thought to be ſpurious. Voſſ. de Poet. Lat. Gen. Dict. Gen. Biog.

Cassius Severus, Titus, a Roman orator in the age of Auguſtus, more odious for his character than admired for his genius. Beſides the pleaſure which he derived from exerciſing the office of an accuſer, often on very trivial grounds, he was ſo much addicted to ſatire and calumny, that his writings occaſioned a law againſt libels to be paſſed by Auguſtus, and drew upon himſelf a ſentence of exile firſt to Crete, and afterwards to Seriphos, where he died in extreme wretchedneſs. Notwithſtanding the bad qualities of Caſſius, he was one of the ableſt pleaders of his time, and is repreſented by Seneca as poſſeſſing every qualification of a good declaimer. Although he particularly excelled in extempore ſpeaking, he never neglected previous preparation, but wrote down the greateſt part of what he intended to ſpeak. Tacitus, if he be the author of the Dialogue on Orators, repreſents Caſſius as the firſt corrupter of ancient eloquence; and Quintilian, though he allows him ingenuity, quickneſs, and force, repreſents him as deficient in gravity and judgment. Gen. Dict.

Cassius's *purple powder*, or *mineral powder*, in *Chemiſtry*, ſo called from the diſcoverer, is obtained by mixing a largely diluted ſolution of gold, with the ſolution of tin in nitro-muriatic acid, carefully prepared. This precipitate is a mixture of imperfect oxyd of gold with perfect oxyd of tin. Its principal uſe is in enamel and porcelain painting. See Gold.

CASSOCK, a kind of ſurtout, or long upper garment, worn over the reſt of the habit; particularly by the clergy, and anciently likewiſe by the laity. The word comes from the French *caſaque*, *a horſeman's coat*: ſome derive them again, by corruption, from a garment of the Coſſacks: others derive the name *caſſock*, as well as the thing, from the ancient *caracalla*, a ſort of upper garment which hung to the heels.

CASSON, in *Geography*. See Kasson.

CASSONADE, in *Commerce*, caſk ſugar, or ſugar put into caſks or cheſts, after the firſt purification, but which has not been refined. It is ſold either in powder or in lumps; the whiteſt, and that of which the lumps are largeſt, is the beſt. Many imagine it to ſweeten more than loaf-ſugar; but it is certain that it yields a great deal more ſcum. See Sugar.

CASSOPO, in *Geography*, a town of the iſland of Corfu, 8 miles N. of Corfu.

CASSOTIS, in *Ancient Geography*, a fountain of Greece, in the Phocide, and in the vicinity of Delphos. Pauſanias.

CASSOVA, in *Geography*. See Caschau.

Cassova, *Plain of*, a tract of country in European Turkey, which ſeparates Raſcia from Bulgaria, noted on account of the victories of the two firſt Amuraths.

CASSOWARY, in *Ornithology*. See Struthio *Caſuarius*.

CASSUMBAZAR, Cassimbazar, or Cossimbazar, in *Geography*. See Cossimbazar.

CASSUMUNAR, in the *Materia Medica*. See Casamunar.

CASSUTHA, in *Botany*, Rumph. See Cassyta.

CASSUVIUM, Rumph. Lam. Juſſ. See Anacardium.

CASSYTA, Linn. gen. 505. Schreb. 690. Willd. 802. Juſſ. p. 439. Gært. 160. (Volutella, Forſk. Collodion, Lour. Cochin.) Claſs and ord. *Enneandria monogynia.* Nat. ord. uncertain. Juſſ.

Gen. Ch. *Cal.* perianth three-leafed, very ſmall, permanent; leaves ſemi-ovate, acute, concave, erect. *Cor.* petals three, roundiſh, acute, concave, permanent; nectary of three glands, oblong, truncate, coloured, the length of the germ, and ſtanding round it. *Stam.* filaments nine, erect, compreſſed; glands two, globular, ſeated on the ſides of the baſe of each of the three interior filaments; anthers adnate to the filaments below their tip. *Piſt.* germ egg-ſhaped, within the corolla and calyx; ſtyle rather thick, the length of the ſtamens; ſtigmas ſlightly trifid, obtuſe. *Peric.* receptacle increaſed into a depreſſed-globular drupe, crowned with the converging calyx and corolla, perforated with a navel. *Seed*, nut globular, acuminate, with the converging ſtamens. Linn. Schreb. and Mart.

*Cal.* one-leafed, permanent; ſegments ſix, ovate-acute, ſtraight, concave; three interior ones reſembling petals. *Cor.* none. *Stam.* nine, in ſeveral ranks; filaments compreſſed; anthers fixed below their tips; accompanied by nine yellowiſh, glandular bodies; ſix of which are fixed to the baſe of the three interior ſtamens, one on each ſide; the three others alternate with thoſe ſtamens, oblong, truncate. *Piſt.* germ ſuperior, ovate; ſtyle thick, ſtigma obtuſe, ſlightly trifid. Lam. and Boſc.

*Cal.* one-leafed, globular, leſſened at the border, ſix-cleft, converging; the inner alternate, ſegments (petals, Linn.) a little larger; bractes at the baſe (calyx, Linn.) three, very ſmall. *Cor.* none. *Stam.* filaments twelve, inſerted in a double order into the top of the calyx; the ſix exterior ones fertile, naked at the baſe, oppoſite to the ſegments of the calyx; the ſix interior ones oppoſite to the former; three fertile, with two glands at the baſe of each; three alternate with them, barren (nectary, Linn.), reſembling tubercles; anthers adnate to the anterior ſide of the fertile filaments, two-celled (two-valved from the baſe to the tip?). *Piſt.* germ ſuperior; ſtyle thickiſh; ſtigma obtuſe (ſlightly trifid?). *Peric.* capſule globular, one-ſeeded; covered by the converging, ſomewhat-berried, calyx. Juſſ.

Eſſ. Ch. *Corolla* reſembling a calyx, ſix-cleft; nectary, three truncate glands ſurrounding the germ; interior filaments glanduliferous. Drupe one-ſeeded. Willd.

Belly of the mature calyx globular, berried, inveſting the ſeed. Filaments ſix or nine; interior ones with two glands at the baſe. Nut ſuperior, one-ſeeded, without valves. clothed with the berried calyx. Gært.

Obſ. Authors differ ſo much with reſpect to the parts of fructification, that we have given the above deſcriptions ſeparately and at full length.

Sp. 1. C. *filiformis*, Linn. Sp. Pl. Gært. tab. 27. f. 4. Lam. Pl. 323. Jacq. Hiſt. Amer. 115. tab. 79. "Filiform, lax, enneandrous; calyx entirely covering the nut." *Stems* paraſitical, twining, ſlender, ſucculent, branched, leafleſs, putting out numerous warts, reſembling the feet of caterpillars, by which they adhere ſo ſtrongly to the ſtems and leaves of ſhrubs, as not to be ſeparated from them; and when they have affixed themſelves to theſe, they no longer draw any nouriſhment from the ſoil. *Flowers* white, with a ſmall tinge of red, very ſmall, in lateral looſe ſpikes, at different diſtances, ſcentleſs. *Fruit* about the ſize of a pea, pellucid, white, ſhining, ſweet to the taſte; nut black, with a yellow kernel. A native of the Weſt Indies. 2. C. *zeylanica*, Gært. tab. 27. fig. 4. b—G. (Cuſcuta rumbut-putri, Rumph. Amb. 5. p. 49. tab. 184. fig. 4. C. ind. & zeyl. Herm. 67. & 42. Burm. Zeyl. 84.) "Flowers hexandrous; calyx not covering the whole nut." The green, tender twigs producing a few very ſmall leaves, coming out ſeveral together. *Calyx* furniſhed at the edge with ſix, pale, obtuſe, concave, diſtant ſcales, reſembling little teeth; three of them ſhorter, and a little without the others, but all converging. *Stamens* in a ſingle order within the ſcales; three ſhorter, correſponding with the larger ſcales, awl-ſhaped; three longer, placed within the ſmaller ſcales, furniſhed on each ſide near the baſe with a globular gland, as in the preceding. *Nut* globular, terminated by a ſhort ſtyle and three ſtigmas, of a dark cheſnut colour, ſmooth, one-celled, valveleſs. Gært. A native of the Eaſt Indies. Linnæus and moſt other authors conſider the Eaſt and Weſt Indian plants as one and the ſame ſpecies; but Gærtner ſeparates them, and if his deſcription of the latter, taken from a ſpecimen of the fruit preſerved in the Leyden muſeum, be accurate, they are certainly diſtinct. 3. C. *corniculata*, Linn. Mant. 277. Burm. Ind. 93. tab. 33. fig. 1. (Caſſutha cornea, Rumph. Amb. 7. p. 56.) "Branches woody, ſpinous." *Branches* a foot long, the thickneſs of a finger; ſpines ſolitary, recurved. *Leaves* ſhorter than the ſpines, lanceolate-linear. *Berries* nearly ſeſſile. A native of mountains in the iſland of Celebes; received alſo from Java by Burman in 1758. Linnæus refers it to this genus on the authority of Burman, but recommends a more accurate examination of its parts of fructification. Juſſieu doubts whether it really belongs to this genus, ſince it differs ſo much from the preceding ſpecies in the ſpines and diſpoſition of the parts.

*Propagation and Culture.* The firſt ſpecies, according to Miller, is eaſily propagated in the ſummer months by cuttings, which ſhould be kept a week in the ſtove before they are planted, that the part cut may have time to heal. They will take root in about ſix weeks, if planted in ſmall pots plunged in a moderate hot bed, and not over watered. They may then be planted ſeparately in ſimilar pots, filled with light ſandy earth; and may be plunged again into the hot-bed, till they have taken freſh root, when they ſhould be removed to the dry ſtove, where they muſt conſtantly remain, being allowed but little water in winter, and a large ſhare of freſh air in the warm days of ſummer.

Cassyta *polyſperma*, Hort. Kew. See Rhipsalis.

CAST, a term in *Sculpture*, for the impreſſion of any figure taken in bronze, plaiſter, wax, or other fuſible material. The original of this word is kaſter, Daniſh, a throw, becauſe the fuſed matter is thrown on the figure of which the impreſſion is to be taken. The proceſs is as follows: plaſter of Paris is mixed with water in a baſon or pan, and ſtirred with a ſpatula until its conſiſtence is like that of batter for pan-cakes; it is then poured on any figure, for inſtance, a human hand, or foot, previouſly greaſed or oiled in the ſlighteſt manner poſſible, which will prevent the adheſion of the plaſter: after a few minutes the plaſter will dry to the hardneſs of ſoft ſtone, taking the exact impreſſion of every part, even the minuteſt pores of the ſkin. This impreſſion, the reverſe or hollow of the original ſubject (like a ſeal in compariſon with its impreſſion), is called the mould, which being taken off from the figure that produced it, muſt be ſlightly greaſed, and then plaſter, mixed with water as before, may be poured into this firſt impreſſion or mould, and remaining until it is hardened, and then relieved, or taken from the mould, is the exact image of the original figure. If the figure is flat, having no deep hollows or high projections, it may be moulded in one piece; if its ſurface is varied with great hollows and projections, it muſt be moulded in many pieces fitted together, and held in one or more outſide or containing pieces. Pliny mentions caſting faces from nature in the early practice of Greek ſculpture. This uſeful art ſupplies the painter and ſculptor with exact repreſentations from nature of limbs, bodies, heads of men and inferior animals, anatomical ſubjects, draperies, and plants; it multiplies models of all kinds, and is now practiſed in ſuch perfection, that caſts of the antique ſtatues are made ſo preciſely like the originals in proportion, outline, and ſurface, that no difference whatever is diſcoverable, excepting in colour and materials. See Bronze and Bronze *caſting*.

Cast, among *Wax Chandlers*, denotes a ladleful of melted wax, poured on the wicks of candles made by the ladle.

Cast, among *Founders*, is applied to tubes of wax, fitted in divers parts of a mould of the ſame matter, by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before poſſeſſed.

Cast, among *Bowlers*. See Bowling.

Cast alſo denotes a cylindrical piece of braſs, or copper, ſlit in two, lengthwiſe, uſed by the founders in ſand to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be caſt.

Cast, among *Plumbers*, denotes a little brazen funnel, at one end of a mould, for caſting pipes without ſoldering, by means of which the metal melted is poured into the mould.

Cast *of the country*, with *Miners*, the colour of the earth.

Cast, in *Falconry*, denotes a ſet or couple of hawks.

To *caſt* a hawk to the perch, ſignifies to ſet her upon it.

Cast, in *Rural Economy*, a term applied to ſome kinds of inſects. Thus a caſt of bees ſignifies a ſwarm or flight of bees. See Bees.—Alſo, a word ſometimes applied to poultry, when they loſe their feathers, or moult. It is alſo applied to the changing of the hair and hoofs of horſes. Horſes caſt or ſhed their hair at leaſt once in a year. Every ſpring they caſt the winter coat, and take a ſummer one; and ſometimes in the end of autumn they put on their winter hair, in caſe they have been ill fed, farried, or clothed, or kept in a cold ſtable. Sometimes they caſt likewiſe their hoofs; when this happens, they ſhould be turned out into a paſture for ſome length of time.

CAST, among the *Hindoos*, denotes a tribe, or number of families of the ſame rank and profeſſion; and this diviſion, which is ancient and peculiar, has very generally prevailed in India. This diſtribution ſeems to have proceeded from a crafty prieſthood in order to fix their own ſuperiority or preponderance. Prior, ſays Dr. Robertſon, (Hiſt. Diſq. concerning India, p. 231) to the records of authentic hiſtory, and even before the moſt remote æra to which their own traditions pretend to reach, this ſeparation of profeſſions had not only taken place among the natives of India, but the perpetuity of it was ſecured by an inſtitution which muſt be conſidered as the fundamental article in the ſyſtem of their policy. The whole body of the people was divided into four orders or caſts. According to all the writers of antiquity, indeed, the Indians are ſaid to be divided into ſeven tribes or caſts. See Strabo, l. xv. p. 1029. Diod. Sicul. lib. ii. p. 153. Arrian, Indic. c. 10. But they were probably led into this error by conſidering ſome of the ſubdiviſions of the caſts, as if they had been a diſtinct independent order. However, from the concurrent teſtimony of the beſt informed modern travellers, we learn, that there were no more than four original caſts. In a work entitled, "La Porte Ouverte, ou la vraye Repreſentation de la Vie, des Mœurs, de la Religion, et du Service des Bramines, qui demeurent ſur les Coſtes de Choromandel, &c." compiled before the middle of the 17th century, by Abraham Roger, chaplain of the Dutch factory at Pullicate, we have a diſtinct account of theſe caſts. No doubt can now be entertained with reſpect either to the number or the functions of the caſts, as both are aſcertained from the moſt ancient and ſacred books of the Hindoos, and confirmed by the accounts of their own inſtitutions, given by Brahmins eminent for their learning. According to them, the different caſts proceeded from Brahma, the immediate agent of the creation under the Supreme Power, in ſuch a manner as to eſtabliſh both the rank which they were to hold, and the office which they were required to perform; ſo that to mingle or confound them would be deemed an act of the moſt daring impiety.

The members of the firſt caſt, called the *brahmins*, from the mouth (wiſdom), and deemed the moſt ſacred, had it for their province, to pray, to read, to inſtruct, to ſtudy the principles of religion, to perform its functions, and to cultivate the ſciences. They were the prieſts, the inſtructors, and philoſophers of the nation. The members of the ſecond order, called *Chehteree*, from the arms (ſtrength); to draw the bow, to fight, to govern; were entruſted with the government and defence of the ſtate. In peace they were its rulers and magiſtrates; in war they were the generals who commanded its armies, and the ſoldiers who fought its battles. The third order, called the *Bice*, from the belly and thighs (nouriſhment); to provide the neceſſaries of life by agriculture and traffic; was compoſed of huſbandmen and merchants. The fourth caſt denominated the *Sooder* from the feet (ſubjection); to labour, to ſerve; conſiſted of artiſans, labourers, and ſervants. Subordinate to theſe caſts is a fifth, or adventitious claſs, denominated *Burrun Sunker*, ſuppoſed to be the offspring of an illicit union between perſons of different caſts. Theſe are moſtly dealers in petty articles of retail trade. (See preface to the code of Gentoo laws, p. 46 and 99.) This adventitious caſt is not mentioned, as Dr. Robertſon ſuppoſes, by any European author. The diſtinction was too nice to be obſerved by them, and they ſeem to conſider the members of this caſt as belonging to the *Sooder*. Beſides theſe acknowledged caſts, there is a race of unhappy men, denominated on the Coromandel coaſt *Pariars*, and, in other parts of India, *Chandalas*. Theſe are outcaſts from their original order, who, by their miſconduct, have forfeited all the privileges of it. Their condition is, without doubt, the loweſt degradation of human nature. If a Pariar approach a *Nayr*, i. e. a warrior of high caſt, on the Malabar coaſt, he may put him to death with impunity. Water and milk are conſidered as defiled even by their ſhadow paſſing over them, and cannot be uſed until they are purified. (Ayeen Akbery, vol. iii. p. 243.) Every Hindoo who violates the rules or inſtitutions of his caſt ſinks into this degraded ſituation. Hence it is that the Hindoos ſo reſolutely adhere to the inſtitutions of their tribe, becauſe the loſs of caſt is, to them, the loſs of all human comfort and reſpectability; and is a puniſhment, beyond compariſon, more ſevere than excommunication in the moſt triumphant period of Papal power.

The four original caſts are named, and their functions deſcribed in the "Mahabarat," the moſt ancient book of the Hindoos, and of higher authority than any with which Europeans are hitherto acquainted. Baghvat-Geeta, p. 130. The ſame diſtinction of caſts was known to the author of Heeto-pades, another work of conſiderable antiquity tranſlated from the Sanſkreet, p. 251.

The members of one caſt can never quit his own, or be admitted into another; ſo that the ſtation of every individual is unalterably fixed, his deſtiny is irrevocable, and the walk of life is marked out, from which he muſt never deviate. Moreover, the members of each caſt adhere invariably to the profeſſion of their forefathers; and from generation to generation, the ſame families have followed, and will always continue to follow, one uniform line of life. However, though the line of ſeparation be ſo drawn as to render the aſcent from an inferior to a higher caſt abſolutely impoſſible, and it would be regarded as a moſt enormous impiety if one in a lower order ſhould preſume to perform any function belonging to thoſe of a ſuperior caſt; yet, in certain caſes, the Pundits declare it to be lawful for perſons of a high claſs to exerciſe ſome of the occupations allotted to a claſs below their own, without loſing their caſt by doing ſo. Pref. of Pundits to the Code of Gentoo Laws, p. 100. Accordingly we find Brahmins employed in the ſervice of their princes, not only as miniſters of ſtate (Orme's Fragments, p. 207), but in ſubordinate ſtations. Many officers of the army, particularly in the Mahratta ſtates, have been Brahmins; and many ſeapoys in the ſervice of the Eaſt India company, eſpecially in the Bengal preſidency, are of the Brahmin caſt. Another fact concerning the caſts deſerves notice. An immenſe number of pilgrims, amounting in ſome years, to more than 150,000, viſit the pagoda of Jaggernaut in Oriſſa, one of the moſt ancient and revered places of Hindoo worſhip, at the time of the annual feſtival in honour of the deity to whom the temple is conſecrated. The members of all the four caſts are allowed promiſcuouſly to approach the altar of the idol, and ſeating themſelves without diſtinction, eat indiſcriminately of the ſame food. This ſeems to indicate ſome remembrance of a ſtate prior to the inſtitution of caſts, when all men were conſidered as equal.

Such arbitrary arrangements of the various members, compoſing a community ſeem, at firſt view, to be adverſe to improvement either in ſcience or arts, and the artificial barriers that ſeparate different orders of men tend to circumſcribe the operations of the human mind within a narrower ſphere than nature has allotted to them. Hence genius muſt ſometimes be checked in its career, and talents fitted to ſhine in an higher ſphere be confined to the functions of an inferior caſt. Neverthelefs, theſe arrangements of Indian policy are adapted to the general ſtate of ſociety, though they may be attended with partial inconvenience; and they ſerve to accompliſh the object of the firſt Indian legiſlators, which was to employ the moſt effectual means of providing for the ſubſiſtence, the ſecurity, and the happineſs of all the members of the community over which they preſided. With this view they ſet apart certain races of men for each of the various profeſſions and arts neceſſary in a well-ordered ſociety, and appointed the exerciſe of them to be tranſmitted from father to ſon in ſucceſſion. This ſyſtem, though repugnant to the ideas which we, who are placed in a very different ſtate of ſociety, may have formed, are better adapted to the attainment of the end propoſed, than a careleſs obſerver is apt to imagine. An Indian, on his entrance into life, knows the ſtation which he is deſtined to occupy, and the functions which he is to perform; and from his earlieſt years, he is trained to the habit of doing, with eaſe and pleaſure, that which he muſt continue to do through life. To this may be aſcribed that high degree of perfection conſpicuous in many of the Indian manufactures; and though veneration for the practices of their anceſtors may check the ſpirit of invention, yet, by adhering to theſe, they acquire ſuch an expertneſs and delicacy of hand, that Europeans, with all the advantages of ſuperior ſcience, and the aid of more complete inſtruments, have never been able to equal the exquiſite execution of their workmanſhip. To this early diviſion of the people into caſts, we muſt likewiſe aſcribe a ſtriking peculiarity in the ſtate of India; the permanence of its inſtitutions, and the immutability in the manners of its inhabitants. What now is in India, ſays Dr. Robertſon, always was there; and is likely ſtill to continue; neither the ferocious violence and illiberal fanaticiſm of its Mahomedan conquerors, nor the power of its European maſters, have effected any conſiderable alteration. The ſame diſtinctions take place, the ſame arrangements in civil and domeſtic ſociety remain, the ſame maxims of religion are held in veneration, and the ſame ſciences and arts are cultivated; and hence, in all ages, the trade in India has been the ſame. This ingenious writer adduces the diviſion into caſts as one evidence of the ancient and high civilization of the Hindoos. But it has been obſerved by Mr. Pinkerton, (ſee Mod. Geog. vol. ii. p. 259.) that the error of his argument conſiſts in his confounding caſts with trades, while in reality they are totally diſtinct, as neither a prieſt, a ſoldier, a farmer, nor a labourer is a tradeſman. Separation of trades argues refinement; but from the Hindoo caſts nothing can be concluded, except that agriculture exiſted at their inſtitution. Beſides, when he adds that "what now is in India, always was there," he evinces rather a ſingular love of hypotheſis. All we know from antiquity is, that the caſts exiſted in the time of Strabo, Arrian, and Pliny, and perhaps were not known even in the time of Alexander. If we ſuppoſe that they exiſted three centuries before the Chriſtian æra, we have only a proof that agriculture and merchandize were then known in Hindooſtan; and yet the firſt tribe that paſſed from the centre of Aſia might, even in that caſe, have only begun to people the north of Hindooſtan a few centuries, or a thouſand years before the Chriſtian æra. Among the followers of Bouddha or Boodh, in the Birman empire, and in Siam, the diſtinction of caſts is utterly unknown. Dr. Buchanan (Aſiatic Reſearches, vol. vi. p. 251.) in tracing the origin of the doctrine of caſt eſtabliſhed in Hindooſtan, refers to Pliny, (N. H. l. xi. c. 19.) who mentions a diviſion of ranks among various Indian nations, which he calls "vita multipartita;" but from what he ſays, it does not appear to have been univerſal at the time he received his intelligence; neither is it by any means clear, that his "vita multipartita" means caſt. It is to be obſerved, that all Roman citizens followed nearly the ſame mode of life; they were ſoldiers and ſtateſmen; and when not employed in either of theſe capacities, they were all cultivators of the land. To them, therefore, a diſtinction of profeſſions among the citizens of a ſtate would appear ſtrange; and hence this writer inclines to think, that the "vita multipartita" of Pliny more reſembles the diviſion of ranks and profeſſions among the Burmas, or in modern Europe, than it does the caſt of the Brahmins. The deſcription of Pliny, in the paſſage above referred to, neither agrees with the preſent diviſions of the different caſts, nor does it call the learned Brahmins; on the contrary, Pliny ſpeaks of the Brachmanæ not as a claſs and order in ſociety, but as a nation, and as a name common to many nations. He mentions, that Seneca had attempted to procure the names of all the people inhabiting India, and had actually heard of 118 nations. The moſt conſiderable of theſe he afterwards enumerates, lib. vi. c. 17. See Birman *Empire*, Boodh, Brahmins, and Hindoos.

Cast-*away*, in *Sea Language*, the ſtate of a ſhip which is loſt or wrecked on a lee ſhore, bank, or ſhallow.

CASTABALA, in *Ancient Geography*, a town of Aſia, in Cilicia Propria, according to Ptolemy, who places it in the neighbourhood of Mopſueſtia. In the Itinerary of Antonine it is in the route from Conſtantinople to Antioch. M. d'Anville places it at a very ſmall diſtance to the north-weſt of Iſſus.—Alſo, a town of Aſia Minor, in Cappadocia, placed by Strabo near the mountains, who ſays that it had a temple of Diana Peraſia. M. d'Anville places it at the ſource of a river which diſcharged itſelf into the Halys. It was at ſome diſtance E. of Cybiſtra.

CASTABUENA, in *Geography*, a town of Iſtria; ſix miles S. of Capo d'Iſtria.

CASTACIUS Sinus, in *Ancient Geography*, a gulf of Aſia Minor, on the Thracian Boſphorus, S. of the gulf *Cydaminus*.

CASTAGNEUX, in *Ornithology*, a name given to a ſpecies of Columbus, which ſee.

CASTAGNO, Andrea, Dal, in *Biography*, an eminent hiſtorical painter, was born at a ſmall village called Caſtagno, belonging to Tuſcany, in 1409, and being deprived of his parents when young, was employed by his uncle to attend the herds of cattle in the fields. His ſingular talents, which were firſt manifeſted in ſurpriſing efforts to imitate an ordinary painter, whom he accidentally obſerved at work, became the common topic of diſcourſe in Florence, and excited the curioſity of Bernardetto de Medici; ſo that he placed him under the tuition of the beſt maſters at that time in Florence. Andrea, aſſiduouſly improving his advantages, became particularly eminent in deſign, and found full employment. At firſt he painted only in diſtemper and freſco; but at length he learned the ſecret of painting in oil from Domenico Venetiano, who had derived his knowledge of it from Antonello da Meſſina. He was the firſt of the Florentine artiſts who painted in oil; but envying the merit of Domenico, from whom he obtained the ſecret, he determined, with the baſeſt ingratitude, to aſſaſſinate his friend and benefactor. At this time Domenico and Andrea lived together, and were partners in buſineſs. Inſenſible, however, of every obligation, and combining treachery with ingratitude, he way-laid Domenico in the corner of a ſtreet, and ſtabbed him with ſuch ſecrecy, that he eſcaped unobſerved and unſuſpected to his own houſe, where he ſat down with apparent compoſure to work; ſoon after Domenico was conveyed thither to die in the arms of his aſſaſſin. The real author of this atrocious act was never diſcovered, till Andrea, through remorſe of conſcience, diſcloſed it on his death-bed, in 1480. Andrea finiſhed ſeveral conſiderable works at Florence, by which he gained great wealth and reputation; but as ſoon as his complicated villainy became public, his memory was afterwards held in the utmoſt deteſtation. The moſt noted of his works is in the hall of juſtice at Florence, and repreſents the execution of the conſpirators againſt the houſe of Medici. Pilkington.

CASTAGNOLA, in *Geography*, a town of Piedmont, on the Po; 8 miles S. of Turin.

CASTAGNOLE, in *Ichthyology*, a name given by the Italians to the fiſh called by the generality of authors CHROMIS, which ſee.

CASTALDI, CORNELIO, in *Biography*, the deſcendant of a noble family, was born at Feltri about the year 1480, and though educated to the bar, he devoted himſelf to poetry and the ſtudy of polite literature. On his marriage he ſettled at Padua, where he founded a college, and gained univerſal eſteem. He died in 1536. His poems were both Italian and Latin. The former contain ingenious and elevated ſentiments, but are defective in ſweetneſs and elegance of ſtyle. The latter are a happy imitation of the ancients. They were publiſhed at Venice, in 4to. in 1757, by the abbé Conti, with a life of the author prefixed by Signor Farſetti. Nouv. Dict. Hiſt.

CASTALDUS. } See GASTALDUS.
CASTALDY. }

CASTALIA, in *Botany* (ſo called quia uterum totum, quaſi ob pudicitiam, occultent ſpecies hujus generis) Saliſbury Annal. of Botany, vol. ii. p. 71. Paradiſ. Lond. 14. (Nymphæa, Linn.) Claſs and ord. *Polyandria monogynia*. Nat. ord. *Hydrocharides*, Juſſ. *Nymphææ*, Salis.

Gen. Ch. *Cal.* perianth four or five-leafed, ſurrounding the margin of the receptacle. *Cor.* petals from twenty to thirty, inſerted into the pericarp from the baſe to the middle. *Stam.* filaments from ſixty to a hundred and fifty, inſerted into the pericarp above the petals, free. *Piſt.* ſtyle none; ſtigma with as many rays as there are cells in the fruit. *Peric.* from twelve to twenty-celled, putrefying as the ſeeds ripen. *Nect.* one, in the centre of the ſtigma, globular. *Seeds* from two to three hundred, ſeſſile on the inner ſide of the pericarp, ſurrounded with a follicle.

Flowers white, red, or blue, rivalling the magnolias. It differs from the proper nymphæa in the inſertion of the petals and ſtamens into the pericarp, and not into the receptacle. We have adopted Mr. Saliſbury's generic name, from a confirmed unwillingneſs to change any name once given, unleſs urged to it by the moſt cogent reaſons; but, at the ſame time, we feel ourſelves conſtrained to add, that we cannot concur with that excellent botaniſt in the principle on which he has been induced to chooſe it. Every attempt to extend the ſexual analogy between plants and animals to the mode of operation and its eſſential circumſtances, appears to us to be no leſs adverſe to philoſophical preciſion and truth, than it aſſuredly is to moral purity, and to that delicacy of decorum, which is one of the beſt characters of a rightly cultivated mind.

* *Leaves with a fiſſure extending to the petiole.*

Sp. 1. C. *odorata*. (C. pudica, Salis. Nymphæa odorata, Hort. Kew. Bot. Rep. pl. 297. "Lobes of the leaves divaricated, acuminate; receptacle ſhaped like the nave of a wheel." (Medioliformis, Salis. ſo the word is ſpelt both in the Annals of Botany, and in Paradiſus Londinenſis, but as we are not acquainted with ſuch a Latin word, we preſume it ſhould be modioliformis, which means either a ſmall concave meaſure, or the nave of a wheel.) A native of Virginia. The flowers diffuſe a ſpicy odour, ſomewhat reſembling aniſeed. 2. C. *alba*, white water-lily. (C. ſpecioſa, Saliſb. Nymphæa alba, Linn. Eng. Bot. pl. 160.) "Lobes of the leaves approximate, ſcarcely acuminate; receptacle cymbal-ſhaped." *Calyx-leaves* four, oblong, green underneath, white above, often tinged at the baſe with a light bluiſh-colour. *Petals* white, lanceolate, in ſeveral rows, gradually leſſening in ſize. *Stamens* yellow; outer ones dilated, reſembling petals, with only the rudiments of an anther. *Fruit* ſcarred with the marks of the fallen petals and ſtamens. A native of various parts of Great Britain; in ponds and ſlow ſtreams.

** *Leaves peltate.*

3. C. *Lotus*, (C. myſtica, Saliſb. Parad. Lond. 14. Nymphæa lotus, Bot. Mag. pl. 729. Plant. Rar. Hung. vol. i. fig. 15. Willd. Sp. Pl. Savign. in Ann. du Muſ. vol. i. p. 336. Haſſelq, Reſ. p. 471. Lotus, Alp. Exot. p. 214. with a figure.) "Leaves nearly orbicular, ſharply toothed, ſmooth on both ſides; receptacle ſhaped like the nave of a wheel; inner petals very ſmall." A native of Hungary in the warm waters near Pecze. Mr. Saliſbury obſerves, that though he has followed other authors in quoting the above ſynonyms, he is not abſolutely certain that the Hungarian plant from which his ſpecific character is formed, is the ſame with the Egyptian lotus; for in that, Savigny ſays, the petioles are hiſpid: and, according to Haſſelquiſt, the peduncles are perforated with only four large tubes; whereas the whole herb of the Hungarian plant is ſmooth, and the peduncles are perforated with ſix large tubes. The flowers have the brandy-like ſmell of Nymphæa lutea, continuing expanded till the evening. 4. C. *pubeſcens*. (C. ſacra, Saliſb. Parad. Lond. 14. Nymphæa pubeſcens, Willd. Sp. Pl. Nymphæa lotus, Marq. of Blandford, in Bot. Rep. fig. 391. Roxb. MSS. Ambel, Rheed. Mal. v. 11. fig. 26.) "Leaves oval, toothed, pubeſcent, and ſpotted underneath; petals white, rather unequal." The flowers have a pungent, vinous odour, but very different from that of the Hungarian lotus. A native of Hindooſtan; in marſhes. 5. C. *magnifica*, Saliſb. Parad. Lond. 14. (Nymphæa rubra, Roxb. MSS.) "Leaves nearly orbicular, toothed, pubeſcent underneath, but not ſpotted; petals bright red, rather unequal." *Flowers* ſometimes ſeven or eight inches in diameter, inodorous. A native of Hindooſtan; in marſhes. Dr. Roxburgh regards this and the foregoing as varieties, but Mr. Saliſbury is inclined to keep them diſtinct. They are both ſacred plants in Hindooſtan, and expand in our climate from the very firſt twilight to about ten in the morning, after which they gradually cloſe, and are quite ſhut at noon. 6. C. *edulis*, Saliſb. (Nymphæa coteka, Roxb. MSS.) "Leaves broad-oval, quite entire, pubeſcent underneath; flowers ſmall. A native of Hindooſtan; in marſhes. 7. C. *ampla*, Saliſb. (Nymphæa foliis amplioribus, &c. Brown Jam. p. 243.) "Leaves orbicular, ſharply toothed, ſmooth on both ſides, with very prominent nerves underneath; petals long; anthers lengthened at the tip. A native of La Vera Cruz. 8. C. *cærulea*. (C. ſcutifolia, Saliſ. Nymphæa cærulea, Bot. Mag. pl. 552. Bot. Repoſ. pl. 197. N. flore cæruleo, Breyn. Prod. 2. p. 77.) "Leaves orbicular, more or leſs repand-toothed, ſmooth on both ſides; primary nerves numerous, ſlender; anthers lengthened at the tip." A native of the Cape of Good Hope, now become very common in the Engliſh ſtoves. 9. C. *ſtellata*, (C. ſtellaris, Saliſb. Nymphæa ſtellata, Willd. Sp. Pl. Bot. Rep. 330. Nymphæa cærulea, Jard. Malm. 6. Savign. Ann. du Muſ. vol. i. p. 336. Citambel, Rheed. Mal. vol. ii. p. 53. pl. 26.) "Leaves orbicular, quite entire, ſmooth on both ſides; primary nerves few, but little prominent underneath; rays of the ſtigma very ſhort." A native of Egypt and Hindooſtan, and Mr. Saliſbury believes it to be the plant of New Holland, found by ſir Joſeph Banks in Endeavour river.

CASTALIA, in *Entomology*, a ſpecies of PHALÆNA, (*Bombyx*), found in New Holland.

Castalia, in *Ancient Geography*, a fountain of Aſia, in the ſuburbs of Daphne, near the city of Antioch in Syria. Sozomen ſays that the Pagans believed, that the water of this fountain communicated to thoſe who drank it a knowledge of futurity, and thus produced an effect ſimilar to that at Delphi. The oracle at this fountain is ſaid to have promiſed Adrian, when he was in a private ſtation, the future poſſeſſion of ſovereign power. Jealous of that diſtinguiſhing favour, and fearing leſt others ſhould obtain the like, and avail themſelves of it, as he had done, he ordered, on his aſcent to the throne, this fountain to be ſhut up with ſtones.

Castalia, a river that runs at the foot of mount Parnaſſus, ſacred to the Muſes, hence called *Caſtalides*, the murmurs of which were thought to be prophetic. Upon the banks of this river the Pythian games were celebrated. Pindar refers to it in a verſe of his 7th Olympic ode, thus rendered by Weſt (vol. i. p. 58):

"Where ſweet Caſtalia's myſtic currents ſound."

Castalia, or *Caſtalius fons*, a fountain which diſcharged its water between the ſummits of Parnaſſus. This water inſpired thoſe who drank it with poetic enthuſiaſm. M. Spon, in his Voyage into Greece, ſays, that the waters of this fountain flowed from the declivity of a rock, where they produced fine caſcades. They paſſed near Delphi; and on this account, Phavorinus ſays, Κασταλια κρηνη εν Πυθωνῖ. See Delphi and Parnassus.

CASTALIO, or Castellio, Sebastian, whoſe proper name was *Chateillon*, in *Biography*, was born in 1515, in the mountainous diſtrict of Dauphiné, or, as ſome ſay, of Savoy. Although nothing certain is known concerning his education, he appears to have obtained the eſteem of Calvin, by his acquaintance with the ancient languages, when he was introduced to that reformer at Straſburg, in 1540 and 1541. On his recommendation he was appointed teacher in the college of Geneva; but the intolerant temper of Calvin obliged him to leave this ſituation, after having occupied it about three years. He diſagreed with Calvin with regard to the doctrine of predeſtination; he diſapproved of the civil puniſhment of heretics; he conſidered the Canticles of Solomon as a profane piece; he entertained an opinion peculiar to himſelf concerning Chriſt's deſcent into hell; and he was ſuſpected of having imbibed ſome of the ſentiments of the Anabaptiſts. Such were the offences for which he was expelled Geneva, and became an object of the perſecution both of Calvin and Beza. At Baſil, whither he removed, he obtained the profeſſorſhip of the Greek language; but having a large family, and his circumſtances being indigent, he found it very difficult to procure for them a ſubſiſtence, and to proſecute the ſtudies to which he was devoted. Calvin, who could not be ignorant of his diſtreſſed ſituation, but who ſeems to have felt no compaſſion for him, accuſed him of ſtealing wood. Caſtalio's own relation of the fact is as follows: "Being totally occupied with my tranſlation of the Scripture, and reſolved rather to beg than to quit it, as I dwelt on the banks of the Rhine, I employed myſelf at leiſure hours in catching with a hook the floating wood which was brought down the ſtream by its inundations, that I might warm my family. This wood is public property, and belongs to him that firſt takes it." He appeals to the whole city of Baſil for the truth of his narration, and concludes with thus addreſſing the unſympathizing Calvin; "I could not have thought that you, you who knew me, could have credited ſuch a charge; but that you ſhould publiſh it to the whole world, and tranſmit it to poſterity, is what (although I know you) I could not eaſily have believed!" The conſiſtory at Baſil would not allow him to publiſh his works in that city without animadverſion; he was cited before them; and the curators of the univerſity wiſhed to reſtrain him from theological topics. But whilſt his opinions met with no indulgence, he was ſo much eſteemed for his piety and learning, that his enemies were not able to expel him. However he peaceably cloſed his life of anxiety and indigence at Baſil, in 1563, at the early age of 48 years. Caſtalio was an elegant, though not a profound ſcholar; and his Latinity reſembles that of the modern Italian ſchools. In 1545 he printed at Baſil four books of Scripture-hiſtories in elegant Latin, with a view of communicating to children a knowledge of the facts of their religion, and at the ſame time of giving them a taſte for polite literature. In 1546 he publiſhed a poetical tranſlation of the Sibylline verſes, with notes, together with a proſe verſion of the books of Moſes, which was followed by a tranſlation of David's Pſalms, and the other Scripture ſongs. In 1548 he publiſhed a Greek poem on John the Baptiſt, and a Latin poetical paraphraſe of the prophet Jonas. He likewiſe tranſlated ſome parts of Homer, ſome books of Xenophon, and St. Cyril. His tranſlation of ſome Italian treatiſes of Ochinus, and particularly his "Thirty Dialogues," favouring polygamy, furniſhed one ground of the accuſations againſt him. But his greateſt work was his Latin tranſlation of the Bible, for an account of which ſee *Latin* Bibles. This verſion was the moſt elegant and claſſical that was ever made; but whilſt it has been highly commended by ſome, it has been cenſured by others for an affected uſe of terms, not properly belonging to Jewiſh or Chriſtian theology, and for an improper and paraphraſtical deviation from the original phraſeology. His "New Teſtament," however, is read with pleaſure, and very properly put into the hands of young ſcholars. It is no improbable conjecture, that the hoſtility of Beza againſt him might have been partly owing to the rivalry of his verſion. Caſtalio's French tranſlation of the Bible (ſee *French* Bibles), dedicated to Henry II. of France, and printed at Baſil in 1555, has been charged with the adoption of a low and vulgar phraſeology. Bayle in Gen. Dict.

CASTALOGNE, or Castelogne, a coverlid made of fine wool, on the weaver's loom.

CASTAMENA, or Kastamoni, in *Geography*, a town of Aſiatic Turkey, in the province of Natolia, formerly a large and flouriſhing city, and the ſee of a Greek archbiſhop, but now much reduced in ſize and magnificence; 240 miles eaſt of Conſtantinople. N. lat. 44° 42′. E. long. 34° 22′.

CASTANEA, in *Botany*, Tourn. Gært. Vent. See Fagus *caſtanea*.

Castanea *æquina*, Ray. See Æsculus *Hippo-caſtanum*.

Castanea, in *Entomology*, a ſpecies of *Chermes*, which ſee.

Castanea, in *Natural Hiſtory*, a ſpecies of *Turbo*, and alſo of *Helix*, which ſee reſpectively.

CASTANET, in *Geography*, a town of France, in the department of the Upper Garonne, and chief place of a canton in the diſtrict of Toulouſe, 2 leagues S.S.E. of Toulouſe. The place contains 1320, and the canton 6339, inhabitants; the territory includes $107\frac{1}{2}$ kiliometres and 16 communes.

CASTANETS, Castagnettes, or Castanettas, ſmall muſical inſtruments of percuſſion, in pairs, with which the Moors, Spaniards, and Bohemians mark the meaſures and ſteps in their dances, holding two in each hand. They conſiſt of two little round pieces of dried wood, and hollowed in the manner of ſpoons, of which the concavities are placed over each other, faſtened to the thumb, and beat from time to time with the middle finger, to mark the ſteps and geſtures.

Each *caſtanet* is kept in its place by a ſtring paſſing through a hole pierced through an eminence left for that purpoſe at the ſide of the caſtanet, and which ſerves as a neck.

There is a notation for caſtanets to mark the time, and the two hands ought at leaſt to have as many characters as there are notes in a bar. Dextrous performers will double and triple the notes aſſigned them.

The tablature for the caſtanets is marked with the uſual characters of the time-table, placed above and below the ſame ſtaff or line; thoſe above for the left hand, and thoſe below for the right. The bars, whether a ſingle line or a five line ſtaff, are to be marked by a perpendicular line. There ought likewiſe to be a clef, and a character for time at the beginning of each tune.

This article is taken from the new *Encycl. Meth.*; but we are unable to diſcover the uſe of clefs for a monotonous inſtrument, or rather for an inſtrument on which no tuneable ſound can be produced.

CASTANETTO, in *Geography*, a town of the iſland of Corſica; 13 miles N.E. of Corte.

CASTANHEIRA, a town of Portugal, in the province of Eſtramadura; 6 leagues N.E. of Liſbon.—Alſo, a town of Portugal, in the ſame province; 8 leagues E.S.E. of Coimbra.—Alſo, a town of Portugal, in the province of Beira; 2½ leagues E. of Aveiro.

CASTANIA, in *Ancient Geography*, a town of Italy, near Tarentum; ſuppoſed to be that which is now called *Caſtellaneta*.

CASTANOVITZ, in *Geography*, a town of Croatia, ſeated on the river Unna, and ſubject to the houſe of Auſtria. N. lat. 45° 40′. E. long. 17° 20′.

CASTAX, in *Ancient Geography*, a town of Spain, mentioned by Appian, and ſuppoſed to be the ſame with the *Caſtulon* of Livy.

CASTEL, LOUIS BERTRAND, in *Biography*, a geometrician and philoſopher, born at Montpellier in 1688, and who entered into the ſociety of Jeſus in 1703. He made himſelf known to Fontenelle and to father Tournemine by his eſſays and ſketches of new invention, which promiſed the greateſt ſucceſs. The young man was at this time in Provence, but was invited to the capital. Caſtel removed from Thoulouſe to Paris in 1720. He ſupported the idea of his talents which his eſſays had excited. The firſt work he publiſhed was his "Treatiſe on Univerſal Gravitation," in 2 vols. 12mo. 1724. All nature, according to him, depends on two principles, the weight of bodies and their tendency to motion; the one, which inceſſantly precipitates them to repoſe, the other, which re-eſtabliſhes their motion. This doctrine, the key of the ſyſtem of the univerſe, as he pretended, did not ſatisfy the abbé de ſaint Pierre. Though a friend of the mathematician, he attacked him; the Jeſuit anſwered. The writings on both ſides manifeſted a conſiderable portion of wit and ingenuity in the combatants, but it was of a ſingular kind. The ſecond work of father Caſtel was his "Plan for an Abridgment of the Mathematics," Paris, 1727, in 4to. which was ſoon followed by a "Univerſal Mathematic," 1728, 4to. This work was applauded both in England and France, and the Royal Society of London opened its doors to the author. Dict. Hiſt.

His "Clavecin Oculaire," or ocular harpſichord, though ſilent, made a conſiderable noiſe in the world, and excited much curioſity and conſiderable expectation among opticians as well as muſicians. His idea of producing the ſame pleaſure to the eye by the melody and harmony of colours, as the ear received from the ſucceſſion and combination of muſical tones, was publiſhed in 1725. Sir Iſaac Newton, having diſcovered (Optics, book i. p. 2. prop. 3.) that the breadths of the ſeven primary colours in the ſun's image, produced, by the refraction of his rays through a priſm, are proportional to the ſeven differences of the lengths of the eight muſical ſtrings, D, E, F, G, A, B, C, D, when the intervals of their ſounds are T, H, t, T, t, T, t, H: which order is remarkably regular. Smith's Harmonics. From this analogy, Pere Caſtel ſets off by telling us that there is a fundamental and primitive ſound in nature to which we may give the name of *ret*, or C.

There is alſo a primitive and original tone which ſerves for baſe and fundamental to all colours, which is blue.

There are three eſſential ſounds which depend on this primitive tone of C, and which together compoſe the perfect, primitive, and original chord, which is CEG.

There are likewiſe three original colours dependent on the blue; they are compounded of no other colours, and they produce the reſt; theſe three colours are blue, yellow, and red. The blue is the key-note, the red the fifth, and the yellow the third. There are five tones, C, D, E, G, A; and two ſemi-tones, F and C. In the ſame manner there are five principal colours, blue, green, yellow, red, and violet: and two ſemi-tone colours, which are orange and indigo.

The muſical ſcales, c, d, e, f, g, a, b. The ſcale of colours is blue, green, yellow, orange, red, and violet. Theſe are the data of father Caſtel, upon which he has founded his organ or harpſichord of colours.

It would be uſeleſs to analyſe and critically examine his plan, which is truly viſionary, falſe in its ratios, and incapable of producing the promiſed effects.

After being tried in all parts of Europe, particularly in London, about the year 1756, when the plan and pretended effects were publiſhed in an Engliſh pamphlet,—but its exhibition was ſoon neglected and forgotten, and has been ſcarcely heard of ſince:—he died in 1767, leaving behind him the character of a viſionary projector, whoſe eccentricities, though wild, were innocent; and if he did not inſtruct mankind, he contributed to their idle amuſements.

Pere Caſtel was the dupe of a fertile and lively imagination. His ſyſtems were at firſt mere hypotheſes; but he cheriſhed them ſo long, that, by degrees, he fancied he had realized them. "The New general Syſtem of Nature," by Newton, in 1743, in 4to. did him more honour, but it diſpleaſed others. He reſpected the Engliſh philoſopher, without allowing his doctrine to be the true ſyſtem of the world. "Newton and Deſcartes," ſays he, "have infinite "merit for their invention. The latter had more facility "and elevation, the former leſs facility and more depth; "which is nearly the character of the two nations; the "French build loftily, the Engliſh profoundly. Both were "ambitious of framing a world, as Alexander was of con"quering it; and both ſaw nature on a large ſcale." Caſtel wrote much in the "Memoirs de Trevoux;" he treated an infinite number of ſubjects, but none deeply. However, "he thought (ſays his biographer,) a great deal, and often well."

CASTEL, in *Geography*, a town of Germany, in the duchy of Carniola; 13 miles S.S.W. of Gottſchee.—Alſo, a town of Germany, in the circle of Bavaria, and Upper Palatinate; 10 miles S.W. of Amberg.

CASTEL *de las Guardas*, a town of Spain, in the province of Andaluſia; 8 leagues from Seville.

CASTEL *Belforte*, a town of Germany, in the country of Tyrol; 11 miles N.N.W. of Trent.

CASTEL-*Branco*, a town of Portugal, in the province of Beira; encompaſſed by a double wall, flanked with ſeven towers, and defended by an old caſtle; containing two churches, two hoſpitals, a poor-houſe, two convents, and

5700 inhabitants. It is ſituated between the two rivers Ponſul and Vereza, which run into the Tagus, and diſtant 18 leagues S.E. from Coimbra. N. lat. 39° 35′. W. long. 8° 0′.

Castel-*Franc*, a town of France, in the department of the Lot; 1 league N.W. of Luzech.

Castel-*Franco*, a town of the iſland of Candia, near the ſouth coaſt; 16 miles S.S.W. of Retimo.—Alſo, a ſmall but ſtrongly fortified town on the frontier of the Bologneſe in Italy.

Castel-*Jaloux*, a town of France, in the department of the Lot and Garonne, and principal place of a canton, in the diſtrict of Marmande, ſeated on the Avance; it carries on a conſiderable trade in honey, cattle, and wine; 7½ leagues W.N.W. of Agen, and 3½ S.W. of Tonneins; the place contains 1757, and the canton 6013 inhabitants; the territory includes 195 kiliometres and 10 communes.

Castel-*Leone*, a ſmall town of Italy, in the Cremoneſe; 15 miles N.N.W. of Cremona.

Castel-*Melhar*, a town of Portugal, in the province of Beira; 5 leagues N. of Pinhel.

Castel-*Moron*, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Marmande; 3 leagues W. of Villeneuve d'Agen. The place contains 2011, and the canton 7425 inhabitants; the territory includes 152½ kiliometres and 9 communes.

Castel-*Moron de Albert*, a town of France, and ſeat of a tribunal, in the department of the Gironde; 9 leagues S.E. of Bourdeaux.

Castel-*Nova*, a town of Portugal, in the province of Beira; 3 leagues N. of Caſtel-Branco.

Castel-*Rapani*, a town of European Turkey, in the Morea; 32 miles S.S.E. of Miſitra.

Castel-*Rodrigo*, a town of Portugal, in the province of Beira; 3½ leagues N.W. of Pinhel.

Castel-*Roſſo*, an iſland in the Mediterranean, near the coaſt of Caramania, about a league in length. It has a large village, inhabited by Greeks, and defended by a caſtle; on the ſouth ſide it has a good harbour; 90 miles E. of Rhodes. N. lat. 36° 7′. E. long. 29° 31′.

Castel-*Roſſo*. See Caristo.

Castel-*Sagrat*, a town of France, in the department of the Lot and Garonne; 6 leagues E. of Agen.

Castel-*Sarrazin*, a town of France, in the department of the Upper Garonne, and chief place of a diſtrict; 10 leagues N.N.W. of Toulouſe. The place contains 7,000, and the canton 10,696 inhabitants; the territory includes 152½ kiliometres and 7 communes.

Castel *St. Pietro*, a town of Germany, in the country of Tyrol; 12 miles S.S.W. of Bolzano.

Castel-*Selino*, a town of the iſland of Candia, on the ſouth coaſt, near the weſtern extremity; 21 miles S.W of Canea.

Castel-*Torneſe*, a town of European Turkey, in the Morea, ſeated on an eminence, near the ſea, and defended with a caſtle; 10 miles S. of Chiarenza.

Castel-*Ubaldo*, a town of Aſiatic Turkey, in the province of Caramania; two miles S.W. of Alameh.

CASTELANZA, a town of Italy, in the Milaneſe; 14 miles N.W. of Milan.

CASTELBONIFACIO, a town of European Turkey, in the iſland of Candia; 12 miles S.S.W. of Candia.

CASTELHOLM, a town of Sweden, in the iſland of Aland. This place is famous for the ruins of an ancient palace, ſeated on an inſulated rock of red granite, and built with red granate and brick, which commands a pleaſing, though bounded, proſpect of two ſmall lakes, whoſe banks riſe into gentle eminences ſkirted with wood. To this ſolitary rock Eric XIV. was, in 1571, confined by his brother John III.; and the dungeon, in which he was impriſoned, ſtill bears the name of the apartment of Eric.

CASTELIA, in *Botany*, Cavan. Icon. 583. Claſs and ord. *Didynamia gymnoſpermia.*

Gen. Ch. *Cal.* perianth tubular, permanent, with five furrows and five teeth. *Cor.* monopetalous, bilabiate; tube curved, longer than the calyx; upper lip upright, bifid; lower lip trifid; lobes obtuſe. *Stam.* four; two longer. *Piſt.* germ ſuperior; ſtyle curved at its ſummit; ſtigma tranſverſely oval. *Peric.* the enlarged calyx encloſing two nuts; nuts two-celled, with two envelopes, the inner one thin and red. *Seeds* oblong, cylindrical, one in each cell.

The only known ſpecies is a native of Brazil. *Root* annual. *Stem* four-ſided, ſmooth. *Leaves* oppoſite, petioled, oval-wedge-ſhaped; upper ones toothed; lower ones crenulate. *Flowers* reddiſh, in terminal racemes; bractes lanceolate.

CASTELL, Edmund, in *Biography*, a learned divine, was born in 1606 at Hatley, in the county of Cambridge, and educated at Emanuel college in the univerſity of Cambridge, whence, after a reſidence of many years, he removed to St. John's college for the benefit of its library. The great work which engaged his chief attention for 17 years, and, as he ſays, coſt him almoſt the incredible ſum of 12000l., was his "Lexicon Heptaglotton," or Dictionary of ſeven tongues. After expending upon it his whole fortune, and being thus reduced to great diſtreſs, he was appointed, in 1666, king's chaplain and Arabic profeſſor at Cambridge, and preſented to a prebend at Canterbury. His Lexicon was publiſhed in 1669, but moſt of the copies remained unſold. Beſides ſome other preferments, the laſt that was conferred upon him was the rectory of Higham Gobion, in Bedfordſhire. Among other ill-requited and unprofitable labours, he aſſiſted Dr. Walton in his Polyglott Bible, for which he tranſlated ſeveral books of the Old and New Teſtament, and diligently examined the eaſtern verſions. At the reſtoration, he publiſhed a thin 4to. pamphlet to the honour of Charles II., containing copies of verſes in all the languages of his Lexicon. He died at his rectory in 1685, and bequeathed all his MSS. to the univerſity of Cambridge. About 500 copies of his Lexicon, which came into the poſſeſſion of his niece and executrix, were conſigned in an old houſe to the mercy of the rats, ſo that ſcarcely one complete volume was left.

Castell, *county of*, in *Geography*, a principality of Germany, in the circle of Franconia, ſituated between the biſhopric of Wurzburg, the principality of Anhalt, the lordſhip of Limburg, and the county of Schwarzenburg: deriving its name from an ancient caſtle, which was deſtroyed by the peaſants in 1525. It pays 18 florins for a Roman month, and is taxed at 18 rix-dollars 84 kreutzers.

CASTELLA, Castles, in *Britiſh Antiquity*, were one of the three kinds of fortifications that were built along the line of Severus's wall; the other two being denominated *ſtations* and *towers*. Theſe caſtles were neither ſo large nor ſo ſtrong as the ſtations, but much more numerous, being no fewer than 81. In ſhape and dimenſion they were exact ſquares of 66 feet every way. They were fortified on every ſide with thick and lofty walls, but without any ditch, except on the north ſide, on which the wall itſelf, raiſed much above its uſual height, with the ditch adjoining it, formed the fortification. The caſtles were ſituated in the intervals between the ſtations, generally at the diſtance of about ſeven furlongs from one another; and guards were conſtantly kept in them by a competent member of men detached from the neareſt ſtations. Horſl. Brit. Rom. p. 108.

CASTELLAIN, *Caſtellanus*, the lord, owner, or captain of a caſtle; and ſometimes the conſtable of a fortified houſe. Bract. lib. v. tract. 2. c. 16. 3 Edw. I. c. 7. It has likewiſe been taken for him that hath the cuſtody of one of the king's manſion-houſes, called by the Lombards *curtes*, in Engliſh *courts*; though they are not caſtles or places of defence. 2. Inſt. 31. And Manwood, in his Foreſt Laws, ſays there is an officer of the foreſt called *caſtellanus*.

CASTELLAN, in *Biography*. See CHATEL.

CASTELLAN, the name of a dignity or office in Poland. The caſtellans are ſenators of the kingdom, but ſenators of the lower claſs; and in diets, ſit on low ſeats behind the palatines, or great ſenators. They are a kind of lieutenants of provinces, and command a part of a palatinate under the PALATINE. They are divided into grand and petty caſtellans: their office, in time of peace, is merely nominal; but when the military or feudal ſervices are required, they are the lieutenants of the palatines, under whom they command the troops of the ſeveral diſtricts.

CASTELLANA, CIVITA, in *Geography*, a town of Italy, between Otricoli and Rome, the firſt of ancient Latium, on the approach to Rome by the Flaminian way. This town is conſidered by many antiquarians as the Feſcennium of the ancients. It ſtands upon a high rock, and muſt formerly have been a place of great ſtrength, but it is now in no very flouriſhing condition.

CASTELLANE, in *Geography*, a town of France, and principal place of a diſtrict in the department of the Lower Alps, ſituate at the foot of a mountain, on the river Verdon, in a pleaſant and fertile ſpot; 12 leagues W. of Nice. The place contains 1962 and the canton 4577 inhabitants; the territory includes 225 kiliometres and 13 communes.

CASTELLANETTA, a town of Naples, in the province of Otranto, the ſee of a biſhop, ſuffragan of Tarento; 18 miles E.S.E. of Matera.

CASTELLANI, in *Ancient Geography*, a people of Spain, who inhabited the Tarragonenſis, to whom Ptolemy aſſigns four cities. They occupied a part of Catalonia at the foot of the Pyrenées.

CASTELLANIA, a Spaniſh word, derived from Caſtello or Caſtile, and denoting a ſeparate territory, in the manner of a province, independent of any other; in which its particular laws are obſerved, and which has a juriſdiction over all the places dependent on its capital.

CASTELLANO, a town of Naples, in the province of Bari; eight miles S.W. of Monopoli.—Alſo, a town of Italy, in the Veroneſe, belonging to the ſtate of Venice; 16 miles S.W. of Verona.

CASTELLANUS, or DU CHATEL, HONORÉ, in *Biography*, a native of Brabant, ſtudied medicine at Montpellier, where he took his degree of doctor in 1544. Being ſoon diſtinguiſhed for his learning, and abilities, he was ſent for to Paris, and in ſucceſſion filled the office of phyſician to Henry II., Francis II., and Charles IX. By his intereſt with Charles, he obtained a conſiderable addition to the ſalaries of the ſeveral profeſſors of the univerſity at Montpellier, which they have acknowledged by an inſcription, in Latin, placed over the entrance into the college, the only memorial left of him, excepting an oration, on the excellence of the practice of phyſic, ſpoken on ſome occaſion, not now known, and printed in 1555, 8vo. He died in November 1569, attending a part of the army of his ſovereign to which he was alſo principal phyſician. Eloy. Dict. Hiſt.

CASTELLANUS, or DU CHATEL, PETER, was born at Grammont in Flanders in the year 1585. Shewing an early diſpoſition to literature, he was ſent to Mons, and afterwards to Orleans, where he acquired ſuch a proficiency in the knowledge of the Greek language, that he was invited to Lovain, in 1609, to fill the chair of Greek profeſſor, then vacant. In 1618, he took the degree of doctor in medicine. The ſame year he publiſhed at Antwerp, "Vita illuſtrium Medicorum, qui toto orbe ad hæc uſque tempora, floruerunt," 12mo. It is a ſmall volume, but the author has contrived, within that compaſs, to introduce the moſt ſtriking paſſages in the lives of the more eminent phyſicians, who had flouriſhed from the earlieſt period, to his time, with brief notices of their works. Although the accounts are taken almoſt entirely from other writers, whoſe words are frequently copied, yet the volume will always be eſteemed, both as a monument of the learning, and diligence of the author, and for the perpetual references given to the ſources from whence he obtained his information. He died in February 1632, aged only 47 years. Haller. Bib. Med. Eloy. Dict. Hiſt.

CASTELLANY, the diſtrict or extent of land under the juriſdiction of a lord caſtellan.

The province of Flanders is divided into ſo many caſtellanies, each of which bears the name of the capital; as the caſtellany of Liſle, of Ypres, of Ghent, &c. The court of caſtellany was anciently compoſed of the caſtellan, a fiſcal, procurator, notary, regiſter, &c. In Poland, a caſtellany is a petty government under the adminiſtration of a CASTELLAN.

CASTELLARIUS, the keeper, or curator, of a caſtellum. Gruter gives an ancient ſepulchral inſcription in memory of a caſtellarius.

CASTELLARO, in *Geography*, a town of Italy, in the duchy of Mantua; 10 miles E. of Mantua.—Alſo, a town in the ſtate of Genoa; 11 miles N.E. of Vintimiglia.

CASTELLATION, *Caſtellatio*, in *Middle Age Writers*, the act of building a caſtle, or of fortifying a houſe, and rendering it a caſtle. By the ancient Engliſh laws, caſtellation was prohibited, without the king's eſpecial licence. Du Cange.

CASTELLAUN, in *Geography*, a town of France, in the department of the Rhine and Moſelle, and chief place of a canton, in the diſtrict of Simmern; 22 miles S.S.W. of Coblentz. The place contains 620 and the canton 4977 inhabitants: the territory includes 28 communes.

CASTELLENGO, a town of Italy, in the country of Vercelli; eight miles S.E. of Biella.

CASTELLI, BENEDICT, *Abbate*, in *Biography*, an eminent mathematician, was born of an ancient and noble family at Breſcia, in the year 1577. In 1595, he entered into a monaſtery of the order of St. Benedict in his native city. He was for ſome time a diſciple of Galileo at Florence, and aſſiſted him in his aſtronomical obſervations, and afterwards maintained a regular correſpondence with him. Under his name the apology of Galileo againſt the cenſures of Leudovico delle Colombe and Vincent di Grazia appeared, though it was principally written by Galileo himſelf. From 1615 to 1625, he occupied the mathematical chair at Piſa. In 1625, Caſtelli was invited to Rome by pope Urban VIII. and made mathematical profeſſor in the college della Sapienza. The ſubject of his particular attention, and in the inveſtigation of which he chiefly excelled, was the motion of water; and in 1628, he publiſhed two works upon it, which gained him much reputation; viz. "The Menſuration of running Waters," and "Geometrical Demonſtrations of the Menſuration of running Waters." Theſe have been lately inſerted in the collection of the author's works on ſimilar topics, printed at Florence, with other treatiſes, on the laguna of Venice, on the improvement of the Pontine, Bologneſe, Ferrareſe, and Romagneſe marſhes, &c. Guglielmini, though in other things he impugns Caſtelli, allows him the honour of having firſt applied geometry to the motion of water; and Montucla (Hiſt. Math. t. ii. p. 201.) calls him "The Creator of a new Part of Hydraulics." He died at Rome in 1644.

Castelli, Bernard, an eminent painter of hiſtory and portrait, was born at Genoa in 1557, and ſtudied his art under Andrea Semini and Luca Cambiaſo, preferring the principles of the firſt, and in his practice imitating both. He afterwards viſited Rome for farther improvement, and there he acquired diſtinction. He had a ready invention, and when he choſe to exert himſelf, he had ſufficient correctneſs and grace; but he became a manneriſt, and frequently adopted the colour and diſpatch of Vaſari and Zucchari. The moſt diſtinguiſhed poets of his time, whoſe portraits he painted, celebrated him in their verſes. Marino and Taſſo, in particular, were his intimate friends; and he made deſigns for the Jeruſalem of the latter. The ſubject of his altar-piece for St. Peter's at Rome was the call of St. Peter to the apoſtleſhip; but this was afterwards removed, to make room for one executed by Lanfranco. The principal works of Caſtelli are at Genoa and Turin. As an engraver, his ſtyle ſomewhat reſembled that of Cornelius Bus. Among other works in this department is a ſet of prints for Taſſo's poems. He died in 1629. Pilkington, by Fuſeli. Strutt.

Castelli, Valerio, ſon of the former, was born at Genoa, in 1625, and received his firſt inſtructions in the ſchool of Domenico Fiaſella; but he gained his principal knowledge in the art of painting by ſtudying the works of the moſt celebrated maſters at Milan and Parma. He thus much improved his taſte of deſign, compoſition, and colouring. His reputation for drawing, colouring, and the elegant turn of his figures, placed him in a rank far ſuperior to his father. His moſt favourite ſubjects were battles; and his horſes are drawn in an admirable ſtyle. In this ſtyle of painting he is ſaid to have united the fire of Tintoretto with the fine taſte and compoſition of Paolo Veroneſe. With reſpect to hiſtorical ſubjects he poſſeſſed great merit both in eaſel pictures and in thoſe of larger dimenſions. The cupola of the church, and the annunciation at Genoa, which is deſcribed as a noble compoſition, was painted by this maſter; and at Florence, in the palace of the grand duke, there is another excellent painting, the ſubject of which is the Rape of the Sabines. His picture, repreſenting Chriſt taken down from the Croſs, is in the collection of the earl of Pembroke at Wilton; and it is ſaid that more of the eaſel pictures of Caſtelli are to be found in the collections of England than in any other part of Europe. His health was injured by his aſſiduous labour; and he died at Genoa at the early age of 34, in 1659. Pilkington.

Castelli, G. B. See Castello.

CASTELLIAR, in *Geography*, a town of Germany, in the county of Tyrol; 7 miles S.S.E. of Bolzano.

CASTELLINA, a town of Italy, in the duchy of Parma; 12 miles W.N.W. of Parma.

CASTELLIO, a town of Naples, in the province of Principato Citra; 16 miles W.S.W. of Policaſtro.

CASTELLO della Abbate, a town of Naples, in the province of Principato Citra; 29 miles S.W. of Cangiano.

Castello *d'Albori*, a town of Naples, in the province of Principato Ultra; 10 miles N.E. of Benevento.

Castello *Arrageneſe*, a ſea-port town on the N.W. coaſt of the iſland of Sardinia, with a good harbour, the ſee of a biſhop, ſuffragan of Saſſari; 18 miles N.E. of Saſſari. N. lat. 40° 56'. E. long. 8° 57'.

Castello *Bianco*, a town of Genoa; 7 miles N. of Albenga.

Castello *di Chiara*, a town of Sardinia; 43 miles N.E. of Cagliari.

Castello *Franco*, a town of Naples, in the province of Calabria Citra; 4 miles N.W. of Coſenza.—Alſo, a town of Naples, in the province of Principato Ultra; 14 miles E.N.E. of Benevento.—Alſo, a town of Italy, in Treviſan, belonging to the ſtate of Venice; 9 miles W.S.W. of Trevigno.—Alſo, a town in the ſtate of Genoa; 11 miles N.E. of Vintimiglia.

Castello *St. Giovanni*, a town of Italy, in the duchy of Piacenza; 10 miles W. of Piacenza. It was taken by the French in 1796.

Castello *Guidone*, a town of Naples, in the county of Moliſe; 11 miles N. of Moliſe.

Castello *Lanbazo*, a town of Portugal, in the province of Entre Duero é Minho; 1½ league E. of Braga.

Castello *Maggiore*, a town of Italy, in the republic of Lucca; 12 miles W.N.W. of Lucca.

Castello *a Mare*, a town of Sicily, in the valley of Mazzara; 19 miles W.S.W. of Palermo.

Castello *a Mare di Stabia*, a ſea-port town of Naples, in the province of Principato Citra, built near the ruins of Pompeia and Stabia, the ſee of a biſhop, ſuffragan of Sorrento, containing 6 pariſh churches and 10 convents; 4 miles N.E. of Sorrento. This is a long town, lying at the bottom of the bay, ſheltered to the ſouth by high mountains that approach ſo near to the water-edge, as to leave only a very narrow ſlip for the buildings, many of which are boldly and beautifully placed on the lower points of the hills. The king has a charming villa above the city. The port is ſmall and artificial, more frequented by lattin-ſail barks than by ſhips. This place roſe by the ruin of the inland towns.

Castello *a Mare della Brucca*, a town of Naples, in Principato Citra; 18 miles W. of Policaſtro.

Castello *Marinba*, a town of Portugal, in the province of Entre Duero é Minho; 5 miles N.W. of Barcelos.

Castello *della Minerva*, a town of Naples, in Principato Citra; 16 miles S.W. of Amalfi.

Castello *Monardo*, a town of Naples, in the province of Abruzzo Ultra; 14 miles S.W. of Aquila.

Castello *Mondo*, a town of Portugal, in the province of Beira; 2½ leagues E.N.E. of Beira.

Castello *Novato*, a town of Italy, in the duchy of Milan; 20 miles W. of Milan.

Castello *Nuova*, a town of Italy, in the county of Friuli, belonging to the ſtate of Venice; 18 miles N.W. of Udina.

Castello *Nuovo di Terzi*, a town of Italy, in the duchy of Piacenza; 5 miles S. of Buſſeto.

Castello *Nuovo*, a town of the duchy of Modena; 9 miles N.N.W. of Reggio.

Castello *Nuovo*, a town of Italy in the Breſſan; 22 miles S. of Breſcia.

Castello *de Nubrega*, a town of Portugal, in the province of Entre Duero é Minho; 2 leagues N. of Braga.

Castello *de Onigo*, a town of Italy, in the Treviſan, belonging to the ſtate of Venice; 12 miles N.W. of Trevigno.

Castello *della Orſo*, a town of Naples, in Principato Citra; 6 miles S.S.W. of Salerno.

Castello *Pignano*, a town of Naples, in the county of Moliſe; 3 miles E.S.E. of Moliſe.

Castello *de la Plana*, a town of Spain, in the province of Valencia, near the ſea-coaſt, containing one pariſh church, ſix convents, and 10,733 inhabitants. This place is famous for its rich collection of pictures. Near Caſtellen is the river Mijares, which ſupplies water to the aqueduct of Almaſora, a tunnel that paſſes through a rock of limeſtone, and being executed in 1240, deſerves to be regarded as ſtupendous.

Castello *di Ponte*, a town of Italy, in the Belluneſe, belonging to the ſtate of Venice; 4 miles N. of Belluno.

Castello *Puſtedengo*, a town of Italy, in the Lodeſan; 10 miles S.S.E. of Lodi.

Castello *de Real*, a town of Portugal, in the province of Entre Duero é Minho.

Castello *della Ripa*, a town of Italy, in the duchy of Spoleto; 8 miles S.W. of Todi.

Castello *di Sangro*, a town of Naples, in the province of Abruzzo Citra; 15 miles S.E. of Sulmona.

Castello *Seprio*, a town of Italy, in the duchy of Milan; 19 miles N.W. of Milan.

Castello *de Sorotico*, a town of Portugal, in the province of Entre Duero é Minho; 2 leagues N.E. of Amarante.

Castello *Vel*, a town of Spain, in Catalonia; 3 leagues from Terramoſi.

Castello *Vetere*, a town of Naples, in the province of Calabria Ultra, containing one collegiate and nine pariſh churches, and 4 convents; 12 miles N. of Gierace.

Castello *de Vide*, a town of Portugal, in the province of Alentejo, containing about 5700 inhabitants; 3 leagues E.N.E. of Pontalegre.

Castello *dell Volurno*, a town of Naples, in the country of Lavora; 11 miles W.S.W. of Capua.

CASTELLORUM Operatio, caſtle work, or ſervice and labour done by the inferior tenants for the building and upholding of caſtles of defence; towards which ſome gave perſonal aſſiſtance, and others paid their contributions. This was one of the three neceſſary charges, to which all lands among our Saxon anceſtors were expreſsly ſubject. See Castle.

CASTELLUCCIO, in *Geography*, a town of Naples, in the province of Capitanata; 6 miles from Troja. This is a kind of double town; one part of which is agreeably ſituated upon a rocky eminence, with a declivity that ſhews all the houſes as if they were upon terraces, and the other part, built at its foot, amidſt a delightful tract of fields, rich in vines and fruit-trees, and bounded by rows of towering oaks.

CASTELLUM, in *Ancient Geography*, a place of Paleſtine, on the ſea of Galilee, near Tiberias.—Alſo, an epiſcopal ſee of Africa, in Numidia.—Alſo, an African epiſcopal ſee, in Mauritania Cæſarienſis.—Alſo, a town and epiſcopal ſee of Africa, in Mauritania Setifienſis.—Alſo, a place of Italy, S.W. of Faventia, belonging to the Boii.

Castellum *Druſi* et *Germanici*, a place mentioned by Tacitus (Annal. 156.), on the other ſide of the Rhine; the ruins of which ſtill bear the name of "Alt Konigſtein," or the old royal monument.

Castellum *Jaberitanum*, an epiſcopal city of Africa, in Mauritania Cæſarienſis.—C. *Medianum*, an epiſcopal ſee of Africa, in Mauritania Cæſarienſis; called "Monumentum Medianum" by Ammianus Marcellinus.—C. *Menapiorum*, *Keſſel*, a fortreſs of Gaul, on the left of the Meuſe.—C. *Minoritanum*, an epiſcopal ſee of Africa, in Mauritania Cæſarienſis.—C. *Morinorum*, *Caſſel*, a place of Gaul, called ſimply *Caſtellum* in the Itinerary of Antonine; it was at ſome diſtance to the eaſt from Bononia, and N.E. of Taruenna. See Cassel.—C. *Ripenſe*, an epiſcopal ſee of Africa, in Mauritania Cæſarienſis.—C. *Romanum*, *Brittenburg*, a fortreſs at the extremity of the Rhine, called by ſome authors Arx *Britannica*, which ſee.—C. *Tatroportenſe*, an epiſcopal ſee of Africa, in Mauritania Cæſarienſis.—C. *Titulianum*, or *Titulitanum*, an epiſcopal ſee of Africa, in Numidia.—C. *Trajani*, *Caſſel*, a fortreſs ſituate to the right of the Rhine, at a place where it received the name of Mænus, the Mayne. This fortreſs was repaired by Julian, and is different from another ſituated a little more to the eaſt, and which is mentioned by Tacitus.

CASTELLUS, Bartholomew, in *Biography*, an Italian phyſician of conſiderable learning and eminence, practiſed at Meſſina the latter part of the 16th and beginning of the 17th centuries. He was author of two works, both for a long time extremely popular. "Totius Artis Medicæ, Methodo diviſa, Compendium et Synopſis, in qua quidquid ab Hippocrate, Galeno, Avicenna, ſummiſque in Arte Doctoribus ſcriptum eſt, continetur," Meſſan. 1597, 4to. This has been many times reprinted, the laſt time at Geneva, in 1746. "Lexicon Medicum Græco-Latinum," Venice, 1607, 4to. This work ſtill retains its popularity. It has paſſed through numerous editions, and been much enlarged and improved, particularly by Vander Linder, and afterwards by Jacob Bruno. The laſt edition was printed at Naples in 1761. Haller Bib. Med.

CASTELLUZZA, in *Geography*, a town of Naples, in the province of Principato Citra; 12 miles E. of Salerno.

CASTELLUZZO di Schiavi, a town of Naples, in the province of Capitanata; 8 miles E. of Troja.

CASTELMARMORA, a town of Aſiatic Turkey, in the province of Natolia; 28 miles S.W. of Mogla.

CASTELMIRABEL, a town of the iſland of Candia, in the Mediterranean, on the north coaſt of a large bay; 18 miles W. of Settia.

CASTELNAU, Michael De, in *Biography*, an eminent commander and ſtateſman in the reigns of Charles IX. and Henry III. of France, was employed in many important negociations, and being five times ambaſſador in England, reſided here for 10 years ſucceſſively in his firſt embaſſy. He took an active part in favour of Mary queen of Scots; endeavouring to reconcile her to her huſband Darnly, and interceding in her favour under the harſh treatment of Elizabeth. He died in 1592. The memoirs of his negociations, publiſhed by Le Laboureur, in 2 vols. fol. in 1659, and reprinted at Bruſſels in 1731, are regarded among the moſt curious and valuable materials of the age, and written in a pure and unaffected ſtyle, without paſſion or partiality. His daughter Catherine was miſtreſs of four languages, and tranſlated her father's memoirs into Engliſh. Nouv. Dict. Hiſt. Robertſon's Hiſt. of Scotland, vol. i. p. 318, &c. vol. ii. p. 128.

Castelnau *de Bonnafoux*, in *Geography*, a town of France, in the department of the Tarn, and diſtrict of Alby; one league W. of Alby.

Castelnau *ſur Gupie*, a town of France, in the department of the Lot and Garonne; 1½ league N.N.W. of Marmande.

Castelnau *de Magnoac*, a town of France, and ſeat of a tribunal, in the department of the Higher Pyrenées, and chief place of a canton in the diſtrict of Bagnères; 20 miles E. of Tarbe. The place contains 1200, and the canton 10,296 inhabitants; the territory comprehends 192½ kiliometres and 32 communes.

Castelnau *de Medoc*, a town of France, in the department

ment of the Gironde, and chief place of a canton in the diſtrict of Bourdeaux; 14 miles N.N.W. of Bourdeaux. The place contains 1008, and the canton 12,574 inhabitants; the extent of the territory comprehends 950 kiliometres and 19 communes.

Castelnau *de Montmirail*, a town of France, in the department of the Tarn, and chief place of a canton in the diſtrict of Gaillac; 2 leagues N.W. of Gaillac. The place contains 2523, and the canton 9715 inhabitants; the territory includes 162⅘ kiliometres and 15 communes.

Castelnau *de Montratier*, a town of France, in the department of the Lot, and chief place of a canton in the diſtrict of Cahors; 4 leagues S. of Cahors. The place contains 4271, and the canton 8861 inhabitants; and the territory includes 182¼ kiliometres and 8 communes.

Castelnau *de Rivière-baſſe*, a town of France, in the department of the Upper Pyrenées, and chief place of a canton in the diſtrict of Tarbe; 7 leagues N.N.E. of Pau. The place contains 1252, and the canton 4574 inhabitants; the territory includes 72⅘ kiliometres and 8 communes.

Castelnau *de Strettefond*, a town of France, in the department of the Upper Garonne, and diſtrict of Toulouſe; 4 leagues N. of Toulouſe.

CASTELNAUDARY, a town of France, and principal place of a diſtrict, in the department of Aude; before the revolution, the capital of Lauragais; ſeated on an eminence, near the grand reſervoir which ſupplies the canal of Languedoc. The place contains 7610, the north canton 13,813, and the ſouth canton 12,629 inhabitants; the territory of the former includes 285 kiliometres and 19 communes; that of the latter 145 kiliometres and 13 communes. N. lat. 43° 19′. E. long. 1° 51′.

CASTELOMONTE, a town of Piedmont, in the marquiſate of Ivrea; 7 miles S.S.W. of Ivrea.

CASTELPROTISSA, a town on the ſouth coaſt of the iſland of Candia; 25 miles S.S.W. of Candia.

CASTELVETRO, Lewis, in *Biography*, an eminent Italian ſcholar, was a native of Modena, deſcended from a noble family, and born in 1505. Educated in the univerſities of Bologna, Ferrara, Padua, and Sienna, he graduated at the latter place in law, being deſigned by his father for that profeſſion; but his natural inclination led him to the cultivation of polite literature. In his native place he was aſſiduous in promoting letters among his countrymen, and became an active member of the newly-erected academy. His connection with this learned body occaſioned his being ſuſpected of hereſy, and his quarrel with Annibal Caro (ſee Caro) contributed to his being accuſed to the inquiſition as unſound in the faith. In 1557 he was cited to Rome, but dreading an examination, he for ſome time concealed himſelf; but at length, in 1560, he repaired thither, and after being thrice examined, he thought it moſt prudent to make his eſcape; the conſequence of which was the publication of a ſentence, previouſly pronounced againſt him, as a contumacious heretic. At Chiavenna, where he ſettled for ſome time, he gave private lectures to ſeveral ſtudents on Homer, and on the rhetoric addreſſed to Herennius. From thence he removed to the court of Maximilian II. at Vienna, and dedicated to that emperor his commentary on Ariſtotle's Poetics. Being driven from Vienna by the plague, he returned to Chiavenna, where he died in 1571. Caſtelvetro was an accurate grammarian, and an acute though ſomewhat too cenſorious critic. He took pains in perfecting the Italian language, and wrote remarks of a grammatical and critical kind on ſeveral authors, both ancient and modern, which were firſt publiſhed by Muratori in 1727. His "Examination of the Rhetoric addreſſed to Herennius," was printed in 1653. His "Expoſition of Petrarch's Poems," which he left unfiniſhed, was publiſhed by his nephew. He compoſed various pieces in Latin verſe, with great elegance; and his ſkill in Greek was manifeſt in his verſion, with a commentary, of Ariſtotle's Poetics, and in his Italian tranſlation of Chryſoſtom's expoſition of the Goſpels. He alſo ſtudied the Provençal tongue, and tranſlated, in conjunction with Barbieri, into Italian, many of the poems and lives of the Provençal poets, and gave a grammar of the language. Gen. Dict. Gen. Biog.

CASTER, in *Geography*, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers; 8 miles E.N.E. of Juliers.

Caster, or Caistor. See Castor.

CASTETS, a town of France, in the department of Landes, and chief place of a canton in the diſtrict of Dax; 7 miles N. of Dax. The place contains 877, and the canton 5429 inhabitants; the territory includes 640 kiliometres and 10 communes.

CASTHANÆA, or Castanæa, in *Ancient Geography*, a town of Theſſaly, in Magneſia, at the foot of mount Pelion.

CASTIGATION, *Caſtigatio*, among the Romans, the puniſhment of an offender by blows, or beating with a wand or ſwitch. Caſtigation was chiefly a military puniſhment, the power of inflicting which on the ſoldiery was given to the tribunes. Some make it of two kinds, one with a ſtick or cane, called *fuſtigatio*; the other with rods, called *flagellatio*; the latter was moſt diſhonourable.

Castigations, in a *Literary Senſe*, denote corrections, or emendations of the text of an ancient writer.

CASTIGATORY. See Cucking *ſtool*.

CASTIGLIOLA, in *Geography*, a town of Piedmont, in the county of Aſti; 5 miles S.S.W. of Aſti.

CASTIGLIONE, Baldassar, in *Biography*, an eminent ſtateſman and writer of Italy, was born of noble parents at the villa of Caſatico near Mantua in 1468. He ſtudied firſt at Milan, and commenced his political career at an early period, as page to Lewis Sforza, duke of Milan. In 1499 he attached himſelf to Gonzaga, marquis of Mantua, and in 1504 entered into the ſervice of Guidubaldo, duke of Urbino, in whoſe court, which was then the favourite reſort of ſcience and letters, he reſided for ſeveral years. This duke ſent him as his embaſſador to Henry VII. king of England in 1506, and in the following year he attended in the ſame capacity on Lewis XII. then at Milan. On the death of Guidubaldo in 1508, he remained in the ſervice of the new duke, Francis Maria della Rovere, whom he accompanied in ſeveral military expeditions as lieutenant-general of the army of the church under pope Julius II. He was recompenſed for his ſervices in 1513 by the caſtle of Nuvilara near Peſaro, and the grant was confirmed to him by pope Leo X. Upon his return to Mantua, he regained the favour of the duke Gonzaga, whom he had offended by quitting his ſervice, and in 1516 married Maria Hippolita, a lady no leſs illuſtrious for her birth than for her beauty and accompliſhments. This lady was diſtinguiſhed by her Latin and Italian compoſitions, both in proſe and verſe; and her poems are publiſhed in a collection of the works of five illuſtrious Italian poets. This connection terminated in 4 years by the death of Hippolita. Caſtiglione was afterwards employed by the marquis Frederic of Mantua as his embaſſador to Rome, where he remained ſeveral years and enjoyed that kind of literary ſociety to which he was attached and of which he was a principal ornament. He was particularly diſtinguiſhed by his reſearches into all the remains of antiquity, and by his exquiſite

quiſite taſte in the fine arts. In 1522 he returned to Mantua, with a view of ſerving his prince in the war againſt the French. When he again viſited Rome, he was employed by pope Clement VII. in 1524 as nuncio to the emperor Charles V.: but failing to terminate the difference between the imperial and papal courts, and incurring unjuſt ſuſpicions on the part of Clement, his diſappointment and anxiety were the occaſions of an illneſs, of which he died at Toledo in 1529. Five years after his death, his body, which had been interred with great ſolemnity in the cathedral, was removed by order of his mother to a church five miles from Mantua, in which a ſuperb mauſoleum was erected to his memory, with an inſcription written by cardinal Bembo. His ſtatue has been ſince placed in the royal academy of Mantua. The moſt celebrated of his works is "Il Cortigiano" or the Courtier, diſcuſſing the manner of living in courts, ſo as to be uſeful and agreeable to the prince, and containing a variety of reflections and maxims, delivered in an eaſy and elegant ſtyle, which has rendered it an original and claſſical work. It was finiſhed in 1518, reviewed by his friend Bembo, but not printed till the year 1528. It paſſed ſpeedily through ſeveral editions, and was tranſlated into moſt of the languages of Europe. It is denominated by the Italians "the golden book," and a fine edition of it was printed ſo lately as 1733 at Padua, with the life of the author prefixed by Bernardino Marliani. On account of ſome free expreſſions it was inſerted in the liſt of prohibited books; but in 1576 the author's ſon obtained for a corrected form of it a licence from the congregation of the index. The letters of Caſtiglione were publiſhed at Padua in 2 vols. in 1769, with annotations by the abbate Saraſſi. His Italian poetical compoſitions have been publiſhed ſeparately, and his Latin productions were publiſhed in the firſt volume of the "Deliciæ Poet. Italor. by Gruter." Moreri. Gen. Biog.

CASTIGLIONE, GIOVANNI BENEDETTO, called GRECHETTO, an admired painter, was born at Genoa in 1616, and ſtudied firſt under Battiſta Pagi and afterwards in the academy of Giovanni Andrea de Ferrari; but he owed his chief improvement to the inſtructions of Vandyck, who at that time reſided at Genoa. His manner of deſign, in all branches of his art, was grand; and he equally ſucceeded in all; in ſacred and profane hiſtory, landſcape, cattle, and portrait; all which he executed with an equal degree of truth, freedom, and ſpirit. His predominant inclination, though he poſſeſſed an univerſal genius, led him to ſelect rural ſcenes and paſtoral ſubjects, markets, and animals, in which he had no ſuperior. He combined with great readineſs of invention a bold and noble tint of colouring, elegant, and generally correct, drawing, a judicious touch, and a free and firm pencil: and he alſo happily applied the chiaro-ſcuro, which he thoroughly underſtood, through all his works. In the chapel of St. Luke's church at Genoa, is an excellent picture by this maſter: alſo in the Palazzo Brignolè is a grand compoſition; and at Palazzo Caragha in the ſame city is an hiſtorical picture of Raphael concealing the Teraphim from Laban, in which the figures and animals are very fine. The etchings of this celebrated artiſt, which are numerous, are ſpirited, free, and full of taſte: and their effect is, in general, powerful and pleaſing. Among his moſt eſtimable plates, may be reckoned the following, all from his own compoſitions: viz. "Animals coming to the ark;" "Laban ſearching for his gods in the tent of Jacob;" "The angel appearing to Joſeph in a dream;" "The nativity of our Saviour;" "The flight into Egypt;" "The reſurrection of Lazarus;" "Diogenes with his lanthorn;" "A magician with ſeveral animals;" "The little melancholy;" "A ruin with a vaſe, and two men, one of them pointing to a tomb;" two "rural ſubjects, with fauns and ſatyrs;" and two "ſets of heads." He died in 1670. Pilkington. Strutt.

*Franceſco Caſtiglione*, the ſon of Benedetto, was the diſciple of his father, and was born at Genoa. He inherited in a very conſiderable degree the talents of his father, and imitated his ſtyle and manner exactly, in compoſition, handling, and deſign. Many pictures, aſcribed to Benedetto, and occurring in ſales and collections, are thought to be copies after him by his ſon Franceſco, or perhaps originals of the younger Caſtiglione. Pilkington.

CASTIGLIONE, in *Geography*, a town of Italy, belonging to the republic of Lucca, inſulated in the Modeneſe; 18 miles N. of Lucca.—Alſo, a town of Italy, in the republic of Lucca, 8 miles S.W. of Lucca.—Alſo, a town of Italy, in the duchy of Tuſcany, ſituated on a lake near the ſea. This lake, which is two leagues in diameter, and communicates with the ſea, produces great quantities of ſalt. The reſervoirs contain 4,859,000 cubic feet of water, which after evaporation, leave 11,000,000 pounds of ſalt.—Alſo, a town in the ſtate of Genoa; 23 miles E. of Genoa.—Alſo, a town of Naples, in the province of Principato Citra; 5 miles N.E. of Salerno.—Alſo, a town of Naples, in the province of Abruzzo Citra; 6 miles E.S.E. of Civita Borella.—Alſo, a town of Naples, in the province of Calabria Citra; 17 miles S.S.W. of Coſenza.—Alſo, a town of Sicily, in the valley of Demona; 9 miles W.N.W. of Taormino.—Alſo, a town of Italy, in the duchy of Mantua; 9 miles W. of Mantua.

CASTIGLIONE *di Gatti*, a town of Italy, in the Bologneſe; 20 miles S. of Bologna.

CASTIGLIONE *della Stivera*, a town of Italy, and principality, in the duchy of Mantua, defended by ſome fortifications and a citadel; and containing about 3000 inhabitants; 20 miles N.W. of Mantua. In 1796 a battle was fought near this town between the Auſtrians and French, in which the latter took 6000 priſoners.

CASTIGLIONIA, in *Botany*, Flor. peruv. pl. 37. Claſs and order, *polygamia monœcia*.

Gen. Ch. *Cal.* five-leafed, permanent; leaves oblong, the three exterior ones largeſt. *Cor.* Petals five, oblong, villous on the inner ſide. *Stam.* ten. *Piſt.* Germ ſuperior, three-ſided, ſurrounded by five ſcales; ſtyle trifid; ſtigmas three, bifid. *Peric.* Capſule three-ſided, ſix-furrowed, three-celled, three-valved. *Seeds* ſolitary. A ſhrub. *Flowers* in racemes; male ones intermingled with the others and differing from them only in the barrenneſs of the germ. A native of Peru.

CASTIGLUINI, in *Geography*, a town of Naples, in the province of Principato Ultra; nine miles E.N.E. of Conza.

CASTIL BLANCO, a town of Spain, in the province of Andaluſia; five leagues N. of Seville.

CASTILE, a country of Spain, comprehending the provinces of Old and New Caſtile, and the kingdom of Caſtile. Some have referred the origin of this name to a certain old Spaniſh tribe, or nation, called by the Romans "Caſtellani," who are ſuppoſed to have inhabited theſe parts of Spain, as well as Catalonia. But others with greater probability have traced it no higher than the recovery of this country out of the hands of the Moors; at which time, they ſay, there was a ſtrong caſtle built for the defence of the frontier, in which the count, or great officer of the province, reſided, from whence it took its name and its arms. Whilſt *Old Caſtile*, ſo called becauſe it was recovered from the Moors long before that which is ſtyled the *New*, remained under the dominion of the Moors, there were ſeveral great lords who maintained themſelves in the poſſeſſion of certain diſtricts, and who, gradually increaſing in wealth and power, at length ſhook off the yoke of the infidels, and put themſelves under the protection of the kings of Oviedo. According to this account, it is probable that theſe lords had each of them a well fortified manſion, or caſtle; whence, at the emancipation of this province from the yoke of the Moors, it might well receive the name by which it has ever ſince been known. Theſe lords, ſupported by their new protector, were not only able to defend their frontier, but to extend their little territories by their excurſions againſt the Moors, as often as any favourable opportunity occurred, and hence aſſumed the title of counts; and being regarded as feudatories of the monarchs before mentioned, were ſummoned in time of war to repair with their vaſſals to attend the king's ſtandard, and in time of peace were called to the aſſemblies of the eſtates. The firſt of theſe counts, mentioned by name in the Spaniſh hiſtories, is Don Rodriguez, who flouriſhed in the reign of Don Alonſo el Caſto, or the Chaſte, about the cloſe of the 9th century, whom he aſſiſted in his wars againſt the infidels. Caſtile, from being only a county, and ſubject to the kings of Leon, was erected in 1016 into an independent kingdom: and in 1037 the two kingdoms of Leon and Caſtile were united in the perſon of Ferdinand I. of Leon, and II. of Caſtile. This union was rendered perpetual in the perſon of Ferdinand II., after the death of Don Alonſo of Leon, A. D. 1230; from which time theſe two kingdoms have never been ſeparated, but have gradually drawn to them all the other ſovereignties in Spain: thoſe of the Chriſtians by inheritance or marriage, and thoſe of the Moors by conqueſt. Upon the death of Don Juan, king of Arragon, in 1479, Arragon and its dominions were united to the crown of Caſtile, in the perſons of their catholic majeſties Ferdinand and Iſabella, who, in 1474, had been proclaimed king and queen of Caſtile and Leon. See Arragon. After this period the Spaniſh crowns were united and deſcended in the ſame line; and the kingdom of Caſtile was loſt in that of Spain. See Spain.

Castile, *Old*, a province of Spain, with the title of kingdom, was formerly part of the Roman Tarraconenſis, and borders all the way on the ſouth to New Caſtile, from which it is divided by a high chain of mountains, extending directly from weſt to eaſt; on the north it is ſeparated from Aſturias and Biſcay by another range of hills branching out from the Pyrenées; but between theſe two provinces it has a narrow ſlip of land which reaches quite to the bay of Biſcay: on the eaſt it is parted by the Ebro and the mountain of Doea, for a conſiderable length, from Navarre and Arragon: and on the weſt it is bounded by Leon. The greateſt extent of this province from north to ſouth reaches from 40° 10′ to 43° 15′ of N. latitude, and from 1° 30′ to 4° 10′ of W. longitude; i. e. about 180 miles from N. to S. and about the ſame number from E. to W. in thoſe parts where it has both ways the greateſt extent; for its figure is very irregular, and its dimenſions are in various parts very different. The principal rivers in this province are the Ebro, Duero, Piſurga, Arlançon, and Arlança; and the chief towns are Avila, Burgos, the capital, Calahorra, Segovia, Siguenza, and Valladolid. Its climate is ſomewhat different from that of New Caſtile, as it is more mountainous, inſomuch that ſome have repreſented it as a terrace formed by the mountains of Biſcay, or by the Pyrenées, of which theſe are a branch. In ſummer this mountain-plain is deſtitute of water, and burnt up with heat. But, in general, whilſt the vallies are very hot, the upper grounds are proportionably cold and bleak. In this country no other means are employed to counteract the ſeverity of the weather and the bleak winds, which, on the high open plains, are very boiſterous, beſides a large chafing-diſh, (braſero) which is uſually placed beneath the table. Stoves and chimnies are never ſeen in common houſes. Snow covers the tops of the mountains through the ſummer; and it is carried away and ſold in the towns, for cooling their wine. The ſoil, though in various parts cold, is moderately good, and might be rendered much more productive by better cultivation. The wine is much extolled; and the plains are covered with cattle, and more eſpecially with ſheep, the wool of which is much valued.

Castile, *New*, called alſo "The kingdom of Toledo," which was formerly its capital, a province of Spain, bounded on the north by Old Caſtile, from which it is ſeparated by a chain of mountains known by the name of the country through which they run; on the eaſt it is divided by a ſimilar ridge from Arragon and Valencia; on the ſouth it is parted from Andaluſia by the mountains called Sierra Morena, and by an imaginary line from Murcia; and on the weſt it is ſeparated from Eſtramadura and Leon by a ridge of hills called Guadaloupe and La Sarena. Its length from ſouth to north is about 180 miles, and its greateſt breadth about the ſame number, though its form is very irregular. New Caſtile conſiſts of three cantons, viz. La Mancha, the ſouthern part, La Sierra, lying towards the eaſt, and Algaria, which is the northern part. Its principal rivers are the Tagus, Guadiana, Guadalquivir, Xucar, Xarama, and Guadarama, beſides ſeveral others of leſs note. The capital of this province is Madrid. As it is inland and ſurrounded with high mountains, its climate is hotter in ſummer, and colder in winter, than other diſtricts which lie along the ſea-coaſts in the ſame latitude. It is, however, ſalubrious, and the ſoil is generally fertile, but needing cultivation. The northern parts produce fruits and wine, and the ſouthern, good paſtures and fine wool.

Castile *del Oro*. See Terra *Firma*.

CASTILLAN, in *Commerce*, a gold coin, current in Spain, valued at fourteen rials and a half.

Castillan alſo denotes a weight uſed by the Spaniards in the weighing of gold, containing the hundredth part of a Spaniſh pound. It is alſo uſed at Buenos Ayres, and the mines of Chili and Potoſi.

CASTILLE, in *Military Language*, a term that was formerly made uſe of to denote the attack of a tower or caſtle. This attack became alſo a ſort of military ſport or play, in which thoſe who carried it on uſed ſnow-balls. In 1546, the diviſion, being ſurpriſed in one of thoſe attacks, that was executed at *Roche Guyon*, became angry and heated, a circumſtance that coſt the duke d'Enghien his life, and put a period to the games or ſports in France called *Caſtilles*, as that which occaſioned the death of Henry III., put an end to the martial game or exerciſe of tournament.

CASTILLEJA, in *Botany*, (ſo called by Mutis in honour of Caſtillejus, a Spaniſh botaniſt, reſident at Cadiz,) Linn. jun. Supp. p. 47. Schreb. Gen. 1059. Willd. 1205. Juſſ. p. 100. Vent. vol. ii. 299. Claſs and order, *didynamia angioſpermia*. Nat. ord. *Perſonatæ*, Linn. *Pediculares*, Juſſ. *Rhinanthoides*, Vent.

Gen. Ch. *Cal.* perianth one-leafed, tubular, longitudinally cloven in front more than half-way down, nerved, coloured, ſomewhat ſwelling at the baſe. *Cor.* monopetalous, gaping; upper lip long, channelled, curved inwards, emarginate, pubeſcent on the back; lower lip very ſhort, trifid; ſegments acute, with two glands between them inſerted into the throat of the corolla. *Stam.* filaments four, inſerted into the baſe of the corolla, the length of the upper lip, filiform, ſmooth; the lower pair a little ſhorter;

anthers twin, linear, oblique. *Piſt.* germ ſuperior, oblong; ſtyle filiform, the length of the ſtamens; ſtigma ſimple, obtuſe. *Peric.* capſule ovate, compreſſed, two-celled; the partition contrary to the valves. *Seeds* numerous, ſmall.

Eſſ. Ch. Calyx tubular, cloven longitudinally more than half-way down; lower lip of the corolla very ſhort, trifid, with two glands between the ſegments; capſule two-celled.

Sp. 1. C. *fiſſifolia*, Smith Ined. tab. 39. Mut. Amer. vol. i. tab. 11. Lam. Illuſt. pl. 519. fig. 2. "Leaves pinnate-gaſhed near the tip." *Root* perennial, branched, fibrous. *Stem* three or four feet high, herbaceous, or ſomewhat woody, erect, roundiſh, with few branches, pubeſcent. *Leaves* alternate, ſeſſile, ſpreading, entire at the baſe, pinnatifid near the tip, pubeſcent on both ſides, three-nerved; ſegments from three to ſeven; ſtipules none. *Flowers* towards the ends of the larger branches, ſolitary, peduncled, ſpecious, probably ſcarlet; proper bractes none; peduncles round, pubeſcent, ſcarcely one-third of the length of the leaves. A native of New Granada. 2. C. *integrifolia*, Smith Ined. tab. 39. Mut. Amer. vol. i. tab. 12. Lam. Illuſt. Pl. 519. fig. 1. "Leaves linear-lanceolate, entire." *Stem* herbaceous, round, upright, branched, leafy, ſlightly rough, with hairs. *Leaves* alternate, ſeſſile, ſpreading, obtuſe, ſlightly channelled, nerved, pubeſcent on both ſides; ſtipules none. *Flowers* on the elongated ends of the branches, forming a ſort of raceme, each from the axil of its own bracte-ſhaped leaf, a little ſmaller than thoſe of the preceding ſpecies; peduncles filiform, upright, ſhorter than the leaves. A native of New Granada, where both ſpecies were diſcovered by Mutis.

CASTILLO, Castello or Castelli, Gio Batista, in *Biography*, an eminent painter of hiſtory of the 16th century, commonly called *Il Bergamaſco*, in contradiſtinction to Gio. Bat. Caſtelli, a Genoeſe, ſcholar of Cambiaſo, and the moſt celebrated miniature-painter of his time, was born at Bergamo, and conducted to Genoa by Aurelio Buſo of Crema, and left by him in that city. In this forlorn ſtate, he was patroniſed by the Pallavicini family, who ſent him to Rome, where he was formed an architect, ſculptor, and painter, not inferior to Cambiaſo. At Rome, Palomino reckons him among the ſcholars of Michael Angelo. He was the companion of Lucas Cambiaſo, and adopted his technic principles; and we diſcover, ſays Mr. Fuſeli, the ſtyle of Raffaello verging already to practice, but not ſo mannered as that which prevailed at Rome under Gregory and Sixtus. In Cambiaſo we recogniſe a greater genius and more elegance of deſign; in Caſtello, greater diligence, deeper knowledge, a better colour, a colour more nearly allied to the Venetian than the Roman ſchool. Theſe two artiſts aſſiſted each other, even on occaſions where they appeared to be competitors. Thus, at the Nuntiata di Portoria, Lucas on the pannels repreſented the final doom of the bleſſed and the rejected in the laſt judgment; whilſt G. Batiſta on the ceiling, expreſſed the judge in an angelic circle receiving the elect. His attitude and ſemblance ſpeak the celeſtial welcome with greater energy than the adjoined capitals of the words "Venite Benedicti." This is a picture ſtudied in all its parts, of a vivacity, compoſition, and expreſſion, which give to the pannels of Lucas the air of a work done by a man half aſleep. He alſo worked alone; ſuch is the S. Jerome ſurrounded by monks frightened at a lion, in S. Franceſco di Caſtello, and the crowning of St. Sebaſtian after martyrdom in his own church, which is a picture as rich in compoſition as ſtudied in execution, and ſuperior, ſays Mr. Fuſeli, to all my praiſe. This artiſt, though little known in Italy, paſſed the laſt years of his life at Madrid, as painter to the court. He died in 1570, at the age of 70 years. He had two ſons, Fabrizio and Granello, whom he took with him to Spain as his aſſiſtants, whoſe works in the Eſcurial are much commended. Pilkington's Dict. by Fuſeli.

Castillo y Saavedra, Antonio Del, a celebrated Spaniſh painter, was born at Cordova in 1603, and having ſtudied under his father Auguſtin, perfected himſelf in the ſchool of Zurbaran at Seville. On his return to his native place, he was employed in a variety of works, evincing his great ſkill in drawing and deſign, but not equal in colouring. He practiſed in hiſtory, portrait, and landſcape, with great reputation. In 1666, he reviſited Seville, where, on ſeeing ſome of the brilliant productions of Murillo, he gazed on them with ſilent admiration, and then ſuddenly exclaimed, "Caſtillo is no more." After his return to Cordova, he died in leſs than a year of melancholy and deſpair. Caſtillo united the talent of poetry to that of painting. Cumberland's Anecdotes of Spaniſh Painters. Nouv. Dict. Hiſt.

Castillo *de Sancho Abarça*, in *Geography*, a town of Spain, in Navarre; 5 leagues from Tudella.

CASTILLON, a town of France, in the department of the Gironde, and chief place of a canton, in the diſtrict of Libourne; 3 leagues S.E. of Libourne. The place contains 2580, and the canton 10,713 inhabitants; the territory includes 117½ kiliometres and 16 communes.

Castillon, a town of France, in the department of the Arriege, and chief place of a canton, in the diſtrict of St. Girons; 7 miles S.W. of St. Girons. The place contains 742, and the canton 12,112 inhabitants. The territorial extent comprehends 350 kiliometres and 25 communes.

CASTILLONES, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Villeneuve-d'Agen; 5 miles E. of Lauzun. The place contains 1756, and the canton 7123 inhabitants: the territory includes 117½ kiliometres and 15 communes.

CASTINE, the ſhire-town of Hancock county, in the diſtrict of Maine, N. America, ſituated on Penobſcot bay. It was ſeparated from Penobſcot, and incorporated in 1796. It takes its name from a French gentleman who reſided here more than 130 years ago.

Castine *River*, which is about 14 miles long, is navigable for 6 miles, and has ſeveral mills at the head of it. It diſcharges itſelf into Penobſcot bay.

CASTING is ſometimes uſed for the quitting, laying, or throwing aſide any thing; thus, deer caſt their horns, ſnakes their ſkins, lobſters their ſhells, hawks their feathers, &c. annually.

Casting *of feathers*, is more properly called *moulting*, or *mewing*.

A horſe caſts his hair or coat at leaſt once a year, viz. in the ſpring, when he caſts his winter coat, and ſometimes at the cloſe of autumn he caſts his ſummer coat, in caſe he hath been ill kept.

Horſes ſometimes alſo caſt their hoofs, which happens frequently to coach-horſes brought from Holland; which being bred in a moiſt, marſhy country, have their hoofs too flabby; ſo that coming into a drier ſoil and leſs juicy provender, their hoofs fall off, and others, that are firmer, ſucceed.

Casting is alſo uſed for diſtributing or diſpoſing the parts of a thing to the beſt advantage.

The caſting of a building is more properly called Compartition.

Theatrical writers ſpeak of caſting a play, i. e. diſpoſing the ſeveral parts or characters to proper actors.

Casting *of candles*, ſignifies filling the moulds with tallow. See Candle.

CASTING *a colt*, in *Rural Economy*, is a term that implies a mare's proving abortive.

CASTING *of drapery*, among *Painters*, denotes the diſtribution of the folds; and the drapery is ſaid to be well caſt, when the folds are diſtributed in ſuch a manner as to appear rather the reſult of mere chance than of art, ſtudy, or labour. In that ſtyle of painting which is called "the grand," the folds of the draperies ſhould be great, and as few as poſſible, becauſe their rich ſimplicity is more ſuſceptible of great lights. But it is an error to deſign draperies that are too heavy and cumberſome, for they ought to be ſuitable to the figures, with a combination of eaſe and grandeur. Order, contraſt, and variety of ſtuffs and folds, conſtitute the elegance of draperies; and diverſity of colours in thoſe ſtuffs contributes extremely to the harmony of the whole in hiſtoric compoſitions.

CASTING, in *Falconry*, is any thing given an hawk to purge and cleanſe his gorge. Of theſe there are two kinds, viz. plumage, i. e. feathers; and cotton: the latter whereof is generally in pellets about the bigneſs of hazel-nuts, made of ſoft fine cotton, and conveyed into her gorge after ſupper. In the morning ſhe will have caſt them out; at which time they are to be obſerved, and from the colour and condition they are found in, the ſtate of her body is conjectured. If they be caſt out round, white, and not ſtinking, nor very moiſt, it is an indication all is well; if otherwiſe, particularly if black, green, ſlimy, or the like, ſhe is diſtempered. The caſting of plumage is obſerved after the ſame manner as that of cotton.

CASTING *a figure*, among *Aſtrologers*, the erecting of a celeſtial theme, and dividing the heavens into houſes.

CASTING, in *Foundery*, is the running of a melted metal into a mould prepared for that purpoſe.

The great importance of a knowledge of caſting to a mechanic, on account of the vaſt quantities of caſt-iron now uſed in machinery, has induced us to give a particular deſcription of this branch of the founder's art.

There are three ſorts of caſting, 1. *open ſand caſting*; 2. *ſand caſting between flaſks*; and 3. *loam-caſting*; in moſt of which, an exact pattern, uſually of wood, of the ſubject to be caſt, is given to the founder.

I. Moſt articles, every part of whoſe ſurface on one ſide is in the ſame plane (which we will call the horizontal plane), and every parallel ſection of which is of the ſame ſize in every part as the horizontal plane, or conſtantly decreaſing as they recede downwards from it, and the edges of all which ſections fall within perpendiculars, let fall from the edges of the plane immediately above it, may be caſt in *open ſand*: becauſe, as the founders expreſs it, every ſuch pattern will *lift* out of the ſand, wherein it has been imbedded as deep as its upper or plane ſurface, to form the mould for the metal.

The floor of every foundery is for many feet deep compoſed of a loamy ſand (of which great quantities are brought to London from near Woolwich) ſo that deep pits may be dug, to bury large moulds in. (See FOUNDERY). An example of open ſand-caſting is ſhewn in *Plate* of *Caſting*, *figs.* 1 and 2, which repreſent the arms of a large wheel, the rim of which is to be ſcrewed on by the flaunches *a*, *a*, *fig.* 1.; *b b* is the arm; *d* is a rib caſt with it to ſtrengthen it, the other ſide of the arm muſt be plain; *e* is the opening through which its ſhaft is to paſs. In the place where the mould is to be made, a layer of ſand, *c d*, *fig.* 2, is lightly ſprinkled through a ſieve on the floor, and the pattern A is preſſed down into it, perfectly level; the next operation is ſhovelling the ſand up all round, level with the top of the pattern, and ramming it down, with a tool, *fig.* 4.; a ſponge is then uſed for ſlightly wetting the ſand all round the edges of the pattern to make it adhere together; the next operation is lifting the pattern out of the ſand by one or more ſcrews, *fig.* 5, ſcrewed into the wood; if the pattern is ſmall, this is done by one or more men, but in very large works it is done by a crane; the cores for the bolt holes through the flaunches, *a*, *a*, *fig.* 1. are made by ſticking pieces of dried clay in the ſand in the proper places, and the core for the hole *e*, made of clay, is alſo ſet in its place; the workman then uſes a pair of bellows for blowing away any ſmall pieces of ſand which may have fallen into the mould. It is now ready for filling with metal; in ſmall works this is done by ladles, and in large, by ſmall ditches made in the ſand, from the mould to the mouth of the furnace: when the mould is filled, the metal is covered up with ſand to keep the air from it.

II. *Sand-caſting* between flaſks is uſed for thoſe articles which if they were cut into two or more pieces (provided the cutting planes were parallel to each other) each ſeparate piece might be caſt in open ſand. A ſpecimen of this ſort of caſting is ſhewn in *fig.* 6, which is an endleſs ſcrew and ſpindle, often compoſed of caſt iron. A B and C D are frames called flaſks, with four handles, *c*, *d*, *e*, *f*, to lift by; *a*, *b*, *l*, *m*, are iron points fitting into holes *g*, *h*, *i*, *k*, in the other flaſk C D, for aſcertaining when they fit each other. The under flaſk C D is ſet upon a board, filled with ſand, and the ſame is rammed tight into it: the workman then takes the pattern E F, and preſſes one half of it into the ſand, and ſmooths the ſand up to the ſides of the pattern with a trowel, *fig.* 3; he then ſets the empty flaſk, A B, over the other, C D, putting its points *a*, *b*, *l*, *m*, into the holes *g*, *h*, *i*, *k*; and after ſprinkling ſome ſand which has been burnt over the ſand in the under flaſk, he fills the upper one with ſand, and rams it down; he next with a piece of wood, put through the ſand in the upper flaſk, makes a hole ſhewn at *p*, to pour the metal through; the upper flaſk, A B, with the ſand in it, is then lifted off by men, or in large works, by a crane, and the pattern, E F, lifted out; the flaſk, A B, is then put on again, and heavy weights are laid on it to keep it down, ready for caſting. It muſt be obſerved, that at every higheſt point of large moulds a ſmall hole muſt be made through the ſand in the upper flaſk, to allow the air to paſs out of the mould when the metal is poured in.

*Figs.* 7, 8, 9, and 10 ſhew the manner of caſting a cog-wheel with eight arms, all of which are ribbed on both ſides. The pattern is laid upon a board with the face ſhewn in *fig.* 7, upwards; an empty flaſk is laid upſide downwards over the board and pattern; it is filled with ſand and rammed tight; a plain board is then laid upon the flaſk, and two men turn it over, bringing the pattern to the top, as ſhewn in *fig.* 10; the workman with a ſmall trowel, *fig.* 3, then digs all the ſand out of the ſpace A A, *fig.* 10, between each arm, leaving it level with the tops of the ribs, *a b*, *c d*, &c. *fig.* 7; into each of the ſpaces thus formed, a piece of iron plate, *fig.* 8, cut to ſuit the ſame, is laid; it has an iron rod, *a*, projecting from the upper ſide and two points, *b*, *d*, at the under ſide, which are inſerted into the ſand between the arms, ſo that the two edges, *e*, *f*, touch the upper edge of the arms *a*, *b*, of the wheel, *fig.* 7. The ſpaces above theſe plates are then filled with ſand and rammed down level with the reſt of the ſand in the flaſk: burnt ſand is then ſprinkled over the lower flaſk to prevent the ſand which is now to be rammed into the upper flaſk, C D, from adhering to that in the lower; the holes for the metal are next made through the top flaſk, and it is then taken off; the iron plates and the ſand upon them are taken out by the ends of the iron, *a*; the ſand round the pattern is ſlightly wetted, and the cogs of the wheel are taken out one by one (for which purpoſe they are only fixed on by a dovetailed groove cut in the rim, ſee M) and then the whole wheel is lifted out by the ſcrews, *fig.* 5; the iron plates are then put again in the place where they ſtood before, being determined by the holes which the points, *b*, *d*, made in the ſand. The hole H through the wheel, which is to receive the ſhaft, is ſolid in the pattern, and a projection of the ſame ſize as the intended hole is fixed on; this projection forms a receſs, *k*, *fig*. 10, in the ſand, which is to determine the place of the core, M, *fig*. 9, for the hole which is made in a ſeparate pattern of well tempered clay or wet loam and dried. The upper flaſk, C D, is then put on again, and loaded with weights ready for caſting. In caſting large cog-wheels, &c. flaſks are often wanted as large as 20 feet on each ſide; to keep the ſand from falling out, bars of wood are bolted acroſs the flaſk, into which long nails are driven, before it is filled, to keep the ſand together. Theſe large flaſks are lifted by a crane.

III. *Loam-Caſting* is uſed for bulky articles, as cylinders, large pipes, boilers, cauldrons, &c. &c. We will begin by deſcribing the manner of forming the mould for a large cylinder: A, *fig*. 11, is a beam of the building; B B is a ſpindle with three or four holes, *d c*, through it, to fix an iron arm D in, at different heights by a nut; E E is a board, that can be firmly fixed between the bars D and F, by two clamps, G, H: the operation is begun by laying an iron ring L upon the ground, and adjuſting it ſo as to be concentric to the ſpindle B; a cylinder of brickbats and clay or wet loam, inſtead of mortar, is then built upon it, ſome inches leſs in diameter than the intended cylinder, for which this is to form a core; the bricks are ſtrongly bound together with iron hoops, nealed wire, &c. and a fire is then lighted in it. When the loam uſed with the bricks is dry, a coating of loam is ſpread over it, and is ſmoothed by turning the board E E round it. This coat makes it of the proper ſize for the inſide of the cylinder to be caſt, and is called the core of the mould; another cylinder is built, plaiſtered, and ſmoothed in the ſame way, except that no hoops are uſed, whoſe diameter is the ſame as the outſide of the cylinder to be caſt; when it is finiſhed, it is covered with charcoal ground with water like paint, laid on with a bruſh; and a thin coating of loam is laid on; this is bound round with hoops, and to theſe, four hooks are fixed to lift it by; a thick coat of loam and hair is then laid over it. When all theſe are dry, a man gets into the cylinder, and with a ſmall pick pulls down all the bricks in the inſide cylinder, and then with a trowel cuts away all the loam, leaving the inſide of the external cylinder (which is called the mould) quite ſmooth; this is effected by the coat of charcoal, which prevents the two coats of loam from adhering together.

A deep pit is now dug, in ſome convenient part of the foundery, into which the core is let down by a crane; an apparatus, ſhewn in *fig*. 12, is uſed for ſlinging it to the crane, A B D E is a wrought-iron croſs, the arms of which are ſtrengthened by ties going through the ring F, by which it is hooked to the crane-rope or chain; on each of the four croſs-bars, a ring with a hook, *a b d e*, is looſely fitted; to theſe hooks ropes which paſs through the hooks on the mould are faſtened, in the core theſe ropes go round the ſtubbs, *l*, *l*, of the ring L, *fig*. 11. The mould can always be made to hang perpendicularly, by ſliding the hooks, *a*, *b*, *c*, *d*, nearer to or farther from the center of the croſs. When the core is ſet down in the pit, the mould is let down over it by the ſame means, and when they are adjuſted, the ſand is thrown in, and rammed round, about half the height; a flat cover of dried loam is then put on the top of the mould and core, and round pieces of wood are put in the holes which had before been made in the cover for pouring the metal in at. The burying of the mould is then completed: when it is all levelled. The ſticks which keep open the holes for the metal are carefully pulled out, and ſmall ditches made from the furnace to them, ready for caſting.

*Fig*. 13, ſhews the method of making the mould for an air-veſſel (ſee our article PUMP); the core, A, is built of bricks, plaiſtered with loam and turned by the machine, *fig*. 11, as before deſcribed; the edge of the board, E E, being cut to the proper curve; another is then built of the ſame ſize and form as the outſide of the veſſel to be caſt, with a projecting ring or flaunch at the bottom; this, after being turned, is painted with charcoal, and the mould made upon it as in the laſt caſe; it is plain, that from the ſhape of the core the mould cannot be lifted off, nor can a man readily get in, to take out the bricks as in the caſe of a cylinder; the mould muſt therefore be ſawn in half, B G, with a fine ſaw, to get it off; it is then put together again round the core A, and the crack is plaiſtered up with loam. To deſcribe the more complicated caſes of this kind of Caſting, as the nozzles or valve-boxes and pipes of ſteam-engines, &c. &c. would far exceed our limits.

CASTING *of gold*, *ſilver*, or *copper*, in plates. See COINING.

CASTING, in *Joinery*, &c. Wood is ſaid to be *caſt* or warped, when, either by its drought or moiſture, or the drought or moiſture of the air, or other accident, it ſhoots or ſhrinks; in prejudice to its flatneſs or ſtraitneſs.

CASTING *of lead on cloth*, is the uſing of a frame or mould covered with woollen cloth and linen over it, to caſt the lead into very fine ſheets.

CASTING *of lead on ſand*, is done by means of a large frame or trough nearly full of ſand, which is made perfectly level, and imprinted with any device from moulds preſſed down in the ſand: the lead is then turned out of the kettle into a receiver or trough, and poured on the ſand, whilſt two perſons ſlide a gauge or lath, of ſuch thickneſs as to leave a ſpace between it and the ſand anſwering to the ſubſtance of the lead, along the edges of the frame; the ſurplus runs into reſervoirs by channels made in the ſand. See CASTING, in *Foundery*.

The goldſmiths uſe the bone of the CUTTLE-*fiſh*, to mould and caſt their leſſer works of gold and ſilver; that bone, when dried, being reducible to a kind of a fine pumice, very ſuſceptible of all impreſſions.

CASTING *in ſtuc* or *plaiſter*, is the filling with fine liquid plaiſter a mould that had been taken in pieces from off a ſtatue or other piece of ſculpture, and run together again. There are two things to be obſerved with regard to the mould: the firſt, that it be well ſoaked with oil before the plaiſter be run, to prevent its ſticking: the ſecond, that each piece whereof it conſiſts have a packthread, to draw it off the more eaſily when the work is dry. See CAST.

CASTING *of metals*, *of letters*, *bells*, *figures*, &c. See FOUNDERY.

CASTING, in reſpect of *Medals*. See MEDALS.

CASTING, in *Rural Economy*, the operation of throwing a horſe down. It is done as follows: having brought him upon ſome even ground that is ſmooth and ſoft, or into the barn upon ſoft ſtraw, take a long rope, double it, and caſt a knot a yard from the bow; put the bow upon his neck, and the double rope betwixt his fore legs, about his hinder paſterns, and under his fetlocks; when you have done this, ſlip the ends of the rope underneath the bow of his neck, and draw them quick, and they will overthrow him; then make the ends faſt, and hold down his head. This practice is neceſſary upon many occaſions, when operations are to be performed on horſes.

CASTING, in *Seamanſhip*, the motion of a ſhip in falling off, ſo as to bring the direction of the wind on either ſide of the ſhip, after it had blown for ſome time right a-head. This term is particularly applied to a ſhip when her anchor firſt looſens from the ground, when ſhe is about to depart from any place where ſhe had anchored; and as it is probable ſhe had been at anchor with her head to windward, it is evident ſhe muſt turn it off, ſo as to fill the ſails before ſhe can advance in her courſe, which operation is called *caſting*. Hence, ſhe is ſaid to caſt the right way, or the wrong way.

Casting-*net*, a ſort of fiſhing-net, ſo called becauſe it is to be caſt or thrown out, which when exactly done, nothing eſcapes it, but weeds, and every thing within its extent, is brought away.

Casting *a point of traverſe*, among *Seamen*, ſignifies the pricking down on a chart the point of the compaſs any place bears from you; or finding what point of the compaſs the ſhip bears at any inſtant, or what way the ſhip has made.

Casting *of timber-work*. See Casing.

CASTIONE, in *Geography*, a town of Italy, in the duchy of Milan; 8 miles S.W. of Milan.—Alſo, a town of Italy, in the Lodeſan; 9 miles S.E. of Lodi.

CASTLE, *Caſtellum*, in *Ancient Writers*, denotes a town or village ſurrounded with a ditch and wall, furniſhed with towers at intervals, and guarded by a body of troops.

The word is originally Latin, *caſtellum*, a diminutive of *caſtrum*.

*Caſtellum* originally ſeems to have ſignified a ſmaller fort, for a little garriſon. Though Suetonius uſes the word where the fortification was large enough to contain a cohort.

The *caſtella*, according to Vegetius, were often like towns, built in the borders of the empire, and where there were conſtant guards, and fences againſt the enemy.

Horſley takes them for much the ſame with what were otherwiſe denominated ſtations. See Castella.

Castle, or Castle-*ſteed*, is alſo an appellation given by the country people in the north to the Roman *caſtella*, as diſtinguiſhed from the *caſtra ſtativa*, which they uſually call *cheſters*. Horſley repreſents this as an uſeful criterion, whereby to diſcover, or diſtinguiſh, a Roman camp or ſtation.

Castle, in a modern ſenſe, is a place fortified either by nature or art, in a city or country, to keep the people in their duty, or to reſiſt an enemy. In the more extenſive interpretation of the word, it includes the various methods of encampment, ſee (Castrametation;) but in its ſtricter meaning, it is uſually applied to buildings walled with ſtone, and intended for reſidence as well as for defence.

Few branches of hiſtorical reſearch have been ſo little attended to as that which relates to *Military Architecture*. Caſtles, indeed, ſuch as we now ſee them, were of late introduction to the world. Whether we may rank them with the accommodations of life brought by the cruſaders from the Eaſt, is doubtful: but thus much ſeems tolerably certain, that it was in France, England, Germany, Switzerland, and Savoy, that the ſyſtem of caſtellation firſt prevailed. In Italy, till the Normans got poſſeſſion of Naples and Sicily, caſtles were comparatively few. And we may at leaſt date their general adoption in Europe with the feudal ſyſtem.

The early Britiſh fortifications ſeem to have been little more than mere intrenchments of earth. Cæſar, however, penetrated not far enough to know the true nature of the Britiſh fortreſſes; and in his work, "De Bello Gallico," (lib. v. § 17.) has given only the deſcription of a lowland camp. In all parts of England there is a vaſt number of ſtrong intrenchments of a very peculiar kind, ſituated chiefly on the tops of natural hills, and which can be attributed to none of the different people who have ever dwelt in the adjacent country, but the ancient Britons. That they may have been uſed at different times, and occupied upon emergencies by the ſubſequent inhabitants of the iſland, is no more than probable; but there are many, and undoubted reaſons, for deeming them the ſtrong poſts and faſtneſſes of the aboriginal ſettlers, where they lodged their wives, formed their garriſons, and made their ſtand. That the Britons were accuſtomed to fortify ſuch places, we have the authority of Tacitus, who, deſcribing the ſtrong holds formed and reſorted to by Caractacus, ſays, "Tunc montibus arduis, et ſi qua clementer accedi poterant, in modum valli ſaxa præſtruit." (Annal. lib. xii. § 33.) One of theſe intrenchments ſtill makes a formidable appearance on a mountain hanging over the vale of Nannerch, in Flintſhire, called Moel-Arthur. But their ſituation being ſo high that they could have no ſupply of water except from the clouds, they were often liable to be untenable for a conſiderable time together.

One of the moſt important of theſe faſtneſſes in our own country, is the Herefordſhire beacon, ſituated on a ſpot that could not but be an object of the utmoſt attention to the original inhabitants of thoſe territories, which afterwards were deemed diſtinctly England and Wales, from the very diviſion here formed. It is on the ſummit of one of the higheſt of the Malvern hills, and is known by the name juſt mentioned. It has been by turns attributed to the Romans, the Saxons, and the Danes, but its conſtruction as a ſtrong hold ſhews it was deſigned as a ſecurity for the whole adjacent country on any emergency. Another of theſe fortreſſes is at Bruff in Staffordſhire; has been deſcribed by Mr. Pennant; (Journey from Cheſter, p. 47.), and exactly anſwers the account of Tacitus. It is placed on the ſummit of a hill, is ſurrounded by two deep ditches, and has a rampart formed of ſtone. Other inſtances are adduced by Mr. Pennant in his "Tour in Wales," and by Mr. King in the firſt volume of the "Munimenta Antiqua:" but a ſtronger inſtance than all perhaps is given by Mr. Gough in the Additions to Camden, (vol. ii. p. 404.) who ſhews that the true Caer Caradoc, the very fortreſs alluded to in the ſentence we have quoted, which if not the royal ſeat of Caractacus, ſeems to have been at leaſt his ſtrong hold, was in Shropſhire, two miles ſouth of Clun and three from Coxal, being a large camp, three times as long as it is broad, on the point of a hill, acceſſible only one way, and defended on the north ſide by very deep double ditches, in the ſolid rock: whilſt on the eaſt, the ſteepneſs of the ground renders it impregnable. On the ſouth it has only one ditch, for the ſame reaſon: and the principal entrance is on the weſt ſide, fenced with double works; whilſt to the ſouth-weſt it is even fenced with treble works. The moſt extraordinary, however, of all theſe kinds of fortreſſes is ſituated in Caernarvonſhire, called Tre'r Caeri, or the town of fortreſſes. The plan and elevation of this ancient ſtrong hold and abode is given by Mr. Pennant in his "Tour in Wales," (vol. ii. p. 206.) On the acceſſible ſide it was defended by three rude walls of ſtone; the upper ones being lofty, about fifteen feet high, and ſixteen broad; exhibiting a grand and extenſive front. The ſpace on the top is an irregular area; but the whole is filled with cells; ſome round, and ſome oval, and ſome alſo oblong or ſquare. Several of the round ones were fifteen feet in diameter; which brings to mind the houſes of the ancient Gauls deſcribed by Strabo; and of thoſe that were oblong, there was at leaſt one even thirty feet in length. Of the ſame kind of fortreſſes were Penmaen Mawr, in Caernarvonſhire, Warton Cragg, in Lancaſhire, Old Oſweſtry, in Shropſhire; the irregular encampment of Maiden Caſtle nigh Dorcheſter; and probably Old Sarum, whoſe character was new modelled by the Romans. Mr. King, (Munimenta Antiqua, vol. i. p. 63.), conſiders the

the dens in the mountains, and the thickets of Scripture, as ſtrong holds or hill-fortreſſes of the kind deſcribed. When Samſon had made a great ſlaughter of the Philiſtines, we are told he went and dwelt in the top of the rock Elam; where we find, afterwards, three thouſand men of Judah went up to confer with him. That hill-fortreſſes were uſed in the earlieſt ages there can be little doubt. The Iſraelites, when their land was invaded by Jabin, the king of Canaan, in conſequence of an exhortation from Deborah the propheteſs, aſſembled to make their ſtand upon mount Tabor. Among the Indians of South America, ſtrong holds of a ſimilar nature to thoſe of Britain have been frequently diſcovered. (Ulloa. Voyage to South America, i. 503, 504.) And a very curious inſtance of the attack and ſurrender of one in Sogdiana, in Aſia, in the time of Alexander the Great, is related by Quintus Curtius, (lib. vii. chap. xi.) The anecdote is worth the reference of the reader.

The Britiſh mode of warfare appears to have received but little alteration from the introduction of Roman tactics. Till finally ſubdued, their princes ſhowed abilities both in the command of armies and in the conduct of a war; they choſe their ground judiciouſly; formed able plans of active operation; and availed themſelves of all the advantages of local knowledge: but to the fortreſſes deſcribed, if we may rely on the teſtimonies of our ancient writers, they did not very frequently retire. Their deficiencies both in the attack, the conſtruction, and the defence of ſuch places, muſt have been very obvious even to themſelves; and as they delighted to live, ſo they uſually choſe to fight in open plains. Their impatient courage, and their averſion from labour, made them unable to endure the delays and fatigues of defending or beſieging the caſtles of their time; and they often reproached the Romans with cowardice for raiſing ſuch ſolid works about their camps and ſtations. (See Boadicea's famous ſpeech to her army in Xiphilin, ex Dione in Nerone.)

Of the Roman military works in this country, they were for the greater part temporary; many, however, were ſtationary poſts; and ſome few, to the retention of which the greateſt importance was attached, became walled *caſtra*.

Cæſar, in the work already quoted, (De Bell. Gall. l. vii.), deſcribes one of his camps as fortified very much in the manner of a walled city. A few of the Roman ſtations in our own country aſſiſt in throwing light on the deſcription; and, in ſhort, ſuch as were ſo ſurrounded, appear to have been the link of connection between the Britiſh earth-work and the feudal caſtle.

Richborough, Portcheſter, and Pevenſey, are the three greateſt fortreſſes the Romans have left us.

Richborough, the very earlieſt in order of time, is ſuppoſed to have been begun in the year 43, in the reign of Claudius: but not to have been completed till 205, under the direction of the emperor Severus. There are in this diſtinguiſhed fortreſs, ſays Mr. King (Munimenta Antiqua, ii. 8.) ſtill plainly to be traced all the principal parts of one of the very greateſt and moſt perfect of the ſtationary camps. The upper diviſion for the general and chief officers; and the lower diviſion for the legion. In the former the Prætorium with its parade; and the Sacellum or ſmall temple for depoſiting the enſigns. In the walls too are the traces of the four great gates; the decuman, the prætorian, and the two poſterns. The great courſes of ſtone, with which the wall is formed, are ſeparated from each other by alternate layers, compoſed entirely of a double courſe of bricks each; as in the walls of Verulam, Silcheſter, and other of our Roman towns.

The Roman remains at Portcheſter are not perhaps ſo clearly to be traced; ſince, having been conſtantly uſed as a fortreſs in ſucceeding ages, it has received vaſt and extremely various additions: and preſents us with ſpecimens of military architecture in almoſt every period from the Normans to the time of queen Elizabeth.

Similar alterations, to thoſe firſt mentioned, have given ſo ſtrong a turn to the general character of Pevenſey, that its real æra has been ſometimes doubted; though portions of the Roman wall, as well as the Decuman gate, may be eaſily and accurately traced.

Here too it may not be irrelevant to obſerve that the caſtle at Colcheſter, in Eſſex, has been ſometimes taken for a Roman fortreſs. And this not only becauſe it has many of the ſame ſort of tiles which are found in Roman walls, but becauſe they are laid in the ſame manner, with bands. Though if the building is examined with attention, there may be traced in almoſt every part evident marks either of the later Saxon or Norman workmanſhip: and though many of the tiles which are uſed in it may have been gathered from the remains of Roman buildings, the greater part appears to have been made on purpoſe. (See the Archæologia, vol. iv. p. 33.)

That in the Roman times, however, there muſt have been many other ſuch walled ſtations as thoſe at Richborough, Portcheſter, and Pevenſey, there can be little doubt. The Saxons, in the courſe of their long wars with the Britons, may be fairly ſuppoſed to have deſtroyed many of the fortifications which had been thus erected: and after their final ſettlement they neglected to repair thoſe which remained, or to build many of their own. By theſe means the country became open and defenceleſs; which greatly facilitated the incurſions of the Danes, who met with little obſtruction from fortified places. That there was, however, ſomething like a caſtle at Bamborough in Northumberland, we have the concurrent teſtimony of hiſtorians (Matth. of Weſtminſter, p. 193. ſub ann. 547. Sax. Chronicle, p. 19. Roger. Hoved. p. 238. b. Bede l. iii. c. vi. 12.): a caſtle at Corffe, in Dorſetſhire, is ſaid to have exiſted in the days of Edgar (Gough's Add. to Camden, i. 49. King's Munimenta Antiqua, iii. 209.) Portcheſter caſtle during this period, probably, retained its deſignation. And Mr. King (Munim. Antiq. iii. 211.) has taken conſiderable pains to prove that the fortreſs at Caſtleton in Derbyſhire is of as high antiquity.

Alfred the Great, however, ſeems to have been the firſt of our princes with whom the building of caſtles became an object of national policy. Though, if Aſſer's authority may be received, they were not exactly what the reader at the firſt mention of their name might take them for; ſince they were compoſed not only of ſtone but of *wood.* (Aſſer de Reb. geſtis Alfredi, p. 17, 18.) Elfleda, too, his daughter, governeſs of Mercia, who ſeems to have been the only perſon in the kingdom who properly complied with the commands, and imitated the example of her illuſtrious father, and who inherited more of the wiſdom and ſpirit of Alfred than any of his children, not only followed his ſteps by fighting many battles with the Danes, but built no leſs than eight caſtles, in the ſpace of three years, to check their incurſions. (Hen. Hunt. Hiſt. p. 204.) A ſtill more remarkable inſtance of the knowledge of caſtle-building at a ſhort period ſubſequent to this, may be found in William of Malmeſbury (c. vi.) When he mentions the rebuilding of Exeter by Athelſtan, who died in 941, "Urbem igitur illam," ſays the hiſtorian, "quam contaminatæ gentis repurgio defæcaverat, *turribus munivit*, muro ex quadratis lapidibus cinxit." And from the few remains of the fortifications of this period we find that the walls preciſely anſwer Malmeſbury's deſcription. They were faced with theſe four-ſquare ſtones both within and without, and the intermediate ſpace, between the facings, was filled up with rubble or rough flint ſtones mixed together with a ſtrong and permanent cement. It is to this period too that the moſt judicious of our writers have referred the caſtle at Colcheſter which has been already mentioned. Its form is four-ſquare, flanked at the four corners with ſtrong towers, and it is about two hundred and twenty-four yards in circumference on the outſide, all projections and windings included; the four ſides nearly facing the four cardinal points. Some have even gone ſo far as to call this venerable ruin Britiſh; others, as we have already ſaid, have attributed it with a greater ſhare of plauſibility to the Romans; but Camden and our better writers aſcribe it to Edward the elder, who repaired the walls and re-edified the town in the beginning of the 10th century.

Still, however, the paucity of ſtrong poſts in the iſland during every period of the Anglo-Saxon hiſtory may be conſtantly obſerved. And it is more than probable that to this defect we may attribute the defeat of Harold; ſince it became neceſſary that all ſhould be riſked upon the iſſue of a ſingle battle. The conqueror, himſelf, was evidently ſenſible that the want of fortified places in England had greatly facilitated his conqueſt, and might, at any time, alſo, facilitate his expulſion. He therefore made all poſſible haſte to remedy the defect, by building magnificent and ſtrong caſtles in all the towns within the royal demeſnes. "William," ſays Matthew Paris, "excelled all his predeceſſors in building caſtles, and greatly haraſſed his ſubjects and vaſſals with theſe works." (Matthew Paris, Hiſt. p. 8. col. 2.) All his earls, barons, and even prelates, imitated his example; and it was the firſt care of every one who received the grant of an eſtate from the crown, to build a caſtle upon it for his defence and reſidence. The diſputes about the ſucceſſion, in the following reigns, kept up this ſpirit for building great and ſtrong caſtles. William Rufus was ſtill a greater builder than his father; and Henry I. was not idle in adding to their number. "William Rufus," ſays Henry Knyghton (col. 2373.) "was much addicted to building royal caſtles and palaces, as the caſtles of Dover, Windſor, Norwich, Exeter, the palace of Weſtminſter, and many others, teſtify; nor was there any king of England before him that erected ſo many, and ſuch noble edifices." Though of one or two of theſe William Rufus was only the improver. But the rage for building caſtles never prevailed ſo much in any period of the Engliſh hiſtory as in the turbulent reign of Stephen, between 1135 and 1154. In this reign, ſays the writer of the Saxon chronicle (Chron. Sax. p. 238.), every one who was able, built a caſtle; ſo that the poor people were worn out with the toil of theſe buildings, and the whole kingdom was covered with caſtles. And this laſt expreſſion will hardly appear too ſtrong, when we are informed, that beſides all the caſtles before that time in England, no fewer than eleven hundred and fifteen were raiſed from the foundation in the ſhort ſpace of nineteen years. (Rad. de Diceto, col. 528.) Stephen, ſays Holinſhed (vol. iii. fol. 50.) "began to repent himſelf, although too late, for that he had granted licence to ſo many of his ſubjects to build caſtles within their own grounds."

An art, Dr. Henry obſerves, (Hiſtory of Britain, vol. vi. p. 188 8vo.) ſo much practiſed as architecture was in this period, muſt have been much improved. That it really was ſo, will appear from the following very brief deſcription of the moſt common form and ſtructure of a royal caſtle, or of that of a great earl, baron, or prelate in this period; and as theſe caſtles ſerved both for reſidence and defence, this deſcription will ſerve both for an account of the domeſtic and military architecture of thoſe times, which cannot well be ſeparated.

The ſituation of the caſtles of the Anglo-Norman kings and barons was moſt commonly on an eminence, and near a river; a ſituation on ſeveral accounts eligible. The whole ſite of the caſtle (which was frequently of great extent and irregular figure) was ſurrounded by a deep and broad ditch, ſometimes filled with water, and ſometimes dry, called the *foſſe*. Before the great gate was an outwork, called a *barbacan*, or *antemural*, which was a ſtrong and high wall, with turrets upon it, deſigned for the defence of the gate and drawbridge. On the inſide of the ditch ſtood the wall of the caſtle, about eight or ten feet thick, and between twenty and thirty feet high, with a parapet, and a kind of embraſures, called *crennels*, on the top. On this wall at proper diſtances, ſquare towers of two or three ſtories high were built, which ſerved for lodging ſome of the principal officers of the proprietor of the caſtle, and for other purpoſes; and on the inſide were erected lodgings for the common ſervants or retainers, granaries, ſtore-houſes, and other neceſſary offices. On the top of this wall, and on the flat roofs of theſe buildings, ſtood the defenders of the caſtle, when it was beſieged, and from thence diſcharged arrows, darts, and ſtones, on the beſiegers. The great gate of the caſtle ſtood in the courſe of this wall, and was ſtrongly fortified with a tower on each ſide, and rooms over the paſſage, which was cloſed with thick folding-doors of oak, often plated with iron, and with an iron portcullis or grate let down from above. Within this outward wall was a large open ſpace or court, called, in the largeſt and moſt perfect caſtles, the *outer bayle*, or *ballium*, in which ſtood commonly a church or chapel. On the inſide of this outer bayle was another ditch, wall, gate, and towers, incloſing the inner bayle or court, within which the chief tower or *keep* was built. This was a very large ſquare fabric, four or five ſtories high, having ſmall windows in prodigious thick walls, which rendered the apartments within it dark and gloomy. This great tower was the palace of the prince, prelate or baron, to whom the caſtle belonged, and the reſidence of the conſtable or governor. Under ground were diſmal dark vaults, for the confinement of priſoners, which made it ſometimes be called *the dungeon*. In this building alſo was the great hall, in which the owner diſplayed his hoſpitality, by entertaining his numerous friends and followers. At one end of the great halls of caſtles, palaces and monaſteries, there was a place raiſed a little above the reſt of the floor called the *deis*, where the chief table ſtood, at which perſons of the higheſt rank dined. Though there were unqueſtionably great variations in the ſtructure of caſtles and palaces in this period, yet the moſt perfect and magnificent of them ſeem to have been conſtructed on the above plan. Such, to give one example, was the famous caſtle of Bedford, as appears from the following account of the manner in which it was taken by Henry III., A. D. 1224, from Matthew Paris. (Hiſt. Angl. p. 221, 222.) The caſtle was taken by four aſſaults. "In the firſt, was taken the barbacan; in the ſecond, the outer ballia; at the third attack, the wall by the old tower was thrown down by the miners, where, with great danger, they poſſeſſed themſelves of the inner ballia, through a chink; at the fourth aſſault, the miners ſet fire to the tower, ſo that the ſmoke burſt out, and the tower itſelf was cloven to that degree, as to ſhew viſibly ſome broad chinks; whereupon the enemy ſurrendered."

As Britain abounded in this period in fortified towns and caſtles, much of the art of war of courſe conſiſted in defending and aſſaulting ſtrong places. For the various kinds of engines which were uſed both in the attack and the defence of theſe, we ſhall refer the reader to ARTILLERY; obſerving only that a knowledge of the application of them in this period may be obtained from the relation of the ſiege of

Exeter caſtle by king Stephen in the year 1136. (See the Geſta Regis Stephani apud Ducheſn, p. 934.) It is perhaps the moſt conſummate ſpecimen of the military ſkill of that age with which we are acquainted. And it may be enough to obſerve, that after this ſiege had laſted three months, and king Stephen had expended upon it in machines, arms, and other things, no leſs than 15,000 marks, equal in efficacy to 150,000 pounds of our money, the beſieged were obliged to ſurrender for want of water. (Henry's Hiſt. of Britain, vol. vi. p. 217.

Berkeley, which was originally founded in the reign of Stephen, is one of the beſt remains we are now poſſeſſed of, of an ancient feudal caſtle. But the changes which almoſt all theſe buildings have undergone in ſubſequent times may be judged of by thoſe which have taken place at Berkeley. The buildings within the inmoſt only of the three gates are ſaid to have been the work of Henry II. when duke of Normandy; while the two outermoſt, with all the buildings belonging to them, except the keep, are referred to the latter end of the reign of Henry II. and to thoſe of the ſecond and third Edwards. The hall and the two chapels are of the latter period; and the great kitchen, adjoining to the keep, was of the work of Henry VII.

Among the caſtles which Mr. King has endeavoured to appropriate to the early Norman period, are thoſe of Nottingham, Lincoln, and Clifford's tower at York, all erected by the Conqueror. (Archæol. vol. vi. p. 257.) The remains of all theſe, he obſerves, fully illuſtrate the Norman mode of conſtructing ſuch edifices. Tick-hill, in the neighbourhood of Doncaſter, appears to have been another of theſe caſtles (ibid. 267.); and Pontefract beſpeaks a Norman deſign, with rude and imperfect alterations. All of theſe appear to have been erected upon artificial mounts, and nearly cover the whole area of the ſummit of the reſpective hills on which they are ſituated.

Tunbridge caſtle, in Kent, built by Richard de Clare about the time of William Rufus, is mentioned by Mr. King as a ſpecimen of the later Norman ſtructures; and he has been very accurate in his deſcription of it. (Ibid. 270.) Gundulph, who directed the building of the Tower of London in 1078, and the caſtle at Rocheſter, he deſcribes to have introduced a great many judicious alterations, and not only to have increaſed the ſecurity but the magnificence of our military piles; and obſerves that the caſtle at Rocheſter is a complete ſpecimen of all that he effected. Newark, which Mr. King afterwards mentions, is an inſtance of a prelate's caſtle in the reign of Stephen: and the keep of Knareſborough, of the time of Henry III., completes the ſpecimens it may be proper to mention of the irregular ſtyle of caſtle building which prevailed during the interval between the Norman conqueſt and the middle of the thirteenth century.

To theſe ſucceeded the magnificent piles of Edward I. more convenient and more ſtately, and containing not only many towers, but great halls, and ſometimes even religious houſes. The beſt ſtyle of military architecture in this period was diſplayed in the caſtles of Caernarvon, Conway, and Caerphilly; and it is ſingular to obſerve that many of our more ancient caſtles were then increaſed with additions in the ſame ſumptuous ſtyle.

After the age of Edward I. we find another kind of caſtle introduced, approaching nearer to the idea of modern palaces. The firſt of theſe was that at Windſor, built by Edward III. who employed William of Wykeham as his architect. This convenient and enlarged ſtyle of building was ſoon imitated, on a leſſer ſcale, by the nobles of the realm; and two remarkable inſtances, wherein convenience and magnificence were ſingularly blended at this period, may be found in the caſtles of Harewood and Spofford in Yorkſhire. The improvements at Kenilworth afford another inſtance of the great enlargement which our caſtles during this age were accuſtomed to receive: and Naworth in Cumberland is another of the beſt ſpecimens that can probably be referred to. Caiſtor in Norfolk affords the ſtyle of Henry VIth's reign. It was built by ſir John Faſtolf, who died in 1459.

To theſe venerable piles ſucceeded the caſtellated houſes; manſions adorned with turrets, and battlements; but utterly incapable of defence, except againſt a rude mob, armed with clubs and ſtaves, on whom the gates might be ſhut; yet ſtill manſions almoſt quite devoid of all real elegance, or comfortable convenience, and fitted only to entertain *a herd of retainers* wallowing in licentiouſneſs. At the ſame time, however, they diſcover marks of economy and good management, which enabled their hoſpitable lords to ſupport ſuch rude revels, and to keep up their ſtate, even better than many of their more refined ſucceſſors. Of theſe buildings one of the moſt perfect and moſt curious, now remaining, is Haddon houſe in Derbyſhire; caſtellated and embattled, in all the apparent forms of regular defence; but really without the leaſt means of reſiſtance in its original conſtruction. The deſcription Mr. King has given of it (Archæol. vi. 347.) is, however, too long to be extracted, and too curious to be abridged.

After this kind of building, the magnificent quadrangular houſes of the reign of Henry VIII. ſucceeded; of which the moſt beautiful and genuine models perhaps were thoſe of Cowdray in Suſſex, and Penſhurſt the ſeat of the Sidney family, in Kent.

Without referring to the ſtately buildings of Elizabeth's reign, it may be enough to ſay that here ends the hiſtory of the Engliſh caſtle. The block houſes of Calſhot, Hurſt, Sandrown, Sandgate, and South Sea, are the laſt inſtances of ſuch buildings ever intended for a ſtand, and ſeem ſtrongly to mark the revolution which has taken place in our defenſive ſyſtem of war.

The total change in military tactics brought about by the invention of gunpowder and artillery, the more ſettled ſtate of the nation, Scotland becoming part of the dominions of the kings of England, the reſpectable footing of our navy, whoſe wooden walls ſecure us from invaſions, and the abolition of the feudal ſyſtem, all conſpired to render caſtles of little uſe or conſequence, as fortreſſes: ſo the great improvements in arts and ſciences, and their conſtant attendant, the increaſe of luxury, made our nobility and gentry build themſelves more pleaſant and airy dwellings; relinquiſhing the ancient dreary manſions of their forefathers, where the enjoyment of light and air was ſacrificed to the conſideration of ſtrength; and whoſe beſt rooms, according to our modern, refined notions, have more the appearance of gaols and dungeons for priſoners, than apartments for the reception of a rich and powerful baron.

However, in the reign of Charles I., a little before the breaking out of the civil war, ſome inquiry into the ſtate of theſe buildings ſeems to have taken place; for on the 22d of January, 1636, a commiſſion was iſſued, appointing lieutenant colonel Francis Coningſby, commiſſary general of and for all the caſtles and fortifications in England and Wales, with an allowance of 13s. 4d. a day to be paid out of the cheques and defalcations that ſhould be made by him from time to time; or, in default thereof, out of the Treaſury. Whether this office was really inſtituted for the purpoſe of ſcrutinizing into the ſtate of theſe fortreſſes, as foreſeeing the events which afterwards happened; or whether it was only formed to gratify ſome favourite, does not appear. During the troubles of that reign, ſome ancient caſtles were garriſoned and defended, ſeveral of which, particularly Corfe caſtle in Dorſetſhire, were afterwards deſtroyed, by order of the parliament: ſince that period, they have been abandoned to the mercy of time, weather, and the more unſparing hands of avaricious men. The laſt have proved the moſt deſtructive; many of theſe monuments of ancient magnificence having been by them demoliſhed for the ſake of the materials: by which the country has been deprived of thoſe remains of antiquity ſo eſſential, in the eyes of foreigners, to the dignity of a nation; and which, if rightly conſidered, tended to inſpire the beholder with a love for the now happy eſtabliſhment; by leading him to compare the preſent with thoſe times when ſuch buildings were erected:—times when this unhappy kingdom was diſtracted by inteſtine wars; when the ſon was armed againſt the father, and brother ſlaughtered brother; when the lives, honour, and property of the wretched inhabitants depended on the nod of an arbitrary king, or were ſubject to the more tyrannical and capricious wills of lawleſs and foreign barons.

The few caſtles exiſting in the Saxon time, were, probably, on occaſion of war, or invaſions, garriſoned by the national militia, and at other times ſlightly guarded by the domeſtics of the princes or great perſonages who reſided in them; but after the conqueſt, when all the eſtates were converted into baronies, held by knights ſervice, Caſtle-guard, coming under that denomination, was among the duties to which particular tenants were liable. From theſe ſervices the biſhops and abbots, who till the time of the Normans had held their lands in frank almoign, or free alms, were, by this new regulation, not exempted; they were not indeed, like the laity, obliged to perſonal ſervice, it being ſufficient that they provided fit and able perſons to officiate in their ſtead. This was, however, at firſt vigorouſly oppoſed by Anſelm, archbiſhop of Canterbury; who, being obliged to find ſome knights to attend king William Rufus in his wars in Wales, complained of it as an innovation and infringement of the rights and immunities of the church.

It was no uncommon thing for the Conqueror, and the kings of thoſe days, to grant eſtates to men of approved fidelity and valour, on condition that they ſhould perform Caſtle-guard, with a certain number of men, for ſome ſpecified time; and ſometimes they were likewiſe bound by their tenures to keep in repair ſome tower or bulwark, as was the caſe at Dover caſtle.

In proceſs of time theſe ſervices were commuted for annual rents, ſometimes ſtyled ward-penny, and wayt-fee, but commonly caſtle-guard-rents; payable on fixed days, under prodigious penalties called ſur-ſizes. At Rocheſter, if a man failed in the payment of his rent of caſtle-guard, on the feaſt of St. Andrew, his debt was doubled every tide, during the time for which the payment was delayed. Theſe were afterwards reſtrained by an act of parliament made in the reign of king Henry VIII., and finally annihilated with the tenures by knights' ſervice, in the time of Charles II. Such caſtles as were private property, were guarded either by mercenary ſoldiers, or the tenants of the lord or owner.

Caſtles which belonged to the crown, or fell to it either by forfeiture or eſcheat, (circumſtances that frequently happened in the diſtracted reigns of the feudal times), were generally committed to the cuſtody of ſome truſty perſon, who ſeems to have been indifferently ſtyled governor or conſtable. Sometimes alſo they were put into the poſſeſſion of the ſheriff of the county, who often converted them into priſons. That officer was then accountable to the exchequer, for the farm or produce of the lands belonging to the places entruſted to his care, as well as all other profits: he was likewiſe, in caſe of war or invaſion, obliged to victual and furniſh them with munition out of the iſſues of his county; to which he was directed by writ of privy ſeal Variety of theſe writs, temp. Edw. III. may be ſeen in Madox's Hiſtory of the exchequer; and it appears from the ſame authority, that the barons of the exchequer were ſometimes appointed to ſurvey theſe caſtles, and the ſtate of the buildings and works carrying on therein. (See Groſe's Preface to the Antiquities of England and Wales.)

Castle, in *Sea Language*, denotes an elevation on the deck of a veſſel; or a part of the deck, fore and aft, raiſed above the reſt.

Castle, *Fore*, *Caſtello di prora*, &c. See Fore-*caſtle*.

Castle, *Hind*, *Caſtello di poppa*. See Poop.

Castle-*Ward*, or Castle-*Guard*, *Caſtelgardum*, or *Wardum Caſtri*, an impoſition laid on ſuch as dwell within a certain compaſs about any caſtle, towards the maintenance of thoſe who watch and ward the *caſtle*, which ſee.

The word is ſometimes alſo uſed for the circuit itſelf, inhabited by ſuch as are ſubject to this ſervice.

Castle, *Water*, a piece of hydraulic work finiſhed with one or more fronts of building, with ſeeming windows and the like, containing a reſervoir which gives play to caſcades, &c. Or, a *water-caſtle* may be defined a receptacle of the public water furniſhed by an aqueduct, or otherwiſe, in which are incloſed the cocks of ſeveral water-pipes with a little baſon; contrived to diſtribute and ſend it to different parts.

The *caſtella* of the ancient aqueducts are ſtill viſible at Rome, though half ruined. They are lined with a durable kind of cement, which, according to Pliny, ſurpaſſes in hardneſs the ſtones themſelves. It is made of lime ſlacked in wine, and beaten up with hog's greaſe, and the juice of figs or pitch.

Modern writers on hydraulics treat of the laws of the efflux of water out of *caſtella* into pipes, canals, &c. Signior Poleni has a treatiſe expreſs on caſtles, or reſervoirs, whereby the waters of rivers are derived, the ſides of which caſtles are made converging.

CASTLEBAR, in *Geography*, a market and poſt town of the county of Mayo, Ireland, which is alſo the ſhire town, and the moſt conſiderable in the county, having been much enlarged within a few years, in conſequence of the judicious encouragement given by the proprietor, lord Lucan, to the linen manufacture and other trades. Agriculture alſo has improved in the neighbourhood. This town is ſituated on the river which runs from the lake of Caſtlebar, weſt of the town, to Lough Conn. In theſe and the other lakes of the neighbourhood, beſides ſalmon and other fiſh, is found that kind of trout called the gillaroo, of which there is an account in the Philoſophical Tranſactions, vol. lxiv. p. 116. 310. It is remarkable for a great thickneſs of ſtomach, which bears ſome reſemblance to the gizzard of birds, and which is brought to table as a delicacy, under the name of gizzard. Mr. Pennant (Brit. Zoology, vol. iii.) does not think it a diſtinct ſpecies, but a variety occaſioned by the nature of the waters, or of the food. Caſtlebar is a corporate town, which, before the union, ſent two members to the houſe of commons, but has now loſt that privilege. It has a barrack, and in the rebellion was a military ſtation. When the French, under general Humbert landed at Killalla, in 1798, they ſurprized the troops at Caſtlebar, and taking poſſeſſion of the town, held it for nine days, when they directed their courſe towards Sligo. Diſtance from Dublin 114 miles weſt by north. N. lat. 53° 50′. W. long. 9° 9′. Statiſtical account of Mayo, &c.

CASTLE-BAY, or Kisimul-bay, a bay at the ſouth end of the iſland of Barray. See Barra.

CASTLE-BELLINGHAM, a ſmall poſt town of the county of Louth, Ireland, on the north road, near the ſea. It is well built, and pleaſantly ſituated, and has a remarkably fine ſpreading elm, ſuppoſed to be the largeſt in the iſland. Here is an extenſive brewery for ale and porter, the former of which has been for many years in high eſtimation. There are alſo a Daniſh fort on the ſea coaſt near this town, and ſome other remains of antiquity in the neighbourhood, deſcribed in the Louthiana. Caſtle-Bellingham is 34 miles north from Dublin. N. lat. 53° 53′. W. long. 6° 23′.

CASTLE-BLAKENEY, a ſmall poſt town of the county of Galway, Ireland, 80 Iriſh miles W. from Dublin. N. lat. 53° 24′. W. long. 8° 22′.

CASTLE-BLAYNEY, a poſt town of the county of Monaghan, Ireland, ſituated near Lough Barrac, a fine lake with many agreeable iſlands in it, on the borders of which is the ſeat of lord Blayney. Poſition N.W. from Dublin. N. lat. 54° 6′. W. long. 6° 44′.

CASTLE-CARY, anciently Cari, in *Geography*, a market town of Somerſetſhire, England, is ſituated three miles W. from Bruton, 12 S.E. from Wells, and 114 W. from London. The town conſiſts principally of three ſtreets, one of which is nearly a mile in length, but is thinly and irregularly built; the pariſh alſo embraces three contiguous hamlets; the houſes of the whole amounted, in 1801, to 240, and the inhabitants to 1281. This town has a charter for holding a market on Tueſdays, but it has been long diſcontinued, except that markets for corn, ſheep, and cattle, are occaſionally held from All-hallow-tide to Eaſter. It has three annual fairs. The old market-houſe (erected in 1616), is now converted into dwelling houſes. The church of Caſtle-Cary was anciently appropriated to the priory of Bath, and in 1292 was valued at twenty marks. A caſtle was erected here in the time of king Stephen, 1138, by William de Percheval, who, poſſeſſing this barony, exerted his power to haraſs that monarch. About this time Stephen was employed in beſieging the city of Briſtol, and Percheval availed himſelf of this event to diſtreſs his ſovereign, by ravaging, from his caſtle at Cary, the adjacent country, and carrying away all proviſions neceſſary for the ſupport of the king's army. The king, finding Briſtol impregnable, and conceiving it unſafe to continue longer before its fortreſs, raiſed the ſiege, and turned all his attention to the caſtle of Cary, from which he had been frequently annoyed. Here his arms were crowned with greater ſucceſs; he battered the fortreſs with ſuch rapidity and violence, that the garriſon, reduced to the utmoſt extremity, receiving no reinforcement nor ſupplies from the earl of Anjou, or their allies in Briſtol, ſurrendered at length upon terms of peace and allegiance. Subſequent to this, in 1153, we find Percheval again in arms in the ſame cauſe, when he defended this caſtle againſt Henry de Tracey, a firm adherent to the royal intereſt, who cloſely beſieged him here, but was obliged to fly before the earl of Glouceſter, who with ſome difficulty diſmantled Tracey's fortifications. (See the Engliſh Chronicles). The caſtle appears to be wholly obliterated, and its ſite only known by an intrenched area of about two acres, called the camp, in which implements of war and bolts of iron have frequently been dug up. The manor and principal property of the town, after paſſing through various hands, now belongs to ſir Richard Colt Hoare, Bart. of Wilts. "Collinſon's Hiſtory of Somerſetſhire," vol. ii. 4to.

CASTLE-COMER, a poſt town of the county of Kilkenny, Ireland, remarkable for its mines of what is uſually called Kilkenny coal. Boate in his Natural Hiſtory of Ireland, publiſhed about 1650, gives an account of the firſt diſcovery, when ſpeaking of the probability that if diligent ſearch were made for them, good coal mines would be diſcovered. "Already," ſays he, "one coal mine hath been found out in Ireland a few years ſince by mere hazard, and without having been ſought for. In an iron mine of Mr. Chriſtopher Wandſworth, after that for a great while they had drawn iron out of it, and that by degrees they were gone deeper, at laſt in lieu of ore they met with ſea-coal, ſo as ever ſince all the people dwelling in thoſe parts have uſed it for their firing, finding it very cheap." Mr. Wandſworth, or more properly ſir Chriſtopher Wandeſford, who was maſter of the rolls, and afterwards deputy to lord Strafford, as lord lieutenant of Ireland, purchaſed the tract in which the collieries are ſituated; and it was erected by Charles I. into the lordſhip of Caſtle-Comer, containing above 12,400 acres. By the marriage of the late lord Ormond with the heireſs of the Wandeſford family, this lordſhip now belongs to a younger branch of the houſe of Ormond. The profits of working have ſometimes been ſix or ſeven thouſand pounds, but from various circumſtances they have decreaſed. The number of pits at work together in 1800 was 16, which is about the average number: for many years have elapſed ſince 24 were at work, and the ſmalleſt number that has been known is twelve. From a pit there is uſually raiſed from 20 to 30 barrels a day of coal, independent of culm. If a navigation exiſted from Caſtle-comer to Kilkenny, and to the Dublin canal, the uſe of the coal would be more extenſive, on account of its greater cheapneſs, the carriage at preſent making the price very high. Near Caſtle-Comer there are alſo iron mines, and good materials for earthen ware. The town has 211 houſes, many of them good and ſlated, and in 1800, 50 of them paid hearth money, from which cabins are exempt. Part of the town was burned during the rebellion of 1798, and has been rebuilt in a handſome manner. It is well ſituated for many manufactures, and the counteſs of Ormond, who reſides there, gives every encouragement to ſettlers. Many particulars reſpecting the mines, price of labour, &c. may be found in Mr. Tighe's valuable and intereſting account of Kilkenny. For an analyſis of the coal, &c. ſee Kilkenny *Coal.* Caſtle-Comer is 45 Iriſh miles S.W. from Dublin, and 10 N. from Kilkenny. N. lat. 52° 47′. W. long. 7° 13′.

CASTLE-CONNELL, a ſmall town of the county of Limerick, Ireland, on the eaſt ſide of the river Shannon, remarkable for a chalybeate ſpa, which cauſes it to be much frequented in the ſummer ſeaſon. The houſes are chiefly ſmall detached dwellings, now become numerous; but there are many fine ſeats in the neighbourhood. The ſurrounding ſcenery is very beautiful, and induces the viſitors to make frequent excurſions, which cannot fail of contributing to the improvement of their health. The ruins of the caſtle, which belonged to the family of Bourk, or de Burgho, are near the ſpa. This caſtle was built ſoon after the arrival of the Engliſh, and was deemed very ſtrong ſo late as 1690, when it was blown up by order of the prince of Heſſe, who commanded at Limerick. Caſtle-Connell is 6 miles north from Limerick, and 89 S.W. from Dublin. Ferrar's Limerick, &c.

CASTLE-DERMOT, a fair and poſt town of the county of Kildare, Ireland. St. Diermit is ſaid to have founded a priory here in A.D. 500, from which it got part of its name. During many centuries it was called Triſtle-Dermot, for what reaſon is not known; but of later years it has been called Caſtle-Dermot, from a caſtle belonging to the Fitzgeralds, of which there is not a trace remaining. It was plundered by the Danes in the 9th century, taken and ſacked by Edward Bruce in 1316, and taken by col. Reynolds for Cromwell in 1650. Since which times its walls have mouldered to decay; but though the gates have been deſtroyed, the names of two of them are ſtill preſerved. The town is ſituated on a flat, and ſurrounded with a fine level country for ſeveral miles. Of the ruins, the old church, in part of which ſervice is ſtill performed, with the round tower adjoining, and two croſſes, are ſuppoſed to be of the 10th century. The round tower is uſed as a belfrey, which ſeems to countenance the opinion, that this was their original deſtination. The remains of a Franciſcan abbey, founded by one of the Fitzgeralds about the year 1300, ſhow it to have been magnificent; particularly one of its windows, two of the ailes, and ſome of the octagon pillars, which ſtill preſerve the outlines of ancient grandeur and elegance. A parliament is ſaid to have been held here in 1377; certainly there was ſuch an aſſembly under the earl of Kildare, lord deputy in Auguſt 1499, when a tax was laid on, and ſome regulations adopted, which however did not probably extend beyond the Engliſh pale. The preſent inn is generally underſtood to be a part of the building in which the parliament was held. The firſt charter ſchool eſtabliſhed in Ireland was in this town, A.D. 1734, for forty boys. See Charter *Schools*. The number of houſes in 1793 was 163, of which 63 were of lime and ſtone, and the reſt cabins. There is no manufacture, but ſome little buſineſs is occaſioned by the great poſt road from Dublin to Cork paſſing through it. It is 34 Iriſh miles S.W. from Dublin. N. lat. 52° 54′. W. long. 6° 52′. Philoſ. Survey of South of Ireland, Antholog. Hibern, &c.

CASTLE-DURROW. See Durrow.

CASTLE-FINN, a ſmall poſt town of the county of Donegal, ſituated on the river Finn, which is navigable for veſſels of 14 tons from Derry to this place. It is 4½ miles S.W. from Liſford, and 104 N.W. from Dublin. N. lat. 54° 48′. W. long. 7° 27′.

CASTLE-GUARD, a mount near Ardee, county of Louth, Ireland, which has been generally conſidered as a Daniſh fort. It is entirely artificial, and encompaſſed with a double ditch and vallum. It is now all planted with wood, and looks very romantic. The perpendicular height of the mount from the bed of its foundation is near 90 feet, and the depth of the main trench betwixt 30 and 40. The circumference at the top is not leſs than 140; and round the foundation upwards of 600 feet. There appear to have been, from foundations yet remaining, two concentric octagonal buildings upon the ſummit of it. One ſeems to have been a ſort of tower or caſtle; the other a kind of breaſtwork, or gallery, by way of parapet or battlements. The uſe as well as origin of this, and ſimilar mounts, has been diſputed.

CASTLEHAVEN, James Touchet, lord Audley, earl of, in *Biography*, a nobleman who lived in the reigns of Charles I. and II. He entered into the ſervice of the confederated Catholics in Ireland, A. D. 1641, and had a command in their ſervice, and afterwards under the king, till the reduction of Ireland by Cromwell. In 1681, and again with ſome little alteration in 1684, he publiſhed "Memoirs concerning the Wars of Ireland," which occaſioned much controverſy, and the firſt edition, together with lord Angleſey's remarks on it, was declared by the king in council to be a *ſcandalous libel* againſt the government. This book was intended to controvert many of the ſtatements in ſir J. Temple's Hiſtory of the Iriſh Rebellion, and will of courſe be conſulted by thoſe who wiſh to collect from the jarring accounts of prejudiced writers a tolerably impartial account of the events which then diſtracted Ireland. Lord Caſtlehaven ſeems to have been much attached to a military life, and his memoirs contain many remarks on the art of war, made by him while ſerving under the prince of Condé. Biſhop Nicholſon's Hiſtorical Library.

Castlehaven, in *Geography*, a harbour on the S.W. coaſt of Ireland, in the county of Cork, which has given name to a ſmall village, and to the adjoining pariſh. It was called by the Spaniards *Porto-Caſtello*, from a caſtle near the entrance, and by the Iriſh *Glen-Barahane*, i.e. glen of Barahane, on account of a deep rocky glen near the church which is dedicated to St. Barahane. The entrance of the harbour is about half a mile wide; it is very clean and ſafe for veſſels, drawing no more than 10 feet water. A body of Spaniards which came to the aſſiſtance of the Iriſh, in 1601, landed here, and intrenched themſelves on the eaſt ſide of the bay, of which ſome veſtiges may ſtill be ſeen. Sir R. Leviſon, an Engliſh admiral, came here and deſtroyed moſt of their veſſels, from which the eaſtern point of the harbour was called *Galleon point*, but his own veſſels ſuffered ſo much from a battery on the ſhore, that he returned with difficulty to Kinſale. The village of Caſtlehaven is 164 miles S.W. from Dublin, and 38 S.W. from Cork. Smith's Cork, &c.

Castlehaven, *Stags of*, a cluſter of rocks, two of them conſiderable, and all of them to be ſeen at high water, lying S.W. of the harbour of Caſtlehaven, in N. lat. 51° 26′, W. long. 9° 7′. M'Kenzie, &c.

CASTLE-HEAD, *Two*, a cape on the S.W. coaſt of Ireland, at the eaſtern extremity of Crookhaven. N. lat. 51° 27′. W. long. 9° 32′.

Castle-head, *Three*, a cape on the S.W. coaſt of Ireland, at the ſouthern extremity of Dunmanus bay, county of Cork. N. lat. 51° 26′. W. long. 9° 44′.

CASTLE-ISLAND, a ſmall iſland near Crookhaven, on the S.W. coaſt of the county of Cork, Ireland. N. lat. 52° 14′. W. long. 9° 19′.

Castle-island, a ſmall town of the county of Kerry, Ireland, formerly called *The caſtle of the iſland of Kerry*. The ruins of the caſtle, which was encompaſſed by the river Mang, ſtill remain. The land about it is very good, ranking among the beſt in Kerry; but it has been very badly managed. The town has decayed much, in conſequence, it is ſaid, of a diviſion of intereſt among the proprietors. It is 9 miles E. from Tralee, and 133 S.W. from Dublin. Smith's Kerry.

CASTLE-KNOCK, a barony of the county of Dublin, Ireland, north of the river Liffy, ſo called from a caſtle of that name, which was formerly a place of conſiderable ſtrength, but was taken by Edward Bruce in 1316. There is much attention paid to huſbandry in this diſtrict; and a very laudable aſſociation has been formed in it, called the *Caſtleknock Farmers' Society*, the object of which is to encourage and reward thoſe labourers in agriculture, with their wives and children, who diſtinguiſh themſelves by their induſtry and ſobriety. This ſociety was eſtabliſhed in 1798, and has been found productive of much benefit. There is an account of it in the *Reports* both of the *Engliſh and Iriſh Societies for bettering the condition of the Poor.*

CASTLE-LYONS, formerly called *Caſtle Lehan*, a market town of the county of Cork, Ireland, pleaſantly ſituated in a fertile country on a ſmall river which joins the

*Bride.* It has a good market for poultry, and has large fairs. The inhabitants are about 1000, and the town ſeems capable of great improvement. The ruin of the caſtle, the reſidence of the earls of Barrymore, which was burned a few years ago, makes a conſpicuous appearance at a great diſtance. Here are a neat church of modern ſtructure, and the ruins of an abbey, the poſſeſſions of which being aſſigned to the firſt earl of Cork, were left by him "to his daughter Barrymore, to buy her gloves and pins." Caſtle Lyons is 111 miles S.W. from Dublin, and about 14 miles N.E. from Cork. Smith's Cork, &c.

CASTLEMAIN, a ſmall town of the county of Kerry, Ireland, ſituated on the river *Main*, or *Mang*, which is deep enough for veſſels of 50 tons or upwards. The caſtle here formerly guarded the paſs over the river, which divided the earl of Deſmond's poſſeſſions from thoſe of Macarthy, and was given up to queen Elizabeth by the laſt earl. Though now in ruins, a conſtable is ſtill appointed to guard it, who has ſome land and privileges annexed to the office. The town is very poor, which is in ſome meaſure occaſioned by the badneſs of the harbour. There is a bar acroſs the mouth of the entrance, and a ſpit of ſand on each ſide of the channel, and there are no land marks which a ſtranger can eaſily underſtand. It is repreſented as too large in moſt old maps, and has been erroneouſly ſpoken of as very ſafe. Near Caſtlemain there is a ſpa, which, according to Smith, contains ſulphur and iron. It is 152½ miles S.W. from Dublin. N. lat. 52° 10′. W. long. 9° 35′. Smith's Kerry, M'Kenzie, &c.

CASTLE-MARTYR, a market and poſt town of the county of Cork, Ireland, belonging to the earl of Shannon, who reſides there, and has paid great attention to its improvement, and to that of the adjoining country. It is a neat, well built town, and well watered by a canal, or artificial river, which ſurrounds lord Shannon's demeſne, as well as the town. Mr. Young mentions the combing buſineſs being carried on extenſively in Caſtle-martyr, but this trade has ſince declined in every part of the country. There is a charter ſchool for 40 boys, to the ſupport of which lord Shannon has largely contributed. This town was made a borough in 1663, and continued to ſend two members to parliament till deprived of this privilege by the union. It is 17 miles E. from Cork, on the road to Youghel, and 123 miles S.W. from Dublin. N. lat. 51° 55′ 30″. W. long. 8° 3′. Smith's Cork, Young, &c.

CASTLE-POLLARD, a market and poſt town of the county of Weſtmeath, Ireland, which is 46 miles N.W. from Dublin, and 11 miles N. from Mullingar.

CASTLEREA, a market and poſt town of the county of Roſcommon, Ireland, which is 84 miles W. by N. from Dublin, and 13½ from Roſcommon.

CASTLEREAGH, a barony of the county of Down, Ireland, ſo called from a caſtle, the ruins of which are about two miles S.E. of Belfaſt bridge.

CASTLE-RISING, is an ancient, though at preſent a very inconſiderable borough-town of Norfolk, England. It was formerly a ſea-port of ſome conſequence, and from its ſtrong caſtle obtained many privileges; but the ſea has deſerted the town, its haven is choaked up with ſand, and the caſtle is in ruins. The latter, with the town, is ſituated on an eminence. The caſtle was built by William d'Albini, earl of Arundel and Suſſex, in the time of Henry I. Three of its towers were defended and maintained by the lords Hunſtanton, Wotton, and Ridon; and to ſupport their men, they had a power given them by a ſtatute of Edward III. to take proviſion of the circumjacent villages, paying for it within 40 days. Caſtle-riſing is 100 miles N. from London, and is an ancient borough by preſcription. The burgeſſes were formerly about fifty, but theſe are now reduced to two perſons; who poſſeſs the privilege of ſending two members to parliament, and each alternately aſſumes the mayoralty of the town. In the vicinity of Caſtle-riſing is a large chace, which poſſeſſes the privileges of a foreſt. The church of this town is a large ancient pile, built in the conventual form, with an ornamented weſt front. The rector has the privilege of proving all wills made in the pariſh, and alſo retains ſome other privileges, reſulting from the cuſtoms of the caſtle. The markets here are diſcontinued, and the town is reduced to 49 houſes and 254 inhabitants. Blomefield's Hiſtory of Norfolk.

CASTLETON, in *Antiquity*, a very ancient edifice in Derbyſhire, ſeated on the ſummit of an almoſt inacceſſible rock, impending at a great height over the mouth of one of the moſt horrid and auguſt caverns which nature ever formed. Mr. King, in the Archæologia (vol. vi.) has very particularly deſcribed this curious remnant of antiquity. This preſents a large niche in the wall of one of the apartments, with a ſingular kind of canopy or ornament at the top, ſuppoſed to have been the "idol-cell," or little idolatrous chapel in Pagan times. This ſuppoſition ſeems to receive ſome ſupport, with reſpect to Caſtleton, from certain ſmall idols which were dug up a few years ago in the neighbourhood. See CASTLE.

CASTLETON, in *Geography*, a townſhip and river of America, in Rutland county, and ſtate of Vermont, 20 miles S.E. of Mount Independence, at Ticonderoga. Lake Bombazon is chiefly in this town, and tranſmits its waters into Caſtleton river; which, riſing in Pittsford, paſſes through this town in a ſouth-weſterly courſe, and falls into Pultney river, in the town of Fairhaven, a little below col. Lyon's iron-works. Fort Warner ſtands in this town. The number of inhabitants is 805.

CASTLE-TOWN, the name of a town in the iſle of Man, which belongs to Great Britain, and is provincially connected with the county of Cumberland. It is the reſidence of the principal officers of the government, and the ſeat of the Manks' parliament. The houſes are ſituated on the oppoſite ſides of a ſmall creek, that opens into a rocky and dangerous bay; the difficulty of entering which injures, in a certain degree, the commerce of the town. The ſtreets are ſpacious and regular, and the houſes are moſtly neat and uniform. In the centre of the town is Caſtle-Ruſhen, a ſolid and magnificent ſtructure of free-ſtone, erected on a rock, and conſidered as the chief fortreſs in the iſland. According to the Manks' traditions, it was built in the year 960, by the Daniſh prince, Guttred, who lies obſcurely buried within its walls. The figure of the caſtle is irregular, and by ſome writers ſaid to bear a great reſemblance to Elſineur, in Denmark. The ſtone glacis which ſurrounds it is ſuppoſed to have been built by cardinal Wolſey. The ſtone-work of the keep and ſeveral interior portions of the building are nearly as entire as when firſt erected, but the other parts have been repaired, as the caſtle has been ſeveral times beſieged. In the keep is a deep dungeon for priſoners, who muſt have been lowered into it by ropes, as there are no ſteps to deſcend by. In this town is a neat and elegant chapel, which was erected between the years 1698 and 1701, and paid for out of the eccleſiaſtical revenues. The firſt ſtone was laid, and the chapel conſecrated, by the good biſhop Wilſon in 1698. Here is alſo a free-ſchool, which was eſtabliſhed by biſhop Barrow, about 1666. The ſchool-houſe was formerly a chapel dedicated to St. Mary, as early as the year 1230. The courts of chancery and common law are held in this town. Here are about 500 houſes. Feltham's Tour through the Iſle of Man, 8vo. 1798.

Castle-town, a ſmall town, or rather village, at the weſtern extremity of the county of Cork, Ireland, ſometimes called *Caſtle-Dermot ;* it is oppoſite to the iſland of Beerhaven, and affords a ſcanty ſupply to veſſels lying in that harbour. It is 186 miles S.W. from Dublin. N. lat. 51° 37′. W. long. 9° 49′.

Castle-town, a townſhip of America, in Richmond county, Staten iſland, New York, which contains 805 inhabitants, including 114 ſlaves. Of its inhabitants 114 are electors.

Castle-town *Delvin*, a market and poſt town of the county of Weſtmeath, Ireland, the caſtle of which gave name to the ſurrounding barony. It is 35 miles N.W. from Dublin, and 10½ miles from Mullingar.

Castle-town *Roche*, a market and poſt-town of the county of Cork, Ireland, thus called from a caſtle that was formerly the ſeat of the lords Roche. It is on the river Awbeg, 115 miles S.W. from Dublin, and about 22 miles from Cork.

CASTLE-TOWNSEND, a ſmall town of the county of Cork, Ireland, on the bay of Caſtle-haven. There is a good fiſhery off this bay, and in it are excellent oyſters. It is 159 miles from Dublin, and 35 from Cork.

CASTLE-WELLAN, formerly Caſtle-Vellin, a market and poſt-town of the county of Down, Ireland, pleaſantly ſituated on the ſide of a ſmall lake of the ſame name. It is 65 miles N. from Dublin, and 9 W. from Downpatrick.

CASTOLA, in *Ancient Geography*, a town of Italy, in Etruria, which was taken by the conſul Fabius.

CASTOLI *Campi*, a mountain of Aſia Minor, in the Doride, according to Xenophon.

CASTOLOGI, a people of Gaul, placed by Pliny in the vicinity of the Atrebatii.

CASTOLUS, a town of Lydia, in Aſia Minor, belonging to the Dorians, called by the Lydians Caſtoli.

CASTOR, in *Aſtronomy*, a moiety of the conſtellation Gemini ; called alſo Apollo.—Alſo, a ſtar in this conſtellation, whoſe latitude for the year 1700, according to Hevelius, was 10° 4′ 23″ N. ; and its longitude 16° 4′ 14″ of Cancer. It is alſo called *Raſalgenze*, *Apollo*, *Aphellan*, *Avelar*, and *Anelar*.

Castor, in *Commerce*. See Beaver, and Castor in *Zoology*.

Castor, or *Caiſtor*, in *Geography*, is a ſmall town of Lincolnſhire, England ; having a weekly market on Monday, and three fairs annually. This place is ſaid to have been a Roman ſtation ; but the only memorials of its fortifications and military character are the traces of an encampment on an eminence, at a place called Caſtle-hill, near the town. Several ſprings iſſue from this eminence, and ſupply the inhabitants with excellent water. The pariſh church is a fine old edifice, ſuppoſed to have been built out of the ruins of the caſtle. The latter ſtructure is called Thongcaſtle, and, according to ſome of our old chronicles, was built by Hengiſt the Saxon ; but this is very improbable, as the moſt eminent hiſtorians have endeavoured to prove, and with every degree of probability, that Hengiſt never penetrated ſo far north into England. Among the ſingular tenures of this country may be noticed one which belongs to this town. A proprietor of an eſtate in this neighbourhood holds it upon the condition of ſending an agent every Palm Sunday to the north porch of the church, where he is enjoined to crack or ſmack, what is here called, a horſe-gad, (a whip) three times while the clergyman is reading the firſt leſſon. He then proceeds into the church, paſſes the pulpit, and performs many other truly ridiculous tricks :—a proof of the folly and ſuperſtition of the age when this ceremony was inſtituted. Caſtor is 156 miles N. from London ; and conſiſts of 202 houſes, with 861 inhabitants.

Castor's *River*, a river of Newfoundland iſland, which diſcharges itſelf in the harbour of St. John's. Its ſize is conſiderable for 15 miles from the ſea.

Castor, *Caſtoreum*, in the *Materia Medica*. This ſubſtance, which may be called an animal gum reſin, is the inguinal gland of the beaver, (erroneouſly ſuppoſed by the ancients to be the teſticle,) which has long been in uſe in medicine, though now but rarely. See Castor in *Zoology*.

The caſtor is brought over in roundiſh but flattened lumps, covered with a tough membranous ſkin. Caſtor is a brittle, reddiſh-brown, friable ſubſtance, of a pungent, bitteriſh, unpleaſant taſte, and an intenſely ſtrong and peculiar ſmell, diſagreeable to moſt organs.

By far the beſt caſtor comes from Ruſſia, and is in rounder and harder maſſes, and its ſmell is ſtronger and more diffuſive. The ordinary ſort, which is in flattened maſſes, is imported from Canada, and other parts of North America.

The odorous and more active part of caſtor is taken up by alcohol, water alone diſſolving chiefly the bitter extractive part ; but the ſcent of caſtor is readily imparted to any liquor with which it is digeſted. Water diſtilled from caſtor becomes ſtrongly impregnated with the flavour, but long keeping and heat diſſipate it.

The only preparation of caſtor in common uſe is the ſimple tincture, made in the proportion of an ounce to a pint of the ſpirit. The doſe is about a dram, and it is ſuppoſed to poſſeſs pretty ſtrong nervine and anti-hyſteric properties, and with this view is often combined with valerian, aſafœtida, or tonics.

By the analyſis of Bullion la Grange, it appears to conſiſt of a mucilage, a bitter extract, a reſin, and an eſſential oil, in which laſt the odorous principle ſeems chiefly to reſide, and a flaky cryſtalline matter much reſembling adipocire, or the ſimilar matter contained in biliary calculi.

Castor *Oil*, *Oleum Ricini*. The ſeed of the *Palma Chriſti* (Ricinus *Communis,*) is a whitiſh kernel encloſed in a brown acrid huſk, which, taken entire, excites pretty violent vomiting and purging. Theſe ſeeds contain a large quantity of a mild nearly inſipid oil, of which from a third to a fourth of the weight may be extracted, and is the common caſtor oil of the ſhops. It is imported largely from the Weſt Indies, where it forms one of the commoneſt domeſtic medicines for moſt occaſions.

Genuine caſtor oil is very thick and viſcid, of a light amber or ſtraw colour, with ſcarcely any ſmell or taſte. It becomes beautifully tranſparent by ſubſidence, and a quantity of mucilage falls ſlowly to the bottom of the veſſel.

The oil is prepared in two different ways, either by ſimple expreſſion, without previous preparation, or by decoction. For the latter method, the nuts are beaten in deep wooden mortars, and then thrown into iron boilers filled with water, and ſlowly brought to a boiling heat with conſtant ſtirring. The oil riſes as a ſcum at the top, which is ſimply ſtrained and bottled. According to Dr. Wright, (Medical Journal for 1787,) the oil thus prepared is much milder than that obtained by preſſure, on account of the mucilaginous and acrid part which the compreſſion forces out of the nut and mixes with the oil.

The very mildeſt and fineſt Jamaica oil is very limpid, and nearly colourleſs, and has ſcarcely more taſte and ſmell than fine olive oil, and its effects are proportionably milder.

Caſtor oil is one of the moſt valuable of all the purgative medicines which we poſſeſs. In the doſe of about half an ounce to three quarters for an adult, it uſually operates by ſtool, ſpeedily and mildly, with but little griping, though the meaſure of effect muſt be much determined by the purity and fineneſs of the oil, the ſtrong-ſmelling and coarſer kind often producing ſome uneaſineſs in the bowels. On account of its general mildneſs, it is the medicine moſt commonly ſelected for puerperal women, and thoſe of very delicate habits, and children. Its virtues are alſo deſervedly extolled in the ſeverer inflammatory and ſpaſmodic affections of the bowels, in enteritis, colica pictonum, &c. The oil, when taken unmixed, always paſſes through, in part undecompoſed, and may be ſeen in the fæces.

The exhibition of the oil is often attended with ſome difficulty, particularly as oil is ſo little uſed for culinary purpoſes, that moſt perſons have an averſion to the ſenſation of any kind of oil clinging to the mouth and fauces. In general, if the mouth is previouſly well moiſtened with peppermint-water, or any other ſtrong-taſted agreeable liquor, and the oil, floating unmixed in a cup of water, be ſwallowed quickly in large mouthfuls, it is not felt in the mouth, and all diſguſt is avoided. But when this cannot be well-managed, and the diſguſt to the unmixed oil is inſuperable, it may be readily made into an emulſion with yolk of egg and ſugar, and any aromatic, which completely covers all the ſlight nauſeous taſte which the raw oil leaves in the throat. In this way, however, the purgative power muſt be diminiſhed, that is, all that depends on the mere oil, which is not inconſiderable, ſince an equal quantity of ſallad oil will prove, in ſome degree, purgative, apparently by its mere lubricating effect.

The very frequent uſe of this oil is rather of late date in this country; though it has been long known and reſorted to in particular caſes.

Where the oil is naturally unuſually acrid, or has become ſo by long keeping, it has been propoſed to agitate it with warm water, with a view of diſſolving out part of the acrid mucilage; a method which will probably ſucceed to a certain degree.

Castor, the *Beaver,* in *Zoology,* a genus of quadrupeds which have the front teeth in the upper jaw truncated, and hollowed in a tranſverſe angle; thoſe in the lower jaw tranſverſe at the tips; grinders four in each jaw: tail long, depreſſed, and ſcaly: clavicles perfect, or collar bones in the ſkeleton.

Two ſpecies only of this genus are at preſent known, *Caſtor Fiber,* the common beaver; and the Chili beaver, *Caſtor Huidobrius,* or as it is called by the natives of Chili, Guillino.

Castor *Fiber* has an ovate, flat, and naked tail, by which character it is immediately diſtinguiſhed from the other ſpecies, the tail of which is long, of a lanceolate form, and hairy. The colour of this animal is ſuſceptible of conſiderable variation in different climates: moſt commonly it is of a reddiſh or cheſnut brown. In northern countries they are duſky, and even ſometimes of an intenſe black; but theſe latter are rare. Others are grey, cream-coloured, or white; and inſtances have occurred, in which thoſe of a light-colour have been ſpotted with brown or black. Thoſe of Canada are cheſnut, and among the Illinois, they are yellow, or olivaceous brown.

The beaver is a native of the northern parts of Europe, Aſia, and North America, abounding moſt in cold regions, and becoming gradually leſs common towards the ſouth. In America they are found from the 30th degree of north latitude to beyond the 60th. In ancient times the beaver was a more general inhabitant of Europe than it is at preſent, eſpecially in France, Spain, Italy, Greece, and Egypt, where they are now ſcarcely ever obſerved, and in Britain they have been wholly extirpated for ſome centuries. That it was formerly an indigenous inhabitant of this country is certain upon the credit of the moſt authentic records. The lateſt accounts we have of them is in Giraldus Cambrenſis, who travelled through Wales in 1188: he gives a brief hiſtory of their manners; and adds, that in his time they were only found in the *Teivi* river. Several pools of water in the northern parts of the Cambrian principality ſtill bear the name of *Llyn yr afange,* the pool (or lake) of beavers. There are two, if not more, of the pools amidſt the wilds of the Snowdonian mountains that bear this name to the preſent day; there is one in particular in the vale of Nant Francon near Beddkelert, in Caernarvonſhire, and another in the river Conway, a few miles above Llanrwſt. Theſe were evidently the haunts of beavers. It is however believed that the beaver was uncommon in Britain before the tenth century, for by the laws of Howel dda (*Leges Wallicæ*) the price of the beaver's ſkin (*Croen Lloſtlydan*) was eſtimated at 120 pence: a great ſum in thoſe days.

Beavers, when full-grown, are nearly three feet in length from the tip of the noſe to the inſertion of the tail; the tail itſelf meaſures almoſt twelve inches long; and the weight of the whole animal is from fifty to ſixty pounds. Of all quadrupeds the beaver is conſidered as poſſeſſing the greateſt degree of natural ſagacity in conſtructing its habitation, though in other reſpects it is believed inferior to many. If we conſider this animal in a ſtate of nature (ſays Buffon) or rather in his diſperſed and ſolitary ſtate, we ſhall find that his internal qualities are not ſuperior to other animals; he has neither the genius of a dog, the ſagacity of an elephant, nor the cunning of a fox, and he is rather remarkable for external ſingularities than for any apparent ſuperiority of internal qualities. The beaver is the only animal that has a flat, oval tail, covered with ſcales, which ſerves as a rudder to direct his courſe in the water; the only one that has the hind-feet webbed, and the toes of his fore-feet ſeparate, which he uſes to convey food to his mouth; the only one which reſembles a land animal in his fore-parts, and approaches the nature of an aquatic one in the poſterior; in ſhort, he forms the ſame ſhade between quadrupeds and fiſhes, as the bat forms between quadrupeds and birds. But theſe ſingularities would be rather defects than perfections, if the beaver did not derive from this conformation peculiar advantages adapted to its mode of life, which render it ſuperior to all other animals.—It is generally allowed, ſays this writer, in another place, that the beaver, far from having a ſuperiority over other animals, ſeems to be inferior to many of them in his merely individual qualities, and this fact he aſſerts he was able to confirm, by having had a young beaver, which was ſent him from Canada alive, in his poſſeſſion for more than a twelve-month. This animal is mild, peaceable, and familiar; it was rather inclined to be gloomy and melancholy, had no violent or vehement paſſions, its movements were ſlow; it made few efforts except to gain its liberty, which it frequently attempted by gnawing the gate of its priſon, but without violence or precipitation. In other reſpects it ſeemed to be perfectly indifferent; forming no attachments, and being as little inclined to offend as pleaſe. He was inferior to the dog in the relative qualities which might make him approach to man: he appeared neither formed to ſerve, command, or even to aſſociate with any ſpecies but his own: his talents were repreſſed by ſolitude, and it ſeemed only by ſociety with his own kind, thoſe talents could be brought into action. When alone he had little induſtry, few tricks, and not ſufficient diſtruſt to avoid the moſt obvious ſnares. Far from attacking any other animal, he had ſcarcely the art to defend himſelf, always preferring flight to combat; he reſiſted only when driven to an extremity, and then bit very hard with his teeth. Such traits of the manners of this animal in a ſtate of captivity are ſingular. We are not, however, ſatisfied that the obſervations of Buffon will apply to the beaver generally; in one reſpect he is evidently incorrect; we are aſſured by the beſt authors that the beaver may be eaſily tamed. M. Klein tells us he kept a beaver for ſeveral years, which followed him, or would go in queſt of him as a dog would ſearch for his maſter; Kalm ſpeaks decidedly to the ſame effect; he obſerves, in his travels, that he has ſeen beavers that would go out to fiſh, and bring the prey home to their maſters; nay, that they would even follow men and dogs, go with them into the water, jump into the water, and come up again with the fiſh; and M. Gmelin affirms that he ſaw a beaver in Siberia, which had been reared in the houſe, who would wander to a conſiderable diſtance, ſometimes returning with a female whom he would ſuffer to depart alone after the ſeaſon of love.

Authors have ſaid that the beaver, being an aquatic animal, could not live ſolely on land; an opinion which Buffon endeavours to prove erroneous; he obſerves that the young beaver before mentioned when taken to the water was afraid of it, and refuſed to go in; when plunged into the baſon there was a neceſſity to hold him there by force, though in a few minutes he became perfectly reconciled; afterwards, when left to his liberty, he would frequently return to it of himſelf, and even roll upon the dirt, or wet pavement. One day he eſcaped and deſcended by a ſtair-caſe into the ſubterraneous vaults in the royal garden, and ſwam a conſiderable time in the ſtagnant water at the bottom of them, yet no ſooner did he perceive the light of the torches which were brought to ſearch for him, than he returned, and ſuffered himſelf to be taken without the leaſt reſiſtance. He was familiar, but not fawning, and was ſure to expreſs his deſire for ſomething to eat from thoſe he ſaw at table, which he ſignified by a ſmall plaintive cry, and ſome geſtures with his fore-paws: when he obtained a morſel he carried it off and concealed it, that he might eat it at his eaſe. He ſlept pretty often, and then laid on his belly. No food came amiſs to him, meat excepted, which he refuſed either raw or dreſſed. It was remarkable that he gnawed every thing within his reach, inſomuch that it had been found neceſſary to line with tin the barrel in which he had been brought from Canada.

The favourite reſorts of the beaver are retired woody ſituations on the borders of lakes, rivers, and other freſh waters; yet they are ſometimes found on the ſea ſhores near the influx of great rivers, where the waters are leſs ſaline than in the open ſea.

According to Buffon, the beavers begin to aſſemble in the month of June or July, for the purpoſe of uniting into ſociety. They arrive in numbers from all parts, and ſoon form a troop of two or three hundred. The place of rendezvous is generally the ſituation fixed for their eſtabliſhment, and always on the banks of ſome water. If the waters be flat, and never riſe above their ordinary level, as in lakes, the beaver makes no banks or dam; but in rivers or brooks, where the waters are ſubject to conſiderable riſings and fallings, they conſtruct a bank, and by this artifice form a pond, or piece of water, which remains always at the ſame height. The bank traverſes the river, from one ſide to the other, like a ſluice, and it is often from eighty to a hundred feet long, by ten or twelve broad at the baſe. This pile, for animals of ſo ſmall a ſize, appears to be enormous, and ſuppoſes an incredible labour; but the ſolidity with which the work is conſtructed is ſtill more aſtoniſhing than its magnitude. The part of the river where they erect this bank is generally ſhallow. If they find on the margin a large tree, which can be made to fall into the water, they begin with cutting it down, to form the principal part of their work. This tree is often thicker than the body of a man. By gnawing the foot of the tree with their four cutting teeth, they accompliſh their purpoſe in a very ſhort time, and always make the tree fall acroſs the river. They next cut the branches from the trunk to make it lie level. Theſe operations are performed by the whole community. Several beavers are employed in gnawing the foot of the tree, and others in lopping off the branches after it has fallen. Others at the ſame time traverſe the banks of the river, and cut down ſmaller trees from the ſize of a man's leg to that of his thigh. Theſe they dreſs and cut to a certain length to make ſtakes of them, and firſt drag them by land to the margin of the river, and then by water to the place where the building is carrying on. Theſe piles they ſink down, and interweave the branches with the larger ſtakes. This operation implies the vanquiſhing of many difficulties; for to dreſs theſe ſtakes, and to put them in a ſituation nearly perpendicular, ſome of the beavers muſt elevate with their teeth the thick ends againſt the margin of the river, or againſt the croſs-tree, while others plunge to the bottom and dig holes with their fore feet to receive the points that they may ſtand on end. While ſome are labouring in this manner, others bring earth, which they plaſh with their fore feet, and tranſport it in ſuch quantities, that they fill with it all the intervals between the piles. Theſe piles conſiſt of ſeveral rows of ſtakes, of equal height all placed oppoſite to each other, and extend from one bank of the river to the other. The ſtakes facing the under part of the river are placed perpendicularly; but the reſt of the work ſlopes upwards to ſuſtain the preſſure of the fluid, ſo that the bank, which is ten or twelve feet wide at the baſe, is reduced to two or three at the top. It has therefore not only the neceſſary thickneſs and ſolidity, but the moſt advantageous form for ſupporting the weight of the water, for preventing its iſſue, and for repelling its efforts. Near the top or thinneſt part of the bank they make two or three ſloping holes to allow the ſurface water to eſcape, and theſe they enlarge or contract, according as the river riſes or falls; and when any breaches are made in the bank by ſudden or violent inundations they know how to repair them as ſoon as the water ſubſides.—It would be ſuperfluous after this account of their public works, to give a detail of their particular operations, were it not neceſſary in a hiſtory of theſe animals to mention every fact, and were not the firſt great ſtructure made with a view to render their ſmaller habitations more commodious. Theſe cabins, or houſes, are built upon piles near the margin of the pond, and have two openings, the one for going to the land, and the other for throwing themſelves into the water. The form of the edifices is either oval or round, ſome of them larger and ſome leſs, varying from four or five, to eight or ten feet in diameter. Some of them conſiſt of three or four ſtories, and their walls are about two feet thick, raiſed perpendicularly upon planks, or plain ſtakes, which ſerve both for foundations and floors to their houſes. When they conſiſt of but one ſtory, the walls riſe perpendicularly only a few feet, afterwards aſſume a curved form, and terminate in a dome, or vault, which ſerves them for a roof. They are built with amazing ſolidity, and neatly plaſtered both without and within. They are impenetrable to rain, and reſiſt the moſt impetuous winds. The partitions are covered with a kind of ſtucco, as nicely plaſtered as if it had been executed by the hands of man. In the application of this mortar their tails ſerve for trowels, and their feet for plaſtering. They employ different materials, as wood, ſtone, and a kind of ſandy earth, which is not ſubject to diſſolution in water. The wood they uſe is almoſt all the light and tender kinds, as alder, poplar, and willow, which grow generally on the banks of rivers, and are more eaſily barked, cut, and tranſported, than the heavier and more ſolid ſpecies of timber. When they once attack a tree, they never abandon it till they cut it down and carry it off. They always begin the operation of cutting at a foot or a foot and a half above the ground. They labour in a ſitting poſture; and beſides the convenience of this ſituation, they enjoy the pleaſure of gnawing perpetually the bark and wood, which are moſt agreeable to their taſte; for they prefer freſh bark and tender wood to moſt of their ordinary aliment. Of theſe proviſions they lay up ample ſtores, to ſupport them during the winter; but they are not fond of dry wood, and make occaſional excurſions during the winter ſeaſon for freſh proviſions in the foreſts. It is in the water, or near their habitations, that they eſtabliſh their magazines. Each cabin has its own magazine, proportioned to the number of its inhabitants, who have all a common right to the ſtore, and never pillage their neighbours. Some villages are compoſed of 20 or 25 cabins, but ſuch eſtabliſhments are rare; and the common republic ſeldom exceeds, 10 or 12 families, each of which has its own quarter of the village, its own magazine, and its ſeparate habitation. They will not allow ſtrangers to ſettle in their neighbourhood. The ſmalleſt cabins contain two, four, or ſix; and the largeſt eighteen, twenty, or it is ſaid even ſometimes thirty beavers. They are almoſt always equally paired, there being the ſame number of females as of males. Thus, on a moderate computation, the ſociety is often compoſed of 150 or 200, which all at firſt laboured jointly in raiſing the great public building, and afterwards in ſelect tribes or companies, in making particular habitations. In this ſociety, however numerous, an univerſal peace is maintained. Their union is cemented by common labours; and it is rendered perpetual by mutual convenience, and the abundance of proviſions which they amaſs and conſume together. Moderate appetites, a ſimple taſte, an averſion againſt blood and carnage, diveſt them of the idea of rapine and war. They enjoy every poſſible good. Friends to each other, if they have ſome foreign enemies, they know how to avoid them. When danger approaches, they acquaint one another by ſtriking their tails on the ſurface of the water, the noiſe of which is heard at a great diſtance, and reſounds through all the vaults of their habitations. Each takes his part; ſome plunge into the lake, others conceal themſelves within their walls, which are ſo firmly conſtructed that no animal will attempt to burſt through, or overturn them. Theſe retreats are not only very ſafe, but neat and commodious. The floors are ſpread over with verdure; the branches of the box and fir ſerve them for carpets, upon which they permit not the ſlighteſt dirtineſs. The window that faces the water anſwers for a balcony to receive the freſh air, and to bathe. During the greateſt part of the day they ſit on end, with their head and anterior parts of the body elevated, and their poſterior parts immerſed in the water. This window is made with caution, the aperture being ſufficiently raiſed to prevent its being ſtopped up with the ice, which in the climates inhabited by the beaver is often two or three feet thick. When this happens, they ſlope the window, cut obliquely the ſtakes which ſupport it, and thus open a communication with the unfrozen water. This element is ſo neceſſary, or rather ſo agreeable to them, that they can ſeldom diſpenſe with it. They often ſwim a long way under the ice, and it is then that they are moſt eaſily taken, by attacking the cabin on one hand, and at the ſame time watching at the hole made at ſome diſtance, where they are obliged to repair for the purpoſe of reſpiration. The continual habit of keeping their tail and poſterior part in the water appears to have changed the nature of their fleſh. That of their anterior parts, as far as the reins, has the taſte and conſiſtence of the fleſh of land or air animals; but that of the tail and hinder parts has the odour and all other qualities of fiſh. The tail, which is a foot long, an inch thick, and five or ſix inches broad, is even an extremity or genuine portion of a fiſh attached to the body of a quadruped; it is entirely covered with ſcales, and with a ſkin perfectly ſimilar to thoſe of large fiſhes: they may be ſcraped off with a knife, and after falling, they leave an impreſſion on the ſkin as is obſervable in fiſhes under ſimilar circumſtances.

The beavers aſſemble in the beginning of ſummer. They employ the months of July and Auguſt in the conſtruction of their bank and cabins. In September they collect their proviſions of bark and wood; and afterwards enjoy the fruits of their labour and foreſight. At this ſeaſon they couple, each, as it is affirmed, ſelecting its mate; and abiding with her by choice rather than indulging in a promiſcuous intercourſe with the reſt of the females. Thus they paſs the autumn and winter together, during which time they occaſionally go out on excurſions to bring in a ſupply of freſh bark, which they prefer to that, which, by remaining long in their magazine, has become dry or hard, or has been by accident moiſtened with water. The females are ſaid to be pregnant for four months; they bring forth at the end of the winter, and generally produce two young, rarely three, or four, which laſt they ſeldom if ever exceed, and nature has provided the female with four teats for ſuckling its young. About the end of winter the females are left by the males, who retire to the country to enjoy the products of the ſpring. They may occaſionally reviſit their cabins, but never remain long in them. The females continue in their cabins, and are occupied in nurſing, protecting, and rearing their young, which at the end of a few weeks, are in a condition to follow their dams. The females now in their turns make frequent excurſions, and recruit their ſtrength with air, and freſh bark, and other herbage. Thus they paſs the remainder of the ſummer till autumn, when the whole ſociety again aſſembles. But even during the ſummer, while thus diſperſed, ſhould their banks or cabins be over-thrown by inundations, they ſuddenly collect their forces, and repair the breaches which have been made. They are much more attached to ſome places than others, and have been obſerved to return every autumn, after their works have been repeatedly demoliſhed to repair them, till haraſſed by this perſecution, and weakened by the loſs of ſeveral of their troop, they have with one conſent deſerted it, and retired to ſome more ſecure and leſs frequented neighbourhood.

Winter is the ſeaſon principally allotted for hunting the beaver, as it is only then their fur is in perfection; and when, after their dwellings are demoliſhed, a number of them are taken, their ſociety, it is ſaid, is never reſtored, but thoſe which eſcape become houſeleſs wanderers. Their genius is overcome by apprehenſion, and they never more attempt to exert it, but conceal themſelves in holes under ground, and reduced to the condition of other animals they lead a timid life, employing themſelves only to ſatisfy their immediate wants, and they retain no longer thoſe qualities which they ſo eminently poſſeſs in their ſocial ſtate. Theſe are the unaſſociated beavers mentioned by authors, who live ſolitary, and inſtead of conſtructing cabins, or vaulted and plaſtered receptacles, only form holes for their dwellings in the banks of rivers. Theſe are commonly termed terrier beavers, and their fur is conſidered as far leſs valuable than that of the beavers which herd together in ſocieties. All the European beavers are ſolitary: it is only in the vaſt and ſcarcely habitable tracts of the northern regions thoſe animals can be ſufficiently ſecure from the intruſion of man, to form the commodious habitations already mentioned.

Many writers, not content with aſcribing to the beaver ſocial manners, and evident talents for architecture, have attributed to them general ideas of policy and government. They have aſſerted that when their ſociety is formed, they reduce travellers and ſtrangers of their own ſpecies into ſlavery; that they employ them in carrying their clay and wood; that they treat in the ſame manner the idle who will not, and the old who cannot, work; that is, throw them upon their backs, and uſe them as ſo many vehicles to carry their materials: that they never aſſemble in an even number, in order that they may have in all their deliberations a caſting vote; that each tribe has its chief; and that they have centinels eſtabliſhed for the public ſecurity. Ælian, and others of the ancients have pretended further, that, when cloſely purſued by the huntſman, they would ſtop ſhort, and tear off the ſecretory glands of caſtor to ſatisfy the cupidity of the hunter; and when thus mutilated would preſent themſelves to obtain mercy. Such reports are abſurd, and are completely exploded by modern obſervers.

The fur of the beaver is more beautiful and thick than that of the otter; it is compoſed of two ſorts of hair; the one, ſhort and buſhy, ſoft as down, and impenetrable to the water, immediately covers the ſkin; the other, longer, briſtly, and ſhining, but thinner, ſerves as an upper coat, and defends the former from filth and duſt. The latter is of little value, it is only the firſt that is uſed in our manufactures. The uſe of its fur in the hat manufactories is ſufficiently well known: attempts have been alſo made in France to weave the hair of beavers with the Segovian wool, but which in the event was found to form a cloth of no very excellent quality. The blackeſt furs are generally thickeſt, and conſequently moſt eſteemed; nor is the fur of the ſolitary beavers equal to that of thoſe who live in ſociety. Theſe animals, like all other quadrupeds, ſhed their hair in ſummer; and therefore the furs of ſuch as are taken in that ſeaſon are of little value; they are called the ſtage-beavers, being thoſe which the Indians kill on their ſtages or journies, and are eſteemed the worſt ſkins. Beaver ſkins are alſo diſtinguiſhed by the name of coat beaver, and parchment beaver, by traders; the firſt is that which is worn by the Indians as coverlets, and the other is ſo named becauſe the lower ſide reſembles parchment.

In hunting beavers, the ſavages moſt commonly either ſhoot them or take them in traps. In the firſt inſtance they always proceed againſt the wind, for the beavers are ſhy, quick in hearing, and of a keen ſcent. The beavers are generally taken by ſhooting while they are at work, or when on ſhore feeding on the poplar bark. If they hear any noiſe when at work, they immediately jump into the water, and continue there ſome time; and when they riſe, it is at a diſtance from the place where they plunged in. The traps laid for them are nothing more than poplar ſticks laid in a path near the water; which when the beaver begins to feed upon they cauſe a large log of wood to fall on their necks, which is put in motion by their moving the ſticks, and of courſe requires an ingenious contrivance. The ſavages generally prefer the latter mode of capture, becauſe it does not damage their ſkins. In the winter they take the beaver in another manner; they break the ice in two places at a diſtance from the cabins, the one behind the other; after which they take away the broken ice with a kind of racket, the better to obſerve where to place the ſtakes. To theſe they faſten nets, which have large meſhes, and are ſometimes 18 or 20 yards in length. When theſe are fixed, they proceed to demoliſh the houſe, and turn in a dog, which terrifying the beaver, he dives into the water, where he is ſoon entangled in the net and taken.

The ſkins of the beaver form a prodigious article of commerce; many thouſands are annually imported by the Hudſon's bay company into England from North America, which is the principal though not the only ſource from which our beaver ſkins are obtained; Ruſſia furniſhes a vaſt number. But beſides the fur, which is a valuable article, the beaver affords a ſubſtance of conſiderable utility in medicine, the drug *caſtoreum* or *caſtor*, which ſee. This ſubſtance is ſecreted in two large cellular glands ſituated near the genital organs and the anus. Each animal affords about two ounces of this ſubſtance, and it is common to both ſexes. It is pretended by ſome that the beavers extract this liquid by preſſing the bladders with the feet; that it gives them an appetite when diſguſted with food, and that the ſavages to entrap them wet the ſnares with it. Others affirm, however, with greater probability, that the animal employs this oily ſubſtance to anoint its fur and render it more impervious to the water. The American ſavages are ſaid to obtain an oil from the tail of the beaver, which they apply as a topical remedy for different complaints. The fleſh is ſeldom eaten; though fat and delicate to appearance, it is extremely bitter and unpalatable. Beavers are ſaid to couple when a twelve month old, and it has been hence inferred that the beaver does not commonly live to the age of 20 years as ſome writers affirm. The American beavers feed principally on the magnolia glauca, fraxina americana, and a variety of roots, among which they ſeem to prefer thoſe of the acorus calamus, or calamus aromaticus; the poplar, aſpin, and birch are the favourite food of the European beavers.

The reader deſirous of obtaining a further hiſtory of the beaver may conſult the following publications with advantage. Præſide, Diſputatio de Caſtore vel Fibro, &c. Johan. Chriſti. Frommann, 1686. Præſide, Diſſertatio; Caſtor breviter delineatus, &c. Laur. Normanno, Upſ. 1687. Berättelſe om Bäfverns natur, &c. Acad. Handling, Nils Giſler, 1756. Hiſtoria naturalis Caſtoris et Moſchi, &c. J. G. Linck. Lipſiæ, 1786. Anatomy of a female Beaver, and an account of Caſtor found in her, vol. 38. Phil. Tranſ. Phyſikaliſch-anatomiſche bemurkungen über den biber. C. Gottwaldt. Nürnb. 1782. Obſervations ſur le Caſtor, ſuivies de l'analyſe chimique du Caſtoreum. Journ. de Phyſique, T. 40.

Castor *huidobrius* differs from the former in having the tail long, lanceolate, and hairy; the fore feet lobed and the hind feet palmated.

This is the guillino beaver of Pennant, and Chili beaver of later Engliſh writers. It is a ſingular animal, and appears to have been firſt deſcribed by Molina in his Natural Hiſtory of Chili. This writer (to whom later authors ſeem principally indebted for their account of this animal) informs us that it inhabits the deepeſt parts of the lakes and rivers of Chili, that it feeds principally on fiſh, and crabs; and does not conſtruct any regular habitation like the common beaver; nor does it afford any of the ſebaceous matter called caſtor. The length is about three feet. The head is nearly ſquare; the eyes ſmall; the ears rounded and ſhort, and the ſnout obtuſe; in each jaw are two ſharp and ſtrong cutting teeth, and the grinders like thoſe of the other ſpecies of beaver. The body is very broad, and covered like the beaver with two ſorts of hair, the undermoſt of which is finer than that of the rabbet, and is in much eſteem with the manufacturers, being wrought into a kind of cloth which has the ſoftneſs of velvet, and is alſo uſed in the manufacture of hats. The colour of this animal is cinereous above, and whitiſh on the belly. The toes of the fore feet are lobated, or bordered with a membrane, and the hind feet are webbed; the toes five in number on each foot. The tail is compreſſed, and is beſides diſtinguiſhed from that of the common beaver in being lanceolate and hairy, a character by which the ſpecies may be eaſily known. This is repreſented as a bold, and even fierce animal, and as having the power of remaining for a conſiderable length of time under water. The female produces from two to three young at a birth.

The Zibethicus, or muſk-rat, is arranged by ſome as a ſpecies of caſtor; but as it appertains more clearly to the rat tribe, recent naturaliſts refer it to the genus Mus. See Mus *zibethicus*.

Castor *and Pollux*, in *Aſtronomy*. See Gemini.

Castor *and Pollux*, in *Meteorology*, a fiery meteor, which at ſea appears ſometimes ſticking to a part of the ſhip, in form of one, two, or even three or four fire-balls: when one is ſeen alone, it is more properly called *Helena;* two are denominated Caſtor and Pollux, and ſometimes Tyndaridæ.

Caſtor and Pollux are called by the Spaniards, San Elmo; by the French, St. Elme, St. Nicholas, St. Clare, St. Helene; by the Italians, Hermo; by the Dutch, Vree Vuuren.

Caſtor and Pollux are commonly judged to portend a ceſſation of the ſtorm, and a future calm; being rarely ſeen till the tempeſt is nigh ſpent. Helena alone portends ill, and indicates the ſevereſt part of the ſtorm yet behind.

When the meteor ſticks to the maſts, yards, &c. they conclude, from the air's not having motion enough to diſſipate this flame, that a profound calm is at hand; if it flutter about, it indicates a ſtorm.

Castor *and Pollux*, in *Fabulous Hiſtory*, were two brothers, the ſons of Tyndareus or Tyndarus, king of Sparta, by his wife Leda, and they had two ſiſters, the famous Helena and Clytemneſtra, the wife and murderer of Agamemnon. According to the fable, Jupiter had an amour with Leda, in the form of a ſwan, and ſhe brought forth two eggs, each containing twins. From that impregnated by Jupiter proceeded Pollux and Helena, who were both immortal: from the other Caſtor and Clytemneſtra, who being begotten by Tyndarus, were both mortal. They were all, however, called by the name "Tyndaridæ." Theſe two brothers entered into an inviolable friendſhip; they accompanied the other noble youths of Greece in the expedition to Colchis, and ſignalized themſelves by their valour. The fable adds, that when Caſtor died, his brother Pollux, who was immortal, prayed to Jupiter that he might ſhare his immortality with him; which being granted, they lived and died by turns, and being tranſlated into the heavens, they formed the conſtellation Gemini. As they were diſtinguiſhed by their courage, particularly in their conteſts with pirates, they received divine honours, and ſeamen paid them peculiar devotion. Accordingly, the veſſel which carried Paul, (Acts xxviii. 11.) was called Dioſcuri, or Caſtor and Pollux, becauſe their images were either carved or painted on the prow. There was beſides ſome other deity on the ſtern; and theſe were regarded as the patrons and tutelary gods of the veſſel.

A martial dance, called the "Pyrrhic," or "Caſtorian" dance, was invented in honour of thoſe deities, whom the Cephalenſes placed among the dii magni, and offered to them white lambs. The Romans alſo rendered them particular honours, on account of the aſſiſtance they are ſaid to have given them in an engagement againſt the Latins; in which, appearing mounted on white horſes, they turned the ſcale of victory in their favour, for which a temple was erected to them in the forum.

CASTOREA, in *Botany*. Plum. See Duranta *Plumierii*.

CASTOREUM, in the *Materia Medica*. See Castor.

CASTORIA, in *Geography*, a lake of European Turkey, in the province of Macedonia, and alſo a town of the ſame name; 30 miles W. of Edeſſa.—Alſo, a river of European Turkey, which empties itſelf into the lake to which it gives name, in Macedonia; and the name is afterwards changed into Viſtritza.

CASTORUM Lacus, in *Ancient Geography*, *Caſtorum templum*, or *Caſtorum nemus*, a place of Italy, 12 miles from Cremona, according to Tacitus; called *Caſtoris lucus* by Oroſius, where Cecina, Vitellius's general, was defeated by the troops of Otho.

CASTRA, the Latin term for a camp, has given name to a great number of places; ſome of the principal of which we ſhall mention: e. g. Caſtra, a town of India, on this ſide of the Ganges, placed by Ptolemy in the country of the Salacenians.—A place or town of Norica, in the Itin. of Anton.—A town of Macedonia, marked in Anton. Itin. on the route from Otranto to Conſtantinople, in paſſing by Macedonia, between Scirtiana and Heraclea.—A place of Italy, N.E. of Tergeſte.—C. *Alexandri*, a place of Africa, in Marmarica; and alſo a place of Egypt near Peluſium.—C. *Annibalis*, a port of Italy, in Magna Grecia, on the peninſula formed by the gulfs Scyllaceus and Tarentinus, according to Pliny.—C. *Cæcilia, Caceres*, a town of Spain, in Luſitania, S. of Ruſticiana.—C. *Cornelia*, a place of Africa Propria, according to Pliny and Mela. It is called by Julius Cæſar and Ptolemy, C. *Corneliana;* and is the place where Scipio Africanus firſt encamped when he landed in Africa. It occupied a tongue of land, called "Gellah," about 2 ſtadia broad, and was the moſt northern and rugged part of the promontory of Apollo, ſituate in Africa, N. of Carthage.—C. *Cyri*, the place where Cyrus encamped when he marched his army into Lydia, againſt Cræſus, mentioned by Quintus Curtius and Arrian.—C. *Dellia*, or *Lælia*, a place of Africa, near C. *Cornelia* and the river Bagradas, according to Mela.—C. *Dan*, a place of Paleſtine, between Zorah and Eſhtaol, in the tribe of Dan, where the ſpirit of the Lord began to move Samſon. Judges xiii. 25. Joſh. xix. 41.—Alſo, another place of Paleſtine, in the tribe of Judah, behind Kirjath-Jearim. Judges xviii. 12.—C. *Exploratorum*, a place in the Iſle of Albion, mentioned in the ſecond route of Antonine's Itinerary. If *Blatum Bulgium*, (which ſee) was really at Middleby, as Horſley renders probable, every circumſtance leads us to fix the Caſtra Exploratorum at Netherby, and the moat at a ſmall diſtance from it; for at the former there was a famous Roman town, and at the other an exploratory camp. Both theſe places are at a proper diſtance from Blatum Bulgium on the one hand, and Luguvallium on the other, and ſituated on the military way which led from the one to the other.—C. *Felicia*, a place in the iſland of Sardinia.—C. *Galba*, an epiſcopal ſee of Africa, in Numidia.—C. *Gemina*, a town of Spain, in the diſtrict of Hiſpalis, according to Pliny; which was tributary to the Romans.—C. *Germanorum*, a place of Africa, in Mauritania Cæſarienſis, according to Ptolemy; near a ſmall iſle E. of the promontory of Apollo.—C. *Hannibalis*, *Caſtello*, a place of Italy, in Brutium, at a ſmall diſtance N.E. of Scylacium. See C. *Annibalis*.—C. *Herculis*, a town of Germany, occupied, according to Ammianus Marcellinus, by the Romans. It was one of the ſeven places on the Rhine, which Julian repaired; and was ſituated over-againſt the

the place where Druſus opened a canal for diſcharging the waters of the Rhine into the Iſſel.—C. *Julia*, a town of Spain, placed by Pliny in Luſitania.—C. *Lapidariorum*, a place of Egypt, in the Thebaide.—C. *Mammaria*, a town of Spain.—C. *Monorum*, a place of Aſia, in Meſopotamia, W. of mount Singaræ.—C. *Nova*, a maritime place of Africa, in Mauritania Cæſarienſis, marked in the Itinerary of Antonine on the route from Cala to Rufucurrum, between Taſagora and Ballene.—C. *Poſthumiana*, the camp of Poſthumius, a place of Spain, in the vicinity of Ucubis, fortified and garriſoned by Cæſar.—C. *Prætoria*, a place of Rome, near the porta Viminalis. It was a kind of citadel, according to Pliny, where Tiberius aſſembled the prætorian cohorts. It was encloſed by walls, ditches, and towers, and had a temple, an arſenal, baths, fountains, &c.—C. *Puerorum*, a place of Africa, in Mauritania Cæſarienſis, between the colony of Gilva and Portus Divinus.—C. *Regina*, a place in Rhætia.—C. *Seberianenſis*, an epiſcopal ſee of Africa, in Mauritania Cæſarienſis.—C. *Trajana*, a place in the vicinity of Ribnik, a ſmall town on the banks of the Aluta, in Dacia.—C. *Tyriorum*, a particular place of Egypt, in the environs of Memphis, according to Herodotus.—C. *Vali*, an epiſcopal ſee in the patriarchate of Antioch, under the metropolis of Anazarbus.
